Altitude, as used in this report, refers to distance above mean sea level at an unknown vertical datum.

Streamflow Characteristics at Streamgages in Northern Afghanistan and Selected Locations

By Scott A. Olson and Tara Williams-Sether

Abstract

Statistical summaries of streamflow data for 79 historical streamgages in Northern Afghanistan and other selected historical streamgages are presented in this report. The summaries for each streamgage include (1) station description, (2) graph of the annual mean discharge for the period of record, (3) statistics of monthly and annual mean discharges, (4) monthly and annual flow duration, (5) probability of occurrence of annual high discharges, (6) probability of occurrence of annual low discharges, (7) probability of occurrence of seasonal low discharges, (8) annual peak discharges for the period of record, and (9) monthly and annual mean discharges for the period of record.

Introduction

Preliminary hydrologic evaluations are needed to determine the water-resource priorities in all areas of Afghanistan for agricultural, industrial, and residential water uses. This report focuses on providing streamflow characteristics of 79 streamgages in the northern half of Afghanistan, primarily in the Kabul, Amu Darya, Northern, Hari Rud and Murghab Basins (figs. 1–4). This report also includes some streamgages in other parts of Afghanistan that were not included in previous reports (Williams-Sether, 2008; Vining, 2010). The basins represented in the report are in arid and mountainous environments, often fed by melting snow from the high mountains and infrequent storms.

Because there can be great fluctuations in streamflow, from flood to drought, in Afghanistan, knowledge of the magnitude and time distribution of streamflow is essential for all aspects of water management and environmental planning. To provide the Afghan managers with necessary streamflow information, the U.S. Geological Survey, in cooperation with the U.S. Task Force for Business and Stability Operations, computed streamflow statistics for data collected at historical streamgages in northern Afghanistan and selected locations in southeastern Afghanistan. Agencies responsible for the development and management of the surface-water resources of Afghanistan can use the data provided in this report to assist in making safe, economical, and environmentally sound water-resource planning decisions. The historical streamgages used are listed in table 1 and their locations are shown in figures 1–4.

History of the Streamgaging Program in Afghanistan

Streamgaging began in Afghanistan in the mid-1940s at a few sites. The number of sites increased over the years until the late 1970s. Streamgaging was discontinued soon after the Soviet invasion of Afghanistan in 1979. Until 1978, Afghanistan had a network of approximately 160 streamgages. No streamflow data were collected after September 1980 until recently. In 2005, three historical streamgages were re-established and currently (2010) much of the historic network has been re-established and is being operated by the Afghanistan Ministry of Energy and Water.

Explanation of Streamgage Summaries

Streamgage summaries are presented so that each station description and tables of streamflow statistics are presented in the same order and format for each streamgage, including the same relative placement on the pages. Because the statistical information listed in the tables was created by computer “data retrievals” or from statistical program results, significant figures were not always rounded to U.S. Geological Survey standards. The order of presentation is as follows:

1. Station description,
2. Graph of the annual mean discharge for the period of record,
3. Table of statistics of monthly and annual mean discharges,
4. Table of monthly and annual flow duration,
5. Table of probability of occurrence of annual high discharges,
6. Table of probability of occurrence of annual low discharges,
7. Table of probability of occurrence of seasonal low discharges,
8. Table of annual peak discharge and corresponding gage height for the period of record, and
9. Table of monthly and annual mean discharges for the period of record.

Station Description

The location, drainage area, period of record, and other available information about each streamgage included in this report are presented in the station description. This information is compiled from records originally published by the Afghanistan Ministry of Energy and Water. The following comments clarify information presented under the various headings of the station description.

LOCATION: Information on streamgage location is limited to latitude and longitude.

DRAINAGE AREA: Drainage area is as reported by the Afghanistan Ministry of Energy and Water from Survey of India maps. The accuracy of the drainage areas is unknown.

ALTITUDE: The datum of the streamgage referenced to mean sea level.

PERIOD OF RECORD: The period of record is the period for which there are published records for the streamgage or for an equivalent streamgage. An equivalent streamgage is a streamgage that was in operation prior to or after the subject streamgage, and whose location is such that records from it can reasonably be considered equivalent with records from the subject streamgage. This situation arises

when a streamgage is relocated upstream or downstream and given a new streamgage number or name, but the changes in drainage area and other basin characteristics are not significantly different.

GAGE: The type of streamgage or recorder that is or was used to collect data. A condensed history of the types, locations, and datums of previous streamgages are given under this heading when available.

Statistics of Monthly and Annual Mean Discharges

Statistics of monthly and annual mean discharges presented for each streamgage include (1) the maximum, minimum, and mean monthly discharges and (2) the maximum, minimum, and mean annual discharges. The water years (October 1 through September 30) in which the maximum and minimum discharges occurred are listed with the respective values, and the standard deviation and coefficient of variation of the monthly and annual mean discharges are listed with the respective values. Also, the percentage of the annual discharge that is comprised by each monthly mean discharge is listed in the table. The statistics of monthly and annual means discharges were computed using statistical applications built into the U.S. Geological Survey Automated Data Processing System (ADAPS) Version 4.9 (U.S. Geological Survey, 2009).

Each of the statistics is explained in the following paragraphs. As an aid to the readers' understanding of how the monthly mean and annual mean discharges are determined, data for the streamgage Kokcha River at Khojaghar (15-0.000-1M) are used as an example. Each monthly mean is the mean of the daily values for the month. Months or years for which all daily values are not available are not included in the compilation of statistics.

The maximum monthly mean discharge is the maximum value of all the monthly mean values for a given month during the period of record. The maximum mean value for October is $142 \text{ m}^3/\text{s}$, which occurred during water year 1968. Similarly, the minimum monthly mean discharge is the minimum value of all the monthly mean values for a specific month over the period of record. The minimum mean value for October is $82.2 \text{ m}^3/\text{s}$, which occurred during water year 1972. The maximum and minimum monthly mean values can be found in the *statistics of monthly and annual mean discharges* table or by searching the columns of the *monthly and annual mean discharges table*.

The mean monthly discharge is the mean of all the monthly mean discharges for a given month for the period of record, and the standard deviation is a measure of the variability of the values. The mean monthly discharge for October is $110 \text{ m}^3/\text{s}$, and the standard deviation is $19.9 \text{ m}^3/\text{s}$. The mean monthly discharge for October is the same as the mean of all October daily values for the period of record used. However, the standard deviation obtained using monthly values is smaller than the standard deviation obtained using all daily values. The standard deviation is smaller because the monthly values have less variability than the daily values.

The coefficient of variation is the ratio of the standard deviation to the mean. The coefficient of variation is dimensionless. Because monthly mean discharges are generally much greater in spring than in winter, the standard deviations also are generally much greater in spring than in winter. However, dividing the standard deviation by the mean monthly discharge tends to normalize the measures for all months so a more meaningful comparison among months can be made.

The percentage of annual discharge is the percentage of the annual discharge occurring each month. It is calculated by dividing the mean monthly discharge for a given month by the total of the

12 mean monthly discharges and multiplying by 100. Because of rounding of the monthly percentage, the sum of the 12 percentages may not always equal 100 percent.

The maximum, minimum, and mean annual discharges are selected or computed from the annual mean discharges for the period of record. The water years of occurrence of the maximum and minimum values are listed with the respective values, and the standard deviation of the annual mean discharge is listed with the mean discharge. For the Kokcha River at Khojaghar streamgage, the maximum annual mean discharge of $262 \text{ m}^3/\text{s}$ occurred in 1969, and the minimum annual mean discharge of $144 \text{ m}^3/\text{s}$ occurred in 1972. The mean annual discharge for the period of record is $198 \text{ m}^3/\text{s}$.

Monthly and Annual Flow Duration

The monthly and annual flow-duration table is a magnitude and frequency analysis of daily discharge values. It is computed by tabulating the number of daily discharge values that fall within pre-selected class limits, computing the percentage of values within each class, and interpolating discharge values for the percentages shown in the table. Monthly values are calculated from daily values for all complete months of record, and annual values are calculated for all complete water years. The monthly and annual flow durations were computed using statistical applications built into U.S. Geological Survey ADAPS Version 4.9 (U.S. Geological Survey, 2009).

For example, at the Kokcha River at Khojaghar (15-0.000-1M) streamgage, the 90-percent flow-duration value for October is $77.3 \text{ m}^3/\text{s}$. This indicates that 90 percent of all October daily discharge values for the period of record were equal to or greater than $77.3 \text{ m}^3/\text{s}$.

Probability of Occurrence of High or Low Discharges

The probabilities of occurrence of annual high discharges, annual low discharges, and seasonal low discharges are presented in three tables for each streamgage. Probability of occurrence is an estimate of the likelihood that a particular discharge in a stream will be equaled or exceeded in 1 year or, in the case of low flows, the likelihood that the discharge will not be equaled or exceeded during the year or season. The probability of occurrence of a high flow is called the exceedance probability, and the probability of occurrence of low flow is called the nonexceedance probability. For example, if the instantaneous discharge for the 0.20 exceedance probability is listed as $1,050 \text{ m}^3/\text{s}$, then a 20-percent chance exists that a discharge equal to or greater than $1,050 \text{ m}^3/\text{s}$ will occur once during the year.

Recurrence interval is another way of expressing annual probability, and it is the reciprocal of the probability of occurrence. The recurrence interval for an exceedance probability of 0.20 is 5 years (1 divided by 0.20). For a long discharge record, the annual maximum discharge can be expected to equal or exceed $1,050 \text{ m}^3/\text{s}$ on average once every 5 years.

The table of probability of annual high discharges for each streamgage lists the maximum instantaneous discharge and the maximum mean discharge for 3, 7, 15, and 30 consecutive-day periods for selected exceedance probabilities and equivalent recurrence intervals. Values for the maximum instantaneous discharge are computed from the streamflow record according to the guidelines established by the U.S. Interagency Advisory Committee on Water Data (1982). No adjustments are made for length of record, and a station skew instead of a regional skew was used in the computations. The U.S. Geological Survey PeakFQ software (Flynn and others, 2006) was used to compute the maximum instantaneous discharges for the selected exceedance probabilities.

Values for the maximum daily mean discharges for 3, 7, 15, and 30 consecutive-day periods are computed from the annual high mean values of the corresponding periods. The computations are based on the log-Pearson Type III distribution (Helsel and Hirsch, 1992) using values obtained for the water year.

The table of probability of annual low discharges for each streamgage lists the minimum daily mean discharge for 1, 3, 7, 14, 30, 60, 90, 120, and 183 consecutive-day periods for selected nonexceedance probabilities and equivalent recurrence intervals. Values for the minimum mean discharges are computed from the annual low discharge values of the corresponding periods using the log-Pearson Type III distribution. Probabilities of annual low discharges are computed using values obtained for the climatic year (April 1 through March 31).

The table of probability of seasonal low discharges for each streamgage lists the minimum daily mean discharge for 1, 7, 14, and 30 consecutive-day periods for selected probabilities and equivalent recurrence intervals. These values are computed from the seasonal low mean values of the corresponding periods using the log-Pearson Type III distribution. The seasonal periods provided are December through February, March through May, June through August, and September through November.

The probabilities of the maximum mean discharge and the annual and seasonal minimum mean discharge were computed using SWSTAT (Lumb and others, U.S. Geological Survey, written commun., 2002). SWSTAT is a U.S. Geological Survey computer program for interactive computation of surface-water statistics.

The annual low discharge and the seasonal low discharges that occur in any given year are sensitive to natural-channel processes, such as evapotranspiration, and human-induced hydrologic modifications, such as the operation of many small water-storage reservoirs; the effects of surface-water withdrawal for agricultural, municipal, and industrial use; and the effects of return flow to the river. Evaluations of such processes and conditions should be made when using the statistics provided in this report.

Annual Peak Discharges

The annual peak discharges for each station are provided by water year. These peak discharges were used in the computation of the instantaneous maximum discharge exceedance probabilities for each streamgage. The data for the peaks discharges were taken directly from the Afghanistan Hydrologic Data Reports published by the Afghanistan Ministry of Water and Power. Peaks from incomplete water years were checked using hydrograph comparison with nearby streamgages to insure that the discharge was the annual peak discharge.

Monthly and Annual Mean Discharges

The monthly and annual mean discharges are found in the final table for each streamgage. The monthly and annual means discharges were computed using statistical applications built into U.S. Geological Survey ADAPS Version 4.9 (U.S. Geological Survey, 2009).

Data Considerations

The reliability of statistical data is related to the length of streamgage record. The Hydrology Subcommittee of the Interagency Advisory Committee on Water Data (1982) recommends that at least 10 years of record be used for computing flood-frequency estimates. However, the record length for each streamgage in Afghanistan can vary substantially. The 10-year requirement was relaxed in this report so statistics could be computed for all streamgages. Subsequently, extreme high or low flows may be included in the streamflow record of one streamgage and not in another, resulting in inconsistencies in the streamflow statistics when comparing streamgage data. In some instances, there was insufficient data to compute a statistic and the statistic is reported as “not given.”

Statistics provided in the report are presented as computed by software with little evaluation. In addition, any differences in statistical values for pre- and post-regulation periods were not addressed in this report. It is the user’s responsibility to interpret the data and understand the limitations of the statistics computed with limited record length.

KABUL RIVER NEAR DARONTA

(U.S. Geological Survey identification number: 342800070220000)

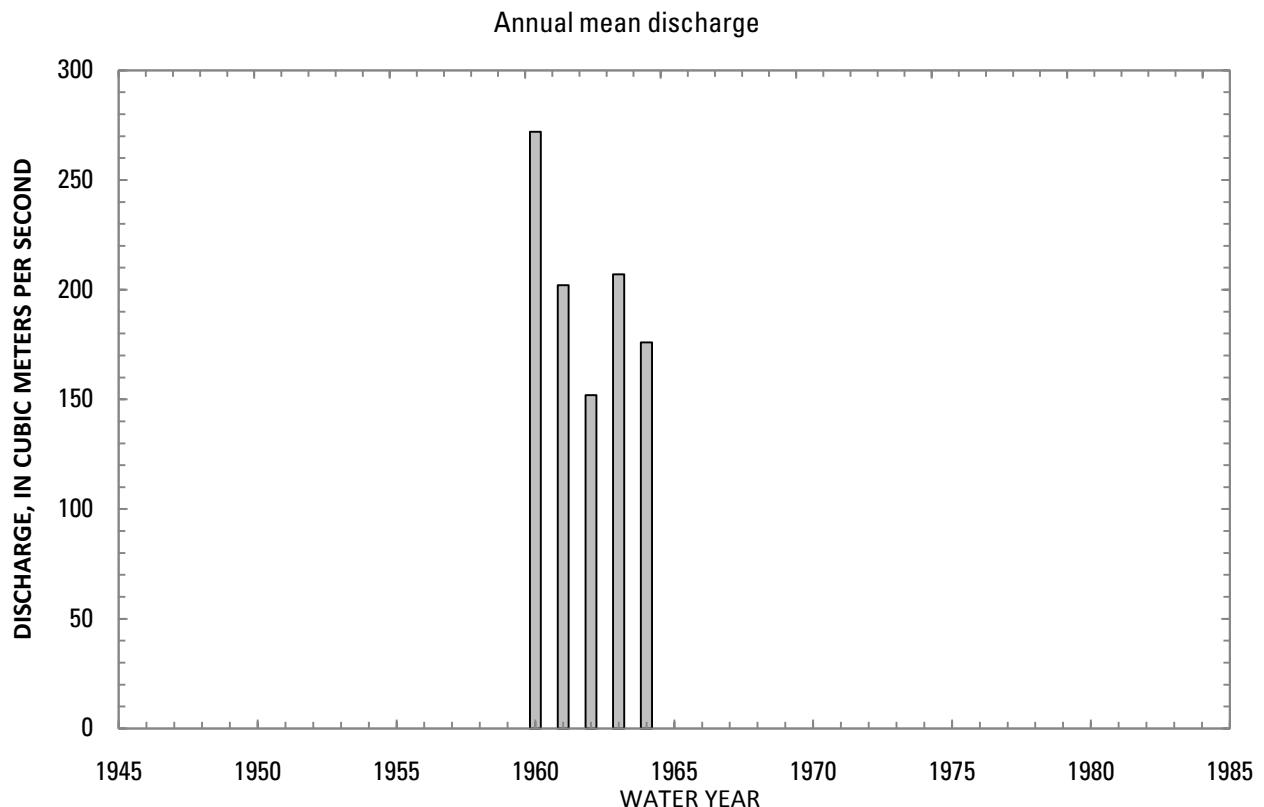

LOCATION: Lat 34°28'N., long 70°22'E.

DRAINAGE AREA: 34,375 km².

ELEVATION: 585 meters above mean sea level.

PERIOD OF RECORD: October 1, 1959 to September 30, 1964.

GAGE: Water-stage recorder.

1-0.000-4S KABUL RIVER NEAR DARONTA, Continued

1-0.000-6M KABUL RIVER AT TANG-I-GHARU

(U.S. Geological Survey identification number: 343400069240000)

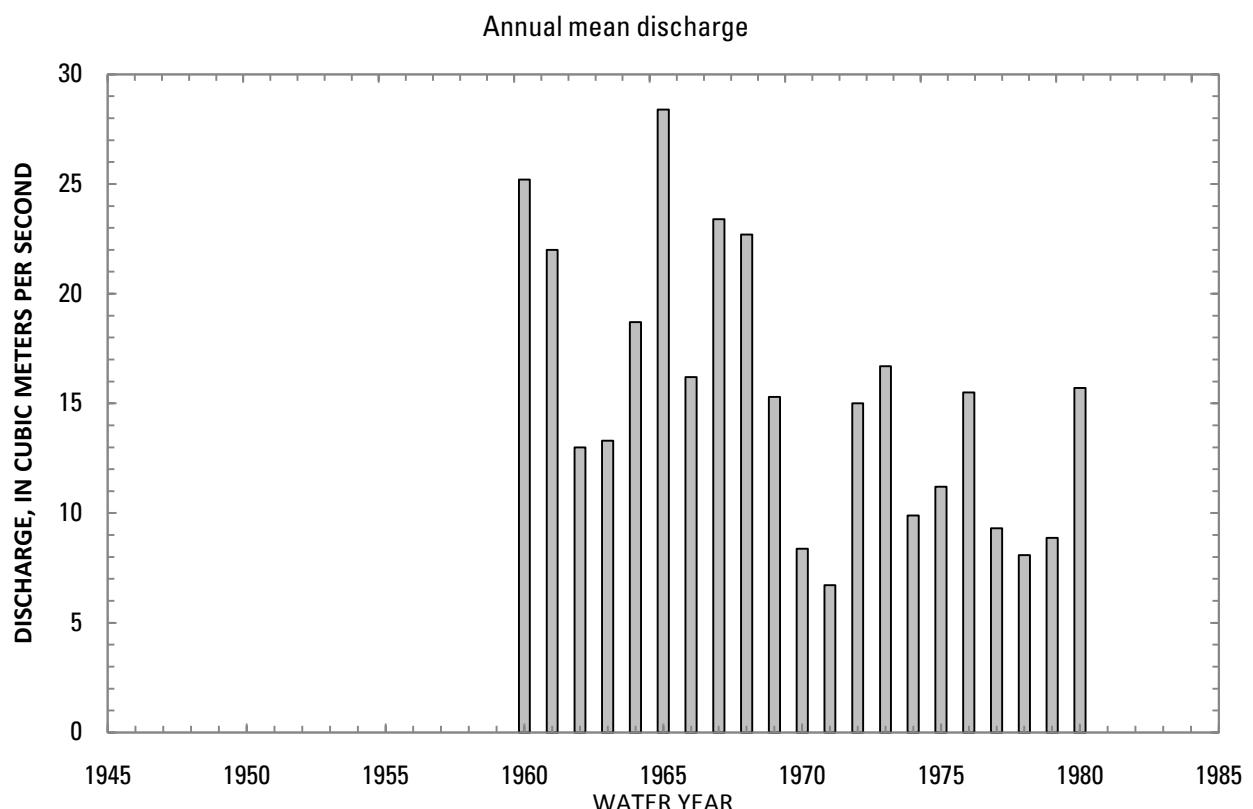

LOCATION: Lat 34°34'N., long 69°24'E.

DRAINAGE AREA: 12,850 km².

ELEVATION: 1,770 meters above mean sea level.

PERIOD OF RECORD: October 1, 1959 to September 30, 1980.

GAGE: Water-stage recorder.

HAZARNAW RIVER AT SABAY

(U.S. Geological Survey identification number: 340600070220000)

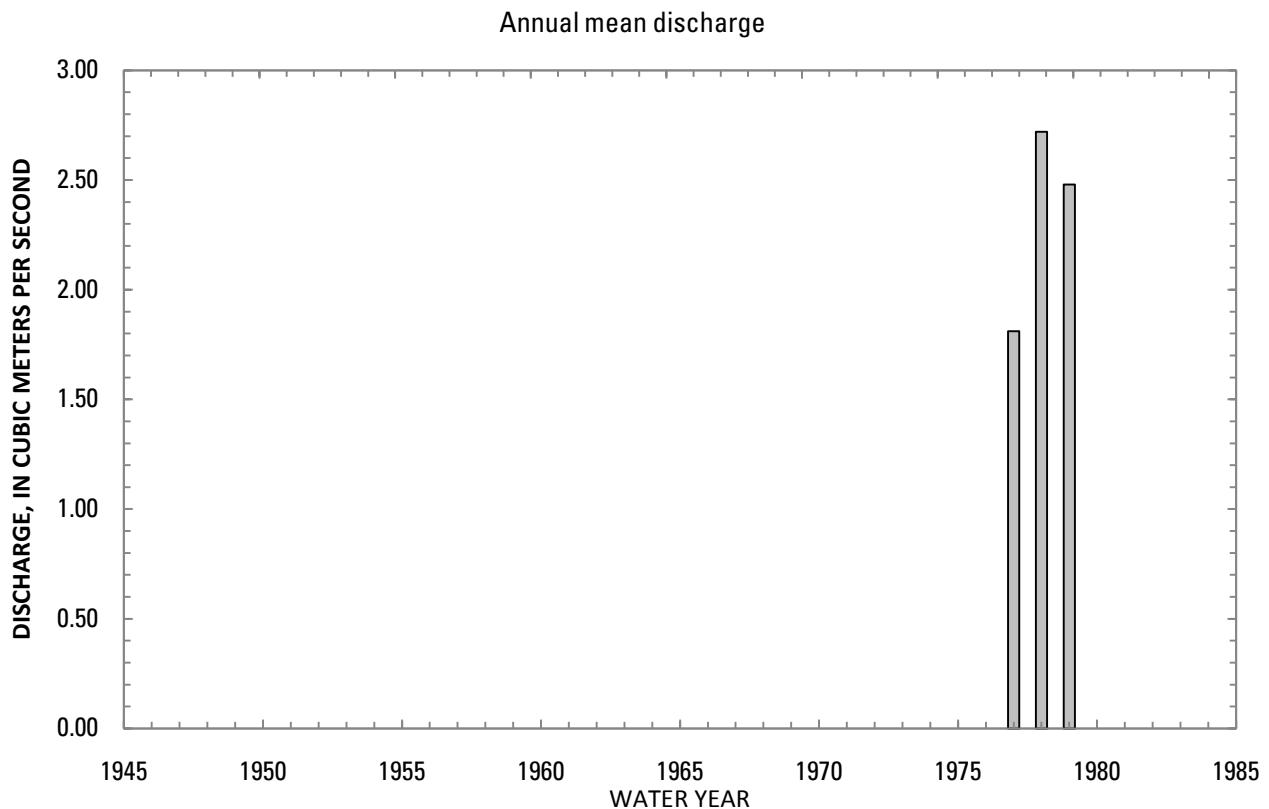

LOCATION: Lat 34°06'N., long 70°22'E.

DRAINAGE AREA: 120 km².

ELEVATION: 1,400 meters above mean sea level.

PERIOD OF RECORD: December 26, 1975 to September 30, 1979.

GAGE: Staff gage.

1-4.2R0-1A LANDAISIN RIVER NEAR GAWARDESH

(U.S. Geological Survey identification number: 352300071320000)

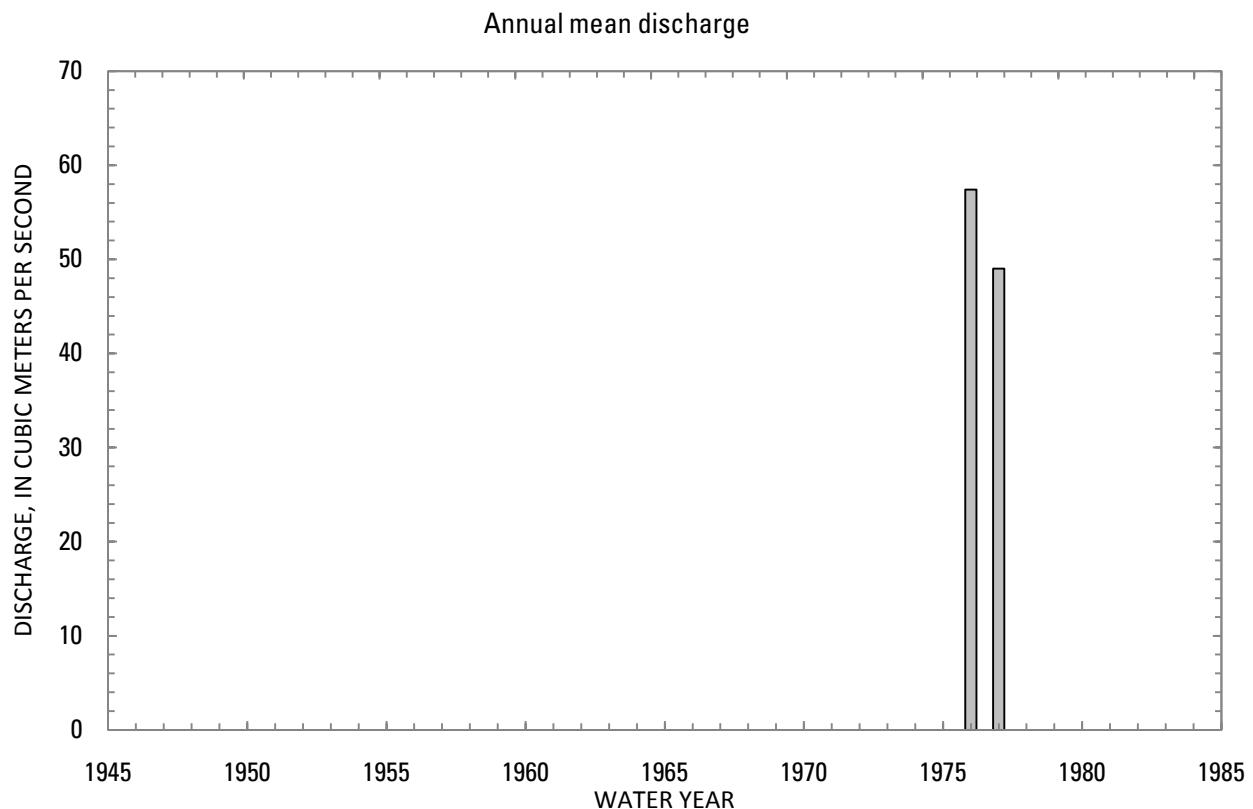

LOCATION: Lat 35°23'N., long 71°32'E.

DRAINAGE AREA: 3,130 km².

ELEVATION: 1,135 meters above mean sea level.

PERIOD OF RECORD: May 1, 1975 to July 22, 1978.

GAGE: Water-stage recorder. Staff gage at same site and datum prior to 1976 water year.

1-6.L00-1A LAGHMAN RIVER AT PUL-I-QARGHAI

(U.S. Geological Survey identification number: 343300070140000)

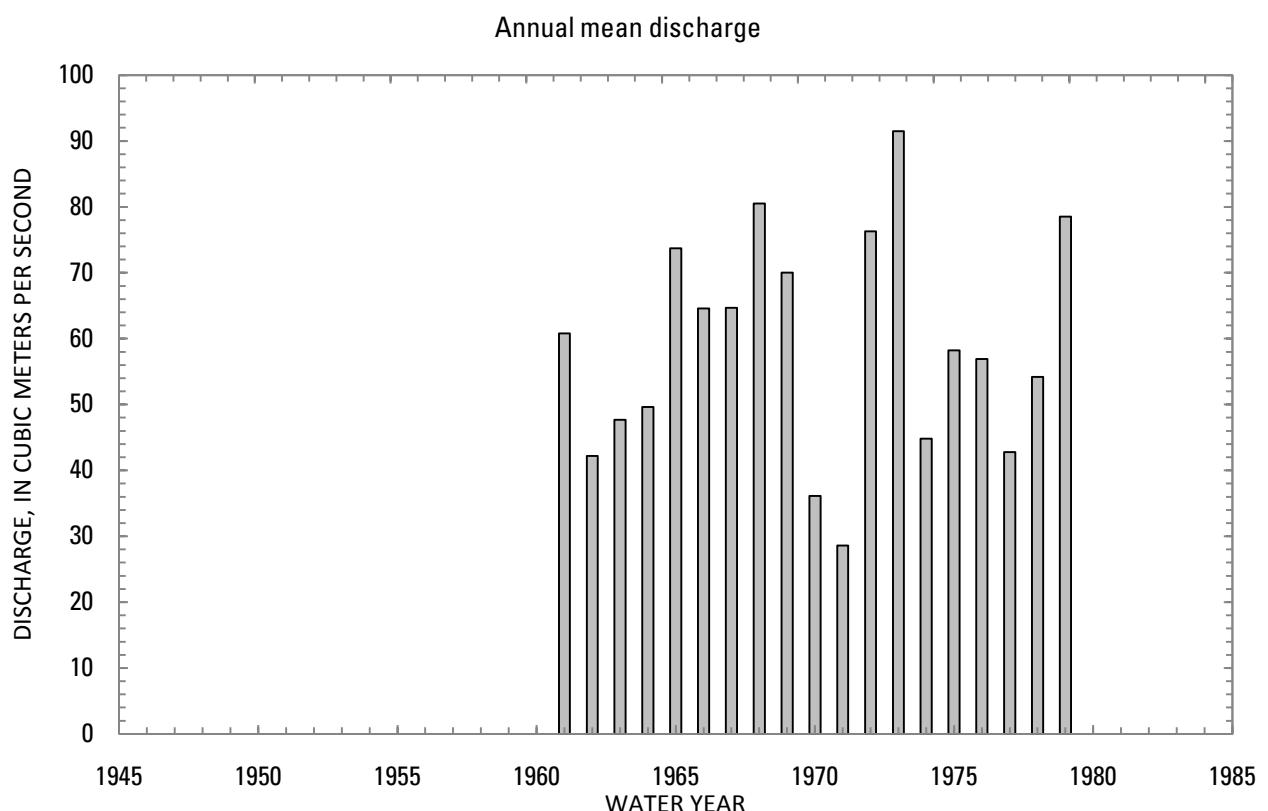

LOCATION: Lat 34°33'N., long 70°14'E.

DRAINAGE AREA: 6,155 km².

ELEVATION: 640 meters above mean sea level.

PERIOD OF RECORD: October 1, 1960 to September 30, 1979.

GAGE: Water-stage recorder.

TAGAB RIVER AT TAGAB

(U.S. Geological Survey identification number: 344000069410000)

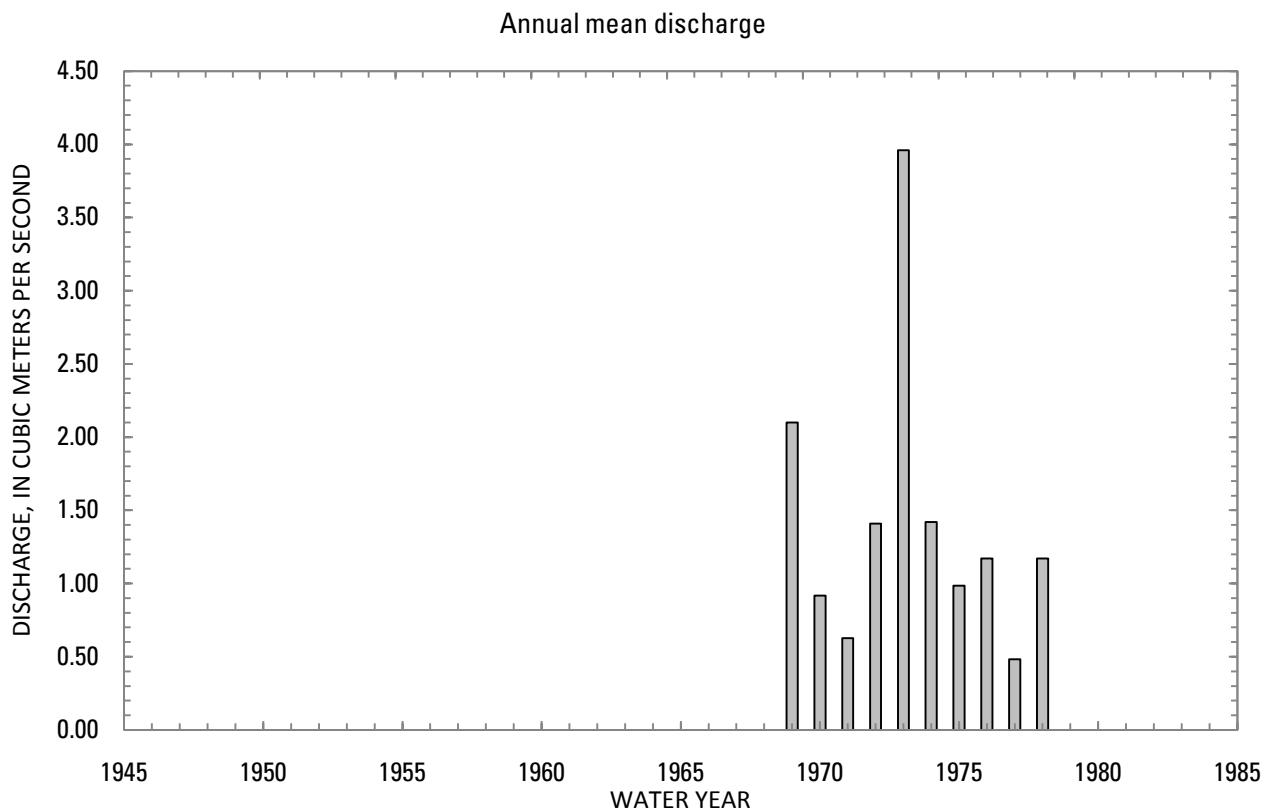

LOCATION: Lat 34°40'N., long 69°41'E.

DRAINAGE AREA: 800 km².

ELEVATION: 1,060 meters above mean sea level.

PERIOD OF RECORD: August 7, 1968 to April 30, 1979.

GAGE: Water-stage recorder.

1-8.21L-1A SALANG RIVER AT BAGH-I-LALA

(U.S. Geological Survey identification number: 350900069130000)

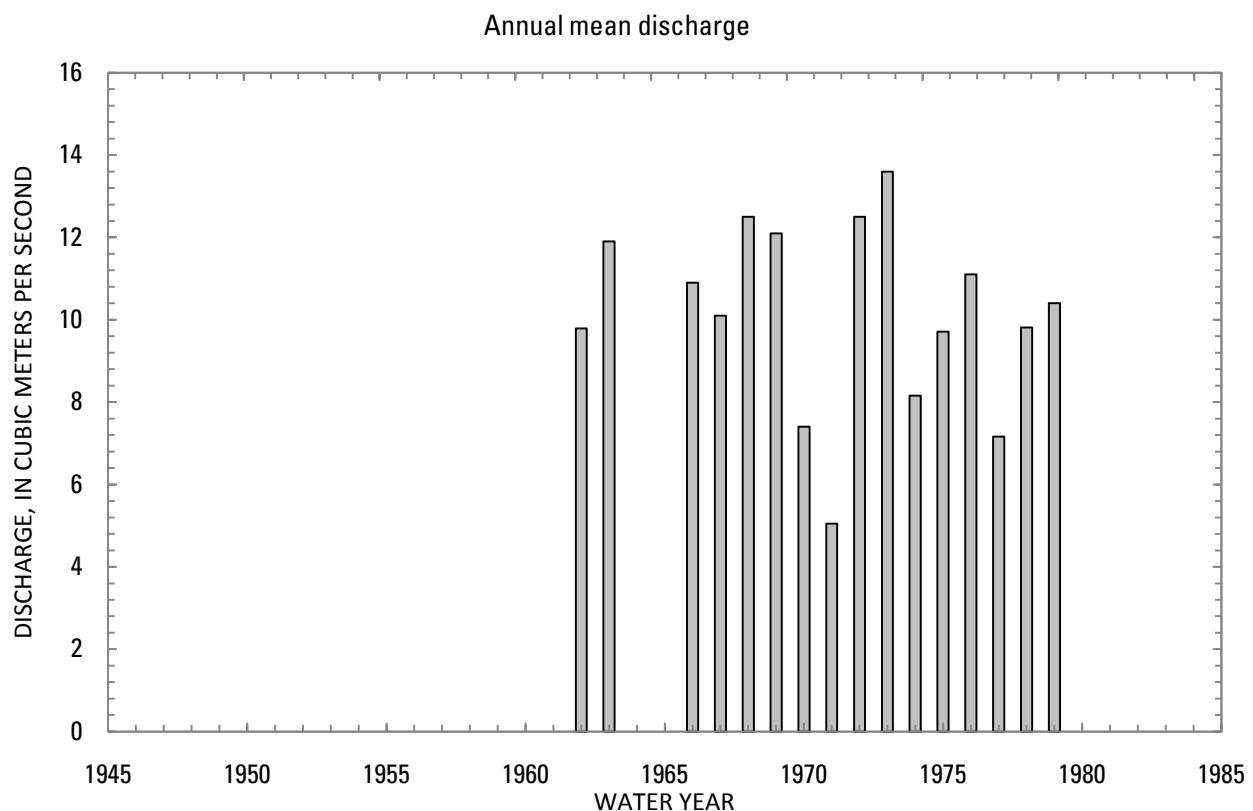

LOCATION: Lat 35°09'N., long 69°13'E.

DRAINAGE AREA: 485 km².

ELEVATION: 1,660 meters above mean sea level.

PERIOD OF RECORD: October 1, 1961 to March 23, 1964 and December 2, 1964 to February 29, 1980.

GAGE: Water-stage recorder. Station was destroyed by flooding on March 23, 1964.

1-8.2R0-1A GHORBAND RIVER AT PUL-I-ASHAWA

(U.S. Geological Survey identification number: 350500069080000)

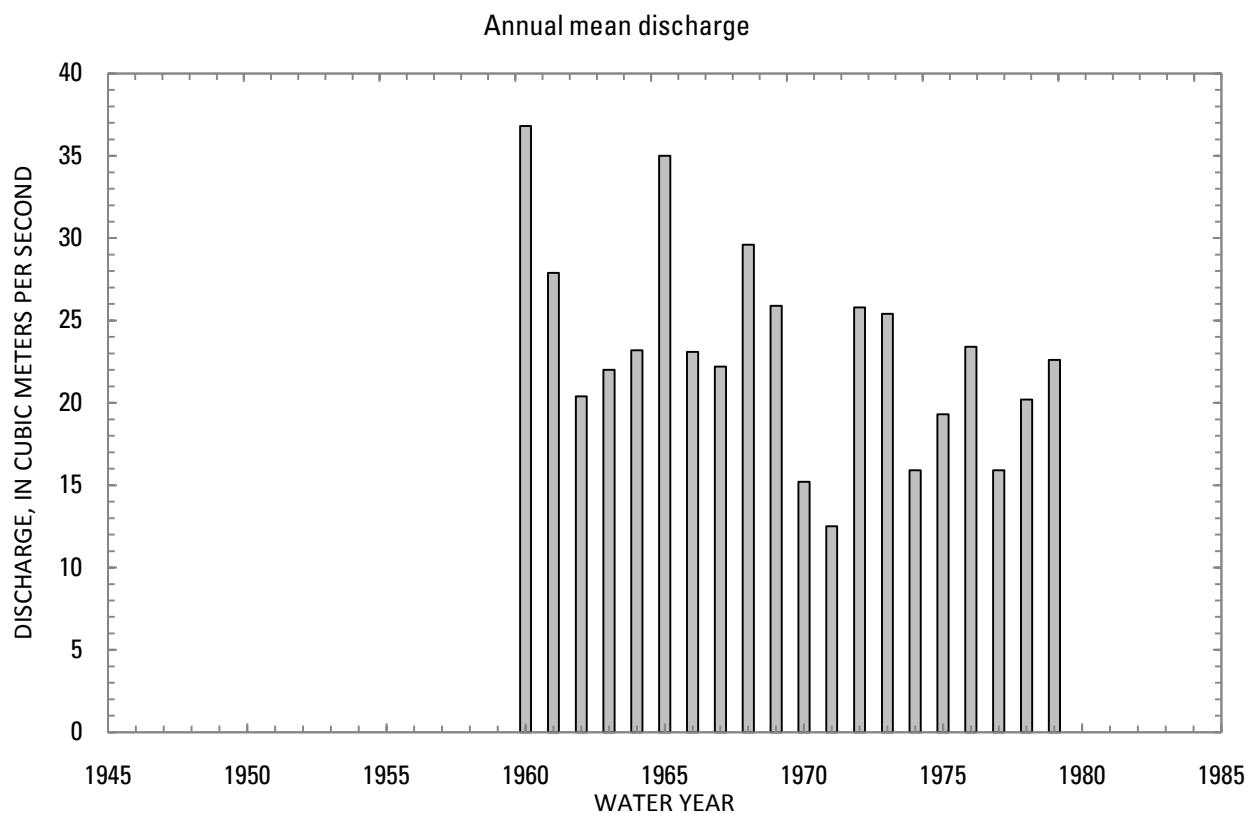

LOCATION: Lat 35°05'N., long 69°08'E.

DRAINAGE AREA: 4,020 km².

ELEVATION: 1,610 meters above mean sea level.

PERIOD OF RECORD: October 1, 1959 to February 4, 1980.

GAGE: Water-stage recorder.

SHATUL RIVER AT GULBAHAR

(U.S. Geological Survey identification number: 350900069170000)

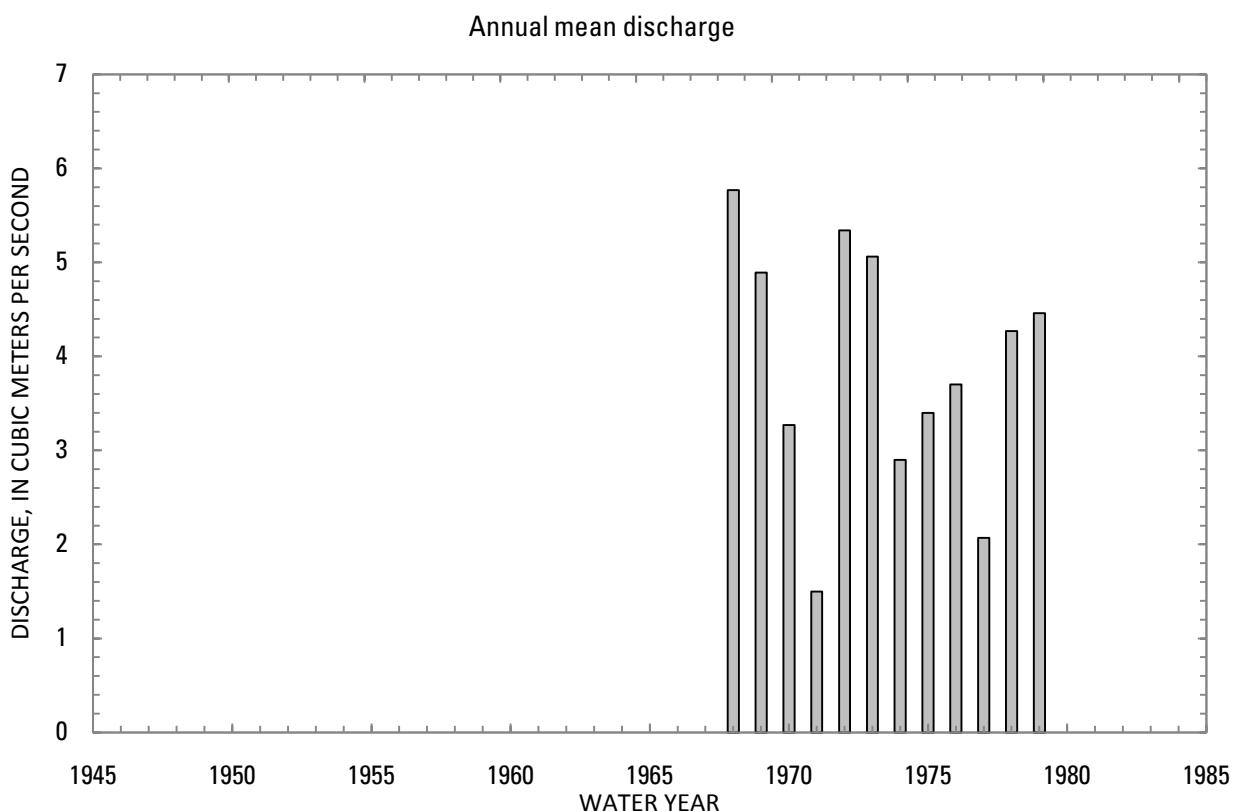

LOCATION: Lat 35°09'N., long 69°17'E.

DRAINAGE AREA: 205 km².

ELEVATION: 1,590 meters above mean sea level.

PERIOD OF RECORD: May 30, 1967 to March 6, 1980.

GAGE: Water-stage recorder.

PANJSHER RIVER AT GULBAHAR

(U.S. Geological Survey identification number: 351000069170000)

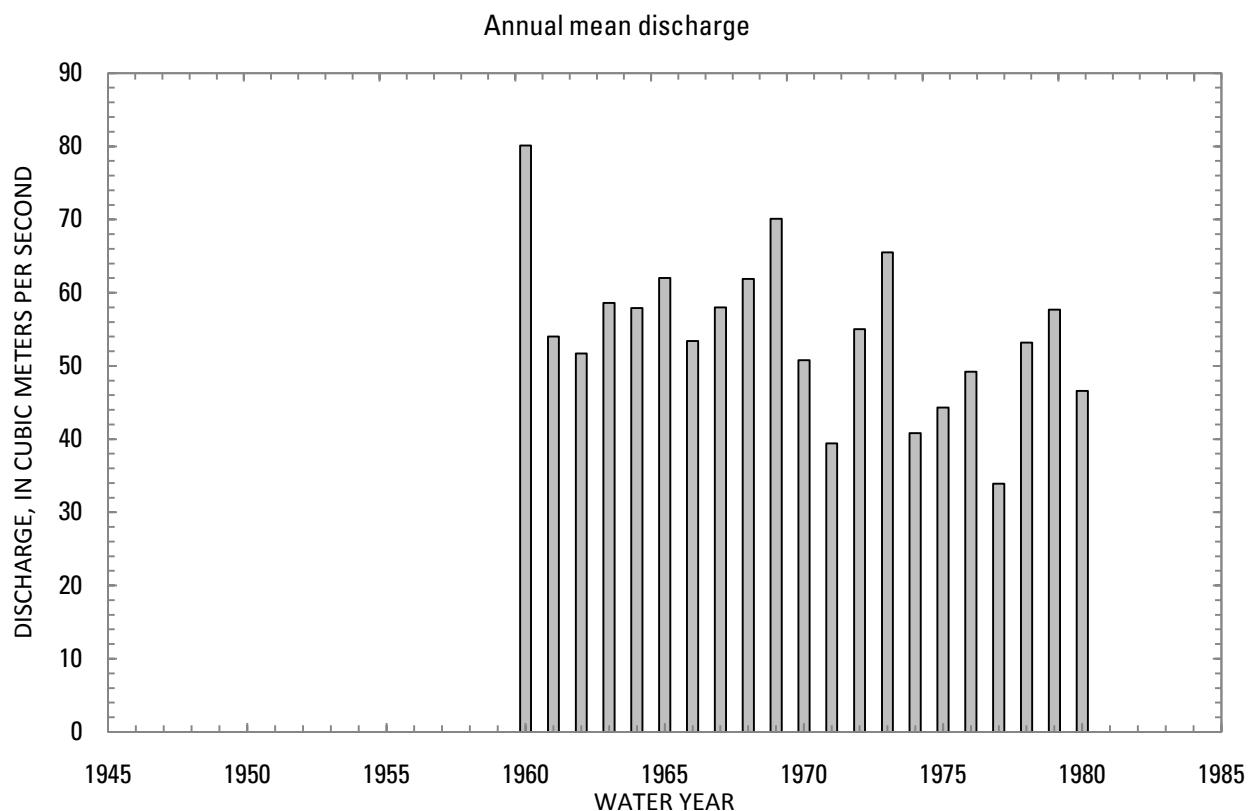

LOCATION: Lat 35°10'N., long 69°17'E.

DRAINAGE AREA: 3,565 km².

ELEVATION: 1,605 meters above mean sea level.

PERIOD OF RECORD: October 1, 1959 to September 30, 1980.

GAGE: Water-stage recorder.

1-8.L00-8A

PANJSHER RIVER AT OMARZ

(U.S. Geological Survey identification number: 352200069380000)

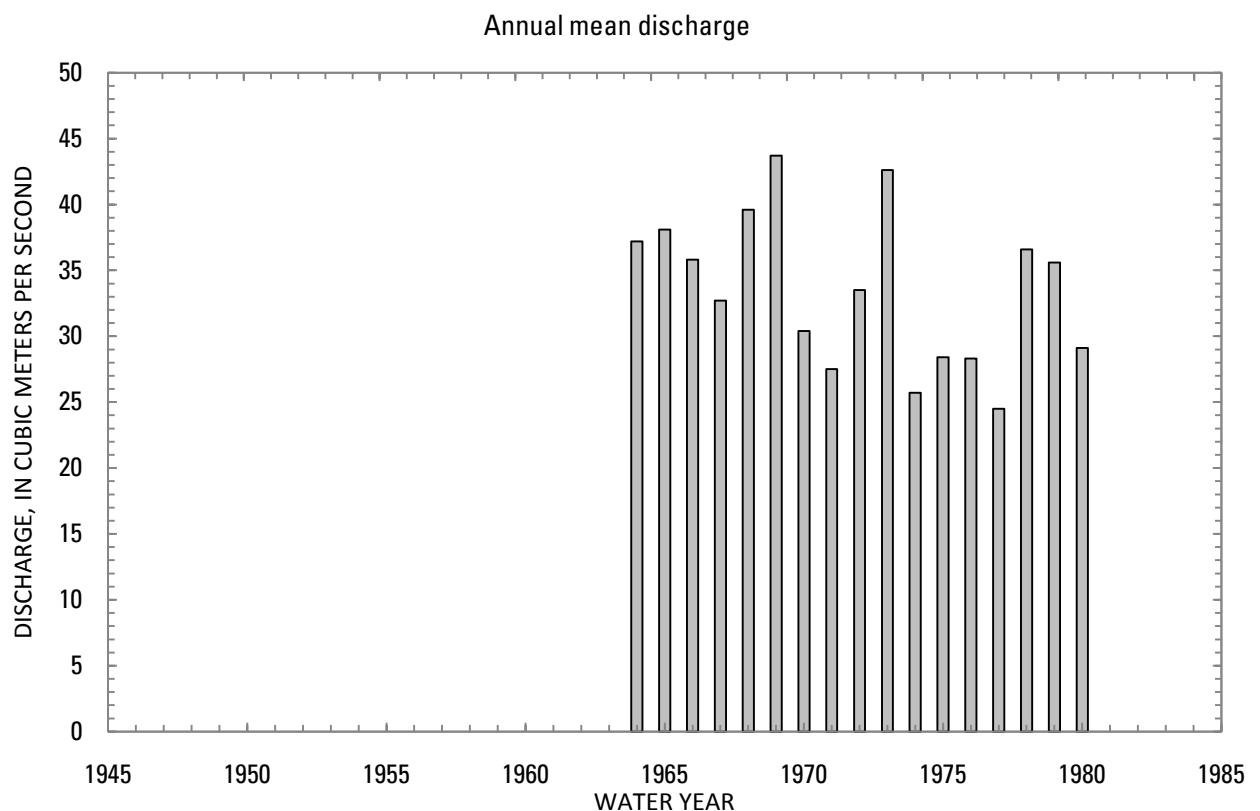

LOCATION: Lat 35°22'N., long 69°38'E.

DRAINAGE AREA: 2,240 km².

ELEVATION: 2,010 meters above mean sea level.

PERIOD OF RECORD: October 1, 1962 to February 20, 1963 and June 25, 1963 to September 30, 1980.

GAGE: Water-stage recorder.

1-9.R00-4W CHAKARI RIVER AT BAND-I-AMIR GHAZI

(U.S. Geological Survey identification number: 342500069230000)

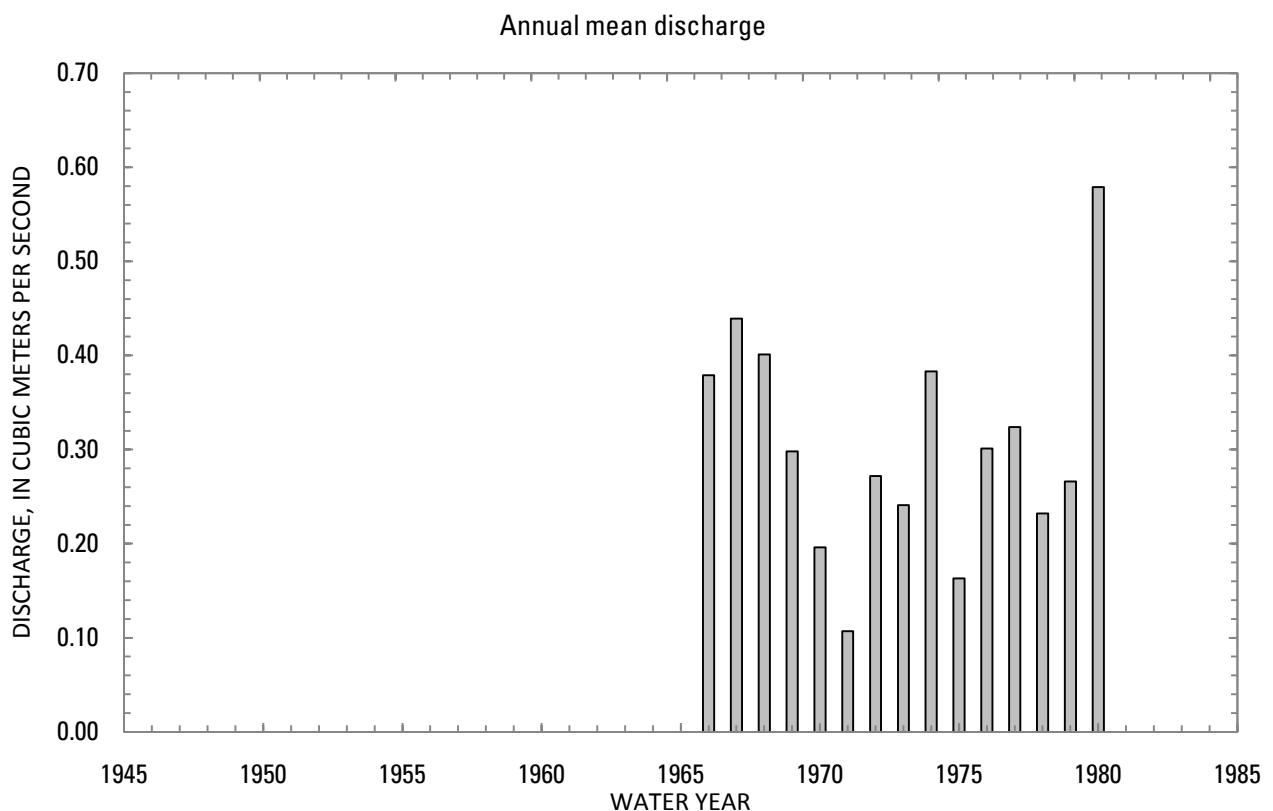

LOCATION: Lat 34°25'N., long 69°23'E.

DRAINAGE AREA: 395 km².

ELEVATION: 2,050 meters above mean sea level.

PERIOD OF RECORD: May 26, 1965 to September 30, 1980.

GAGE: Staff gage.

2-4.000-5A

URGUN RIVER AT PIRKOTI

(U.S. Geological Survey identification number: 325500069150000)

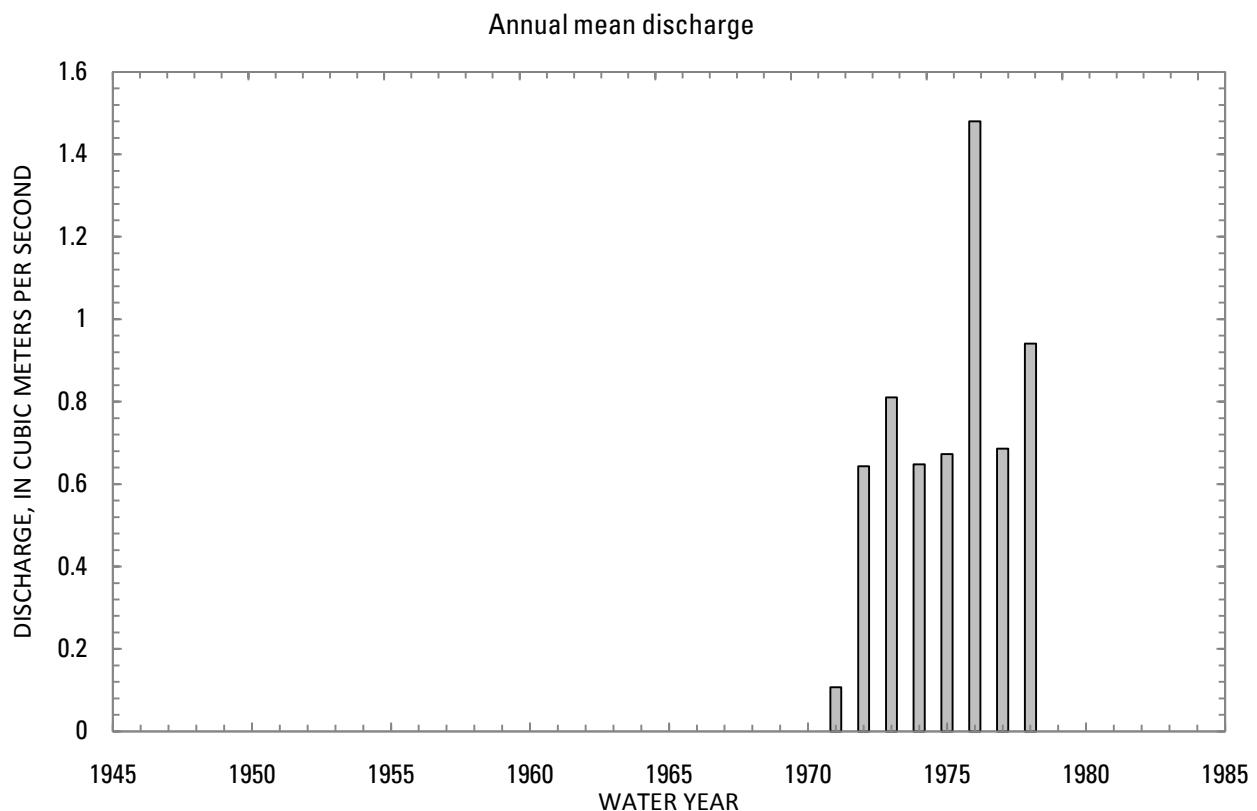

LOCATION: Lat 32°55'N., long 69°15'E.

DRAINAGE AREA: 780 km².

ELEVATION: 2,108 meters above mean sea level.

PERIOD OF RECORD: August 13, 1970 to September 30, 1978.

GAGE: Water-stage recorder.

HARI RUD RIVER AT ROBAT-I-AKHOND

(U.S. Geological Survey identification number: 341600062560000)

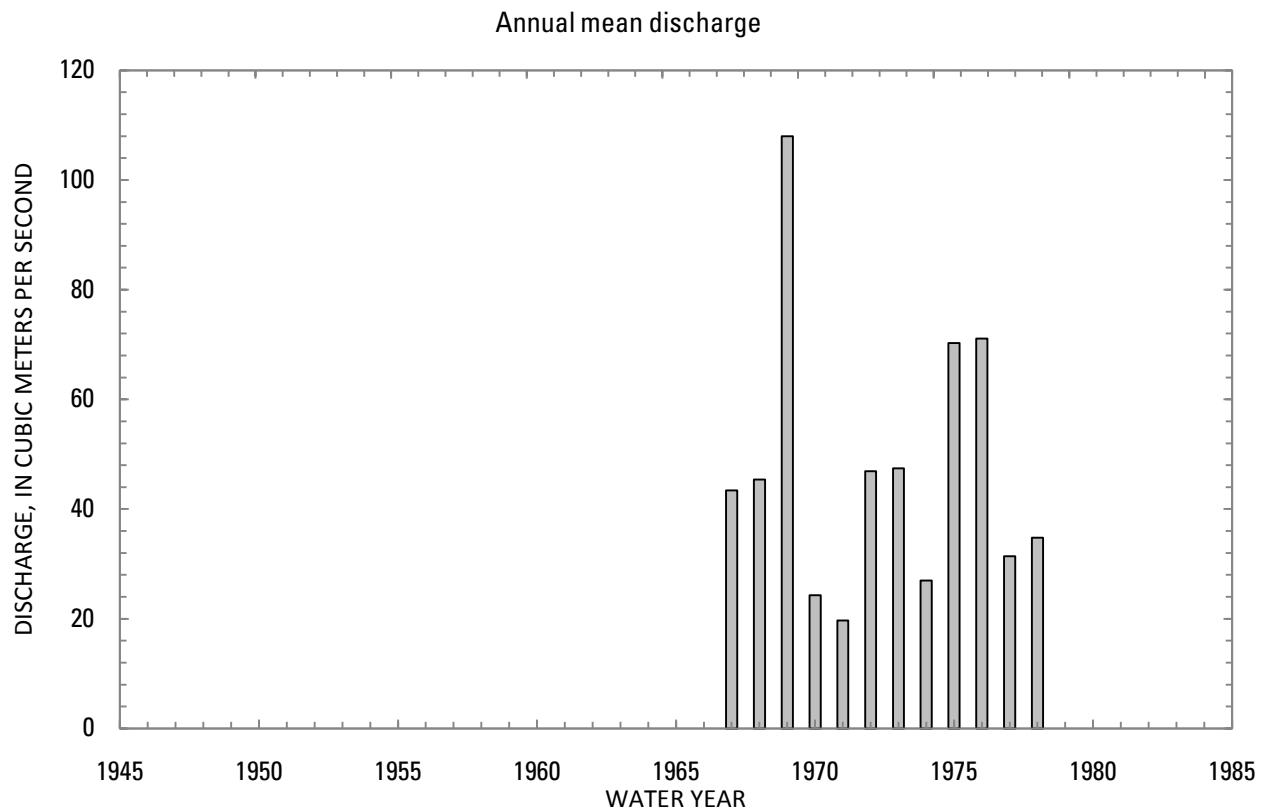

LOCATION: Lat 34°16'N., long 62°56'E.

DRAINAGE AREA: 21,630 km².

ELEVATION: 1,170 meters above mean sea level.

PERIOD OF RECORD: April 18, 1966 to September 30, 1978.

GAGE: Water-stage recorder. Staff gage at same site and datum prior to 1969 water year.

HARI RUD RIVER AT TAGAW GHAZA

(U.S. Geological Survey identification number: 342100063390000)

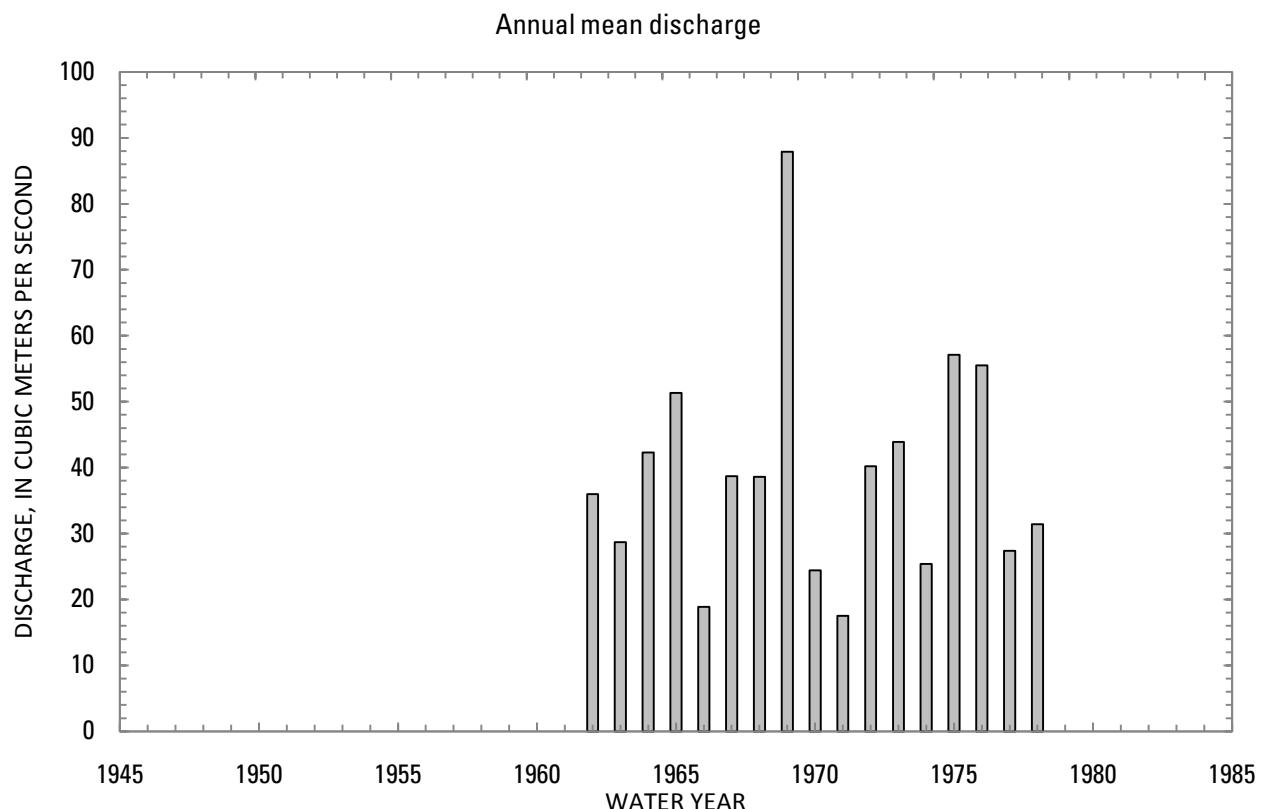

LOCATION: Lat 34°21'N., long 63°39'E.

DRAINAGE AREA: 11,920 km².

ELEVATION: 1,460 meters above mean sea level.

PERIOD OF RECORD: October 1, 1961 to September 30, 1978.

GAGE: Water-stage recorder. Staff gage at same site and datum prior to 1963 water year.

8-0.000-9M HARI RUD RIVER AT DAULATYAR

(U.S. Geological Survey identification number: 343300065460000)

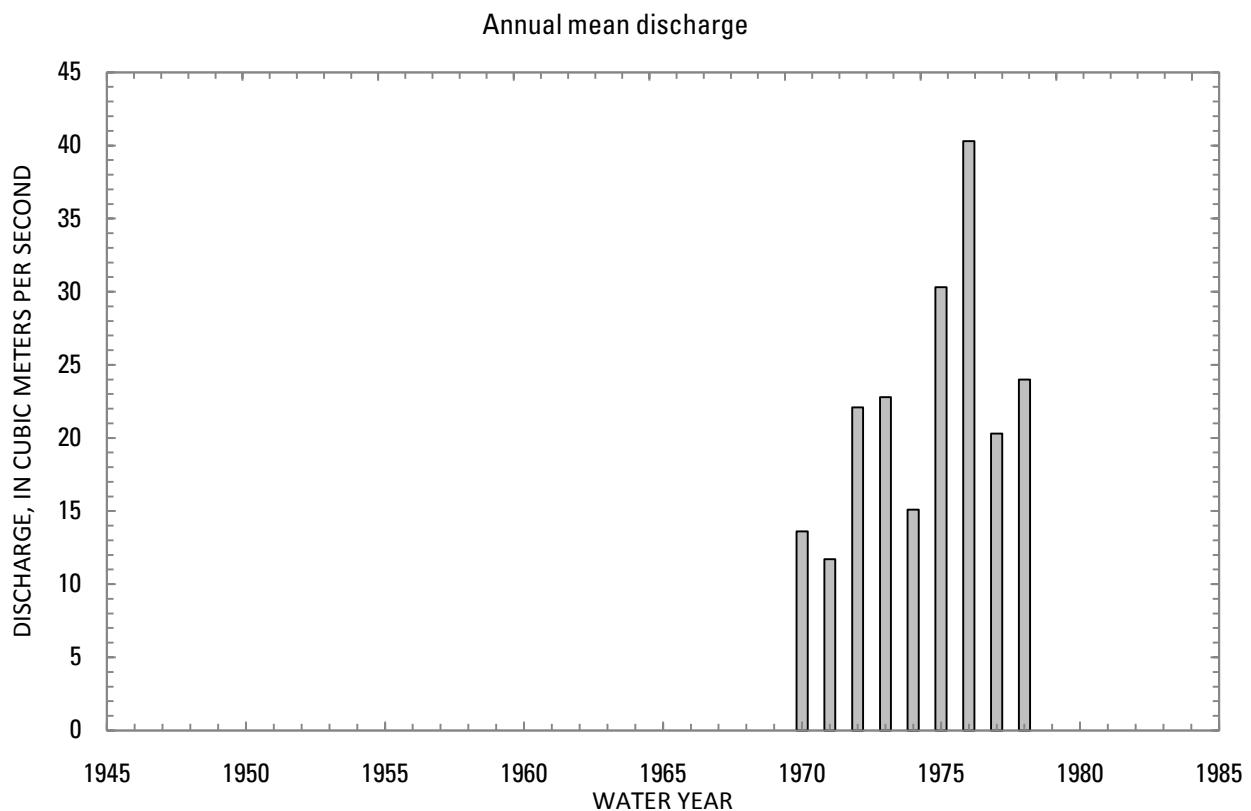

LOCATION: Lat 34°33'N., long 65°46'E.

DRAINAGE AREA: 2,840 km².

ELEVATION: 2,440 meters above mean sea level.

PERIOD OF RECORD: August 6, 1969 to September 30, 1978.

GAGE: Water-stage recorder.

SENJAB RIVER AT KHUSH RABAT

(U.S. Geological Survey identification number: 344100062070000)

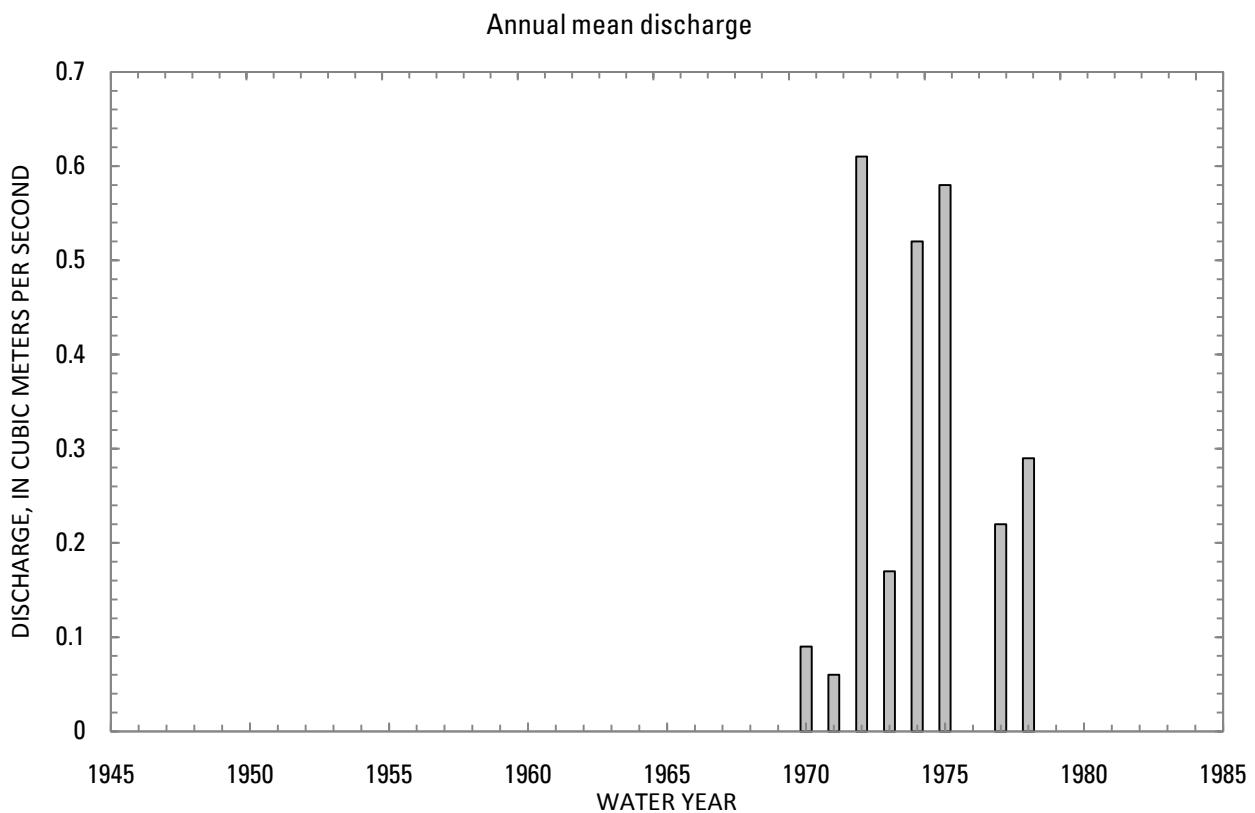

LOCATION: Lat 34°41'N., long 62°07'E.

DRAINAGE AREA: 65 km².

ELEVATION: 1,320 meters above mean sea level.

PERIOD OF RECORD: May 24, 1969 to September 30, 1978.

GAGE: Water-stage recorder. Staff gage at same site and datum prior to 1970 water year.

8-3.L00-1A KOWGAN RIVER AT LANGAR

(U.S. Geological Survey identification number: 341300063000000)

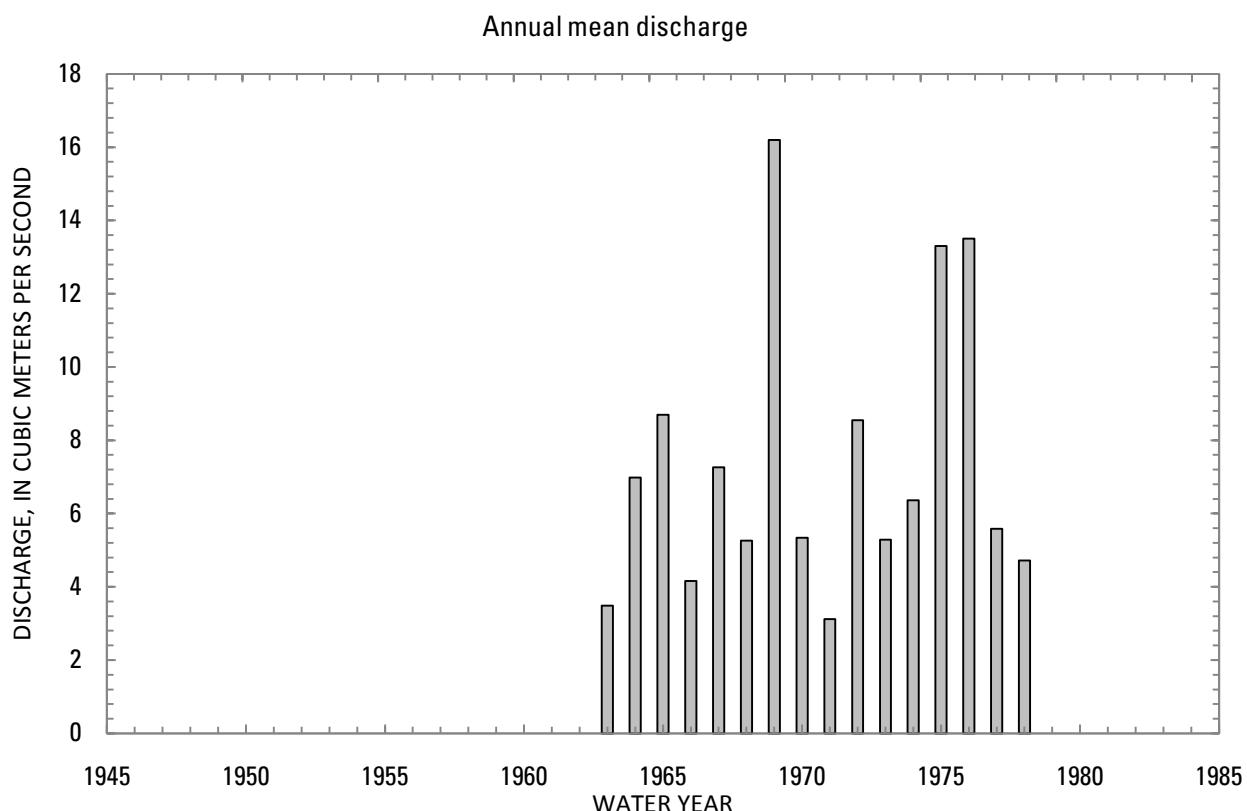

LOCATION: Lat 34°13'N., long 63°00'E.

DRAINAGE AREA: 7,490 km².

ELEVATION: 1,230 meters above mean sea level.

PERIOD OF RECORD: April 25, 1962 to September 30, 1978.

GAGE: Water-stage recorder. Staff gage at same site and datum prior to 1965 water year.

8-11.L00-1A LAL RIVER AT SHINYA

(U.S. Geological Survey identification number: 343000065400000)

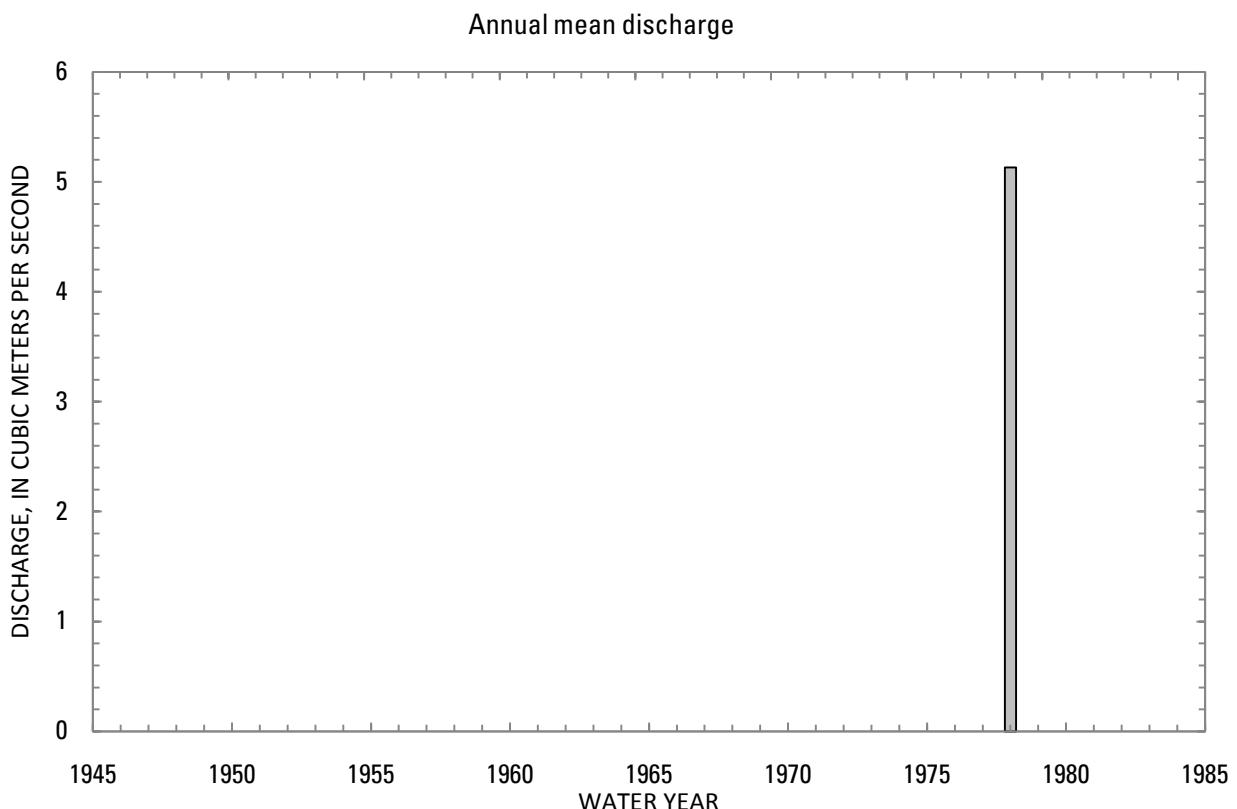

LOCATION: Lat 34°30'N., long 65°40'E.

DRAINAGE AREA: 1,685 km².

ELEVATION: 2,420 meters above mean sea level.

PERIOD OF RECORD: October 27, 1976 to September 30, 1978.

GAGE: Water-stage recorder.

9-0.000-1M MURGHAB RIVER AT BALA MURGHAB

(U.S. Geological Survey identification number: 353500063190000)

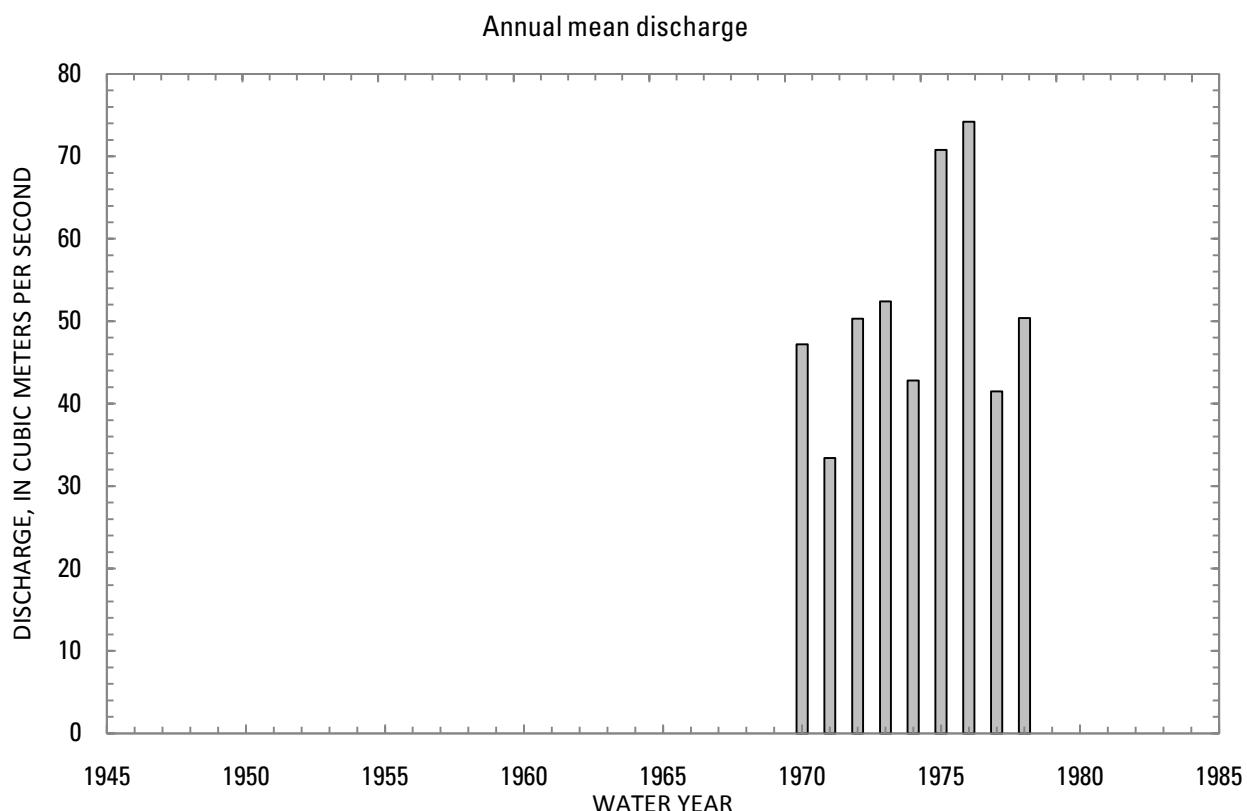

LOCATION: Lat 35°35'N., long 63°19'E.

DRAINAGE AREA: 20,525 km².

ELEVATION: 468 meters above mean sea level.

PERIOD OF RECORD: April 1, 1969 to September 30, 1978.

GAGE: Water-stage recorder. Staff gage prior to 1970 water year.

10-0.000-4M SHIRIN TAGAB RIVER AT DAULATABAD

(U.S. Geological Survey identification number: 362700064530000)

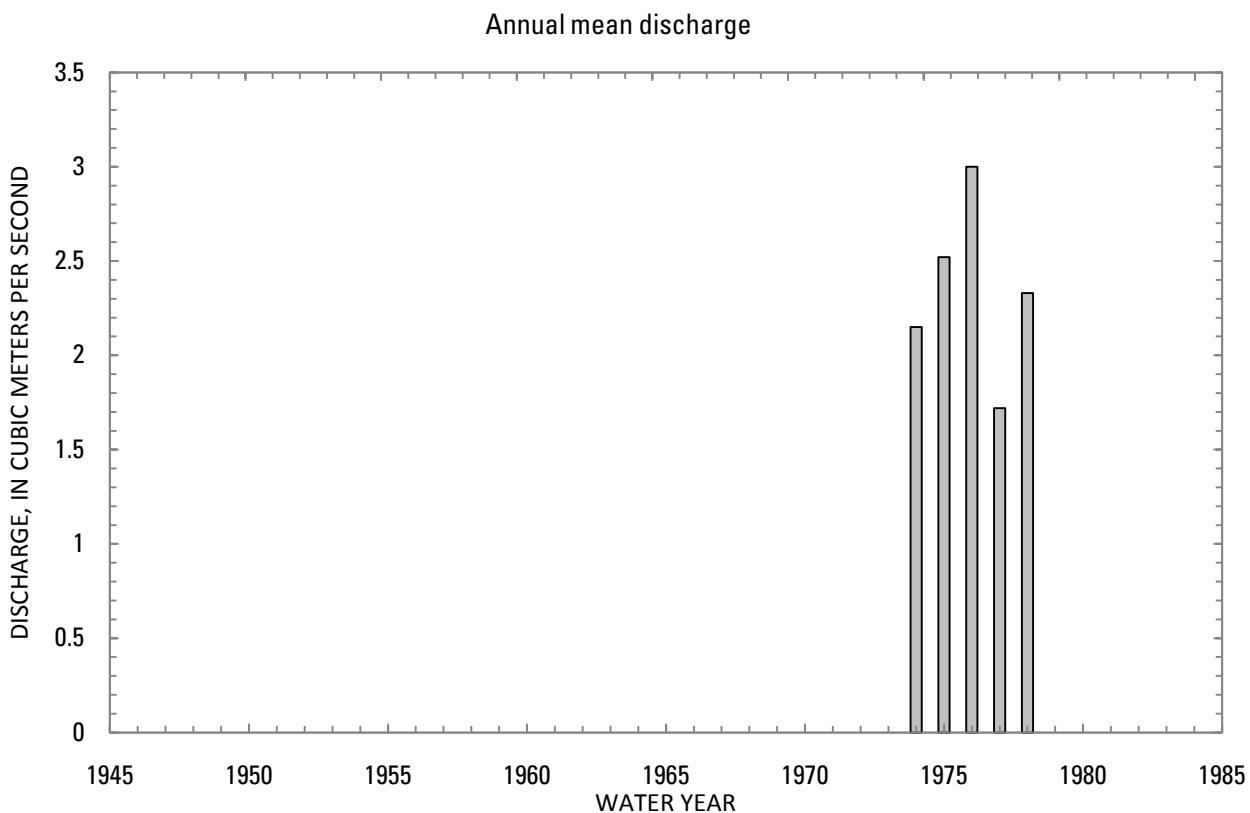

LOCATION: Lat 36°27'N., long 64°53'E.

DRAINAGE AREA: 4,645 km².

ELEVATION: 391 meters above mean sea level.

PERIOD OF RECORD: January 16, 1969 to May 31, 1970 and June 1, 1973 to September 30, 1978.

GAGE: Staff gage from January 16, 1969 to May 31, 1970. Water-stage recorder at same site and datum June 1, 1973 to September 30, 1978.

10-0.000-6M SHIRIN TAGAB RIVER AT KHISHT PUL

(U.S. Geological Survey identification number: 355700064540000)

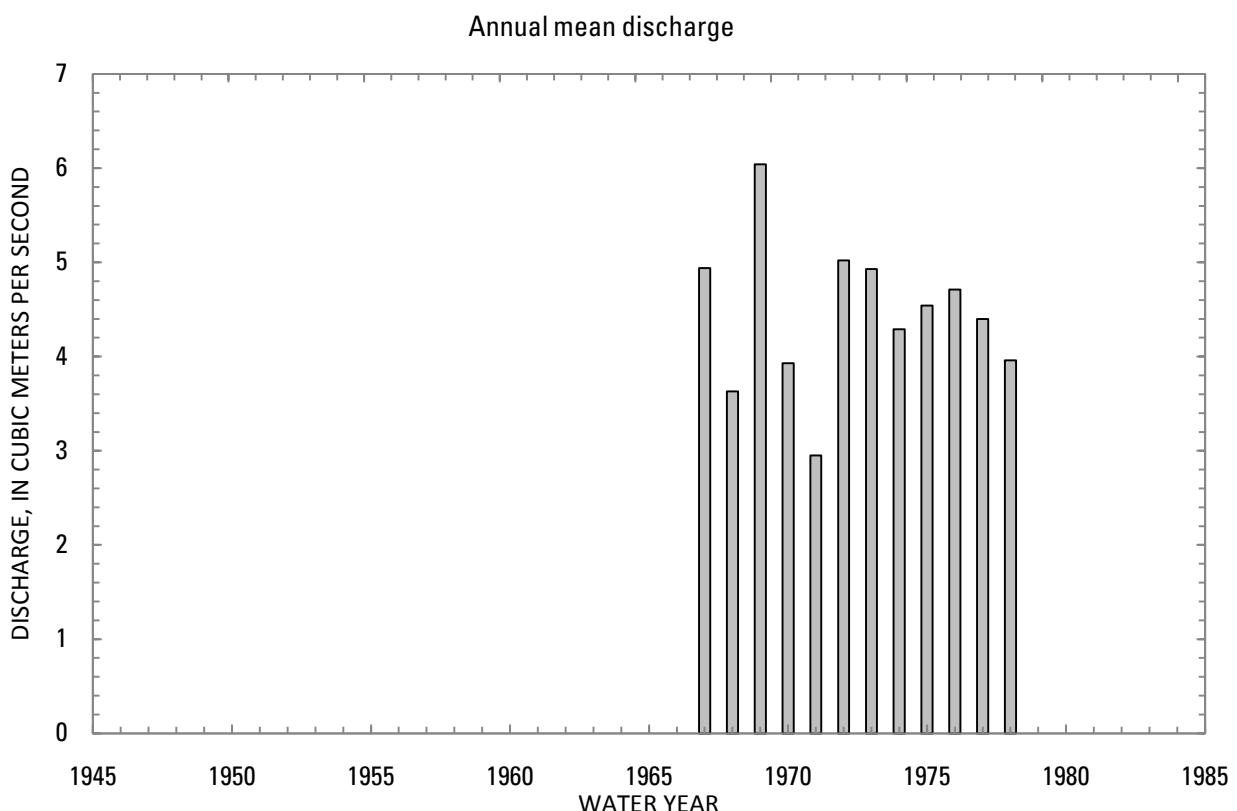

LOCATION: Lat 35°57'N., long 64°54'E.

DRAINAGE AREA: 3,280 km².

ELEVATION: 769 meters above mean sea level.

PERIOD OF RECORD: January 1, 1966 to September 30, 1978.

GAGE: Water-stage recorder. Staff gage at same site and datum prior to 1969 water year.

10-1.L00-1T MAIMANA RIVER NEAR PATA BABA

(U.S. Geological Survey identification number: 363200064530000)

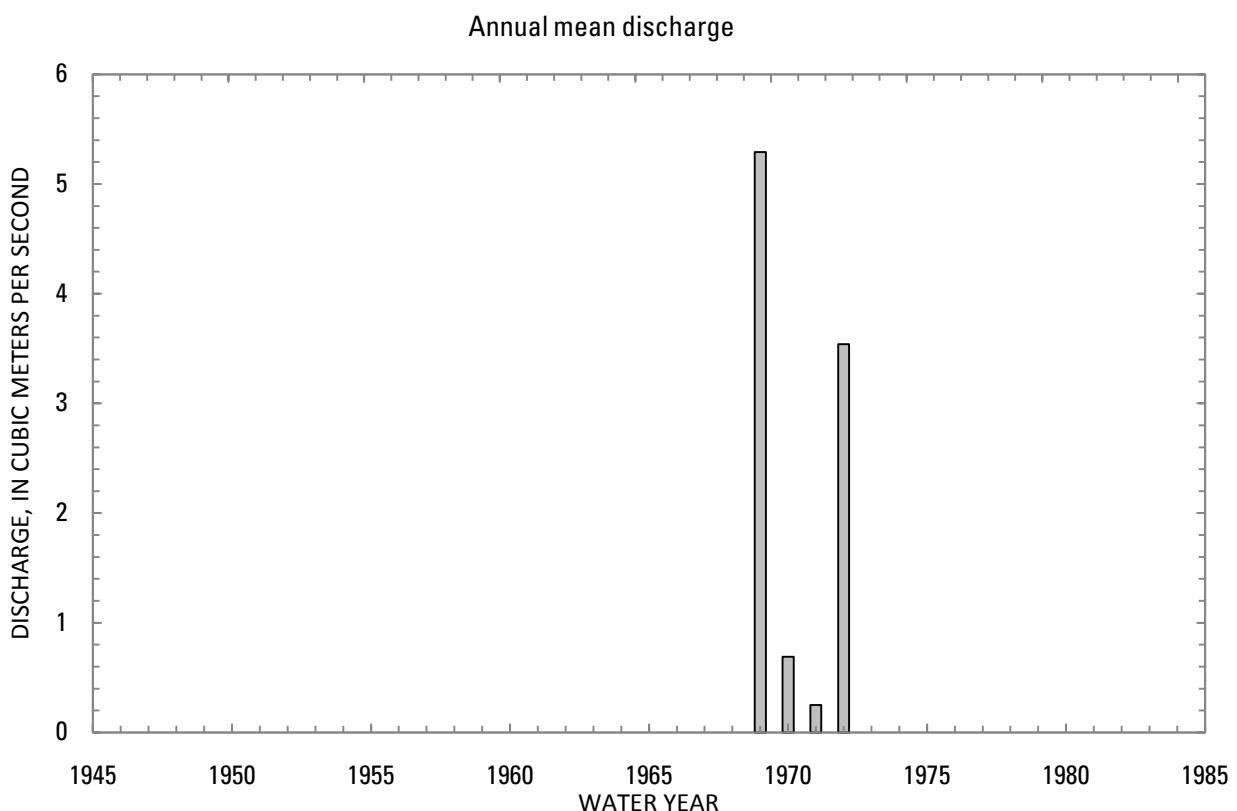

LOCATION: Lat 36°32'N., long 64°53'E.

DRAINAGE AREA: 6,685 km².

ELEVATION: 381 meters above mean sea level.

PERIOD OF RECORD: November 11, 1967 to September 30, 1972

GAGE: Water-stage recorder. Staff gage prior to 1970 water year.

11-1.R00-1A SHORAB RIVER NEAR SARE PUL

(U.S. Geological Survey identification number: 361100066020000)

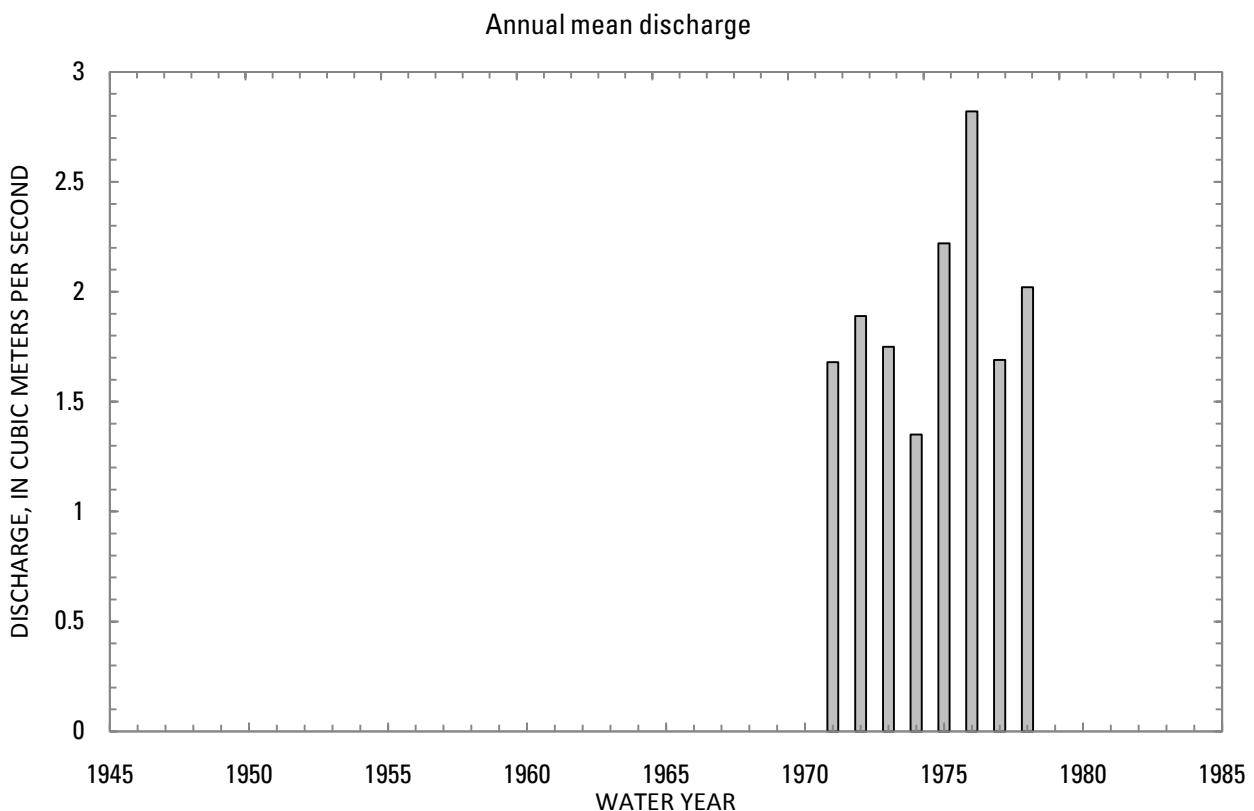

LOCATION: Lat 36°11'N., long 66°02'E.

DRAINAGE AREA: 3,700 km².

ELEVATION: 703 meters above mean sea level.

PERIOD OF RECORD: November 24, 1969 to September 30, 1978.

GAGE: Water-stage recorder.

12-0.000-1M BALKH RIVER AT RABAT-I-BALA

(U.S. Geological Survey identification number: 363500066580000)

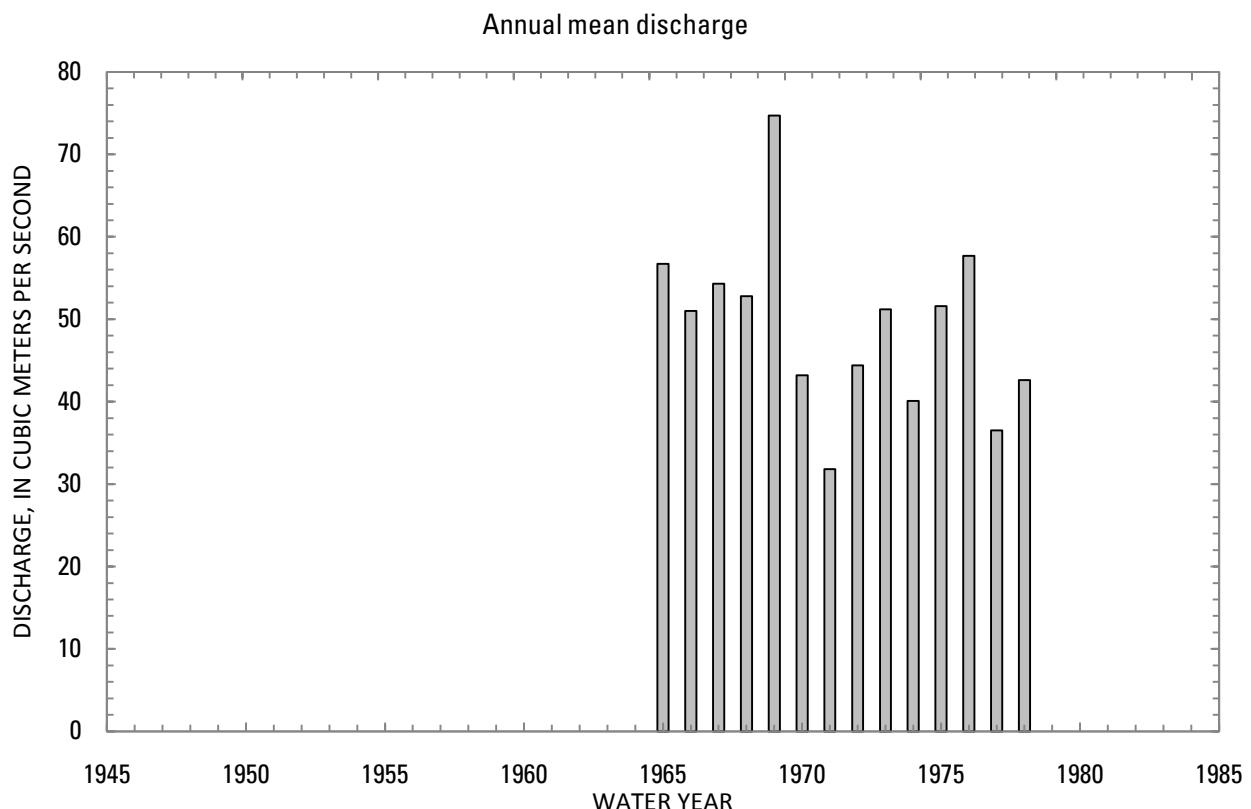

LOCATION: Lat 36°35'N., long 66°58'E.

DRAINAGE AREA: 18,035 km².

ELEVATION: 432 meters above mean sea level.

PERIOD OF RECORD: April 1, 1964 to September 30, 1978.

GAGE: Water-stage recorder. Staff gage at same site and datum prior to 1968 water year.

13-0.000-1M KHULM RIVER AT TANGI TASHQURGHAN

(U.S. Geological Survey identification number: 364000067420000)

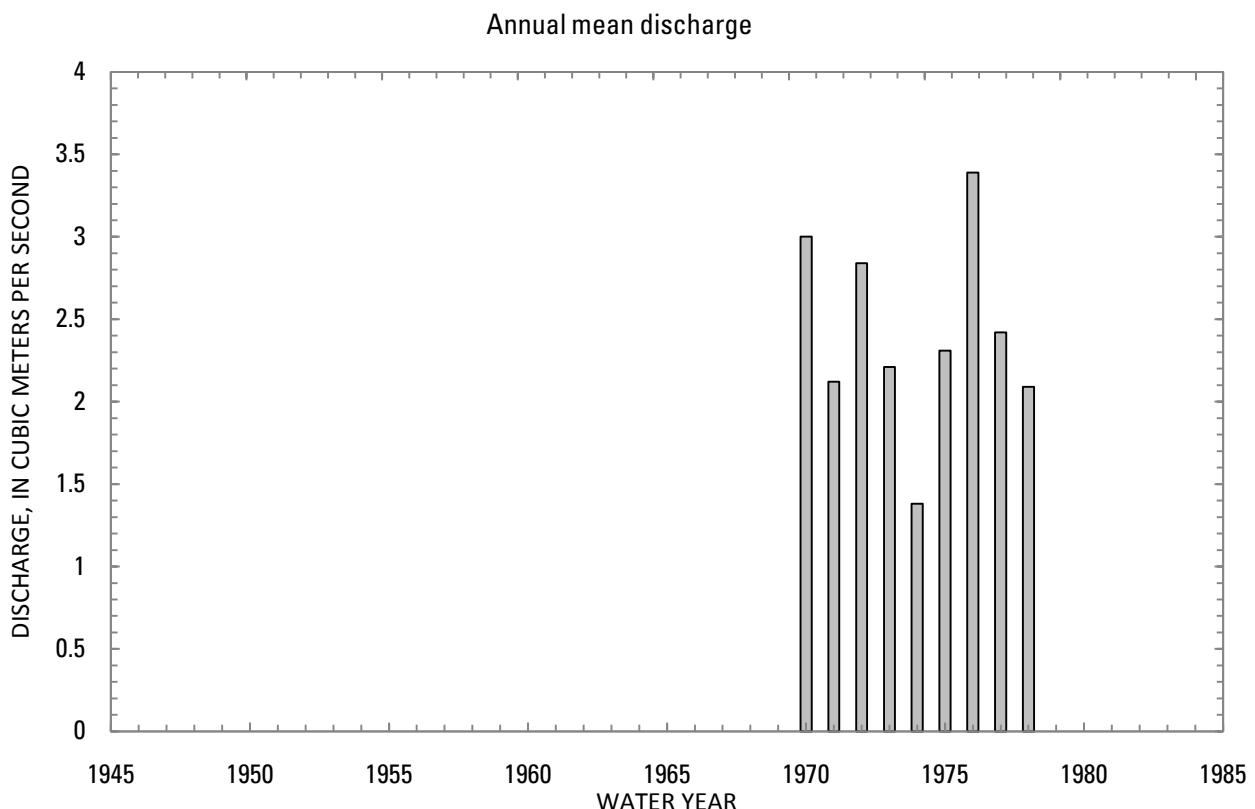

LOCATION: Lat 36°40'N., long 67°42'E.

DRAINAGE AREA: 8,220 km².

ELEVATION: 515 meters above mean sea level.

PERIOD OF RECORD: February 17, 1969 to September 30, 1978.

GAGE: Water-stage recorder. Staff gage at same site and datum prior to 1970 water year.

13-0.000-2M KHULM RIVER AT SAYAD

(U.S. Geological Survey identification number: 363500067470000)

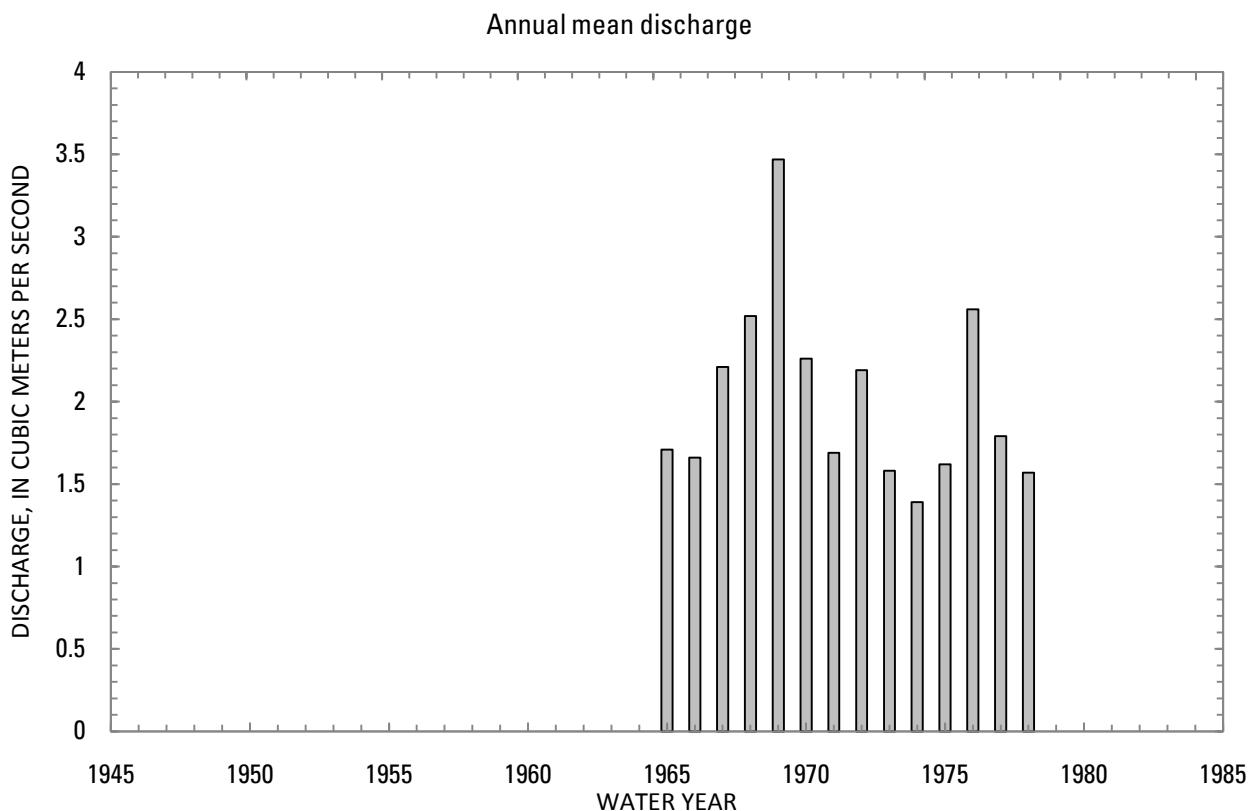

LOCATION: Lat 36°35'N., long 67°47'E.

DRAINAGE AREA: 8,170 km².

ELEVATION: 669 meters above mean sea level.

PERIOD OF RECORD: May 13, 1964 to September 30, 1978.

GAGE: Water-stage recorder. Staff gage at same site and datum prior to 1970 water year.

14-0.000-2M KUNDUZ RIVER AT CHAR DARA

(U.S. Geological Survey identification number: 364200068500000)

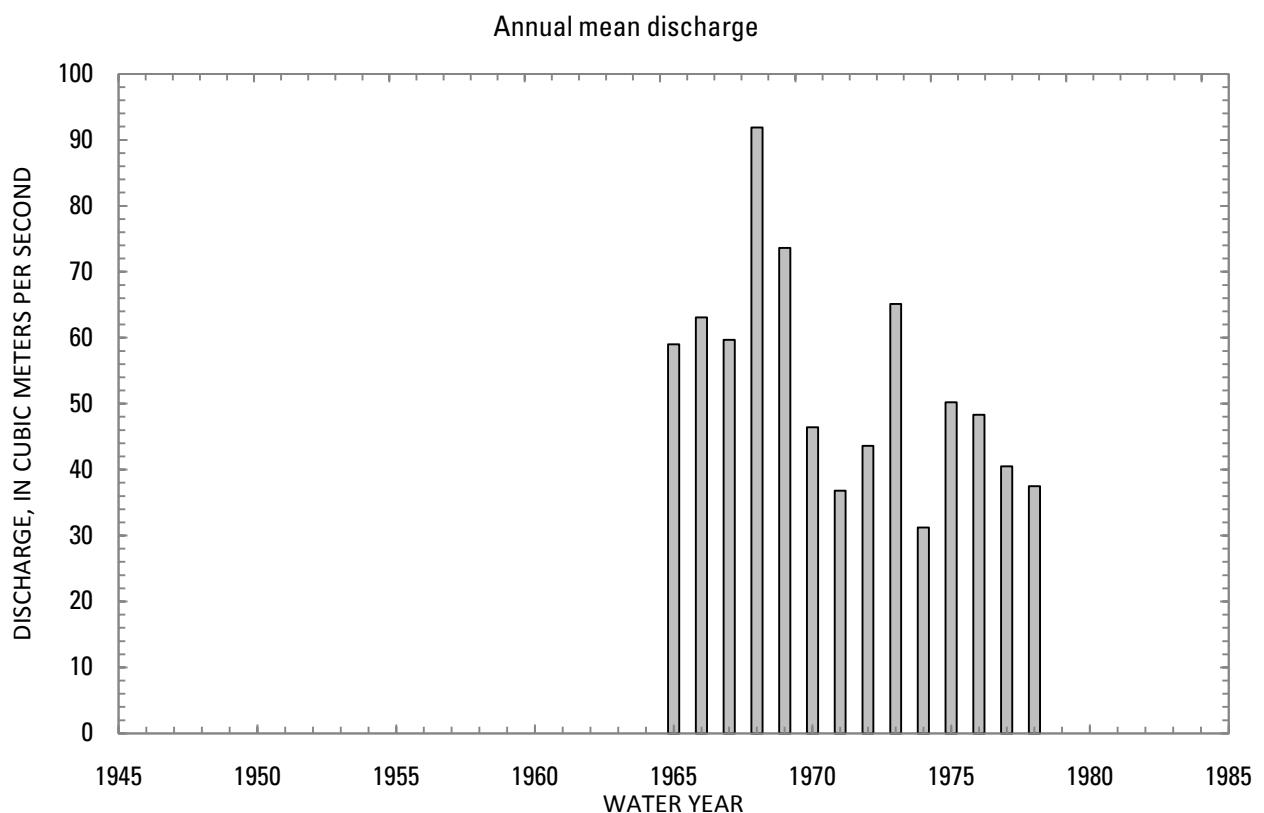

LOCATION: Lat 36°42'N., long 68°50'E.

DRAINAGE AREA: 24,820 km².

ELEVATION: 401 meters above mean sea level.

PERIOD OF RECORD: August 5, 1964 to September 30, 1978.

GAGE: Water-stage recorder.

14-0.000-3M KUNDUZ RIVER AT GERDAB

(U.S. Geological Survey identification number: 362200068520000)

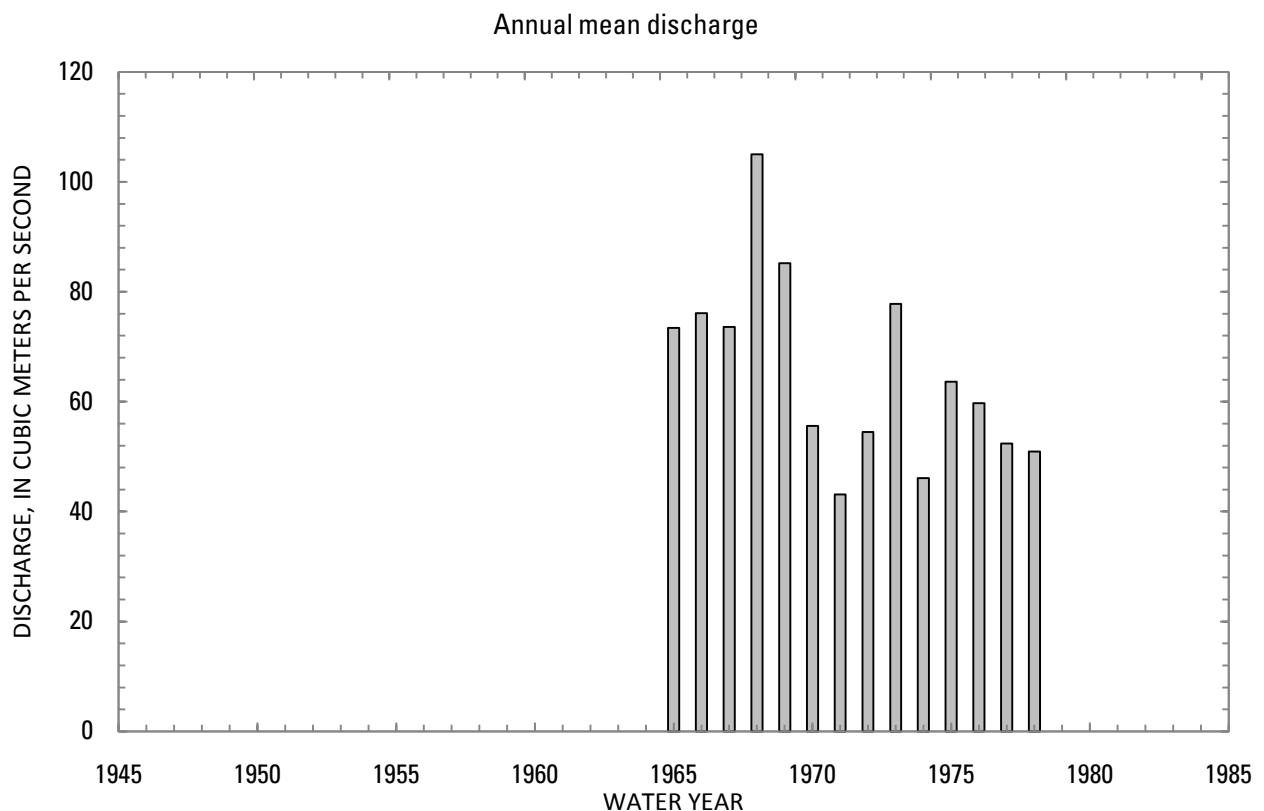

LOCATION: Lat 36°22'N., long 68°52'E.

DRAINAGE AREA: 22,930 km².

ELEVATION: 464 meters above mean sea level.

PERIOD OF RECORD: April 21, 1964 to September 30, 1978.

GAGE: Staff gage. Water-stage recorder at same site and datum during the 1978 water year.

14-0.000-3M KUNDUZ RIVER AT GERDAB, Continued

(U.S. Geological Survey identification number: 355600068430000)

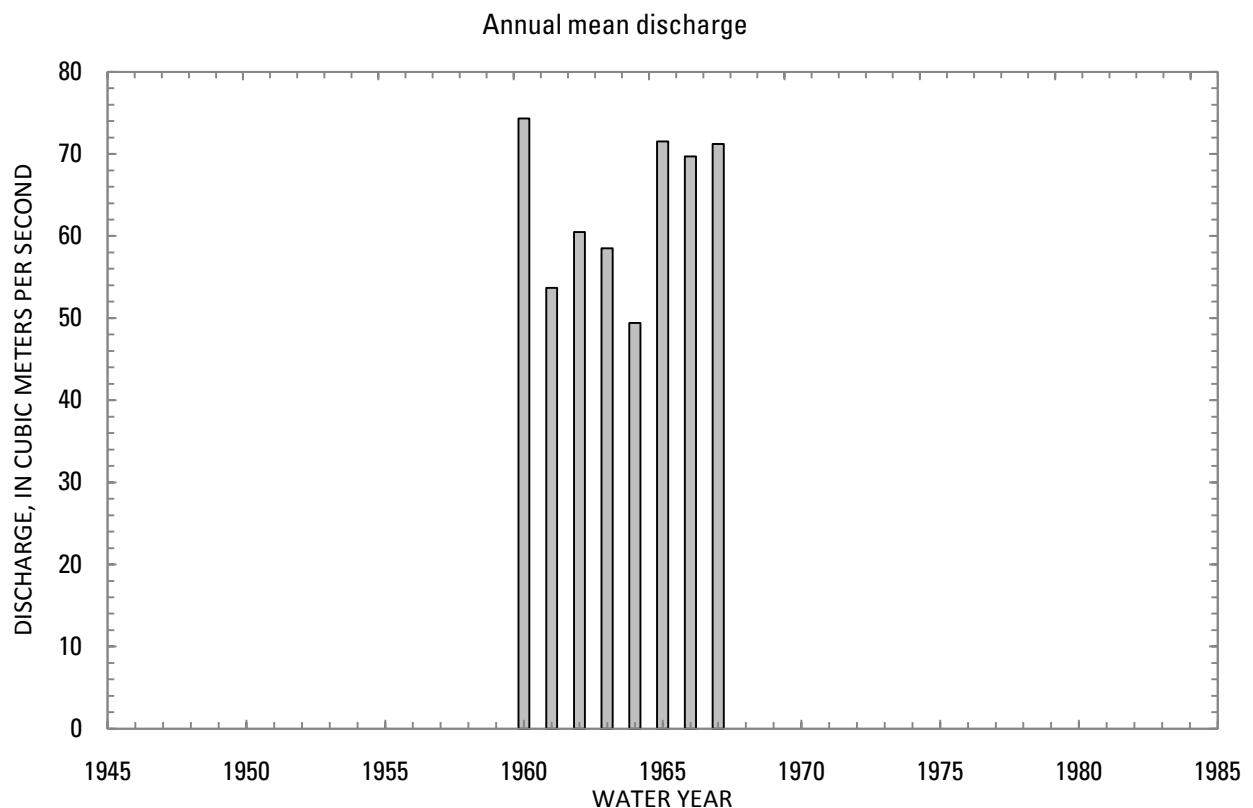

LOCATION: Lat 35°56'N., long 68°43'E.

DRAINAGE AREA: 17,405 km².

ELEVATION: 639 meters above mean sea level.

PERIOD OF RECORD: Monthly mean values April 1, 1950 to September 30 1959. Daily mean values October 1, 1959 to March 26, 1968.

GAGE: Water-stage recorder. Head works gage prior to January 1966 at hydropower station 2 km downstream.

14-0.000-8M KUNDUZ RIVER AT DASHT-I-SAFED

(U.S. Geological Survey identification number: 351800067550000)

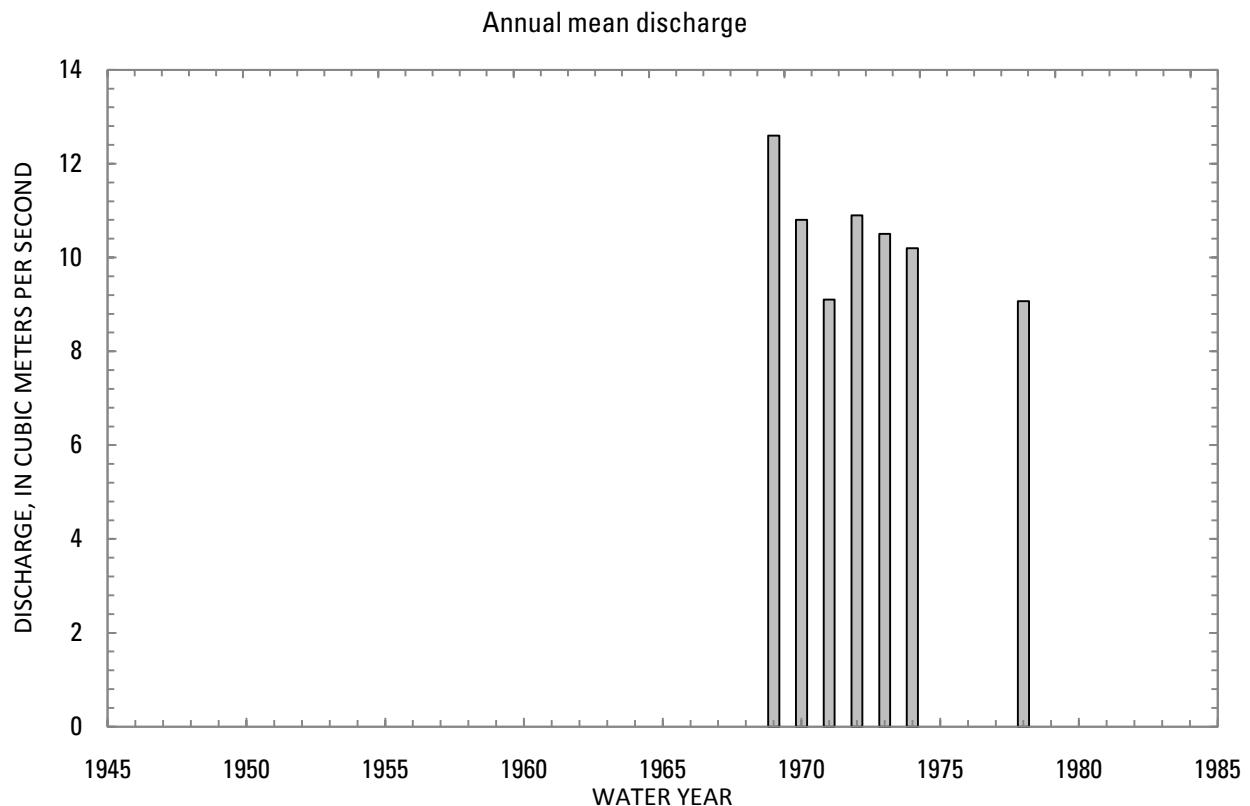

LOCATION: Lat 35°18'N., long 67°55'E.

DRAINAGE AREA: 3,795 km².

ELEVATION: 1,588 meters above mean sea level.

PERIOD OF RECORD: October 12, 1967 to May 5, 1975 and August 13, 1977 to September 30, 1978.

GAGE: Water-stage recorder. Site damaged by floods on May 5, 1975 and re-established 10 km downstream (Kunduz River at Doab) on August 13, 1977.

14-1.R00-5A FARKHAR RIVER NEAR TALOQAN

(U.S. Geological Survey identification number: 363800069430000)

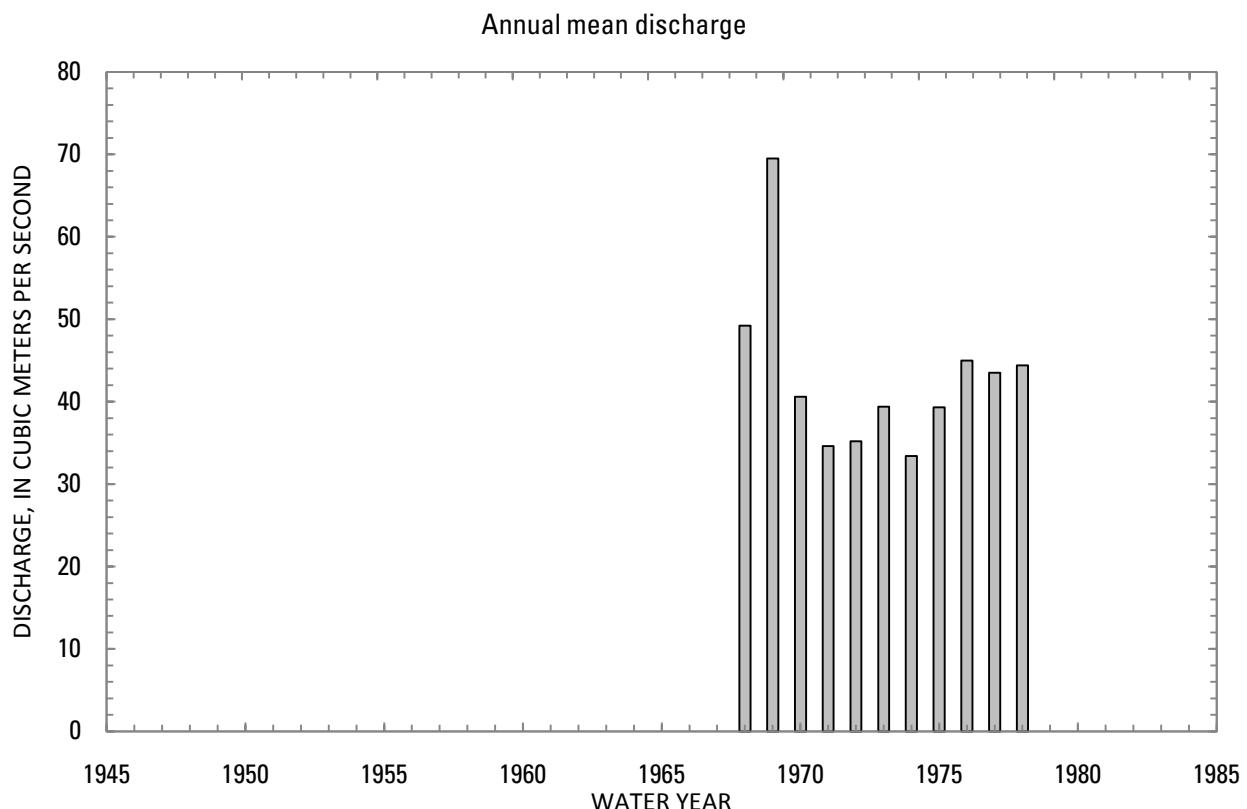

LOCATION: Lat 36°38'N., long 69°43'E.

DRAINAGE AREA: 4,110 km².

ELEVATION: 991 meters above mean sea level.

PERIOD OF RECORD: November 22, 1966 to September 30, 1978.

GAGE: Water-stage recorder.

ANDARAB RIVER AT DOSHI

(U.S. Geological Survey identification number: 353600068410000)

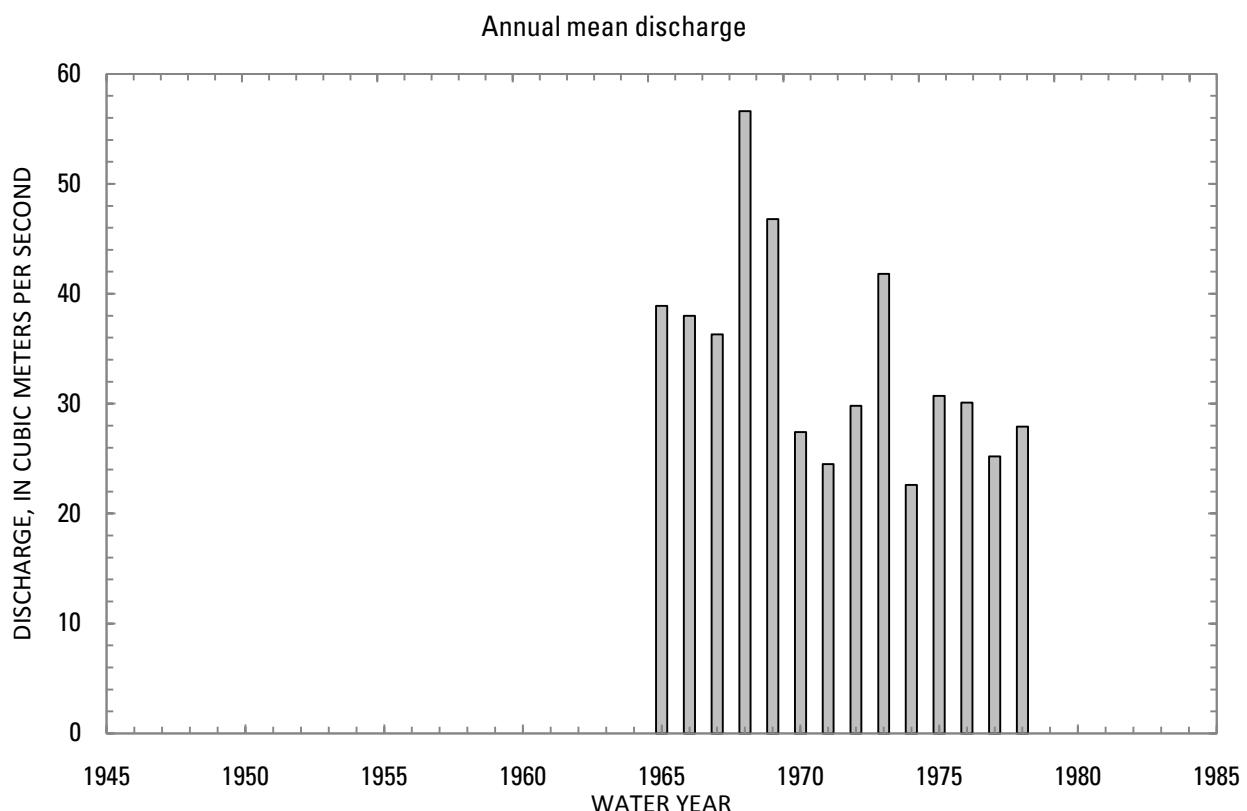

LOCATION: Lat 35°36'N., long 68°41'E.

DRAINAGE AREA: 3,705 km².

ELEVATION: 860 meters above mean sea level.

PERIOD OF RECORD: October 1, 1964 to September 30, 1978.

GAGE: Water-stage recorder.

15-0.000-3M KOKCHA RIVER NEAR KESHEM

(U.S. Geological Survey identification number: 365700070030000)

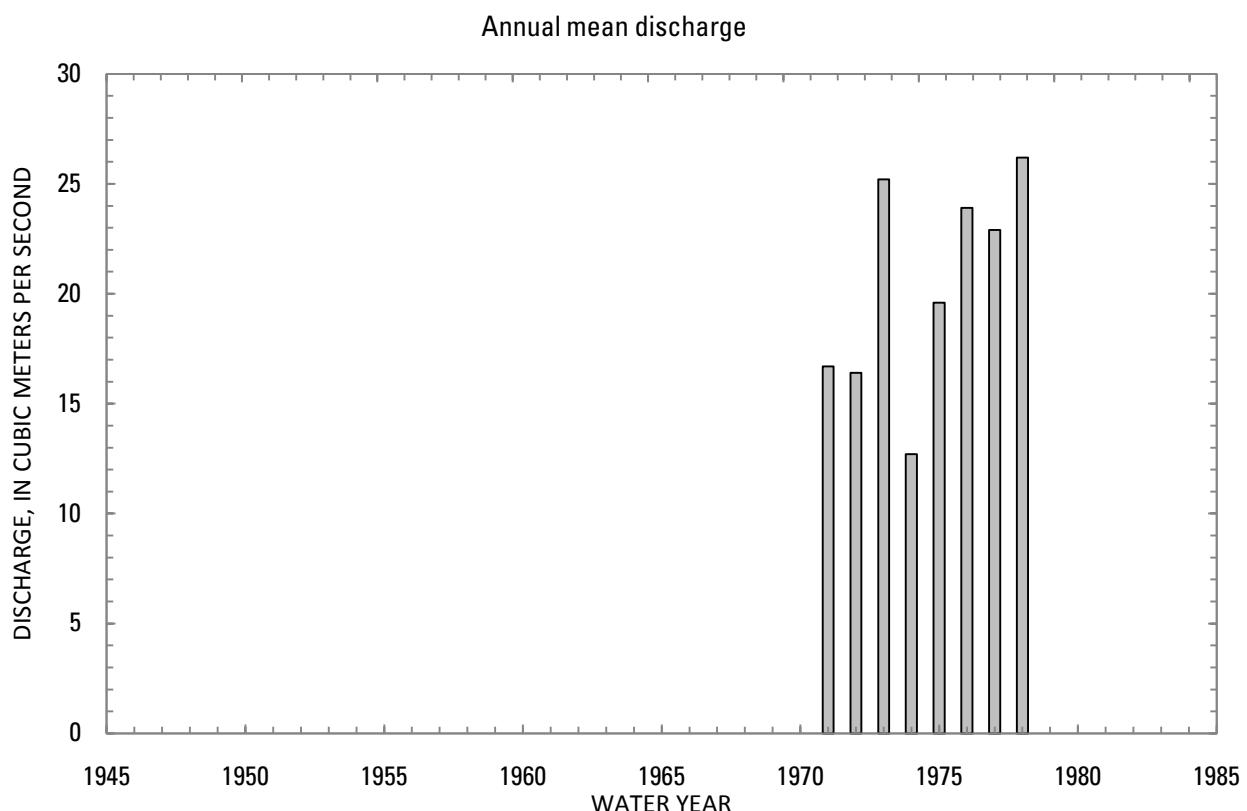

LOCATION: Lat 36°57'N., long 70°03'E.

DRAINAGE AREA: 16,765 km².

ELEVATION: 805 meters above mean sea level.

PERIOD OF RECORD: October 1, 1969 to September 30, 1978.

GAGE: Water-stage recorder.
