Status: S= Supporting, PS= Partial Supporting, NS= Not Supporting.

Reason: BIO= Biota Impacted, DO= Dissolved Oxygen, FC= Fecal Coli form Bacteria.

Source: GDNR 2006b.

** Feature not crossed my centerline – no MP or crossing length assigned.

a/ Crossing widths measured along pipeline centerline or field estimated for small waterbodies. Waterbodies with a crossing width of 0 feet will not be crossed by centerline. Temporary work space will be reduced at these locations in order to avoid any impacts to the feature.

b/ Crossing Methods:

1. (Wet Crossing - < 50 feet). A backhoe will open the trench, the pipe will be put in, and the trench will be backfilled.
2. (Dry Crossing – 10 to 50 feet). Stream flow may be channeled into one or multiple flume pipes to convey water across the trench and maintain downstream flow or use a dam and pump arrangement to convey the stream around the construction area. The trench will be excavated from under the flume pipe, the pipeline will be threaded under the flume, the trench will be backfilled, and the flume pipe removed to restore natural downstream flow.
3. (Wet Crossing - > 50 feet). The trench will be opened using a backhoe or dragline, and the pipe will be pulled or floated into place. Flow in these streams will most likely be sufficient to fill the trench and allow natural downstream flow.
4. (Directional Drilling). The pipeline will be installed by directional drill. Overlying waterbodies and wetlands will not be disturbed. This method will require approval by Project's engineer.

c/ Indiscernible at the time of survey due to flooded conditions and coincident with Type 3 wetland.

Notes: Linear data is converted to fixed mileposts with endpoint of MP 188.4. Actual pipeline length is 189.5 miles.
