## INTRODUCTION

During the winter and spring of 1998 gravity surveys were conducted in the vicinity of Amargosa Desert and Pahrump Valley to improve control of basement depth estimates. Basement depths are very useful in determining ground water flow and potential reservoir capacities. Approximately 530 new gravity stations were made. Amargosa Desert and Pahrump Valley are located along the California-Nevada border between Death Valley and Las Vegas, NV. The boundaries of the study area are 35° 45' to 37° 00' N. latitude and 115° 30' to 117° 00' W. longitude. A map showing the location of the study area is shown in figure 1. A map showing the study area's local towns and geographic features is shown in figure 2. Two gravity base stations were used for control for these surveys. AMV is located at the post office building in Amargosa Valley, NV. This base was established by other workers prior to these field operations. The observed gravity of this station was calculated based on multiple ties to base stations on the Nevada Test Site and base stations on the Mount Charleston calibration loop. A second base station, NYECO was also used for these surveys. It is located next to the flag pole of the Nye County building in Pahrump, NV. This base was established with multiple ties to AMV. Descriptions of these base stations are made in figures 3 and 4.

## GRAVITY REDUCTION

Conversion to milligals was made using factory calibration constants and a calibration factor which varies with each gravity meter and has been determined by multiple gravity readings over the Mt. Hamilton calibration loop east of San Jose, CA (Barnes and others, 1969). Observed gravity values were based on an assumed linear drift between successive base readings. Vertical and horizontal control was mostly provided by small portable Global Positioning Systems (GPS). A base GPS unit was used to record variations in the satellite signals. These variations were applied to the roving GPS unit. The horizontal locations calculated by GPS were as close as one could plot on a 1:24,000 scale map. Printed elevations on these maps, either bench marks or spot elevations, are preferred over GPS elevations, but comparisons of GPS to map elevations rarely exceed 10 feet. There have been some occasions when these differences are in the 50 foot range, but this is quite rare. When these wide ranges of elevation differences occur, interpolated elevations from the 30 meter Digital Elevation Model (DEM) are used for station elevations when no elevation is printed on the map. This data set also includes two closely spaced profiles in which the vertical and horizontal control were established with laser surveying equipment.

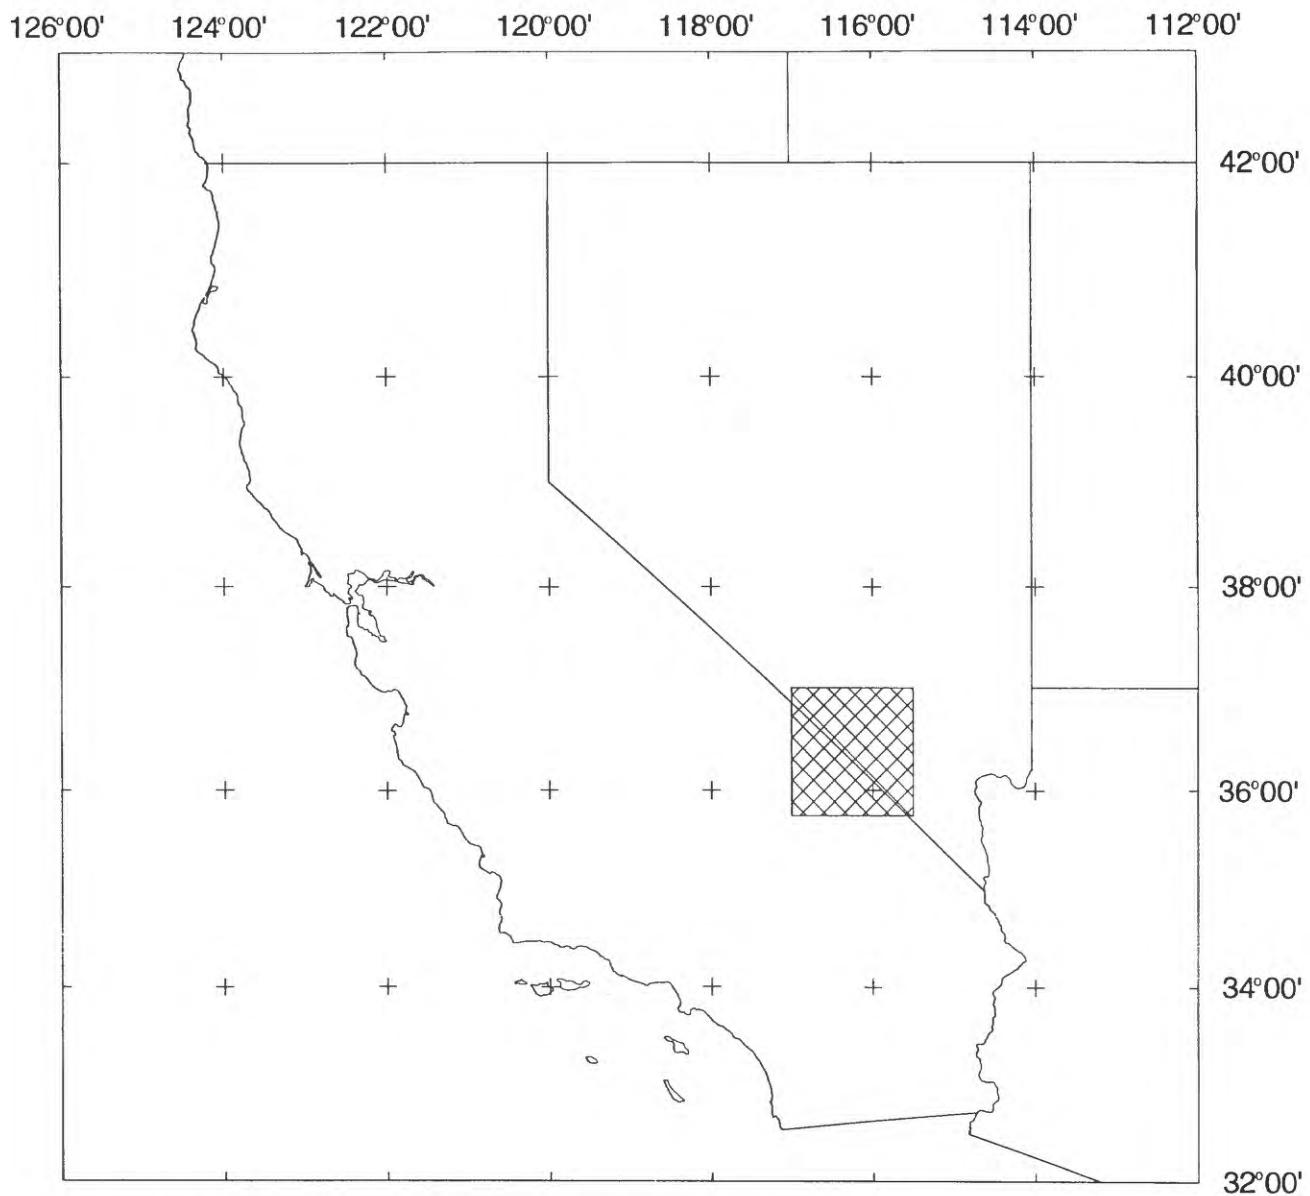

Field terrain corrections were made in the field which calculates to effect of the local terrain from the station to a radial distance of 68 m. Inner terrain corrections from 68 m to 0.59 km were calculated using 30 m DEM's. Terrain corrections were computed for the area from a radial distance of 0.59 km from the station to a radial distance of 166.7 km with a FORTRAN program (Plouff, 1977) and a digital terrain model. These data were processed through an isostatic reduction program (Jachens and Roberts, 1981) in order to

suppress the effects of deep density distributions that buoyantly support the topography. The isostatic reduction assumes an Airy-Heiskanen model with the following parameters from the station to 166.7 km: density of topography above sea level,  $2.67 \text{ g/cm}^3$ ; crustal thickness at sea level, 25 km; density contrast across the base of the model crust,  $0.4 \text{ g/cm}^3$ . From 166.7 km to a point on the opposite side of the Earth, isostatic and terrain corrections were taken off maps by Karki (1961). These corrections were added to the output of the isostatic program of Jachens and Roberts (1981) to produce the isostatic correction.

Theoretical gravity at sea level is based on the Geodetic Reference System 1967 (GRS 67) (International Association of Geodesy, 1971, p. 58) for the shape of the spheroid. The datum for the observed gravity is the International Gravity Standardization Net 1971 (IGSN 71) (Morelli, 1974, p. 18). Observed gravities were calculated by adding meter drift and earth-tide corrections to the milligal equivalent meter readings. Free-air anomalies are calculated by subtracting the theoretical gravity from the observed gravity and adding the free-air correction as defined by Swick (1942, p. 65). Simple Bouguer anomalies are calculated by subtracting the Bouguer correction, which accounts for the attraction of rocks between the station and sea level using a rock density of  $2.67 \text{ g/cm}^3$  from the free-air anomaly. Complete Bouguer anomalies are calculated by adding the terrain correction and the curvature correction to the simple Bouguer anomaly. Isostatic anomalies are calculated by adding the isostatic correction to the complete Bouguer anomaly.

#### ACKNOWLEDGMENTS

We wish to acknowledge Bruce Chuchel and Peter Fahringer for their assistance in the field during the collection of these data.

**FIGURE 1.**—Index map of study area.

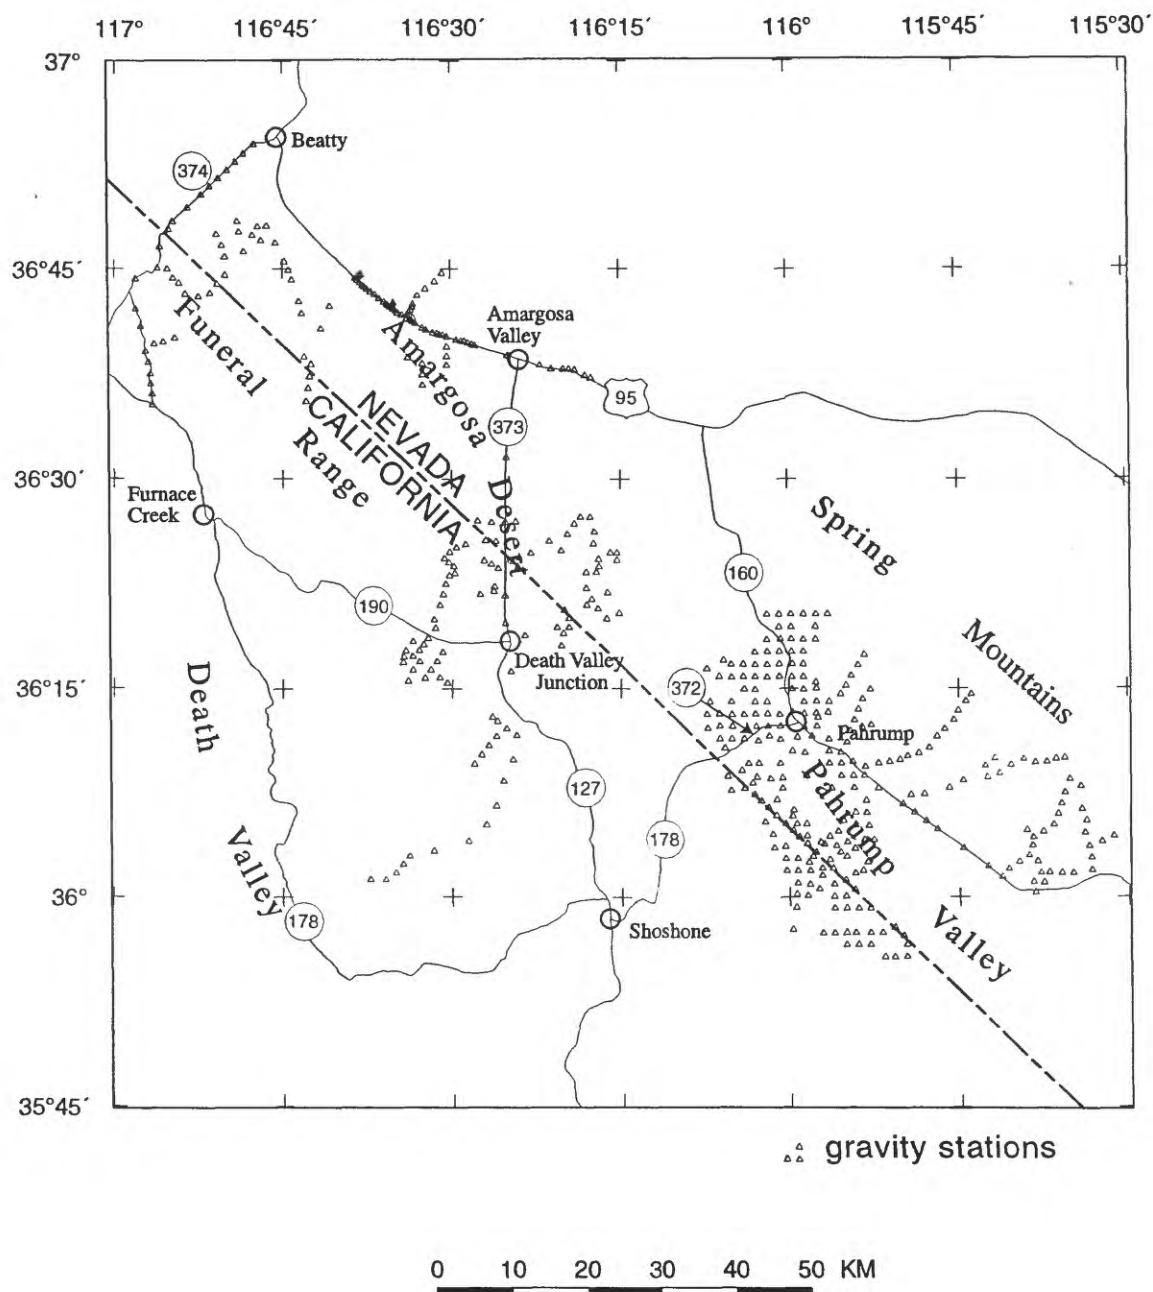

FIGURE 2.— Study area showing locations of towns, highways, and selected geographic place names.

LOCATION: Amargosa Valley Post Office	NAME: AMV
LATITUDE: 36° 31.54'	LONGITUDE: 116° 25.14'
OBSERVED GRAVITY: 979,600.39 mGal	ELEVATION: 2344 ft      714 m
DATUM: ISGN 71	

DESCRIPTION: The gravity base station is located at the Amargosa Valley Post Office. The post office is located about 70 m west of Nevada Highway 373 on Sage Road, about 13 km north of the California-Nevada boarder. The meter was read on the front, south facing, covered concrete porch of the post office about 2 m east of the door leading into the post office and about 0.2 m from the south wall of the building. This location is just east of a set of windows and about 2 m west of the east edge of the concrete porch..

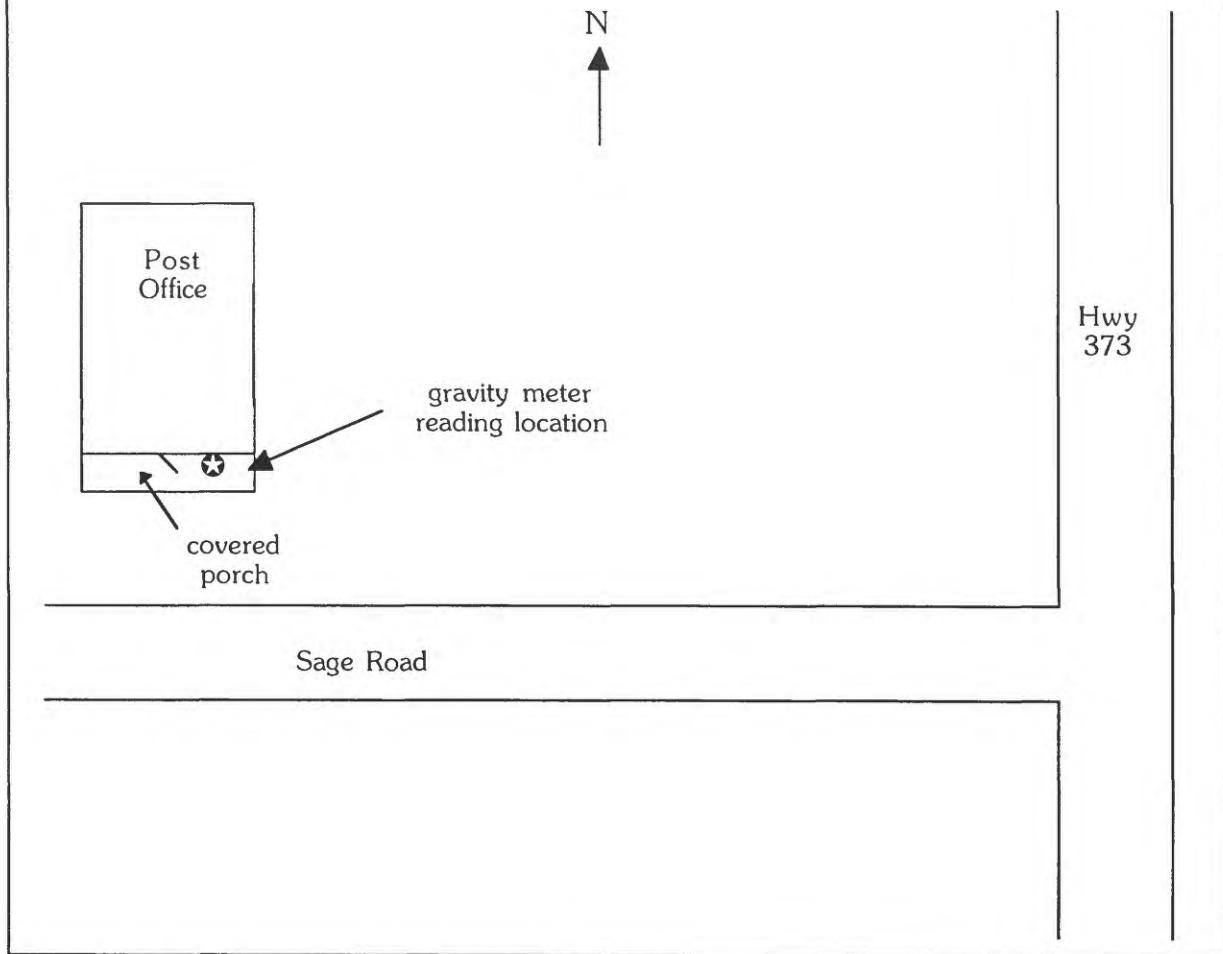

FIGURE 3.— Gravity base station at Amargosa Valley, NV

LOCATION: Nye County offices, Pahrump, NV	NAME: NYECO
LATITUDE: 36° 13.30	LONGITUDE: 115° 59.66
OBSERVED GRAVITY: 979,554.18 mGal	ELEVATION: 2632 ft 802 m
DATUM: IGSN 71	
<p>DESCRIPTION: The gravity base station is located on the west side of a sidewalk, adjacent to the flag pole in front of the Nye County offices in Pahrump, NV. The Nye County offices are located on the west side of Nevada Highway 160 about 1.1 miles NNW of the junction of Nevada Highways 160 and 372. The flag pole is located at the east side of the Nye County office building, about 20 ft from the building and about 10 ft west of the parking lot. The gravity station is an unmarked spot on the sidewalk which is located between the parking lot and the flag pole. The station is on the west edge of the sidewalk and next to an electrical box.</p>
