RECORD OF DEEP-WELL DRILLING FOR 1905.

By MYRON L. FULLER and SAMUEL SANFORD.

PROGRESS IN THE COLLECTION OF WELL RECORDS AND SAMPLES, 1905.

By MYRON L. FULLER.

The present is the second of the series of reports on the collection of deep-well samples, the first of which, covering the period from the beginning of the work July 1, 1904, to December 31, 1904, was published as Bulletin No. 264. This report presents the records of a large number of wells from which more or less complete sets of samples have been secured and placed on file at the Survey, and also many additional records not represented by samples.

The work has been conducted by the eastern section, division of hydrology, the expense being shared with the western section of hydrology and the geologic branch. The writer has continued in charge of the investigations and has been assisted by Messrs. E. F. Lines and Samuel Sanford. The burden of executive details has fallen mainly on Mr. Sanford since his assignment to the work on its relinquishment by Mr. Lines April 1. The methods followed are in most particulars those formulated by Mr. A. C. Veatch on the inauguration of the work in 1904, but to Mr. Sanford is due the credit for materially increasing the usefulness of the work to the driller, especially in furnishing geologic information.

OBJECTS OF THE WORK.

GENERAL STATEMENT.

The chief objects of the collection of well samples and the publication of records were: (1) To encourage drilling by pointing out to prospective well owners the probabilities of success; (2) to assist drillers by helping them to a better understanding of the rock succession and by interpreting for them their samples and records, and (3) to furnish to geologists accurate stratigraphic data from which a more intimate economic or scientific knowledge of the geologic conditions could be derived.

Much has been accomplished toward achieving the objects indicated. The sinking of wells has been recommended in numerous instances, drillers have been furnished with advice, well samples have been described and explained, records have been interpreted, and geologists have been supplied with a large number of records. It is hoped that even more will be accomplished during the next year, and it is with the view of emphasizing to drillers and others the importance to them of the work that more detailed statements of the benefits are given in the following paragraphs.

ENCOURAGEMENT OF DRILLING.

It is the earnest wish of the Survey to encourage drilling for pure-water supplies. Each year a large number of requests for advice as to the desirability of drilling wells in different localities are received, and recommendations based on the prevailing conditions in the region in question are given. It is evident that every successful well tends to lead to the drilling of others for similar supplies, and the more definite the information that can be given as to depth, materials penetrated, quantity and quality of supply, and cost of the well, the better able is the person to judge of the advisability of sinking the well. Failures to obtain supplies do not always, in the long run, tend to discourage drilling, as the cause is often discoverable when accurate records are available and it is possible to suggest remedies so that following wells are more successful. Data as to the small water seams overlying the supposed main water-bearing bed are of great importance in suggesting sources of supply when for one reason or another the expected flow from the lower bed does not materialize. In general the shallower the wells, beyond a certain limit, the greater will be the demand for drillers, for it is evident that where water can be obtained within a relatively short distance of the surface and at a moderate cost much more drilling will be done in the aggregate than if the wells had to be sunk many hundreds or thousands of feet, in which case only towns or large corporations could afford to drill.

In order that the greatest number of wells may be drilled and the greatest success attained, it is desirable that the Survey be furnished, as a basis for its recommendations to those contemplating drilling, with as full data as possible regarding each well, whether deep or shallow (if over 100 feet) and whether successful or not.

Another point that should be more widely appreciated among drillers is that the man who goes about his work intelligently is most likely to secure the large contracts. The work of large corporations is generally conducted along severely practical lines, and when drilling is to be done practical men are selected. It is manifest that to the driller who gives careful attention to his work and who

not only sees that machinery is in proper condition and that it is properly handled, but also studies and keeps careful records of the character of the rocks to be penetrated, their dip, and the nature of the joints, seams, or bedding which may control the occurrence of water, a contract can be given with much greater assurance of success than to one who drills blindly ahead without such study and records.

ASSISTANCE TO DRILLERS OR OTHERS.

CORRESPONDENCE.

Information in regard to rock succession and structure.—No matter how complete and thorough a driller's information in regard to a given field may be, there almost always comes a time when he is required to sink a well in new and unknown territory. One of the commonest requests received by the Survey is for information as to the nature of the rock at a certain point in such regions, as to the depths of supposed productive horizons, and as to the characters of the formations which must be penetrated to reach them. This information will be cheerfully furnished by the Survey whenever the data are available, and it is hoped the driller and well owner will reciprocate by furnishing such details as will enable this organization to offer even more definite advice in the future.

Information in regard to prospects for water, oil, or gas.—The demand for information in regard to prospects for oil, gas, or water is great and constantly increasing. While it is of course impossible in most cases to make absolute predictions as to the occurrence of these substances, even after detailed investigations in the field, and it is still more impracticable to make them from the office, yet for certain regions and for certain rocks it is possible to make very definite statements and to give advice which if followed would prevent the waste of hundreds of thousands of dollars in drilling in hopeless situations. For other regions, while only the drill will finally decide the presence or absence of water, oil, or gas, certain generalizations can often be made from the success of wells in adjacent territory, the data relating to which are constantly being collected by the Survey, thereby enabling it to furnish to the driller free of cost information which might give him much trouble to obtain otherwise. Every record furnished by a driller helps to a better understanding of the conditions and makes possible the giving of more accurate advice by the Survey.

Suggestions in regard to drilling methods.—The methods of drilling in different types of material, the methods of handling quicksand, and many other problems connected with the sinking of deep wells are under investigation by the Geological Survey, which ~~will~~ gladly furnish the driller with such suggestions in regard to his difficulties as its experience warrants.

Examination and interpretation of samples.—In order to assist toward more intelligent drilling, the Survey will also examine the samples of such materials as the driller does not recognize or will interpret for him the logs of such wells as are represented by complete sets of samples.

PUBLICATIONS.

In addition to the aid rendered the driller by correspondence, as pointed out in the foregoing paragraphs, the Survey is enabled to assist the driller or well owner further through its publication of well records and other information relating to the occurrence of oil, gas, and water. Among the many ways in which reports containing such information may be of value, the following, which were pointed out in the first report on the sample system, may be repeated. To the oil and gas driller they furnish information as to (1) the best point for locating the well, (2) the depth of the supposed productive bed, (3) the character of the material to be penetrated, (4) the amount of water which will be encountered, (5) the amount of casing required, and (6) the limit of depth to which it is desirable to drill. To the owners of such wells information as to each of the foregoing points, especially those affecting the cost of the wells, is furnished by the records, in addition to data relating to still more important factors—namely, those of quantity and quality of supplies. In the case of drillers and owners of water wells the same information is furnished, but here the items affecting the cost are of increased importance, owing to the lower value of the product, and questions of head, quantity, and quality of supply again come to the fore. To prospective owners records show the results obtained by others and the probabilities of success of new ventures, while to the geologist they are of value in assisting to a more thorough understanding of the geology, which, in turn, enables him to answer more intelligently the numerous questions constantly referred to him by drillers, well owners, and others.

The reports giving information likely to be of interest to drillers are of several kinds, full descriptions of which are given on pages 10–14.

METHOD OF COLLECTING SAMPLES.^a

Arrangements for cooperation.—Cooperation with drillers forms the basis on which the work of collecting well samples is conducted. Problems are continually arising in the field in connection with drilling, and information is wanted by the driller as to the geologic formations to be encountered, the nature of peculiar materials brought up by the sand pump, and the probable depth and character of supplies. Careful attention is given to such requests, and all

^a For full description of office methods see Bull. U. S. Geol. Survey No. 264, 1905, pp. 27–39.

available information is furnished the applicant. From the records the geologist is able in many cases to give suggestions as to type of well, method of drilling, etc., and to offer such encouragement as the facts warrant to those contemplating the sinking of deep wells. In return the driller is requested to furnish written records of his wells and samples of materials penetrated, his assistance being acknowledged in the reports on well records issued annually.

List of drillers.—One of the first steps is to secure the names and addresses of competent drillers, a task of some difficulty because of the lack of a comprehensive drillers' directory, the nonexistence of any trade publication devoted to drilling, and the general absence of advertisements of drilling firms in engineering publications. Advertisements for bids, however, appear in such publications in case of most of the deeper water wells, and by communicating with owners the addresses of drillers are obtained. Some addresses are procured through news notes in the trade journals, especially in oil publications, while still others are obtained from well reports received from postmasters, town and county officials, and geologists in the field.

Initial correspondence.—To the addresses procured from the above and other minor sources letters are sent calling attention to the nature of the system for the collection of samples and records and the benefits to be derived from it by the driller. With the letter is inclosed a sample of the bags used for shipping the samples under frank through the mails. When favorable replies are received, notebooks especially devised for the use of drillers and containing pertinent suggestions and simple geologic definitions are mailed, together with a supply of canvas bags for mailing the individual samples.

When the drillers are not at the time engaged in drilling, special blanks are mailed for the purpose of obtaining records of previously completed wells. Similar blanks are also frequently sent to well owners. Much data of value in determining the geologic features of the different regions and of economic importance from the standpoint of underground waters and oil or gas has been procured in this manner.

Examination and filing of samples and records.—As soon as received at the office the samples are transferred from the bags to properly labeled glass bottles. Those most commonly used are approximately $2\frac{1}{4}$ inches long and three-fourths of an inch in diameter, but glass jars measuring 3 by $1\frac{1}{2}$ inches are employed where the fragments are larger or where they contain fossils or pebbles. As soon as a set of samples is completed it may be taken from the temporary filing cases in which it has previously been stored and, after reference to a geologist for examination and identification of horizons

where possible, placed in the permanent storage cases, which have a capacity of 432 bottles to a drawer, or 5,000 to a case measuring, approximately, 40 by 32 by 24 inches.

The notebooks, both those accompanying samples and those received independently, together with the records of completed wells obtained on the special well blanks, are filed by locality in the record files, all data pertaining to a given well being segregated and filed as a unit in a form convenient for consultation.

Confidential records.—Owing to the expense involved in obtaining information through drilling, the operator may sometimes desire that certain information he has furnished to the Survey for scientific purposes be regarded as confidential. In all such cases his wishes will be rigidly followed.

PUBLICATION OF RESULTS.

The results of the work of collecting samples are described in reports issued annually, the general plan being to present each year a list of persons cooperating in furnishing samples or records, a summary of the wells reported, and detailed records of selected wells. The material is thus quickly made available to drillers, well owners, and geologists, who are enabled to make immediate use of the information, instead of being compelled to wait for complete reports, which, in general, could only be prepared after many years of work, the data in the meanwhile being unavailable, except to a few connected with the Survey at Washington.

In addition to the reports descriptive of the systematic collection of samples and records, many other papers containing well records or giving information in regard to oil, gas, artesian waters, etc., have been published by the Survey. A list of these and an index to the subjects treated has been prepared by the writer and published by the Survey as Water-Supply and Irrigation Paper No. 120. Of these papers those which are likely to be of the most interest to drillers and well owners are given below. Those of which the supplies have not been exhausted can be obtained from the Director on request.

In the summary given below the following abbreviations are used for the various publications of the United States Geological Survey:

- A. R. Annual Reports.
- P. P. Professional Papers.
- B. Bulletins.
- M. R. Reports on Mineral Resources.
- G. F. Geologic Folios.
- M. Monographs.
- W. S. P. Water-Supply and Irrigation Papers.

 The California or "stovepipe" method of well construction, by C. S. Slichter: W. S. P. 110.

MEASUREMENTS OF FLOW AND HEAD.

- Approximate methods of measuring the yield of flowing wells, by C. S. Slichter: W. S. P. 110.
 Corrections necessary in accurate determinations of flow from vertical well casings, from notes furnished by A. N. Talbot: W. S. P. 110.
 Field measurements of the rate of movement of underground waters, by C. S. Slichter: W. S. P. 140.
 A convenient gage for determining low artesian heads, by M. L. Fuller: W. S. P. 145.

LISTS OF WELLS AND BORINGS.

- Record of deep well drilling for 1904, by M. L. Fuller, E. F. Lines, and A. C. Veatch: B. 264.
 Preliminary list of deep borings in United States, pt. 1, by N. H. Darton: W. S. P. 57.
 Preliminary list of deep borings in United States, pt. 2, by N. H. Darton: W. S. P. 61.
 Contributions to the hydrology of eastern United States, 1903, by M. L. Fuller: W. S. P. 102.
 Preliminary list of deep borings in the United States, second edition, with additions, by N. H. Darton: W. S. P. 149.

WELL RECORDS.

By SAMUEL SANFORD.

INTRODUCTION.

The definition of a deep well is so variable in different localities that it has been difficult to determine where to draw the line in selecting logs for publication in the present report on deep-well drilling in 1905. In many localities a 100-foot well is regarded as deep, while in others 500 or even 1,000 feet is the limit fixed. Nor is the value of a record necessarily dependent on depth, the data of certain shallow wells being more important than those of many of the deeper ones. There are, moreover, a large number of drillers, especially those using light portable rigs for drilling domestic wells, who are interested in relatively shallow wells, for which reason the present report is made to cover all wells over 100 feet in depth. That shallower wells are not included does not mean that details of such wells have not been obtained, nor that they are not deemed worthy of record. The line is drawn as indicated because the number of records of shallow wells is so great as to prohibit their inclusion in a report primarily relating to deep wells.

Many hundreds of records that have been obtained by the Survey during the past year are not published here, but are reserved for use in the preparation of special reports on particular districts where it is desired to present with the greatest exactness the relations of the underlying rocks or the depths to certain beds. Such records are of particular value in the preparation of the structural geology maps that appear in the various folios of the Geologic Atlas of the United States, many hundred logs often being collected and compared before the publication of a folio, especially in the case of those located in the oil and gas fields of Pennsylvania and other States. It is because of the omission of such records that so few wells from the more active districts, where the rock succession in many places is well known, are included. The object, on the contrary, has been to present records from the scattering or so-called "wild-cat" wells drilled in new or little-known territory.

ACKNOWLEDGMENTS.

Thanks are tendered the following contractors and drillers who have assisted the Survey in its endeavor to secure information as to the strata penetrated in drilling and the economic results of the deep borings. To the interest they have shown and the pains they have taken in furnishing data whatever of value this work may have is chiefly due.

Drillers and contractors furnishing records or samples.

Ackerman & Hogden, drillers for Loy & Wilson, Chanute, Kans.
Adams & Bergh, Argusville, N. Y.

York, Chas. S., hydraulic engineer, Baltimore, Md.

SUMMARY OF WELL DRILLING FOR 1905.*Abbreviations used in table.*

- O = owner.
C = contractor.
D = driller.
M = miscellaneous source of authority, other than owner, contractor, or driller.
L = Survey has a log.
S = Survey has samples.
— under "Height of water" = distance of surface of water below the well mouth.
+ in same column = distance water will rise in an open pipe above the well mouth.

Summary of well drilling

ALABAMA.

No.	Kind of well.	County.	Location.	Owner.	Contractor.
1	Water..	Bullock.....	Perote.....	City of Perote.....	Y. T. Radford....
2do....	Calhoun.....	Anniston, 1½ m. NW. of, sec. 1, T. 16, R. 7.	Woodstock iron works.	
3	Oil.....	Clarke.....	Jackson, 6 m. NW. of, well No. 1, Henry Bumpas farm.	Edgar Oil Co.....	W. R. Osborne...
4do....	Colbert.....	Cherokee, ½ m. S. of, sec. 2, T. 4, R. 14.	Alabama-California Oil Co.	
5	Water..	Covington.....	Collins, ¼ m. SE. of, sec. 25, T. 8, R. 16.	City of Collins.....	
6do....	Dallas.....	Selma, ½ m. NE. of.....	Selma Water Co.....	
7do....	Jefferson.....	Adger.....	Marshall Howton.....	
8do....do.....	Belle Sumter, 1½ m. S. of	Tennessee Coal, Iron and Railroad Co.	
9	Water..do.....	Bessemer, 2 m. W. of...	Woodward Iron Co.	Swalley & Morgan.

SUMMARY OF DRILLING.

33

reported in 1905.

ALABAMA.

Driller.	Authority.	Depth.	Diameter.	Depth to principal water or oil supply.	Height of water.	Yield per minute.	Year completed.	Remarks.	No.
		Ft.	In.	Ft.	Ft.	Gals.	Gals.		
Y. T. Radford.....	D.	325						1904 (S.).....	1
Woodstock iron works.	O.	500	8	500			720	1887 Hard water; used at blast furnaces.	2
W. R. and G. A. Osborne.	C.	1,201						1905 Show of oil at 324-352 feet and at 504-528 feet; show of oil and gas at 702-705 feet. Considerable gas obtained; no oil.	3
O. R. Hanson.....	O.	1,618	8		-20			Show of gas and oil at 282 and 1,060 feet; water is sulphur bearing. (L.)	4
W. C. Porter.....	D.	190	8	125	-21		139	1905 Soft water; city supply.	5
John Bicksler.....	O.	655	8-6	655		175	750	1903 Iron-bearing water strata at 280, 365, and 452 feet; temperature, 70°.	6
Alfred L. Thorp....	D.	187	5 $\frac{1}{2}$		-80			Water has bad taste; not used.	7
.....do.....	D.	202	6		+ 1			Test hole for coal; hard water; not used.	8
R. R. Swalley.....	C.	239	6	237			100	1905 (L. S.).....	9
Andy Andrews.....	C.	180	6	130			60	1905 Soft water; also at 70-73 feet. (L.)	10
Chas. Morgan.....	C.	120	6	82	+ 4	200		(L.).....	11
.....:.....	O.	135	2 $\frac{1}{2}$	75	Flows.			Test hole for coal; hard water.	12
H. B. Conover.....	D.	391	8-6 $\frac{1}{2}$	67			100	1905 (L. S.).....	13
.....do.....	O.	310						1905 (L. S.).....	14
.....do.....	D.	351						1905 (S.).....	15
.....do.....	D.	400	6 $\frac{1}{2}$					1905 Water at 46-50 feet, rises to 6-12 feet; 140 gallons per minute; pockets of gas at 215-220 and 255-260 feet. (L. S.)	16
Ed Cornell.....	D.	125	6	110	- 8			1905 Hard water.....	17
J. O. Heflin & Co..	M.	300						1905 (S.).....	18
John I. Hawk.....	C.	1,040	4-3	1,000		4	15	1905 (L. S.).....	19
John L. Ford.....		550	4	440	+ 40	135		1905 Water salty. (L.)...	20
Holmes Bros.....	D.	122	6	100	- 25			1905	21
Ed Cornell.....	D.	245	7-6 $\frac{1}{2}$	100	- 20			1904 Sulphur water. (S.)	22
J. T. Sullivan.....	M.	413	4 $\frac{1}{2}$	340	- 50		30	1905	23
M. Canfield.....	O.	585	8	576	- 46			1905 Well choked by sand..	24
L. B. Clay.....	M.	285	6-2	264	Flows.	18	30	1905 Soft water at 178 feet,	25
.....do.....	M.	160						1905 (S.).....	26
Alfred L. Thorp...	D.	186						1904 Test hole for coal....	27

DETAILED RECORDS.

The records which follow were selected from the great number listed in the preceding table because of the stratigraphic information which they afford. They do not always represent the deepest borings reported from a particular section, nor are they necessarily records of wells from which samples have been received by the Survey. They were chosen mainly with the view of supplying data for those localities in which information is deficient. In discriminating among well records within a given area those which showed the most care in recording naturally received preference. The logs are reproduced mainly as given by the driller, although obvious mistakes were corrected and occasional changes made in the nomenclature, such as the substitution of "shale" for "soapstone" where it was clear that the former was the proper term. In some cases where no logs accompanied the samples, but the latter had been taken at fairly close intervals, records were compiled from them. Where the driller's notes and the samples have varied decidedly as to the character of the rocks at a given depth, the original name is followed by a description of the sample in parentheses. The Survey has attempted to publish only reliable records, but, owing to the absence of any opportunity for verification, can not guarantee them. It is hoped, however, that they will be of aid to drillers by showing the character of the rocks, the types of rig used, the depth to the oil or water bearing horizon, the size and length of casing probably needed, etc. Companies or individuals prospecting in unfamiliar territory should also find among these records information that will be of service to them in many ways.

In some of the logs the samples are described in detail, even though the exact depths of the beds are not given. This is for the purpose of showing the general character of the rocks. While drillers employ certain terms which are descriptive and, if properly used, sufficiently exact, such as "slate," "shells," "shelly slate," etc., yet usage varies enough to make records containing such entries puzzling. Again, rocks are not always properly differentiated; "sand" is frequently any rock gritty enough to wear the bit, hence limestone and sandstone are confused, which results in great difficulties in stratigraphic correlations. On the other hand, while a sample of pulverized rock is of little or no value unless the location of the well and the depth are known, and while in drilling with a standard rig pieces of crumbly beds may fall and mingle with the pieces of the bed on which the drill is pounding, and with a hydraulic rig other contamination of samples is likely, yet a series of samples carefully taken from top to bottom of a well, even if unaccompanied by the driller's notes, gives evidence of high reliability. As a bed deeply buried often differs much from its outcrop, samples from a number of deep wells are described in some detail.

Geologic nomenclature for sedimentary rocks.

System.	Series.	Groups and formations.
Quaternary.....	Recent.....	<i>South Atlantic and Gulf Coastal Plain.</i>
	Pleistocene.....	Columbia loam and gravel.
	Pliocene.....	(Lafayette gravel. Shell Creek limestone. Caloosahatchee limestone.)
	Miocene.....	(Oakville group. Pascagoula group. Chesapeake sands.)
Tertiary.....	Oligocene.....	(Oak Grove marl. Chipola sand. Chattahoochee group. Vicksburg group.)
	Eocene.....	(Jackson group. Cockfield group. Caliborne group. Wilcox group. Midway group.)
		<i>Texas and Great Plains region.</i>
	Gulf.....	(Montana group. Colorado group. Dakota group.)
Cretaceous.....	Comanche.....	(Washita group. Fredericksburg group. Trinity sand.)
		<i>North Atlantic Coastal Plain.</i>
Jurassic.....		(Arundel sands. Patuxent clays.)
Triassic.....		(Brunswick sandstone. Lockatong shale. Stockton sandstone.)
Carboniferous.....	Permian.....	<i>New York-Pennsylvania region.</i>
	Pennsylvanian.....	Dunkard sandstone. Monongahela formation. Conemaugh formation. Allegheny formation. Pottsville conglomerate.
	Mississippian.....	(Mauch Chunk shale. Pocono sandstone. Chemung sandstone. Portage sandstone. Hamilton shale. Marcellus shale. Onondaga limestone. Schoharie grits. Oriskany sandstone.)
		(Helderberg limestone. Salina formation. Niagara group. Clinton shale. Medina sandstone.)
Silurian.....		(Eden-Lorraine shale Utica shale.)
Ordovician.....		Hudson group. Trenton limestone. Chazy limestone. Beekmantown limestone.
Cambrian.....	Saratogian.....	Potsdam sandstone.
	Acadian.....	Braintree slate.
Algonkian.....	Georgian.....	Chickies quartzite.
Archean.....		

So far as the evidence warrants, the various logs show the geologic age of the beds and formations penetrated. In the choice of formation names the usage of the Survey is followed. Some local or State names will no doubt be missed, owing to the substitution of place names for the older descriptive names, which, however apt for the formation at the place where first bestowed, may be absolutely misleading if applied to beds of the same age not far distant. The above table shows the stratigraphic divisions (formations, groups, series, and systems) used in classifying the sedimentary rocks in certain parts of the United States.

The term formation, as here used, means any rock or succession of rocks having such extent and such peculiarities that it can be distinguished over a considerable tract of country and treated as a unit in mapping. Thus a formation may be a persistent bed but a foot or two thick, or it may be a succession of beds 10,000 feet thick. With the progress of investigation the number of formation names has become great. The list is continually increasing, though some names are replaced by others as accumulating evidence shows that certain names are entitled to preference. Also, since a limestone bed in one locality may have been deposited at the same time as a sandstone bed in another and since the succession of changes of deposition may have differed widely, a formation in one locality may represent half a dozen in another. Hence a table of formation and group names (several formations make a group) for the whole country would be long and complicated.

ALABAMA.

13. Well near Hazelgreen, Madison County.

[Well begun and completed in 1905. Authority, H. B. Conover, driller. Geologic correlations by E. O. Ulrich.]

The red clay at and near surface has resulted from the decay of the underlying limestone (the Tullahoma), which is of Mississippian age. The underlying shales and limestones, in downward order, are Chattanooga shale (Devonian), Helderberg limestone and shale (Silurian), Fernvale limestone and shale (Ordovician), Leipers limestone and shale (Ordovician), "Trenton" limestone (Ordovician). These formations were determined by careful study of the fossils found in their outcrops. The well drillings show few marked differences below the Chattanooga shale, the only striking formation being the Fernvale red limestone and shale.

Record of well on D. A. Moseley farm, in the SW. $\frac{1}{4}$ NW. $\frac{1}{4}$, sec. 19, T. 1, R. 1.

Tullahoma:		Feet.
Red clay.....	0- 20
Clay and rock.....	20- 67
Hard gray flinty limestone.....	67- 93
Chattanooga:		
Hard black shale.....	93-103

	Feet.
Helderberg:	
Hard black shale and gray flinty limestone.....	103-112
Hard brownish cherty limestone.....	112-117
Hard black shale and gray and brownish cherty limestone.....	117-135
Hard brownish cherty limestone and gray shale.....	135-139
Brownish cherty limestone with black shale.....	139-148
Soft gray limy shale.....	148-152
Hard greenish shaly limestone and black shale.....	152-156
Hard gray limestone and greenish limy shale.....	156-165

Clifton:	
Soft gray shaly limestone and calcareous shale.....	165-170
Hard dark-gray and greenish calcareous shale and white and gray shaly limestone.....	170-182
Hard dark calcareous shale and gray and brownish limestone.....	182-190
Hard gray and brownish limestone and black calcareous shale.....	190-196
Hard dark-gray and brownish limestone.....	196-200
Hard gray and greenish limestone.....	200-204
Hard dark-gray limestone.....	204-212
Soft gray and greenish limestone.....	212-220
Soft gray and greenish limestone and gray shale.....	220-230

Fernvale:	
Soft gray limestone and reddish shale.....	230-245
Soft greenish and reddish limestone and brown shale.....	245-250
Hard greenish and reddish shaly limestone.....	250-255
Soft greenish and reddish limestone and reddish calcareous shale.....	255-260
Hard gray limestone and greenish and reddish shaly limestone.....	260-265

Leipers to "Trenton":	
Hard gray limestone.....	265-275
Hard gray and brownish shaly limestone.....	275-285
Hard gray and brownish limestone and calcareous shale.....	285-290
Hard gray limestone.....	290-320
Soft gray shaly limestone.....	320-350
Soft gray limestone.....	350-391

Rig used, standard. Diameter of well, 8 and $6\frac{1}{2}$ inches. Show of oil at 148 feet. Show of gas at 190 feet.

19. Well at Thomaston, Marengo County.

[Well begun May 23, 1905; completed July 7, 1905. Authority, John I. Hawk, contractor and driller. Samples preserved. Geologic correlations checked by E. C. Eckel.]

The surface formation is the Columbia yellow loam (Pleistocene). All the underlying formations are of Cretaceous age. They are the Ripley sands, the Selma chalk, and the Eutaw sands and sandstones. The record is of interest as showing the total thickness of the Selma chalk, or "Rotten limestone."

Record of well of Southern Cotton Oil Company.

	Feet.
Columbia:	
Yellow soil and subsoil and sand; sand water-bearing.....	0- 40
Ripley:	
Alluvium, sand, and clay with cemented shells and gravel at 45 feet.....	40- 60
Brownish limy sand.....	60-100
Gray limy sand with sandstone at 119 feet.....	100-120

Selma:

	Feet.
Medium soft gray marl and sand.....	120- 180
Medium soft gray marl, fossiliferous in places and in places containing pyrite, the formation growing more sandy toward the bottom.....	180- 980
Hard marl and sand rock.....	980-1,000

Eutaw:

Soft gray limy micaceous sand.....	1,000-1,040
------------------------------------	-------------

Rig used, jet. Diameter of well, 4 inches from 0 to 720 feet; 3 inches from 720 to 1,040 feet. Well barely flows; pumps 15 gallons a minute from a depth of 50 feet.

20. Well 1 mile east of Granite, Mobile County.

[Well begun November 14, 1905; completed December 4, 1905. Authority, John L. Ford, driller. Samples preserved. Geologic correlations by E. C. Eckel.]

This well starts in recent deposits and penetrates clays and sands of late Tertiary (Pliocene) age that are classified as Grand Gulf formation.

Record of well of Alabama Port Company.

	Feet.
Recent:	
Soft black mud with shells.....	0- 35

Grand Gulf:

Hard yellow clay.....	35- 95
White sand and gravel.....	95-210
Hard green clay.....	210-250
Fine white sand.....	250-285
Hard green clay.....	285-340
Gray sand—water bearing; flows 35 gallons per minute.....	340-389
Hard green clay.....	389-440
Gray sand—water bearing; flows 135 gallons per minute; static head, + 40 feet.....	440-550

Rig used, jet. Diameter of well, 4 inches. The water from the bed at 440 to 550 feet was too salty to be potable, so the well was abandoned and another sunk to the 340-foot sand.

ARIZONA.

35. Well near Phoenix, Maricopa County.

[Well begun February 22, 1905; completed March 27, 1905. Authority, C. W. Goodman, superintendent United States Indian school. No samples.]

The formations penetrated by this well comprise clay, sand, and "cement," the latter being sand cemented by carbonate of lime, forming a more or less sandy limestone. The whole series partly fills an old rock valley through which Salt River now flows. A summary of the geology of Salt River Valley and a detailed account of the character of the waters developed by wells are given in Water-Supply and Irrigation Paper No. 136, "Underground waters of the Salt River Valley," by W. T. Lee.

Record of well at United States Indian school, 3 miles northeast of Phoenix.

	Feet.
Soil and reddish cement.....	1- 46
Clay and cement.....	46- 60
Cement (pinkish sandy limestone).....	60- 65
Pinkish sandy clay.....	65- 68
Gravel—water-bearing stratum in an adjoining well.....	68- 70
Cement (pinkish sandy and limy clay).....	70- 73
Clay and fine gravel.....	73- 78
Gravel, with small chunks of limestone.....	78- 90

	Feet.
Honeycomb sand rock.....	90- 95
Limestone (pink, limy clay).....	95-100
Sand and small gravel—second water-bearing stratum.....	100-105
Pinkish limy and clayey sandstone.....	105-123
Pinkish soft limy and sandy clay.....	123-147
Soft red clay and limestone.....	147-162
Gravel—third water-bearing stratum.....	162-165
Soft limestone with streaks of soft clay (sample is red sandy clay).....	165-180
Cemented sand, mostly lime rock, with streaks of clay.....	180-185
Sand—fourth water-bearing stratum.....	185-198
Clay and sand.....	198-200

Rig used, cable. Diameter of well, 8 inches; length of casing, 200 feet. Casing perforated, 165 to 195 feet.

ARKANSAS.

62. Well near Fulton, Hempstead County.

[Well begun October 16, 1905; completed October 26, 1905. Authority, Charles E. Hudson, contractor. No samples. Geologic correlations by A. C. Veatch.]

This well starts in the weathered surface of the Arkadelphia clay, penetrates that formation, and strikes the water-bearing beds in the Nacatoch sand. The Arkadelphia clay and the Nacatoch sand are of Cretaceous age.

The geology of southern Arkansas is described in Professional Paper No. 46, "Geology and underground water resources of northern Louisiana and southern Arkansas," by A. C. Veatch.

Record of well in the NW. $\frac{1}{4}$ SE. $\frac{1}{4}$ sec. 7, T. 13, R. 25, 6 miles northeast of Fulton.

	Feet.
Arkadelphia:	
Soft red and dark clay.....	20- 40
Hard black, blue, and gray clay.....	40-165
Hard gray clay with layers of limestone.....	165-220
Nacatoch:	
Clay and rock.....	220-285
Sandstone, sand, and clay.....	285-300
Sandstone and sand.....	300-320

Diameter of well, 2 inches. Water-bearing strata at 285 to 320 feet; main supply from 320 feet. Water rises within 26 feet of surface.

CALIFORNIA.

92. Well near Alvarado, Alameda County.

[Well begun September, 1904; completed October, 1904. Authority, W. H. Haley, driller. No samples.]

This well is situated in the valley between two ridges of the Coast Range in which lies San Francisco Bay. The beds of sand, gravel, and clay penetrated were brought down from the Mount Diablo Range and deposited in recent or Pleistocene time as alluvial fans in the valley or as deltas beneath a former extension of San Francisco Bay.

Record of well 2 miles north of Alvarado.

	Feet.
Blue mud.....	0- 20
Blue clay.....	20- 22
Yellow clay and gravel.....	22- 71
Coarse sand.....	71- 74
Yellow clay.....	74- 80

	Feet.
Yellow sandy clay.....	80- 95
Blue sandy clay.....	95-106

Blue clay.....	220-237
Gravel.....	237-242
Yellow clay.....	242-253
Blue silt.....	253-265
White limestone.....	265-269
Hard sand.....	269-275
Blue sand.....	275-281
Gravel.....	281-293
Yellow clay.....	293-294
Gravel.....	294-310
Yellow clay.....	310-350
Limestone.....	350-364
Sand and gravel.....	364-371
Yellow clay.....	371-425

Rig used, hand tools. Diameter of well, 12 inches. Water-bearing strata at 71-74, 143-147, 160-170, 194-198, 237-242, 269-293, 294-310, and 364-371 feet. The supply of water obtained was small and the well was considered a failure.

94. Well near Coalinga, Fresno County.

[Well begun April 26, 1905; completed August 1, 1905. Authority, Besley Lefever, contractor and driller. No samples.]

The oil-bearing horizons in the main Coalinga field occur at the base of a great series of sandstones, conglomerates, shales, and clays which range from the lower Miocene to the upper Pliocene.

Record of well in the N. $\frac{1}{2}$ NW. $\frac{1}{4}$ sec. 7, T. 20, R. 15, 6 miles northwest of Coalinga.

	Feet.
Soft gray sand rock.....	0- 40
Hard yellow conglomerate.....	40- 150
Soft blue clay.....	150- 170
Hard gray sand rock.....	170- 180
Soft sand, water bearing; first water.....	180- 190
Conglomerate full of hard pebbles.....	190- 250
Soft sandy black shale.....	250- 275
Sand with hard streaks; water-bearing.....	275- 300
Sand and blue clay; water-bearing.....	300- 350
Very hard gray sand rock.....	350- 353
Soft brown shale.....	353- 375
Soft sand; water-bearing.....	375- 385

	Feet.
Soft blue clay.....	385- 450
Soft shale and blue clay.....	450- 560
Soft sand; water-bearing.....	560- 585
Soft blue clay mixed with sand.....	585- 640
Hard gray sand rock.....	640- 700
Soft black sand with gravel; water-bearing.....	700- 710
Soft gray sand and blue clay.....	710- 770
Soft, tough blue clay.....	770- 825
Soft sand and gravel; contains sulphur water.....	825- 880
Soft blue clay.....	880-1,010
Hard blue sandy clay.....	1,010-1,030
Very hard gray rock.....	1,030-1,038
Soft, tough blue clay.....	1,038-1,190
Hard black sandy shale.....	1,190-1,295
Soft sand, carrying some oil.....	1,295-1,315
Sand containing black sulphur water; last water in well.....	1,315-1,340
Hard gray sand rock.....	1,340-1,425
Very hard dark flinty rock.....	1,425-1,440
Hard black sandy shale.....	1,440-1,500
Soft brown shale.....	1,500-1,530
Soft sand, oil-bearing.....	1,530-1,550
Blue shale.....	1,550-1,573
Sand—pay-oil sand.....	1,573-1,595
Very hard sandstone.....	1,595-1,615
Soft blue shale.....	1,615-1,630

Rig used, standard: Diameter of well, 10, 8, and 6 inches. Initial yield, 600 barrels in twenty-four hours.

95. Well near Bakersfield, Kern County.

[Well completed July 3, 1901. Authority, Milo M. Garvin, driller. No samples.]

The formations penetrated comprise beds of sandstone, sand, clay, and shale of lower Miocene age, the whole series representing sediments brought down from the mountains to the east. The oil-bearing horizons in the Kern River field have been defined, but the logs of wells a short distance apart show great variations and no attempt has been made to differentiate the beds into distinct formations.

Record of Orient Oil Company's well No. 2, sec. 30, T. 28, R. 28.

	Feet.
Brown wash sand, firm enough to stand up.....	0- 420
White water sand containing fresh water.....	420- 495

Brown sand; oil-bearing.....	1,105-1,111
Light sand; oil-bearing.....	1,111-1,130
Blue clay.....	1,130-1,132
Light sand.....	1,132-1,142
Shells and gravel; oil-bearing.....	1,142-1,147
Light sand; oil-bearing.....	1,147-1,178
Blue clay.....	1,178-1,180

Casing perforated from 1,163 to 1,030 feet, 8 inches apart. Initial production, 180 barrels per day.

105. Well at Orange, Orange County.

[Well begun and completed July, 1904. Authority, A. K. Small, superintendent Orange city water system. No samples.]

This well is outside the original artesian area of the eastern coastal plain region of southern California. The many wells put down draw their supply from a common source—the saturated sands and gravels lying between the Puente Hills and the sea. These beds are of recent age and were deposited in a bay that extended up Santa Ana River Valley. A long list of wells and a general account of the conditions governing the underground supply of this area are given in Water-Supply Paper No. 137, "Development of underground waters in the eastern coastal plain region of southern California," by W. C. Mendenhall.

Record of well 1 mile east of Orange post-office.

	Feet.
Gravel.....	0- 40

Gray sandstone.....	635-640
White sandstone; water-bearing	640-700
Coarse gravel; large flow of water	700-720
Blue sandy shale	720-765

Elevation of well about 2,500 feet.

166. Well near Sunnyvale, Santa Clara County.

[Well begun January 17, 1905; completed February 14, 1905. Authority, George A. Free, contractor and driller. Samples preserved.]

The beds of sand, clay, and gravel penetrated by this well represent material brought down from the mountains to the south by streams flowing into San Francisco Bay and laid down in alluvial fans or in deltas. Individual beds vary considerably in thickness within short distances and are not persistent, so that logs of neighboring wells often show notable differences. Two water-bearing zones are recognized, however, the upper yielding water by pumping and the lower giving flows. The water from the lower zone is often notably pure.

Record of well in Rancho Pastoria de las Borregas, 1½ miles north of Sunnyvale.

	Feet.
Adobe and yellow clay with water gravel at 12-14 and 18-24 feet.....	0- 26

Dark and light blue clay.....	300-340
Soft yellow clay.....	340-358
Sand and gravel; water bearing; flow of 150 gallons per minute at surface.....	358-360

Rig used, rotary hand tools. Diameter of well, 7 inches. Flows 200 gallons per minute. Casing perforated at 178 to 182 feet and also, to admit water from last gravel bed, at 21 feet from bottom.

172. Well near Portersville, Tulare County.

[Well begun June 12, 1905; completed June 24, 1905. Authority, H. M. Lee, contractor and driller. Samples preserved.]

The beds of clay and sand in which this well is sunk represent material deposited in a fresh-water lake of which Tulare Lake is a shrunken remnant. The beds are of Pleistocene age.

Record of well in sec. 18, T. 22, R. 28, 4 miles south of Portersville.

	Feet.
Black soil.....	0- 40
Red clay.....	40- 50
Soft grayish, brownish, and reddish clay.....	50-110
Sand and gravel with pebbles 2 inches in diameter and larger; water-bearing.....	110-120
Soft, sticky yellow shale or clay.....	120-155
Quicksand (silt and fine and coarse sand); water-bearing.....	155-160

Rig used, California. Diameter of well, 11 inches. Casing of No. 18 iron plate, riveted, perforated for 20 feet at bottom. Well pumped by single-action 7-inch by 34-inch pump, driven by gasoline engine. Yield, 135 gallons per minute. Water is very soft. Temperature, 72° F.

174. Well near Ventura, Ventura County.

[Well begun and completed in 1905. Authority, Mound Water Company, owner. Samples preserved.]

The gravels, sands, and clays penetrated by this well are of marine origin and of Pleistocene age.

Record of well 5 miles east of Ventura.

	Feet.
Gravel.....	0- 52
Sand.....	52- 62
Greenish clay.....	62-230
Dark clay.....	230-287
Coarse sand.....	287-290
Granite pebbles and boulders.....	290-312
Sand and gravel.....	312-490

COLORADO.

184. Well near Florence, Fremont County.

[Well begun July 31, 1905; completed October 16, 1905. Authority, R. G. Brown and T. S. Harrison, owners. No samples. Geologic correlations by N. H. Darton.]

This well is in an artesian area in an embayment into the Rocky Mountain Front Range. The formations penetrated are of Cretaceous age. The light-blue clay from 18 to 210 feet is the Pierre clay and shale; the light limestone from 210 to 250 feet is part of the Niobrara; the light limestone at 780 to 810 feet is the Timpas; and the light sand from 810 to 825 feet is the top of the Carlile formation.

Record of Brown and Harrison well No. 1, in the SW. $\frac{1}{4}$ sec. 26, T. 18, R. 69.

	Feet.
Reddish sandy loam.....	0- 13
Reddish conglomerate.....	13- 18
Light-blue clay.....	18- 210
Light limestone.....	210- 250
Light sand.....	250- 255
Alternating strata of shale and limestone.....	255- 780
Light limestone.....	780- 810
Light sand.....	810- 825
Alternating strata of shale and limestone.....	825-1,025
Drab shale.....	1,025-1,195
Sand and limestone, locally called "Dakota cap rock".....	1,195-1,210
Light, almost white Dakota sandstone.....	1,210-1,230

Rig used, standard cable. Casing used, 1,048 feet of 5 $\frac{1}{2}$ -inch. Water-bearing strata penetrated at 230 to 235, 300 to 345, and 815 to 900 feet. Main supply from 1,210 to 1,230 feet. Static head of main supply, + 80 feet. Flow, 360 gallons per minute. Temperature at well mouth, 87° F. Quality, hard, alkaline.

193. Well 8 miles southeast of Swallows, Pueblo County.

[Authority, W. H. Spruance, jr. No samples. Geologic correlations by N. H. Darton.]

The rock formations penetrated by this well are of Cretaceous age. The Timpas limestone is between 9 and 45 feet, the top of the Carlile formation at 45 to 75 feet, the Benton shale at 75 to 500 feet; and the Dakota was struck at 535 feet.

Record of well in the SW. $\frac{1}{4}$ sec. 5, T. 21, R. 66.

	Feet.
Earth.....	0- 6
Light-gray shale.....	6- 9
Limestone with partings of shale 1 to 3 inches thick.....	9- 45
Sandstone.....	45- 75
Black and gray shale; water-bearing; surface flow of 8 to 10 gallons per minute at 265 feet.....	75-500
Soft shale and clay with a hard sandstone boulder.....	500-505
Shales streaked with clay.....	505-535
Sandstone; water-bearing.....	535-553
Shale.....	553-573
Fine sandstone; flow of water from sandstones below 535 feet was, at 580 feet, 10 gallons per minute.....	573-618
Shale and clay.....	618-665
Firm, hard limestone.....	665-672
Rather porous sandstone; flow at 680 feet 18 gallons per minute and at 700 feet 30 gallons per minute.....	672-715

	Feet.
Shale and clay.....	715-725
Sandstone.....	725-740
Shale and clay.....	740-743
Sandstone.....	743-753
Shale and clay.....	753-770
Sandstone.....	770-776
Shale and clay.....	776-778
Sandstone.....	778-781
Shale with traces of clay.....	781-796

Diameter of well, 10, 8, and 6 inches. Water at 265 feet salt; sulphur-bearing, with much carbonic-acid gas; unfit for either boiler or domestic use. Water from the sandstones below contained much carbonic-acid gas with 30.22 grains of incrustants to the gallon, while sodium carbonate and other nonincrusting solids made the water objectionable for boiler use. Flow of well, 19 to 30 gallons per minute; by pumping 150 gallons per minute water is lowered to -346 feet.

DELAWARE.

207. Well at Fort Dupont, Newcastle County.

Well begun December 17, 1904; completed April, 1905. Authority, Capt. L. F. Garrard, jr., constructing quartermaster. Geologic correlations by W. B. Clark.]

The sands, greensands, and clays penetrated by this well are of Pleistocene and Cretaceous age. As a jet rig was used, some samples may show a mixture of the particular beds penetrated with material washed from strata above. The section is remarkable chiefly for the thickness of the Potomac (early or fresh-water Cretaceous) formations. They are characterized by red and white clay and sand, as the overlying late or marine Cretaceous is characterized by beds of sand containing glauconite, known as greensands. The formations, in downward order, are Columbia (Pleistocene), Rancocas, Monmouth, and Matawan (late Cretaceous), Magothy, and Potomac group (early Cretaceous).

Record of United States well at Fort Dupont.

	Feet.
Columbia:	
Yellowish sand and fine gravel, brackish water.....	0- 24
Rancocas:	
Gray, slightly clayey sand and fine gravel.....	24- 40
Dark-greenish limy sand with shells; contains much glauconite.....	40- 60
Monmouth:	
Dark sandy micaceous clay.....	60-140
Medium gray sand with very little glauconite.....	140-150
Brownish-gray sandy clay with some glauconite.....	160-180
Matawan:	
Dark coarse sand and clay, some glauconite.....	180-197
Hard, light-red, slightly sandy clay.....	197-223
Dark micaceous sandy clay.....	223-240
Fine to medium drab or brownish-gray clayey sand with a little glauconite.....	240-280
Fine to coarse brownish micaceous clay with some glauconite.....	280-300
Magothy, in part:	
Medium to coarse drab or brownish sand with varying amounts of glauconite and occasionally some clay.....	300-418
Fine to medium light-gray sand, no clay and very little glauconite.....	418-421
Potomac:	
Light brick-red clay with some sand.....	421-467
Fine to medium, slightly clayey, pinkish-buff or pinkish-brown sand.....	467-500
Fine to medium brownish-gray micaceous sand.....	500-510
Medium to fine pinkish-brown sand with red and white clay.....	510-640

Potomac—Continued.

	Feet.
Fine to medium light-brown micaceous sand and clay.....	640-650
Brownish-gray micaceous clayey sand containing lignite.....	650-661
Fine to medium pinkish-brown sand with beds of pink, red, and white clay and lignite.....	661-710
Medium varicolored sand with lignite.....	710-725
Coarse, light pinkish-brown sand.....	725-730
Light-brown sand, containing many brown granules; also lignite.....	730-734
Dark-brownish clay and coarse sand.....	734-736
Medium pinkish-brown clayey sand.....	736-740
Brown clay with coarse sand; contains lignite.....	740-745
Medium brownish clayey sand.....	745-750
Fine to coarse pinkish-brown sandy clay containing brown granules and lignite.....	750-755
Medium grayish-brown clayey sand.....	755-762

Rig used, jet. Diameter of casing, 8 inches. This well was lost by the slipping of a coupling on the casing. Another was drilled 10 feet away. Water-bearing stratum, 720 to 734 feet. Water rises nearly to surface, but flows over casing at and after high tide. Yield by pumping, 20 gallons per minute. Water is alkaline, yellowish brown in color, contains iron, has a slight odor of sulphur, and is distilled for drinking purposes. Mouth of well is 11 feet above mean low tide.

FLORIDA.

223. Well at Jacksonville, Duval County.

[Well begun August, 1903; completed October, 1903. Authority, R. N. Ellis, superintendent water-works. No samples preserved by Survey.]

The sand and gravel penetrated from 15 to 35 feet are probably of Pleistocene age. The formations lying below, it is believed, are late Tertiary, though the water-bearing limestone at the bottom may be equivalent to the Vicksburg (lower Oligocene). The beds, as shown by samples from neighboring wells, differ from those penetrated by deep borings at Savannah and other points on the south Atlantic coast in the large proportion of limestone. The beds from 750 to 860 feet, described as rock, are limestone or silicified phases of it; probably other "rock" beds are also. The "black gravel" mentioned in various beds from 50 feet down to 470 feet is most likely dark, fine and coarse, smoothly rounded nodules of uncertain origin.

Well at city waterworks, Jacksonville.

	Feet.
Filled ground and sand.....	0- 15
Varicolored gray to red sand.....	15- 34
Gravel.....	34- 34½
Yellowish fossiliferous rock.....	35- 40
Gravel with water.....	40- 44
Gray fossiliferous rock.....	44- 53
Clay with thin layers of white rock.....	53- 58.
Blue clay with black gravel at 58-70 and 82-89 feet.....	58- 89
Rock.....	89- 94
Blue clay with black gravel.....	94-100
Rock, 2 inches thick.....	100
Blue clay with quartz sand and very fine black gravel.....	100-130
Very hard compact clay and sand.....	130-142
Greenish sandy clay.....	142-204
Greenish sandy clay with more or less black gravel and occasional streaks of pure clay.....	204-250
Sticky clay with sand and fine gravel.....	250-263

	Feet.
Rock.....	263 -263½
Greenish sandy clay with heavy gravel bed.....	263½-272
Blue clay containing very fine sand.....	272 -287
Sand rock.....	287 -289
Bed of shells, oysters, etc.; living types.....	289 -290
White clay.....	290 -294
Sand with clay enough to hold it.....	294 -298
Compact greenish sandy clay with streaks of nearly pure clay.....	298 -314
Sand containing shells with just enough clay to hold them.....	314 -320
Shells with scraps of fossil bone	320 -330
Coquina rock.....	330 -331
Clay.....	331 -340
Blue clay and sand.....	340 -350
Sticky blue clay; very little sand.....	350 -358,
Clay with black gravel.....	358 -365
Blue clay with gravel and shell casts.....	365 -368
White clay with gravel.....	368 -375
White marl with very little sand.....	375 -385
Light-colored clay.....	385 -390
Greenish clay.....	390 -400
Greenish sandy clay.....	400 -410
Sticky clay.....	410 -428
Clay with very little sand.....	428 -434
Nearly pure clay; very light when dry.....	434 -443
Bluish sandy clay with gravel and streaks of sticky clay with some nodules of rock.....	443 -470
Rock.....	470 -470½
Greenish clay with fine sand above and coarse sand below; small flow of water at 487 feet.....	470½-487
Rock boulder (siliceous concretion) in blue sandy clay.....	487 -492
Compact blue clay.....	492 -496
White clay.....	496 -497
Conglomerate rock.....	497 -499
Hard brownish rock.....	499 -504
Very hard compact rock (siliceous limestone).....	504 -510
Soft white rock with some water.....	510 -519
Hard compact rock.....	519 -524
Very soft white rock in layers 1 to 5 feet thick with strata of more compact rock 3 to 12 inches thick; increase in the flow of water on breaking each hard stratum. Gaged flow at 632 feet 1,000,000 gallons in twenty-four hours.....	524 -727
Compact brownish rock; no water.....	727 -758
Alternate hard and soft strata of grayish rock with very little water.....	758 -865
Soft white rock with hard brown layers 1 to 3 feet thick every few feet; a slight increase of flow from each soft layer.....	865 -930
Very hard brown rock.....	930 -935
Soft brownish rock with hard layers, flow increasing as each hard layer is broken.	935 -950
Alternate layers of hard and soft rock; small increase in flow.....	950 -970
More compact rock; no water	970 -980

Total flow 2,000,000 gallons in twenty-four hours. Temperature of water from 524 to 727 feet, 76° to 77.5°; from 865 to 970 feet, 78° to 79° at well bottom; temperature of flow at well mouth, 77½°. Static head +58 feet. This well is one of several supplying the city Quality hard, sulphur bearing.

233. Well near Pensacola, Escambia County.

[Completed June, 1905. Authority, W. C. Le Gallais, driller. Samples preserved.]

The formations penetrated by this well range from the Pleistocene down into the Tertiary.

Record of well 4½ miles southwest of Pensacola.

	Feet.
Black soil.....	0- 1
Gray sand.....	1- 6
White sand.....	6- 29
Dark sandy clay.....	29- 72
White sand with bits of wood.....	72- 86
Gray sand.....	86- 106
Coarse white sand.....	106- 190
Coarse yellowish sand.....	190- 236
Fine gravel.....	236- 256
Coarse gravel.....	256- 276
Fine white sand.....	276- 290
Gray micaceous sand.....	290- 306
Brownish sand and white gravel.....	306- 326
Coarse gray sand with bits of shells.....	326- 342
Dark sandy clay.....	342- 390
Sand and gravel.....	390- 392
Dark sandy clay.....	392- 524
Coarse sand and gravel.....	524- 526
Dark sandy clay.....	526- 943
Coarse gray sand.....	943-1,011

Elevation of well above sea level, 14 feet.

250. Well near Sumterville, Sumter County.

[Well completed in 1903. Authority, John W. Pearson, manager Pearson Oil and Gas Company, owner. Incomplete set of samples preserved. Log compiled from samples by S. Sanford.]

The rocks penetrated below 500 feet are nearly all limestones, varying somewhat in color and texture, but in general rather porous and granular and containing few determinable fossils. The well is noteworthy as being the deepest in the Florida peninsula; the only deeper well in the State was drilled at Key West.

Record of well 2½ miles south of Sumterville.

	Feet.
Soft brownish-gray limestone; hardens on exposure.....	165
Brown porous limestone.....	500- 525
Cream-colored porous limestone.....	525- 540
Brown porous limestone.....	540- 550
Light-brown porous limestone.....	560- 575
Light-buff porous limestone.....	575- 675
Light-buff to light-brown porous limestone, with much brown chert.....	700- 710
Light-buff porous limestone with little brown chert.....	740- 750
Brownish porous limestone.....	750- 785
Grayish-brown porous limestone with brown chert.....	785- 800
Light-buff porous limestone with little or no chert.....	800- 825
Porous brownish limestone with much brown chert.....	825- 850
Light-buff porous limestone with a little brown chert.....	850- 865
Grayish, light-buff, and brown porous limestone with considerable brown chert	865- 880
Light-buff or brownish limestone with much brown chert	880- 900

	Feet.
Hard brownish limestone with little brown chert.....	900- 925
Hard brownish limestone.....	925- 950
Brownish to light-brown porous limestone.....	950- 975
Light-buff porous limestone.....	1,000-1,005
Brown and brownish porous limestone with crystals of calcite.....	1,020-1,025
Brown sandy clay and black carbonaceous shale, approaching lignite.....	1,025-1,055
Light-buff lime rock.....	1,055-1,060
Brownish porous fossiliferous limestone.....	1,060-1,080
Light-brown porous fossiliferous limestone.....	1,100-1,110
Light-brown limestone with much brown chert.....	1,110-1,130
Cream-colored fossiliferous limestone.....	1,130-1,160
Soft white chalky fossiliferous limestone.....	1,160-1,230
Creamy-white oolitic limestone.....	1,230-1,260
White to brownish fossiliferous chalky limestone.....	1,260-1,325
Harder and more compact brown limestone with white fossiliferous streaks.....	1,325-1,375
Brownish lime rock.....	1,375-1,400
Fine light-brown limestone containing much crystalline calcite.....	1,400-1,425
Brown granular limestone.....	1,425-1,450
White to brownish, rather granular limestone.....	1,450-1,475
Rather compact white to brownish fossiliferous limestone.....	1,475-1,500
Hard; compact grayish or brownish limestone; also soft white fossiliferous limestone.....	1,500-1,525
Coarse brown limestone with crystals of calcite.....	1,525-1,550
Brownish and grayish fossiliferous limestone.....	1,550-1,625
Hard brown to brownish limestone.....	1,625-1,650
Grayish and light-brown fossiliferous limestone.....	1,650-1,660
Compact crystalline brownish fossiliferous limestone.....	1,660-1,700
Light-buff crystalline limestone.....	1,700-1,750
Dark-brown clayey material, almost lignitic; contains streaks of brown limestone.....	1,750-1,800
Brown limestone with lignitic material and brown chert.....	1,800-1,850
Granular light-brown limestone.....	1,850-1,900
Brownish granular limestone with lignite and grains of quartz.....	1,900-1,950
Compact buff limestone.....	1,950-1,975

Rig used, standard. Diameter of well, 10 inches from top to bottom. Well was drilled for oil and shows were reported at several depths. A strong sulphur water was struck at 1,386-1,400 feet, but no salt water was found. Fresh water was struck from 18 feet downward at many horizons and gave much trouble in drilling. Water stands 2 feet below surface.

251. Well at Deland, Volusia County.

[Begun June 17, 1905; completed August 8, 1905. Authority, H. E. Smith, driller. Samples preserved.]

This well, starting in post-Tertiary sands and sandy clays, penetrates a succession of limy beds that are in part at least of Pliocene age.

Record of city well at Deland.

	Feet.
White quartz sand.....	0- 12
Yellow sandy clay.....	12- 22
Soft limestone with bits of shells.....	22- 36
Marl and sand with bits of shells.....	36- 54
Soft white limestone with bits of shells.....	54- 90
Hard gray and yellowish limestone.....	90-170
Hard dark to light brownish limestone.....	170-209

	Feet.
Hard white to brown limestone.....	209-230
Hard porous white and brown limestone.....	230-250
Soft porous limestone.....	250-264

Rig used, cable. Diameter of well, 10 inches. Water-bearing strata at 80 to 160 and 209 to 250 feet. Water from first bed rises within 29 feet of surface, and from second bed within 27 feet.

252. Well at Ormond, Volusia County.

[Well begun November 7, 1904; completed December 17, 1904. Authority, A. B. Kimball. Incomplete set of samples saved.]

The sands penetrated for the first 50 feet are post-Tertiary. The marls, shell beds, and limestones below are probably Tertiary. No attempt has been made to determine the divisions of the Tertiary or establish formation names.

Record of well at Hotel Ormond, Ormond.

	Feet.
Beach sand.....	0- 50
Fine sand containing small shells.....	50- 56
Clay.....	56- 64
Blue clay and shells (dark-gray marl containing shells of <i>Liocardium</i> , etc.).....	64- 90
Small roots.....	90- 92
Blue clay, shells, and sand.....	92-106
Gray coquina rock, shells of <i>Nassa</i>	106
Very hard rock (hard dark-gray shell rock, coquina, shells of <i>Lunatia</i>).....	106-110
Very soft rock (soft limestone, fossil shells).....	110-111
Soft gray and white limestone, containing fossil shells.....	111-150
Soft white marly limestone.....	150-200
Soft light-buff limestone with a layer of hard "rock" at 261-263 feet.....	200-352

Rig used, cable. Diameter of well, 10 inches. Length of casing, 106 feet. Water did not rise to surface. Well abandoned on account of salt water breaking in below casing.

GEORGIA.

254. Well near Savannah, Chatham County.

[Well begun May 2, 1905; completed in 1905. Authority, Hughes Specialty Well Drilling Company, contractor. Samples preserved.]

The sand and clay near surface are probably of late Tertiary age (Pliocene), though the uppermost stratum of sand may correspond to the Columbia formation (Pleistocene). The marls and limestones below were all deposited in Tertiary time.

Record of well of Mutual Fertilizer Company, 3 miles west of Savannah post-office.

	Feet.
Soft dark-brown soil.....	0 - 1
Soft light-gray sand.....	1 - 3
Red and gray clay and fine sand.....	3 - 20
Loose dark-gray sand.....	20 - 30
Hard greenish-gray sandy limestone.....	30 - 31½
Tough dark-green sandy marl.....	31½-235
Porous white limestone, slightly sandy; water-bearing.....	235 - 245
Soft gray porous limestone.....	245 - 270
Coarser textured white, brownish, and gray limestone with coarse sand, bits of shells, and dark grains, the latter probably phosphatic; formation water bearing.....	270 - 310
Light-buff limestone; considerable water.....	310 - 330

Rig used, jet. Diameter of well, 8 inches; length of casing, 136 feet. Water rises within 4 feet of surface. Quality hard.

255. Well at Lela, Decatur County.

[Well begun September 11, 1905; completed December 1, 1905. Authority, Hughes Specialty Well Drilling Company, contractor. Samples preserved. Geologic correlations by W. B. Clark.]

The white (kaolinic) and red and buff clays first penetrated may represent the weathered surface of the underlying limestones or may belong to the Columbia and Lafayette formations. The formations below are of Tertiary age. The limestone is probably part of the Vicksburg-Jackson group and may be Oligocene or Eocene. The underlying sands, with beds of rock, in part at least, represent the Claiborne and lower Eocene formations.

Record of well No. 3 at sawmill, Lela.

	Feet.
Soft white clay with red streaks; coarse white sand and fine gravel.....	1- 20
Soft gray and buff sandy clay; soft water in large supply.....	20- 40
Soft creamy-white sandy limestone.....	40-140
Soft brownish limy sandstone.....	140-160
Soft light-brown sandy limestone.....	160-180
Soft light-gray limestone, containing dark-green grains.....	180-200
Soft white to light-buff sandy limestone.....	200-220
Soft greenish marl.....	220-240
Hard white to grayish-brown sandy limestone.....	240-260
Soft white marl; may contain glauconite.....	260-320
Fine gray sand; contains glauconite and bits of shells; some water.....	320-380
Hard light-brown sandy limestone.....	380-400
Medium to fine light-gray sand; contains glauconite and bits of shells; has hard layers.....	400-460
Same sand with very little glauconite.....	460-520
Fine to medium gray sand containing layers of rock (probably white limestone and very few grains of glauconite).....	520-580
Same sand and rock with more glauconite.....	580-720
Soft dark marl (no sample).....	700-918

Rig used, hydraulic. Diameter of well, 6 and 2 inches. Casing used, 600 feet of 3-inch. Main supply of water from 737 feet. Water rises within 10 feet of surface. Yield, about 15 gallons per minute.

256. Well at Fort McPherson, Fulton County.

[Well begun December 13, 1904; completed April 24, 1905. Authority, Capt. B. Buck, constructing quartermaster. Samples preserved.]

This well is noteworthy, since it is sunk in the crystalline rocks of the Piedmont plateau, and the water obtained comes from joints, cracks, and like openings, no true water-bearing formations being penetrated.

Record of well at Fort McPherson.

	Feet.
Soil, clay and stones.....	0- 42
Hard light schistose crystalline rock.....	42
Very hard dark schistose crystalline rock.....	50- 55
Hard light schistose crystalline rock; little water at 75 feet, enough for drilling.....	55-100
Hard dark schistose crystalline rock, with water-bearing crevices at 130 and 145 feet.....	130-145
Softer dark schistose crystalline rock, with water-bearing crevices at 165 feet; yield at 178 feet, 18.5 gallons per minute of clear, soft water.....	165-185
Hard dark schistose crystalline rock.....	205-225
Softer and lighter schistose crystalline rock.....	245-285
Hard dark schistose rock.....	305
Hard light schistose crystalline rock; small crevices in very hard rock at 365 feet.	325-365
Very hard light schistose crystalline rock; increase in water from 365 to 385 feet.	385-440

Rig used, standard. Depth of well, 452 feet. Diameter of well, 10 inches. Length of casing, 42 feet. Well pumps 45.6 gallons per minute. Water rises within 30 feet of surface.

258. Well at Offerman, Pierce County.

[Well begun April 1, 1905; completed June 9, 1905. Authority, Hughes Specialty Well Drilling Company, contractor. Incomplete set of samples preserved.]

All the formations below the thin surface soil at this well are probably of Tertiary age. They include beds laid down in Pliocene, Miocene, and Oligocene or Eocene time which have not been well enough identified to permit formation names to be given. The limestones below 500 feet are thought to belong to the Jackson-Vicksburg group.

Record of well of Southern Pine Company, on lot No. 269, Fourth district, Pierce County.

	Feet.
Black soil, chiefly made land.....	0- 1
Tough reddish and cream-colored sandy clay.....	1- 40
Tough pink clayey sand.....	40- 60
Loose, coarse white gravel; water-bearing; yields one-half gallon per minute for each foot head is depressed.....	60- 70
Tough, sticky cream-colored sandy clay.....	70-120
Loose fine grayish sand; no water.....	120-130
Tough, sticky cream-colored marl, like pipe clay.....	180-240
Soft cream-colored sandy marl, with hard layers.....	240-260
Dark-blue sandy marl, with hard layers.....	260-280
Loose, coarse white sand.....	280-300
Soft blue-black and black sandy marl with hard layers.....	300-400
Loose, fine brownish limy sand with hard layers.....	400-420
Tough white limestone with hard layers.....	420-440
Loose, fine white sand with hard layers.....	440-460
White limestone; water-bearing.....	460-480
Loose, fine gray sand; water-bearing.....	480-490
Hard brown limestone and soft marl.....	490-500
Loose white sand, containing glauconite; no water.....	500-518
Coarse gray sand, with bits of soft limestone and shells; also black granules.....	532
Cream-colored limestone with very siliceous gray limestone, chert nodules, and grains of quartz.....	540-550
Flinty gray limestone and yellow shell rock with chert nodules and quartz grains; two days' drilling.....	550-555
Hard white sand (sample much like preceding); no water.....	555-560
Medium soft cream-colored limestone (sample much like preceding).....	560-570
Very hard flinty limestone (sample shows little chert at 573-575 feet).....	570-600
Very soft cream-colored limestone, with plenty of water at 640 feet to bottom.....	600-675 $\frac{1}{2}$

Rig used, jet. Diameter of casing, 6 and $4\frac{1}{2}$ inches; length, 635 feet. Water obtained from 640 to 675 $\frac{1}{2}$ feet; rises within 33 feet of surface; is depressed about 25 feet by pumping 250 gallons per minute. Water slightly sulphuretted. Temperature at well mouth, 76° F.

260. Well at Claxton, Tattnall County.

[Well begun July 6, 1905; completed August 25, 1905. Authority, Hughes Specialty Well Drilling Company, contractor. Incomplete set of samples preserved.]

The red pebbly sand and stiff red clay near surface probably belong to the Lafayette formation. The marl and limestone below are of Tertiary age, but no attempt is made to correlate them with formations which outcrop farther inland. The water-bearing limestone at the bottom is part of the Jackson-Vicksburg group of early Oligocene or late Eocene age.

Record of well at Claxton.

	Feet.
Orange and red pebbly sand with ferruginous nodules.....	0— 3
Stiff red clay.....	3— 10
Fine white sand; water bearing, with a little white clay.....	10— 60
Soft "shell formation".....	60— 70
Brownish-gray sandy marl.....	70—120
Stiff blue marl.....	120—145
Tough gray rock.....	145—155
Gray sandy marl (probably gray sandy clay).....	155—175
Very hard gray rock.....	175—180
Soft blue marl.....	180—220
Very hard rock.....	220—225
Tough marl.....	225—250
Very hard rock.....	250—270
Brownish-gray sandy marl.....	270—310
Hard white rock.....	310—350
Fine white sand.....	350—365
Hard brownish limestone.....	365—370
Hard brownish-gray marl.....	370—380
Hard gray rock.....	380—400
Marl and rock.....	400—452
Hard rock.....	452—460
Soft "shell formation;" water-bearing.....	460—505
Hard brownish limestone and dark-gray shale.....	505—510
Brownish limestone with soft layers; water-bearing.....	510—546

Rig used, jet. Diameter of well, 8 inches. Length of casing, 452 feet. Water stands 80 feet below surface. Well yields 3 gallons per minute for each foot head is depressed. Present yield 100 gallons per minute. Temperature, 75° F.

ILLINOIS.**266. Well near Mount Sterling, Brown County.**

[Well begun September 1, 1905; completed September 20, 1905. Authority, Joseph Simmons, jr., contractor. Samples preserved.]

The rocks penetrated by this well belong chiefly, if not wholly, to the Pennsylvanian or Coal Measures series of the Carboniferous. The limestones and limy shale below 200 feet may belong to the Mississippian series.

Record of well in sec. 1, 3 miles west of Mount Sterling.

	Feet.
Soft gray, slightly limy shale.....	30— 55
Soft reddish and light-brown limy shale.....	55— 75
Soft dark-gray, slightly limy shale.....	75—120
Soft dark-gray and greenish shale.....	120—135
Soft black and gray limy shale.....	135—165
Soft brownish, slightly limy shale.....	165—170
Soft red and dark-gray limy shale.....	170—180
Hard white shaly limestone.....	180—195
Soft cream-colored limy shale.....	195—200
Soft gray limestone.....	200—225
Soft greenish limy shale.....	225—235

Rig used, cable. Diameter of well, 5½ inches. Main supply of water from below 225 feet. Water rises within 80 feet of surface. Well yields by pumping 2 gallons per minute.

280. Well at Doltons, Cook County.

[Well begun in 1905; completed October 3, 1905. Authority, H. W. Hambrecht, superintendent L. Wilson Well Company, contractor. Samples preserved. Geologic correlations checked by G. H. Ashley.]

As the record of this well was apparently kept with much care and the samples and the driller's log check nicely, the record probably has greater value than any from Cook County yet published. The formations below the drift are, in downward order, Niagara limestone (Silurian); Cincinnati shale, Galena and Trenton limestone, St. Peter sandstone, and "Lower Magnesian" limestone (Ordovician).

A description of the geology of the Chicago quadrangle is given in folio 81, Geologic Atlas of the United States.

Record of well at Doltons.

Recent and Pleistocene:

	Fect.
Black soil.....	0- 1
Light-yellow quicksand.....	1- 7
Gray limy brick clay.....	7- 40
Hard gray clay, hardpan, with limestone pebbles.....	40- 57

Niagara:

Loose gray limestone; water-bearing; water bad quality.....	57- 60
Medium hard to hard light-gray to gray limestone, heavy bedded.....	60- 340
Medium hard light-gray and light-brown limestone.....	340- 440
Soft brownish-gray limestone.....	440- 446

Cincinnati:

Soft bluish-gray clayey limestone or calcareous shale.....	446- 460
Soft gray limy shale with limestone lentils.....	460- 500
Soft dark-gray limy shale.....	500- 602
Soft gray and brown limy shale.....	602- 620

Galena and Trenton:

Soft brownish and gray limestone with streaks of shale.....	620- 640
Hard brownish and gray limestone with streaks of shale.....	640- 645
Soft light-brown and white limestone.....	645- 700
Soft and hard light-brown limestone with streaks of gray shale.....	700- 795
Hard white to brownish limestone.....	795- 805
Hard brown limestone with streaks of brownish shale.....	805- 840
Hard light-gray and light-brown limestone with streaks of gray shale.....	840- 850
Hard to medium gray and brownish limestone.....	850- 895
Hard white, dark-brown, and light-brown limestone.....	895- 910

St. Peter:

Hard light-brown sandy limestone and gray shale.....	910- 920
Medium to hard white, gray, and brownish sandstone; no water in upper portion of sandstone; some water in lower layers.....	920-1,036

"Lower Magnesian:"

Soft greenish shale with brownish limestone.....	1,036-1,041
Greenish and brown shale and gray limestone.....	1,041-1,110
Hard white and brownish, magnesian limestone.....	1,110-1,140
Soft light-buff magnesian limestone.....	1,140-1,170
Hard brownish sandy magnesian limestone.....	1,170-1,240
Soft grayish and brownish magnesian limestone and gray shale.....	1,240-1,260
Hard white and brownish magnesian limestone.....	1,300-1,312

Limestone below 1,040 feet full of small crevices. Between 1,200 and 1,300 feet crevices of 2 to 18 inches.

Rig used, cable. Well diameter, 12 inches, 0 to 65 feet; 10 inches, 65 to 203 feet; 8 inches, 203 to 1,073 feet; $6\frac{3}{16}$ inches to bottom. Yield by pumping 186 gallons per minute.

282. Well at Galewood, Cook County.

[Well completed in 1905. Authority, Chicago, Milwaukee and St. Paul Railway, owner. No samples. Geologic correlations checked by G. H. Ashley.]

This record is of interest in connection with that of well No. 280, from its greater depth. It agrees with others from near Chicago. The formations, in downward order, are Niagara limestone (Silurian); Cincinnati shale, Galena and Trenton limestones; St. Peter sandstone, and "Lower Magnesian" limestone (Ordovician); Madison sandstone, Mendota limestone, and Potsdam sandstone (Cambrian).

Record of well at Galewood.

	Feet.
Drift.....	0- 94
Niagara:	
Limestone.....	94- 265
Cincinnati:	
Shale.....	265- 505
Galena and Trenton:	
Limestone.....	505- 845
St. Peter, in part:	
Sandstone.....	845- 925
"Lower Magnesian:"	
Limestone; caves from 1,160 to 1,264 feet, containing crevices; also streaks of shale.....	925-1,325
Madison (?):	
Sandstone.....	1,325-1,525
Mendota (?):	
Hard limestone.....	1,525-1,540
Streaky shale.....	1,540-1,620
Shale.....	1,620-1,645
Limestone.....	1,645-1,785
Potsdam:	
Sandstone.....	1,785-1,804
Limestone.....	1,804-1,812
Shale.....	1,812-1,815
Sandstone.....	1,815-1,819

Diameter of well, 10½, 8, 6, and 5 inches. Water stands 84 feet below surface.

284. Well in T. 7, R. 12, Crawford County.

[Authority, John F. Lafferty. No samples.]

This record shows the general character of the formations penetrated by the gas and oil wells in the southern part of the Illinois field. The formations are part of the Carboniferous system and much the greater portion of them are included in the Pennsylvanian or Coal Measures series. The sandstones at 1,134-1,196 feet may be the basal sandstones of the series, corresponding to the Mansfield sandstone of the Indiana geologists.

Record of well in sec. 28, T. 7, R. 12.

	Feet.
Clay and shale.....	0- 110
Sandstone.....	110- 140
Black shale.....	140- 160
Dark slate.....	160- 175
Light and dark shale.....	175- 220
Light sandstone.....	220- 228
Light "sticky" shale.....	228- 245

	Feet.
Dark and light shale.....	245- 275
Sandstone.....	275- 315
Brown and light shale.....	315- 395
Dark slate.....	395- 402
Dark limestone.....	402- 408
Light shale.....	408- 430
Hard limestone.....	430- 437
Dark-brown shale; caves.....	437- 447
Light and dark shale.....	447- 532
Coal.....	532- 536
Clay.....	536- 544
Limestone.....	544- 549
Shale.....	549- 557
Sandstone.....	557- 575
Coal.....	575- 577
Rock.....	577- 582
Slate.....	582- 592
Shale.....	592- 600
Sandstone.....	600- 627
Shale.....	627- 635
Hard rock.....	635- 639
Coal.....	639- 641
Fire clay and shale.....	641- 666
Sandstone.....	666- 676
Shale.....	676- 720
Sandstone.....	720- 750
Brown and black shale; 9-foot seam of coal at about 820 feet.....	750- 840
Sandstone; a little salt water.....	840- 880
Shale; 6-inch seam of coal at about 900 feet.....	880- 970
Sandstone; some gas.....	970- 980
Shale.....	980-1,010
Sandstone.....	1,010-1,045
Shale.....	1,045-1,055
Sandstone; heavy flow of salt water at 1,100 feet.....	1,055-1,127
Dark shale; 6-inch seam of coal at about 1,130 feet.....	1,127-1,134
Sandstone; heavy flow of salt water at 1,170 feet.....	1,134-1,174
Brown sandstone.....	1,174-1,184
Dark sandstone; gas.....	1,184-1,196
Dark limestone.....	1,196-1,206
Dark sandstone.....	1,206-1,218
Dark slaty shale, finely jointed; caves badly.....	1,218-1,238
Slaty shale; limestone at bottom.....	1,238-1,345

Salt water at 1,100 and 1,170 feet rises within 60 feet of surface. Hole dry below 1,196 feet.

285. Well at Flat Rock, Crawford County.

[Well begun January 1, 1905; completed June 20, 1905. Authority, Creswell Bros., contractors. No samples.]

This well was sunk for oil; none was found in paying quantity. The well started in the Pennsylvanian (Coal Measures) series of the Carboniferous system and probably penetrated the underlying sandstones and shales of the Mississippian. The record may not show every change in the rocks, but is given because few deep-well records from Crawford County have been published.

Record of well in the SW. ¼, sec. 6, T. 7, R. 11.

	Feet.
Soil and subsoil.....	0- 28
Yellow sand; fresh water.....	28- 30
"Soapstone" and conglomerate.....	30- 50
Sandstone; fresh water in very large quantity.....	50- 60
Shales with small breaks of limestone.....	60- 450
Coal.....	450- 455
Shale and slate, light and dark, in alternating strata.....	455- 500
Sandstone.....	500- 510
Coal.....	510- 517
Slate and shale.....	517- 650
Soft sand; salt water.....	650- 780
Shale.....	780- 850
Salt sand; water.....	850-1,000
Shale.....	1,000-1,060
Sandstone; white sulphur water.....	1,060-1,110
Dark shale.....	1,110-1,200
Sandstone; about 2 feet of limestone at 1,400 feet; small show of oil.....	1,200-1,530
Red shale.....	1,530-1,535
Dark shale.....	1,535-1,540

Rig used, cable. Casing used, 32 feet of 10-inch; 800 feet of 6½-inch; 1,100 feet of 4½-inch. Water-bearing strata from surface to 28 feet, at 60 feet, and from 650 to 1,110 feet. Well flows 20 gallons per minute of salt water.

301. Well near Warsaw, Hancock County.

[Well begun in October, 1904; completed in March, 1905. Authority, D. W. Haggerty, contractor. No samples. Geologic correlations checked by G. H. Ashley.]

This well penetrates limestones and cherts of Mississippian age which underlie the recent soil and glacial (Pleistocene) clays. They are Keokuk formation, Montrose chert, and Burlington limestone.

Record of well in the SW. ¼, sec. 13, T. 4, R. 9.

	Feet.
Recent and Pleistocene:	
Black soil.....	1- 3
Yellow clay.....	3- 50
Blue clay.....	50- 98
Keokuk:	
Blue limestone.....	98-140
Blue shale.....	140-155
White limestone.....	155-200
Montrose chert:	
Flint and rock.....	200-235
Burlington:(?)	
Blue shale.....	235-240
Black limestone.....	240-304
Magnesian limestone.....	304-320
Flint and limestone.....	320-325
Magnesian limestone.....	325-330
Blue lime.....	330-334
Sandstone.....	334-337
White limestone.....	337-340

Rig used, cable. Diameter of well, 6 inches. Length of casing, 112 feet. Water from 325 to 340 feet. Well yields 10 gallons per minute by pumping.

316. Well at Peru, La Salle County.

[Well begun and completed in 1905. Authority, J. D. Kemp, driller. Samples preserved to 550 feet. Log compiled from samples by S. Sanford.]

Several deep wells have been sunk near Peru, but the overlap of Carboniferous on much older rocks makes correlation of the well records difficult. The water-bearing stratum is apparently the base of the Trenton limestone (Ordovician).

Record of city well at Peru.

	Feet.
Soft brown shale, with limy streaks.....	20- 40
Soft red and gray shale with fragments of white limestone.....	40- 50
Soft gray, slightly limy and micaceous shale.....	50- 70
Soft dark, slightly limy shale.....	70- 85
Soft black shale.....	85- 95
Soft gray limy shale.....	95-110
Soft gray limy and micaceous shale.....	110-135
Soft black shale, slightly limy.....	140-158
Gray sandy limestone.....	158-170
Brownish sandy and slightly limy shale.....	170-220
Soft dark gritty shale with brownish limestone at base.....	220-255
Brownish-gray limestone.....	255-285
Dark gritty shale.....	285-305
Soft dark limy shale.....	305-350
Brownish-gray impure limestone.....	350-375
Brownish-gray limy shale.....	375-400
Brownish-gray impure limestone.....	400-420
Soft brownish-gray limestone to 480 feet, harder below.....	460-520
White to brownish-gray granular cherty limestone.....	520-550

Rig used, pole tools. Depth of well, 1,255 feet. Casing used, 14-inch, 52 to 355 feet; 12-inch, 355 to 450 feet; 10-inch, 450 to 900 feet; 8-inch, 900 to 1,255 feet. Salt water at 700 to 750 feet. Principal water bed at 1,100 feet. Well flows 200 gallons per minute and yields about 600 gallons by air lift. Static head, +85 feet. Temperature, 67° F.

"Coal No. 2 at Peru is mined at 314 feet, so that the bottom of the Coal Measures may come at 350 feet. The limestone below is probably Trenton. Where the Coal Measures outcrop but a short distance away, no such thickness of limestone is found as reported by this well from 220 to 285 feet."—G. H. Ashley.

330. Well near Baylis, Pike County.

[Well begun November 3, 1905; completed November 14, 1905. Authority, A. J. Clark, contractor and driller. Samples preserved.]

This is one of a group of three shallow wells drilled for gas. The rocks penetrated are all of Carboniferous age and are part of the Mississippian series, which, by the Illinois State Survey, was divided into St. Louis group, Keokuk group, Burlington limestone, and Kinderhook group. The gas found by this well is thought to occur in the Burlington limestone.

Record of well in the SE. ¼ sec. 1, 5½ miles south of Baylis.

	Feet.
Soil and clay.....	0- 14
Light shale (soft dark-grayish shale).....	14-115
Dark shale (soft dark-brown, finely micaceous shale); strong odor.....	115-174
Light shale like No. 2 (no sample).....	174-182
Limestone (white, more or less crystalline cherty limestone).....	182-194
Sandstone (light-brownish, finely gritty limestone) containing gas, pressure 7 to 8 pounds.....	194-214
Limestone (white and light-brown, not crystalline).....	214-215
Light shale like No. 2 (no sample).....	215-286
Drab sandstone (finely gritty limestone).....	286-312

Rig used, cable tools. Diameter of casing, 7½ and 5½ inches.

343. Well near Rushville, Schuyler County.

[Well begun and completed in September, 1905. Authority, J. B. Dunant, driller. Incomplete set of samples preserved.]

This well went through rocks of Pennsylvanian or Coal Measures age from 16 to 170 feet, and then struck Mississippian (?) limestone.

Record of well in sec. 5, T. 2, R. 3, 7 miles northwest of Rushville.

	Feet.
Hard yellow clay.....	1- 16
Soft brown sandstone.....	16- 70
Hard blue slate.....	70- 80
Coal.....	80- 83
Hard brown shale.....	83-170
Gray cherty limestone.....	170-270
White limestone.....	270-372

Rig used, cable. Diameter of well, $7\frac{1}{2}$ and $5\frac{3}{4}$ inches. Casing used, 90 feet of $5\frac{1}{2}$ -inch. Water stands .47 feet below surface.

INDIANA.**370. Well near Selma, Delaware County.**

[Well begun January 18, 1905; completed February 2, 1905. Authority, Shirkiff & Anderson, contractors. Samples preserved. Geologic correlations checked by G. H. Ashley.]

This log gives a section of the rocks overlying the Trenton limestone in the Smithfield district in Wayne County. The formations below the drift (Pleistocene) are Niagara limestone and shale (Silurian), Cincinnati and Utica shale, and Trenton limestone (Ordovician).

Record of well in the SW. $\frac{1}{4}$ NW. $\frac{1}{4}$ sec. 22, T. 20, R. 11 (well No. 25 on H. K. Lewis's farm).

	Feet.
Drift:	
Light-brown clay.....	0- 20
Drab quicksand, clay and gravel.....	20- 80
Hard gray gravel and sand.....	80- 140

	Feet.
Niagara:	
Hard dark-brownish limestone.....	140- 180
Drab limestone; water-bearing.....	180- 200
Soft gray limestone and shale.....	200- 340

	Feet.
Cincinnat:	
Soft black shale.....	340- 540

	Feet.
Utica:	
Soft brownish-gray shale.....	540- 932

	Feet.
Trenton:	
Hard rock.....	932-1,219

Rig used, cable. Diameter of well, 8 inches from 0 to 343 feet; 6 inches from 343 to 1,219 feet. Length of casing, 343 feet.

387. Well near Loogootee, Martin County.

[Well begun June 28, 1905; completed July 15, 1905. Authority, C. O. Potter, driller. Samples preserved. Geologic correlations by G. H. Ashley.]

This record gives a section at one of the few gas and oil pools in Indiana that occur in other rocks than those of the Trenton group. The pay sand in this, the Loogootee pool, has been referred to the Devonian and called the equivalent of the Onondaga (Carboniferous) of New York. This, however, is clearly impossible, since, according to a section across southern Indiana, given in the twenty-sixth annual report of the State survey, the stratigraphic equivalent of the Onondaga must lie over 1,200 feet below the surface at Loogootee. Almost as wrong is its correlation as "Huron, Kaskaskia in part," since the Kaskaskia was probably passed through within the first 200 feet. The pay sand is referred to the top of the Knobstone formation of the Mississippian series of the Carboniferous system.

Record of well in center of SE. ¼ sec. 2, Barr Township.

	Feet.
Soft yellow and white clay.....	2- 10
Soft light marl with a little water.....	10- 22
Soft greenish-gray limy shale with yellow quicksand.....	22- 42
Soft light shale, not enough water for drilling.....	42- 50
Hard gray sandy shale; at 75 feet water stands within 20 feet of surface.....	50- 90
Soft dark-gray limy shale; show of coal at 90-95 feet; shale is hard to mix.....	90-120
Soft dark shale.....	120-180
Very soft black shale, almost coal.....	180-187
Soft light-gray sandy shale; show of oil at 210 feet.....	187-240
Soft white sand with streaks of gray limestone and shale; sandstone fine at top, coarse at bottom.....	240-265
Coarse white sandstone with streaks of limestone and shale.....	265-280
Soft gray limy sandstone; water fell 20 feet in hole at 330 feet.....	280-335
Very hard brownish limestone with about 4 feet of shale near the center.....	335-355
Very hard gray sandstone and limestone; show of oil.....	355-405
Very hard brownish and grayish limestone.....	405-415
Thin layers of very hard bluish-gray sandstone and brown limestone with occa- sional streaks of soft green shale; show of oil.....	415-465
Hard gray sandstone with limy streaks.....	465-475
Very hard white to brownish limestone with dark-gray shale.....	475-480
Hard greenish gray limy shale, called "rubber rock," hard to mix.....	480-498
Hard brown limestone.....	498-509
Soft gray shale.....	509-518
Light-gray sandstone and dark-gray shale; Loogootee gas sand.....	518-542

Rig used, cable. Casing used, 8-inch from top to 498 feet; 5½-inch from 498 to 542 feet. Initial pressure of gas, 55 pounds per square inch; volume, about 75,000 cubic feet per day.

401. Well near Parker, Randolph County.

[Well] begun December 16, 1904; completed January 16, 1905. Authority, S. C. Clover, of Iona Drilling Company, contractor. Samples preserved. Geologic correlations by G. H. Ashley.]

This is the log of a well near the eastern edge of an oil pool that extends westward nearly to Muncie. The formations penetrated are, in downward order, clay, sand, and gravel of the drift (Pleistocene); Niagara limestone (Silurian); Cincinnati and Utica shale and Trenton limestone (Ordovician). As the well went into "Trenton rock" for 500 feet it is possible that the limestone last penetrated is older than Trenton age.

Record of well No. 4 on Van Pelt farm, 3 miles northeast of Parker.

	Feet.
Drift:

"First break;" soft, white.....	165- 225
"Second break;" soft, white, dry.....	225- 280
Cincinnati:	
Soft white slate, dry.....	280- 380
Hard white (gray) shells; shale gas at 380-420 feet.....	380- 440
Soft white (gray) slate.....	440- 725
Utica:	
Soft brown (gray) shale.....	725- 945

Trenton:

	Feet.
Hard light Trenton rock; gas at 960 feet, dry below.....	945-1, 240
Hard darker Trenton rock; pay sand.....	1, 240-1, 260

Rig used, cable. Diameter of well, 8 inches from 0 to 345 feet and $5\frac{1}{2}$ inches from 345 to 1,260 feet. Length of casing, 345 feet. Main inflow of water struck at 100 to 300 feet.

This well was drilled almost dry; after shooting it made a fair producer, settling down to 12 or 15 barrels daily. Very little gas was found, enough for a 25-horsepower gas engine.

402. Well near Howell, Vanderburg County.

[Well begun May 24, 1905; completed June 6, 1905. Authority, William H. Miller, contractor and driller. Samples preserved. Geologic correlations by G. E. Ashley.]

This well penetrates rocks that form part of the Coal Measures or Pennsylvanian series of the Carboniferous system. As porous beds are seldom of great extent in the Coal Measures, deep wells in those rocks often fail to obtain large supplies of water. The rocks penetrated by this well have been described in the Ditney folio (No. 84) and the Patoka folio (No. 105) of the Geologic Atlas of the United States. They are included in the Inglefield, Ditney, Somerville, Millersburg, Petersburg, and Brazil formations.

Record of well at West Height Park, Evansville, Ind.

Drift:

	Feet.
Yellow clay.....	0 - 8
Yellow sand.....	8 - 28

Inglefield:

Soft yellow sandstone.....	28 - 35
----------------------------	---------

Ditney:

Gray limy shale.....	35 - 62
----------------------	---------

Somerville:

Hard light-gray limestone.....	62 - 65
Soft gray limy shale.....	65 - 67
Soft limestone (no sample).....	67 - 79

Millersburg and Petersburg:

Brownish and dark-gray shale.....	79 - 245
Coal (Petersburg).....	245 - 247

Brazil:

Gray shale.....	247 - 278
Hard light-gray sandstone.....	278 - 286
Gray limy shale.....	286 - 288
Soft light-gray limy sandstone.....	288 - 294
Soft, coarse white sandy limestone.....	294 - 298
Coal.....	298 - 299 $\frac{1}{2}$
Dark-gray shale.....	299 $\frac{1}{2}$ - 303
Dark sandy limestone.....	303 - 306
Dark gray limy shale.....	306 - 309
Hard yellowish to bluish limestone (no sample).....	309 - 310

Rig used, cable. Diameter of well, $5\frac{1}{2}$ inches. Length of casing, 33 feet. Water in small quantity found between 288 and 298 feet.^o Well pumped but 1 gallon per minute.

INDIAN TERRITORY.

407. Well near Alluwe, Cherokee Nation.

[Well begun and completed in 1905. Authority, Marcus Simpson, of Carey Oil and Gas Company, owner. Samples preserved.]

This record shows the formations struck by the wells near Alluwe, in the Alluwe-Nowata-Coodys Bluff oil pool. The formations belong to the Pennsylvanian series of the Carboniferous system. They consist largely of shales, sandy shales, and sandstones, and have not been definitely correlated with formations studied in the Kansas oil field. The Alluwe-Coodys Bluff pool is noted for the wells being comparatively shallow..

Record of well in the SE. $\frac{1}{4}$ SW. $\frac{1}{4}$ sec. 18, T. 25, R. 17.

	Feet.

Soft white (light-gray) limy shale.....	146-310
Soft light-gray shale.....	310-423
Oil sand (gray limy sandstone and black shale).....	423-433
Soft gray shale.....	433-462
Oil sand (light-gray, slightly limy sandstone and black shale)—pay at 475-510 feet.....	462-510
Soft gray shale; pocket.....	510-519 $\frac{1}{2}$

Rig used, cable. Casing used, from 0 to 37 feet, 8 $\frac{1}{4}$ -inch; from 37 to 146 feet, 6 $\frac{1}{4}$ -inch. Initial yield of oil, 75 barrels in twenty-four hours. Quality, 36° B.

408. Well near Bartlesville, Cherokee Nation.

[Well begun June 14, 1905; completed June 30, 1905. Authority, A. E. Reed, of Curl & Scott, owners. Samples preserved. Log compiled from samples by S. Sanford. Geologic correlations by E. O. Ulrich.]

This well is in the Bartlesville oil pool. The formations penetrated belong to the Pennsylvanian series of the Carboniferous system. The oil is found in sandstone lentils in the bottom member of this series, the Cherokee shale. The formations have not been correlated, except tentatively, with those that have been studied in the Kansas oil and gas fields.

Record of well No. 2 on Norton lease, in the NW. $\frac{1}{4}$ SE. $\frac{1}{4}$ sec. 1, T. 26, R. 12.

Light-brown, limy sandstone, with streaks of dark-gray shale below 1,300 feet	1, 290—1, 319½

Rig used, cable. Casing used, 10-inch to 40 feet; 8½-inch to 1,005 feet; 6½-inch to 1,319½ feet. Initial yield of oil, 40 barrels in twenty-four hours. Quality, above 32° B.

416. Well near Turley, Cherokee Nation.

[Well begun December 1, 1905; completed December 18, 1905. Authority, T. B. Mack, driller. Incomplete set of samples preserved. Geologic correlations by E. O. Ulrich.]

This well is in the Hominy Creek pool, which includes the wells in the strip of oil-producing territory near Tulsa. The oil is found in sandstones belonging to the Pennsylvanian series of the Carboniferous system. The formations penetrated by this well have not been given formation names, except the two limestones which outcrop to the east, the Oologah and the Fort Scott. Between the latter and the Mississippian are possibly over 5,000 feet of shales and sandy beds, compared with 450 feet in Kansas.

Record of well in the NW. ¼ sec. 13, T. 21, R. 12, 3½ miles north of Turley.

Rig used, cable. Length of casing, 1,100 feet. Water-bearing strata from 30 to 40, 300 to 450, and 700 to 750 feet. Initial yield of oil, 20 barrels in twenty-four hours.

422. Well at Davis, Chickasaw Nation.

[Well begun May 24, 1905; completed August 2, 1905. Authority, Jolly & Hahn, contractors. No samples.]

The formations penetrated belong to the "red beds," which are generally referred to the Permian series of the Carboniferous system. The record shows the alternations of red mud (soft shale), red and blue slate (gritty shale), limestone, and sandstone that are characteristic of the "red beds."

The geology of the Arbuckle Mountains and the adjacent "red beds" is discussed in Professional Paper No. 31, "Geology of the Arbuckle and Wichita mountains," by J. A. Taff.

Record of well at Davis.

435. Well near Henryetta, Creek Nation.

[Well begun September 17, 1905; completed October 24, 1905. Authority, J. B. Swan, of Smith & Swan, contractors. No samples.]

This deep well penetrated formations of Pennsylvanian age. The log shows the rocks underlying the pay sands at Henryetta for a depth of 1,300 feet. The top of the Mississippian rocks may be 10,000 feet below the surface, hence endeavors to reach it by drilling in this section are bound to end in failure.

Record of well No. 1, Henryetta.

	Feet.
Surface soil and wash.....	1- 10

Coal, fine quality.....	2, 020-2, 024
Hard gray limestone.....	2, 024-2, 276
Soft gray slate.....	2, 276-2, 306
Hard sandy lime shell.....	2, 306-2, 309

Rig used, standard. Casing used, 8½-inch from surface to 1,097 feet; 6½-inch from 1 foot to 1,097. Water-bearing strata from 402 to 434 and 915 to 960 feet. Nothing of value below 1,027 feet. The oil from the well came out in chunks, was bright yellow in color, turning to light green after melting. It did not flow at a temperature of 60° F. To utilize the gas at 1,016 to 1,027 feet a string of 2-inch casing with Dresser packer was put in. The yield was 250,000 cubic feet in twenty-four hours; initial pressure, 280 pounds.

IOWA.

457. Well at Waterloo, Blackhawk County.

[Well begun in October, 1904; completed in June, 1905. Authority, Waterloo Water Company, owner.
Log compiled from samples by S. Sanford. Geologic correlations by E. O. Ulrich.]

This record is of unusual interest, since it shows a remarkably close agreement with the hypothetical depths of the various strata given by Prof. W. H. Norton in a contribution to Water-Supply and Irrigation Paper No. 145, written some months before drilling began.

No samples were saved to 100 feet, the well being sunk to that point through clay, lime rock, and quicksand streaks, the material caving badly and making progress slow. The formations represented by samples are, to follow Norton's classification: Devonian limestone and shale, Niagara limestone (Silurian); Hudson (or Maquoketa) shale, Galena and Platteville limestone, St. Peter sandstone, Oneota limestone (Ordovician), Jordan sandstone, St. Lawrence dolomite (Cambrian).

Record of city well at Waterloo.

	Feet.
Devonian:	
Brownish limestone with quartz grains and pebbles.....	100- 120
Brownish limy sandstone.....	120- 126
Silurian:	
Light-buff cherty limestone.....	131- 143
Brownish limestone, sandy in places and cherty.....	152- 240
Gray limestone.....	240- 245
White to brownish limestone.....	245- 255
Reddish-brown sandy limestone.....	255- 259
Maquoketa:	
Brownish limestone and gray limy shale.....	259- 265
Gray limy shale, in places brownish.....	265- 425
Galena and Platteville:	
Brownish limestone.....	440- 605
White to reddish limestone.....	605- 635
Soft brownish and grayish limestone.....	635- 815
St. Peter:	
White and gray sandstone.....	815- 862
Brownish limestone and gray sandstone.....	862- 900
Oneota:	
White to brown limestone, in places sandy.....	900- 980
White sandstone.....	1,030-1,045

Light-brown sandstone.....	1,235-1,253
Brownish sandy limestone.....	1,253-1,302
St. Lawrence:	
White and brownish magnesian limestone.....	1,302-1,373
Diameter of casing, 15 inches to 200 feet; 9 inches to 470 feet. Diameter of well below, 8 inches. First flow at about 840 feet amounted to about 75 gallons per minute, with a head above street grade of about 18 feet. The flow remained stationary till a depth of 1,362 feet was reached, when there was a considerable increase and the head rose to 20 feet. The flow is about 200 gallons per minute. The well is pumped by a deep-well centrifugal pump and yields 700 gallons per minute. Temperature of the water at well mouth, 56° F.	

461. Well at Charles City, Floyd County.

[Well begun in December, 1904; completed in May, 1905. Authority, W. Dennis, city clerk. Log compiled from samples by S. Sanford. Geologic correlations by E. O. Ulrich.]

This well is sunk through rocks of Devonian, Silurian, Ordovician, and Cambrian age. The formations in order are Devonian limestone and shale, Silurian limestone, Maquoketa shale, Galena and Platteville limestones, St. Peter sandstone, Oneota limestone and included New Richmond sandstone, Jordan sandstone, and St. Lawrence limestone and shale.

Record of city well at Charles City.

	Feet.

Dark limy shale.....	1,550-1,570
Dark brownish-gray and gray sandy and limy shale.....	1,570-1,590

"I am inclined to think that 'No sample' to, perhaps, 1,440 feet will include all of St. Lawrence. Then greenish-gray limy shale most probably is Dresbach."—E. O. Ulrich.

465. Well at Letts, Louisa County.

[Well begun and completed in 1905. Authority, W. W. Wagner, owner. Samples preserved. Log compiled from samples by S. Sanford. Geologic correlations by E. O. Ulrich.]

This record, though fragmentary, is of interest from its depth. Many of the samples were washed, making identification of the material penetrated difficult. This particularly applies to the recent and Pleistocene deposits, down to 325 feet. The formations below are Devonian and Silurian limestones and Maquoketa shale, "Trenton" limestone and St. Peter sandstone, of Ordovician age.

Record of well in the SW. 1/4 NW. 1/4 sec. 6, T. 75, R. 8.

	Feet.
Clay, sand, gravel, and bowlders.....	0- 325

"Trenton"—Continued.

	Feet.
White to brownish limy sandstone.....	1,105
Gray and brown shale.....	1,125

St Peter:

Red and white sandstone.....	1,135
Casing used, 10-inch, 300 feet; 8-inch, 338 feet. Main supply of water from below 1,025 feet; water rises within 40 feet of surface; yield and quality not tested. Elevation of well, 630 feet.	

Mr Ulrich says: "The crystalline limestone in this log [from 818 to 1,025 feet] indicates that there is no true Galena in this section, and that the equivalent but crystalline Kimmswick limestone extends northward to this point. This is an interesting and important point that I had hitherto only suspected."

466. Well near Oskaloosa, Mahaska County.

[Well begun and completed in 1905. Authority, R. L. Purcell, driller. No samples. Geologic correlations by E. O. Ulrich.]

This well penetrates the drift and rocks of Carboniferous age. The white rock is thought to be Mississippian limestone, in which case the rocks above are to be included in the Pennsylvanian series (Coal Measures).

Record of well 6 miles southeast of Oskaloosa.

Recent and Pleistocene:

--------------------------------	-----------

Rig used, cable. Casing used, 188 feet of 4-inch. Main supply of water at 215 feet. Yield, 3 gallons per minute.

470. Well at Davenport, Scott County.

[Authority, H. W. Hambrecht, superintendent of L. Wilson Well Company, contractor. No samples. Geologic correlations by E. O. Ulrich.]

This is one of a considerable number of deep wells that have been sunk in the artesian basin that underlies Scott County, Iowa, and Rock Island County, Ill., Davenport having more deep artesian wells than any other city in Iowa.

The rocks penetrated by this well include shales, sandstones, and limestones, ranging in age from Devonian to lower Ordovician. The formations are, from top to bottom, Devonian limestone, Silurian limestone, Maquoketa shale, "Trenton" limestone, St. Peter sandstone, Oneota limestone and sandstone (Ordovician).

Record of well of Davenport Malt and Grain Company.

Diameter of well, 12 to $5\frac{3}{16}$ inches. Casing used, 92½ feet of 12-inch to rock, 20 feet of 9-inch, 40 feet of 6½-inch, 81 feet of $5\frac{3}{16}$ -inch. Well began to flow at 1,400 feet. Flow, 150 gallons per minute.

471. Well at Ottumwa, Wapello County.

[Well begun in May, 1904; completed in May, 1905. Authority, L. Nichols, driller. No samples. Geologic correlations by E. O. Ulrich.]

Though this record mentions only the formations below 1,240 feet, the location and depth of the well make the record important. The formations given are of Ordovician age.

Record of John Morrell Packing Company's well No. 5:

	Feet.

Sandy limestone.....	2, 190-2, 205

All rocks between 1,451 and 1,896 feet water-bearing. First flow struck at about 1,100 feet (probably in St. Peter sandstone), 1,000 gallons per minute. Flow increased to about 1,400 gallons per minute from 1,451 to 1,899 feet.

KANSAS.**477. Well near Laharpe, Allen County.**

[Well begun July 25, 1905; completed August 10, 1905. Authority, E. T. Stanley, driller. Samples preserved. Log compiled from samples by S. Sanford. Geologic correlations checked by E. O. Ulrich.]

This well is in the famous natural-gas field that covers a considerable area about Iola. The gas is found in sandstone lentils in the Cherokee shale, the bottom member of the Pennsylvanian series of the Carboniferous system of rocks in southeastern Kansas and northern Indian Territory. The formations penetrated by this gas are all included in the Pennsylvanian series. They are, in descending order, Iola limestone, Chanute shale, Bronson limestone, Dudley shale, Parsons limestone, Bandera shale, Pawnee limestone, Labette shale, Fort Scott limestone, Cherokee shale.

The geology of the gas field has been described at some length in Bulletin No. 238, "Economic geology of the Iola quadrangle," by George I. Adams, Erasmus Haworth, and W. R. Crane.

Record of well No. 1, on F. E. Farmer addition, in the NE. $\frac{1}{4}$ SE. $\frac{1}{4}$ sec. 27, T. 24, R. 19.

Dark gray and brownish shale, slightly limy.....	735-800
Black shale; lentils of brownish limestone.....	800-820
Medium brownish-gray sandstone.....	820-890
Dark-gray to black sandy shale and gray sandstone.....	890-908

Rig used, cable. Casing used, 8-inch, 0 to 273 feet; $6\frac{1}{2}$ -inch, 273 to 850 feet. Water-bearing strata at 215 to 225 and 470 to 500 feet. Initial yield of gas about 3,000,000 cubic feet in twenty-four hours. Initial pressure, 220 pounds.

483. Well near Strong City, Chase County.

[Well begun August 20, 1904; completed March 27, 1905. Authority, George W. Crum, of the Strong City Gas, Oil, and Mineral Company, owner. No samples preserved above 1,500 feet; complete series below.]

This well was sunk as a prospect. The nearest deep well is at Emporia, about 18 miles east. Neither oil nor gas was found in paying quantity, but the log is of interest, since samples of cuttings were preserved at 5 to 15 foot intervals below 1,500 feet. The driller seems to have noted all changes in the formations, but his descriptions are not exact enough to render the log above 1,500 feet of much value, hence it is not given in detail.

Rocks of Permian age outcrop in the higher ground about Strong City, but the rocks penetrated by this well all belong to the Pennsylvanian series (Coal Measures) of the Carboniferous system. Owing to the imperfect character of the log above 1,500 feet, it is not possible to correlate the formations with those that outcrop in the State farther to the east.

Record of well in the SE. $\frac{1}{4}$ SE. $\frac{1}{4}$ sec. 17, T. 19, R. 8.

Slate (light-brown limestone and dark-gray shale).....	1,920-1,945
"Mississippi limestone" (sample doubtful).....	1,945-1,960

Rig used, cable. Diameter of well, 14 inches from 0 to 400 feet; 10 inches from 400 to 1,000 feet; 6½ inches from 1,000 to 1,500 feet; 4½ inches from 1,500 to 1,945 feet. At 1,600 feet strong brine overflowed the casing.

As this well apparently started about 200 feet below the top of the Garrison formation, which is taken as the uppermost member of the Pennsylvanian, or Coal Measures series of Kansas, and as the Coal Measures are about 2,700 feet thick, the bottom of the well was probably 500 feet above the Mississippian, but may have reached the Cherokee shale.

487. Well near Burlington, Coffey County.

[Well begun in December, 1904; completed in January, 1905. Authority, Loy & Wilson, contractors
No samples.]

This is the log of a wild-cat well, not credited with having found oil or gas. The rocks belong to the Pennsylvanian division of the Carboniferous system, the driller stopping at the underlying "Mississippi limestone" (Boone formation). The hole shows the full thickness of the Cherokee shale and the included limestone (or sandstone) lentils. The well apparently started above the horizon of the Oread limestone, or over 1,000 feet above the top of this shale. While most of the intervening formations have been studied by surface outcrops and well records in the Iola quadrangle to the southeast, variations in thickness of the various beds of limestone and shale make correlation difficult.

Record of well No. 1 on Clark farm, 4 miles west and 1 mile south of Burlington.

492. Well near Junction City, Geary County.

[Well begun April 21, 1905; abandoned September 28, 1905. Authority, C. P. Fogelstrom, president Junction City Oil and Mining Company. No samples.]

This well is of interest from its location and depth. The deepest well in the same section of the State is at McFarland, 30 miles east. The nearest important oil and gas producing area is in Allen County, about 95 miles southeast. The Junction City well starts at the base of the Permian, or at the top of the Pennsylvanian series. As the McFarland well shows the Coal Measures to be there more than 2,500 feet thick, it is doubtful if the Junction City well penetrated the bottom member of the series, the Cherokee shale. Incidentally, the log shows the necessity of starting a well to go through the upper shales of the Pennsylvanian of central Kansas with a large diameter, owing to the caving of the beds.

Mr. Fogelstrom says: "This was the second well drilled for the Junction City Oil and Mining Company. This was abandoned on account of being started too small. A light flow of oil was struck near the bottom, but soon water was again struck and, being unable to case it off, drilling was abandoned."

498. Well near McPherson, McPherson County.

[Well begun in 1904; drilling stopped in June, 1905. Authority, Jeff Tourney, of McPherson Prospecting Company, contractor. Samples preserved. Log compiled from samples by S. Sanford.]

This well is in the northern portion of the Kansas salt field, and the samples give a good idea of the formations penetrated to its depth of 2,225 feet. But one deeper well has been put down in the salt fields. That one, having a depth of 2,335 feet, is at Anthony, about 85 miles to the south. The deepest well in the State, at Caney, was down 2,600 feet on March 1, 1906. The McPherson well starts in a formation of earliest Quaternary age, the "Equus beds;" below 140 feet comes the Wellington, and below that the Marion formation (Permian). The well penetrates the highest limestones and shales of the Pennsylvanian series of the Carboniferous system. As these beds differ somewhat from those exposed at the surface farther east, where they have been given formation names, no attempt is made to group the beds as formations or to separate the Permian from the Pennsylvanian.

Record of well 3 miles west of McPherson.

Brownish-gray oolitic magnesian limestone with streaks of dark-gray shale, with pyrite below 2,170 feet.....	2, 160-2, 180
Gray shale and gray limestone with pyrite below 2,190 feet.....	2, 180-2, 200
Brownish-gray sandy limestone, possibly fossiliferous, and dark-gray shale.....	2, 200-2, 225

No oil or gas was found in paying quantity.

605. Well near Bonner Springs, Wyandotte County.

[Well begun March 8, 1905; completed April 19, 1905. Authority, T. B. Wood, owner. Samples preserved. Geologic correlations checked by E. O. Ulrich.]

The log of this well seems to have been kept with unusual care, the driller's notes and the record shown by the samples, most of which were taken at 5-foot intervals, agreeing almost exactly. All the formations belong to the Carboniferous system, the drill passing through the lower portion of the Pennsylvanian series and reaching the underlying limestone of the Mississippian. The well starts at about the horizon of the Iola limestone. The Cherokee shale is shown to be over 465 feet thick. The limestone first penetrated is believed to be the Iola.

Record of well No. 1 on Thomas Kinahan farm, in the NE. $\frac{1}{4}$ SW. $\frac{1}{4}$ sec. 21, T. 11, R. 23.

	Feet.

Soft brown sandy limestone.....	810-820
Soft brown limy sandstone.....	820-845
Hard brown limestone, Mississippian (?)	845-853

Rig used, cable. Casing used, 10-inch, 31 feet; 8½-inch, 369 feet; 6½-inch, 510 feet; 5-inch, 709 feet. Enough water to drill with was found at 139 and 400 feet. A small flow of gas was struck at 391 feet, and at 440 feet the flow increased to 200,000 feet in twenty-four hours. A trace of oil was found at 505 to 510 feet, and a strong vein of salt; sulphur water at 770 feet, with a trace of oil. The well was plugged at 743 to 720, 550 to 518, and 510 to 460 feet; an 8½-inch packer was set at 436 feet and the gas from 440 feet saved. The rock pressure of this was 120 pounds.

"The 99 feet of limy sandstone, from 746 to 845 feet, probably corresponds to the bed at 767 to 865 feet in well No. 606. Perhaps the sandstone is Winslow formation and the limestone Morrow formation."—E. O. Ulrich.

606. Well near Bonner Springs, Wyandotte County.

[Well begun in July, 1898; completed in February, 1899. Authority, S. J. Hatch. No samples. Geologic correlations by E. O. Ulrich.]

This well record is of interest in connection with the preceding one, since the log shows not only the thickness of the Cherokee shale, the bottom member of the Pennsylvanian, but the underlying Mississippian limestones. A fossil shell brought up from 2,065 feet was pronounced by E. O. Ulrich to be probably a crushed specimen of *Dinorthis subquadrata*, indicating that the limestone bed from which it came corresponds in age to the Maquoketa shale of the central Mississippi Valley, the uppermost Ordovician, which, west of Mississippi River, immediately overlies the Trenton. The well penetrates the Pennsylvanian and Mississippian series (Carboniferous) and rocks of Devonian, Silurian, and Ordovician age.

Record of well one-half mile north of Bonner Springs.

MAINE.**666. Well at Fort Levett, Cumberland County.**

[Well begun July 7, 1905; completed October 31, 1905. Authority, Capt. A. W. Gates, quartermaster. Samples preserved.]

This well is of interest from its being sunk on an island in Portland Harbor, at a point where, previous to an investigation of the occurrence of underground water in rocks of similar character on islands in Portsmouth Harbor, it had been thought that a sufficient supply of potable water could not be obtained by drilling. The rocks comprise metamorphosed sediments and intrusive igneous rocks.

Record of well at Fort Levett, 3 miles southeast of Portland.

	Feet.
Soil.....	0- 18
Medium hard to hard dark sandstone.....	40- 50
Hard light sandstone or gneiss.....	50- 60

Patapsco:	
Dark-blue clay	510-516
Very tough red or pink clay (crust of iron ore at 524 and 545 feet)	516-548
Yellow sand; lower portion coarse and water bearing	548-583
Pink clay	583-587
Coarse sand and gravel, pebbles one-half inch in diameter; large flow of water	587-601
Very hard rock	601

Rig used, rotary to 250 feet, hollow-rod jumper below. Casing used, 250 feet of 12-inch, 170 feet of 10-inch, 181 feet of 8-inch. Length of strainer, 15 feet. Well flows 75 gallons per minute at elevation of 8 feet above tide. Supply from 587 to 601 feet. Water contains iron, but is of excellent quality when filtered.

687. Well at Chaptico, St. Mary County.

[Well begun January 9, 1905; completed February 2, 1905. Authority, L. Rude, driller. Geologic correlations by W. B. Clark.]

This well, starting in deposits of Columbia (early Pleistocene) age, penetrates clays, sands, and greensands of the Calvert formation of the Chesapeake (Miocene) group and Nanjemoy and Aquia formations of the Pamunkey (Eocene) group. A detailed account of the underground-water resources of that section of the Coastal plain in which this well is situated is given in the Nomini folio (No. 23) of the Geologic Atlas of the United States.

Record of well at Chaptico.

	Feet.
Columbia:	
Coarse yellow sand and gravel	1- 20
Calvert:	
Hard dark sandy clay	20- 70
Hard, coarse grayish-brown sand containing shell fragments	70- 80
Hard dark sand and limy clay	80-100
Hard dark coarse sand	100-120
Nanjemoy:	
Hard dark coarse sand with glauconite	120-250
Aquia:	
Soft light-brown sandy clay	250-270
Hard dark sand containing glauconite; water-bearing	270-295

Rig used, jet. Diameter of well, 1½ inches. Main water supply at 270 to 291 feet. Well flows 7 gallons per minute; static head, +22 feet.

689. Well near Tilghman, Talbot County.

[Well begun March 10, 1905; completed March 21, 1905. Authority, L. Rude, contractor. Samples preserved. Geologic correlations by W. B. Clark.]

The water-bearing stratum of dark sand in this well possibly belongs to the top of the upper (marine) division of the Cretaceous and is part of the Matawan formation; according to Mr. Rude, it is about 60 feet thick. The formations penetrated, from top to bottom, are Columbia formation (Pleistocene); Calvert formation of the Chesapeake group (Miocene); Pamunkey group (Eocene); and Matawan formation (Cretaceous).

Record of well one-half mile north of Tilghman post-office.

	Feet.
Columbia:	
Hard buff clay	0- 12
Calvert:	
Soft micaceous gray sand with a little glauconite	12- 18
Soft dark brownish-gray micaceous sand	18- 40
Gray sand containing shell fragments	40- 50
Hard dark-gray sandy micaceous clay	50-130

Pamunkey:	Feet.
Soft rock (glauconite with a little sand and gravel); a little water	130-155
Hard black earth (dark clay with much glauconite, a little sand, and some bits of shells)	155-340
Hard dark sand (glauconite with coarse sand, and bits of shells); some water.	340-360
Pamunkey or Matawan:	
Hard dark sand (less glauconite and more grains of brownish quartz than preceding; some bits of shells); plenty of water	360-380
Rig used, jet. Diameter of well, 1½ inches. Length of casing, 366 feet; strainer at 360 feet. Well pumps 10 gallons per minute.	

MASSACHUSETTS.

702. Well at South Hadley Center, Hampshire County.

[Well begun November 15, 1904; completed March 6, 1905. Authority, Ernest Lyon, driller. Samples preserved. Geologic correlations by S. Sanford.]

After passing through the sand and hardpan of the drift (Pleistocene) this well struck the brown, gray, and red sandstones and thin beds of shale that have been classified as the Longmeadow sandstone formation. This is one of the four formations into which the rocks of the Triassic (Newark) system in Connecticut River Valley have been divided in Massachusetts and is the best water bearer of the four. An account of some of the wells drilled in the Triassic rocks of Connecticut River Valley and a consideration of these rocks as water bearers are contained in Water-Supply and Irrigation Paper No. 110, "Contributions to the hydrology of the eastern United States," by M. L. Fuller.

Record of well at South Hadley Center.

Drift:	Feet.
White sand	0- 20
Hardpan with boulders	20- 45
Longmeadow sandstone:	
Soft brown sandstone	45- 80
Soft black sandstone	80-100
Soft brown sandstone	100-120
Soft black sandstone	120-160
Hard brown sandstone	160-200
Soft black sandstone	200-220

Soft red sandstone	370-390
Soft black sandstone	390-410
Soft red sandstone	410-450
Soft black sandstone	450-470
Hard dark-brown sandstone	470-490
Hard dark-red sandstone	490-520
Soft black shale	520-540
Hard dark-red sandstone	540-600
Soft black shale	600-714

Diameter of well, 6 inches, with 45 feet of casing to ledge. Well pumps 40 gallons per minute from a depth of 100 feet, the water level being 60 feet below surface.

MINNESOTA.

723. Well at South Minneapolis, Hennepin County.

[Authority, Chicago, Milwaukee and St. Paul Railway, owner. No samples.]

Minneapolis is near the center of an artesian basin that underlies a considerable area in southeastern Minnesota. The rock strata forming the basin are of Ordovician and Cambrian age. The formations penetrated by this well, below the drift, are, according to the nomenclature of the Minnesota Survey: "Trenton" limestone, St. Peter sandstone, Shakopee limestone, New Richmond sandstone, Oneota limestone (Ordovician); Jordan sandstone, St. Lawrence sandstone, shale and limestone, and Dresbach sandstone (Cambrian)

Record of well at South Minneapolis.

	Feet.
Soil and surface material.....	0- 56
"Trenton" limestone.....	56- 84
St. Peter sandstone.....	84-250
Shakopee dolomite.....	250-260
New Richmond sandstone.....	260-267
Oneota dolomite.....	267-390
Jordan sandstone.....	390-478
Dresbach sandstone.....	478-704

Well has brick curb, 0 to 20 feet; casing from 20' to 184 feet; no casing below.

727. Well at Fergus Falls, Ottertail County.

[Well begun October 4, 1904; completed April 15, 1905. Authority, John Shogren, driller. Samples preserved.]

This well is sunk wholly through beds of clay and sand that were deposited during the Ice Age by glaciers or by streams deriving their waters largely from glaciers. It shows how deeply this glacial material has covered the old rock surface at some localities and how irregular is the distribution of water-bearing beds.

Record of well at State Hospital for the Insane, Fergus Falls.

	Feet.
Black soil.....	0- 2
Soft yellow clay.....	2- 56
Hard blue clay and sand with numerous boulders from 64 to 120 feet.....	56-120

Hard blue clay.....	249-260
Hard gray clay and sand.....	260-314
Gray gravel; water-bearing; well pumps 45 gallons per minute, water standing 97 feet from surface.....	314-315
Hard gray, dry sand.....	315-358
Hard gray "shale" and clay.....	358-400
Gray gravel; main water supply.....	400-420
Hard, blue clay.....	420-422

Rig used, cable. Casing used, 12-inch, 0 to 215 feet; 10-inch, 180 to 366 feet; 8-inch, 300 to 325 feet; 6-inch, 310 to 400 feet. Water stands at 97 feet from surface. Well pumps 100 gallons per minute from a depth of 160 feet. Quality, hard, alkaline.

728. Well at Groningen, Pine County.

[Well begun July 1, 1904; completed August 10, 1904. Authority, A. J. Carey, of the St. Paul Artesian Well Company, contractor. Samples preserved.]

The sandstones which underlie the soil and clay, the latter deposited during the Ice Age, form part of a very old formation dating back to early Paleozoic time. The sandstone is locally known as the "Kettle River sandstone" and is believed to be a part of what has been called the "Basal Sandstone series," of middle Cambrian age.

Record of well at Groningen.

	Feet.
Black soil.....	0- 3
Red clay.....	3- 18
Red sand; water-bearing.....	18- 30
Orange sandstone.....	30- 39
Very hard pink sandstone with light-buff beds from 75 to 110 feet.....	39-320

Rig used, cable. Diameter of well, 8 inches. Length of casing, 34 feet. A small stream of water was struck at 175 feet, but the principal supply is from 300 to 320 feet. Water rises within 22 feet of surface and was not lowered by pumping 260 gallons per minute.

MISSISSIPPI.**735. Well near Bay St. Louis, Hancock County.**

Well begun September 18, 1905; completed September 28, 1905. Authority, John L. Ford, driller. Samples preserved. Geologic correlations checked by E. C. Eckel.]

The formations penetrated by this well are clays, sands, and gravels varying in age from Quaternary to late Tertiary (Pliocene). The water-bearing beds have been developed by a great number of wells along the Gulf coast of Mississippi.

Record of well 1½ miles southwest of Bay St. Louis.

	Feet.
Quaternary:	
Yellow sand.....	0- 10

Greenish clay.....	257-600
Fine gray sand; water-bearing.....	600-705

Rig used, jet. Diameter of well, 3 inches. Water from 685 to 705 feet; flows 225 gallons per minute and has a static head estimated at +85 feet.

745. Well near Vancleave, Jackson County.

[Well begun July 4, 1905; completed July 12, 1905. Authority, John L. Ford, driller. Sample preserved. Geologic correlations by E. C. Eckel.]

This well develops a bed of water-bearing sand in the Grand Gulf formation, which was deposited in late Pliocene time. Overlying the Grand Gulf are sands that represent the Lafayette formation.

Record of well of L. N. Dantzler Lumber Company, 1½ miles southwest of Vancleave.

Lafayette (?):

Lafayette (?):	Feet.
Hard yellow sandy clay.....	0- 10
Soft fine yellow sand.....	10- 30
Brownish gravel and coarse sand.....	30- 80

Grand Gulf:

Hard green sandy clay.....	80-250
Light-gray sand; water-bearing.....	250-295
Green sandy clay.....	295-680
Sand (no sample); water-bearing.....	680-747

Rig used, jet. Diameter of well, 3 inches. Strainer from 727 to 747 feet. Well flows 125 gallons per minute. Static head not determined.

747. Well near Ellisville, Jones County.

[Well begun October 1, 1905; completed November 1, 1905. Authority, W. C. Porter, contractor and driller. Incomplete series of samples preserved. Geologic correlations checked by E. C. Eckel.]

The clay first penetrated may belong in part to the Lafayette formation (Pliocene). The underlying sands and clays are classified as Grand Gulf (Pliocene).

Record of well of Ellisville Lumber Company.

Lafayette (?) in part:

Clay	0- 90
------------	-------

Grand Gulf:

Coarse sand	90-110
Blue clay and marl	110-257
Coarse white sand	257-288

Rig used, rotary and jet. Diameter of well, 6 inches. Main supply at 257 to 287 feet. Water stands 21 feet from surface.

748. Well at Holly Springs, Marshall County.

[Well begun July 20, 1905; completed August 4, 1905. Authority, A. Goldsberry, driller. Incomplete set of samples preserved. Geologic correlations checked by E. C. Eckel.]

The sands penetrated down to 20 feet belong to the Lafayette formation (Pliocene). The sands, sandstones, and clays below are of Tertiary age and probably comprise the Wilcox ("Lignitic") group, which, as a water bearer, is one of the most important divisions of the Tertiary in Mississippi.

Record of well of Holly Springs Light and Water Company.

Lafayette:	Feet.
Dry sand.....	0 - 20
Wilcox:	
Pipe clay.....	20 - 34
Sand; water-bearing; water rises within 19 feet of surface.....	34 - 56
Hard blue clay.....	56 - 64
Dry sand.....	64 - 88
Fine to medium light brownish-gray micaceous sand; water-bearing.....	88 - 102
Rock and sandstone.....	102 - 104
Blue clay.....	104 - 209
Rock.....	209 - 209 $\frac{3}{4}$
Fine sand.....	209 $\frac{3}{4}$ - 285
Clay.....	285 - 306
Medium varicolored sand, pink to light brown, with pink clay.....	306 - 316
Medium to coarse yellowish sand; water-bearing.....	316 - 348 $\frac{3}{4}$

Rig used, rotary. Diameter of well, 8 inches. Strainer from 325 $\frac{1}{2}$ to 348 $\frac{3}{4}$ feet. Water rises to 174 feet below surface. Good quality. Well yields 200 gallons per minute.

749. Well at Newton, Newton County.

[Well begun April 1, 1905; completed August 1, 1905. Authority, P. J. Doyle, contractor. No samples. Geologic correlations checked by E. C. Eckel.]

This log is the deepest reported from Newton County. The formations shown are the Claiborne and Wilcox or "Lignitic" (Eocene), and the Ripley (late Cretaceous).

Record of well of Newton Oil and Manufacturing Company.

Claiborne:	Feet.
"Quicksand".....	0- 35
Hard clay and shells.....	35-187
Hard, packed dry sand.....	187-262

Buff and light-buff sand.....	145-175
Coarse sand and gravel.....	175-185
Fine yellow sand.....	185-210

Rig used, rotary. Diameter of casing, 10 inches; length, 190 feet; length of strainer, 20 feet (from 170 to 190 feet). Water-bearing stratum at 185 to 210 feet. Well pumps 210 gallons per minute.

MISSOURI.**844. Well near Kansas City, Jackson County.**

[Authority, S. J. Hatch. No samples. Geologic correlations by E. O. Ulrich.]

The log of this well gives data supplementing the logs of wells Nos. 605 and 606. The rock last penetrated, as shown by a sample from the drill core between 2,348 and 2,404 feet, was a biotite granite. This sample indicates that the drill passed through all the Paleozoic formations present and the record shows the thickness of these formations below the base of the Coal Measures, at 750 feet. The record is presumably accurate. Mr. Hatch states that the core was destroyed by a fire.

Record of well 10 miles southeast of Kansas City.

	Feet.
Lower Coal Measures.....	0- 750
Boone limestone (?):	
Limestone, shelly in places, with shale partings.....	750- 825

Soft white sandstone; water.....	1,045-1,060
Very hard white limestone.....	1,060-1,075
Medium hard gray sandstone.....	1,075-1,160
Hard gray limestone.....	1,160-1,190
Soft brown shale.....	1,190-1,214
Very hard white limestone with iron pyrite.....	1,214-1,226
Soft gray sandstone; very strong flow of water.....	1,226-1,234
Soft brown shale; shells.....	1,234-1,236
Hard white limestone.....	1,236-1,340

Drilling stopped by water breaking in at bottom of casing. Rig used, cable. Casing used, 13-inch, 24 feet; 10-inch, 341 feet; 8-inch, 904 feet; 6-inch, 1,330 feet.

1039. Well near Altyn, Teton County.

[Well begun in June, 1904; drilling stopped March 14, 1905. Authority, W. A. Leonard, driller. Samples preserved.]

This well was put down near the eastern edge of the great series of pre-Cambrian (Algonkian) rocks, shales, sandstones, quartzites, and limestones that constitute the mass of the Front Range of the Rocky Mountains in the northwest corner of Montana. These rocks are nearly horizontal, but are known to overlie at depth rocks of much later age (Cretaceous), this inverse relation being due to a great thrust fault. Seepages of oil at various points have caused many oil claims to be located and have led to some deep drilling. All the rocks penetrated by this well are probably of Algonkian age.

Record of well 8 miles southeast of Altyn.

	Feet.
Dark-gray gritty shale.....	20- 150
Dark-gray limestone, sandy from 300 to 350 feet.....	150- 400
Sample missing.....	400- 500

	Feet.
Hard light- and dark-gray sandy limestone; formation full of crevices.....	1,220-1,260
Medium hard sand shell and lime (no sample); small amount of gas.....	1,260-1,270
Hard gray sandy limestone or layers of sandstone and limestone; caving forma-	
tion from 1,285 to 1,305 feet	1,270-1,350
Medium hard gray sandy magnesian limestone.....	1,350-1,400
No sample.....	1,400-1,415
Hard gray gritty limestone.....	1,415-1,460
Hard brown limy sandstone.....	1,460-1,475
Medium hard gray gritty limestone.....	1,475-1,530

Rig used, cable; casing used, 55 feet of 10-inch; 265 feet of 8-inch; 345 feet of 6-inch.
No water found below 15 feet.

NEW JERSEY.

1061. Well at Fort Hancock, Monmouth County.

[Well begun January 20, 1905; completed March 10, 1905. Authority, H. C. Harper for Thos. B. Harper, contractor. Samples preserved. Geologic correlations by W. B. Clark.]

This well is on the end of Sandy Hook. The formations below the recent and possibly Pleistocene sands were deposited in the Cretaceous period. They belong to the upper or marine division of the Cretaceous and include the Matawan formation.

Record of well at Fort Hancock.

	Feet.
Recent and Pleistocene:	
Beach sand (medium gray sand).....	5- 20
Coarse gray sand; brackish water.....	20- 25
Beach sand (medium fine gray sand).....	25- 50
Matawan:	
Very coarse water-bearing gravel (fine gray gravel).....	50- 65
Fine gray gravel (sample is coarse yellow and white sand).....	65- 80
Fine yellow, reddish, and gray sand.....	80-100
Fine yellowish sand (sample is dark gray), with "petrified wood".....	100-125
Light-gray gravel, with shells.....	125-130
Fine light-blue clay.....	130-240
Fine gray micaceous sand.....	240-263
Mixed blue clay and sand (sample is very fine dark sand).....	263-300
Magothy:	
Fine light-gray micaceous sand, with "charcoal".....	300-330
Fine white sand; some water.....	330-363
Yellow gravel (coarse varicolored sand); water-bearing.....	363-365

Diameter of well, 8 inches. Length of casing, 325 feet, with strainer from 325 to 365 feet. Principal supply from 363 to 365 feet. Well pumps 60 gallons per minute.

NEW MEXICO.

1077. Well near Artesia, Eddy County.

[Well begun in May, 1905; completed July 8, 1905. Authority, E. L. Robertson, contractor. No samples.]

Pecos River Valley, from Roswell to McMillan, has become one of the most beautiful and densely populated sections of New Mexico, through the development of a remarkable underground-water supply. This well is not among the largest sunk in the valley, but it shows what bountiful flows may be obtained by proper care in sinking and casing. The beds of clay, sand, and gravel, down to 780 feet, are of post-Tertiary age, and partly fill an old rock valley. The underlying sandstone and hard limestone are part of the Carboniferous system. A detailed account of the geology of part of Pecos River Valley and the development of the artesian water is given in Water-Supply and Irrigation Paper No. 155, "Geology and underground-water resources of the Roswell artesian basin," by C. A. Fisher.

Record of well in the NW. $\frac{1}{4}$ sec. 32, T. 16, R. 26.

	Feet.
Soil and clay.....	0- 60
Clay and gravel.....	60-150
Light clay.....	150-250
Red clay.....	250-375
Rock; water-bearing at 378 to 380 feet; flow about 10 gallons per minute.....	375-380
Clay.....	380-420
Sand.....	420-575
Rock; water-bearing; flow about 300 gallons per minute.....	575-580
Red sand.....	580-625
Sandstone or packed sand.....	625-780
Hard limestone; strong flow of water at 830 to 860 feet.....	780-933

Rig used, rotary. Diameter of casing, 6 inches; length of casing, 625 feet; water at 380 and 580 feet cased off. Well flows 680 gallons per minute. Static head, about +90 feet. Quality of water, hard; used for all domestic purposes and for irrigation.

1120. Well near Torrance, Torrance County.

[Authority, El Paso and Northeastern Railway, owner. No samples.]

This record shows the alternating beds of red shale and sandstone, dark shales, white sandstone, and limestone that characterize the Red Beds, a series of rocks that range in age from Carboniferous into Jurassic. In this case the rocks are believed to be of Carboniferous age. The water level of this well is over 300 feet below surface, but at a well near Pastura, on the same railroad, water level is 636 feet below surface. The region is arid and the rocks are poor water carriers.

Record of well 1 mile southwest of Torrance.

	Feet.
Limestone and gypsum.....	0- 28
Red shale.....	28- 93
Limestone.....	93-139
Blue shale.....	139-147

Gray sandstone.....	634-676
Yellow sandstone.....	676-692
Gray sandstone and shale.....	692-809

	Feet.
Slate and shale.....	809-823
Red clay.....	823-826
Gray sandstone.....	826-853

Elevation of well mouth, 6,460 feet. Water rises to -357 feet.

NEW YORK.

1163. Well near Getzville, Erie County.

[Well begun January 1, 1903; completed February 22, 1903. Authority, Fred Stahl, driller. No samples. Geologic correlations by F. B. Weeks.]

This well gives a section at a small gas pool, the Getzville, in Erie County. The rocks penetrated belong to the Silurian system and the Lockport limestone, Rochester shale, and Medina sandstone and shale are represented.

Record of well No. 1 on George G. Wolf farm, 2 miles south of Getzville.

	Feet.
Drift:	
Clay.....	1- 40
Gravel; fresh water; rose 30 feet.....	40- 45
Lockport:	
White limestone; black sulphur water at 330 feet.....	45-410
Rochester:	
Black slate; no water.....	410-485
White limestone; gas.....	485-495
Black slate.....	495-505
Medina:	
Red sandstone; some gas.....	505-565
Black slate.....	565-575
Blue sandstone: gas sometimes.....	575-605
Soft red shale; no gas; no water.....	605-800

Rig used, cable. Diameter of casing, 8 and 6 inches; length, 420 feet. Initial pressure of gas, 280 pounds.

Mr. Weeks says: "The peculiar thing of this section is the thickness, 365 feet, of white limestone (Lockport); at the falls it is about 175 feet."

1195. Well near Saratoga Springs, Saratoga County.

[Well begun and completed in 1905. Authority, E. J. Saunders, driller. Samples preserved. Log compiled from samples by S. Sanford. Geologic correlations by F. B. Weeks.]

The Saratoga springs occur along fault fissures and, owing to the faults and the lack of outcrops, the geology of the district has not been worked out in detail. The rocks penetrated by this well are thought to include the Utica shale and Trenton limestone (Ordovician) to 420 feet and the Beekmantown limestone (late Cambrian) below.

Record of well at Geyserville, near Saratoga Springs.

	Feet.
Yellow clay.....	1- 16
Utica shale:	
Black gritty shale, slightly limy.....	17-360
Trenton:	
Dark-gray to black fossiliferous limestone.....	360-370
Dark-gray to black limy shale, fossiliferous.....	370-390

Brownish-black sandy clay.....	219-239
Black clay.....	239-291
Gray clay and fine sand.....	291-304
Gray sand.....	304-310

Casing used, 300 feet of 10-inch; 40 feet of 8-inch, with 12-foot strainer. Main supply of water from below 300 feet flows 12 gallons per minute. Static head, +24 feet. Water is depressed to -150 feet by pumping 150 gallons per minute. Temperature of water at well mouth, 64° F. Quality, very soft. This is one of several wells used for city supply.

1218. Well at Fort Caswell, New Hanover County.

[Well begun February 12, 1900; drilling stopped April 1, 1902. Authority, T. T. Allard, civil engineer.
No samples. Geologic correlations by W. B. Clark.]

This well is of interest from the fact that no sufficient supply of fresh water was found, in this respect resembling the deep well sunk at Wilmington, about 20 miles to the north. The beds above 240 feet are thought to belong to the Tertiary and Quaternary systems; those below to the Ripley formation of the Cretaceous system.

Record of well at Port Caswell.

	Feet.
Recent and Pleistocene:	
Gray sand.....	0- 10
Sand and shells.....	10- 30

Blue clay	280-365
Sand and marl in thin strata; salt water stood at 365 feet	365-550
Fine sand and clay with 2 feet of flint at 700 feet and 2 feet of flinty limestone at 719 feet.....	550-800
Sandstone	800-801

Length of casing, 12-inch, 90 feet; 10-inch, 250 feet; 8-inch, 719 feet; 6-inch, 800 feet.
Water overflows top of casing at rate of 25 gallons per minute. Quality, brackish; contains 80 grains salt per gallon.

1220. Well at Pinehurst, Moore County.

[Well begun in May, 1905; completed in October, 1905. Authority, T. B. Cotter, general superintendent, of Pinehurst. Samples preserved. Log compiled from samples by S. Sanford. Geologic correlations by W. B. Clark.]

Pinehurst is near the western edge of the Atlantic Coastal Plain. The well passes through the basal clays, sands, and arkoses of the Potomac formation (Cretaceous) and penetrates the underlying greenish crystalline schists for 475 feet.

Record of well at hotel, Pinehurst.

Potomac:	Feet.
Light-brownish sandy clay or arkose	54
Light-buff and light-gray clayey sand	65- 80
Light-gray clayey sand	100
Dark sandy clay	111
Light-buff, slightly clayey sand	128
Brown sandy clay	147
Light-brown clayey sand	160
Pre-Cambrian:	
Brownish, grayish, and greenish sandy clay, an arkose, or the oxidized top of the schist	191
Coarse crystalline schist; contains quartz, feldspar, mica and a black to greenish silicate	207
Crystalline schist, sometimes fine, sometimes coarse with oxidized zones at 391, 400, and 408 feet	207-457
Gray gneiss with quartz vein	457
Coarse crystalline schist	465-500
Dark and light schist containing much quartz and chlorite	520-595
Fine dark gneiss	600-655

Rig used, cable. Diameter of well, 6 inches; depth, 681 feet. Water rises within 100 feet of surface. Well pumps over 100 gallons per minute.

OHIO.

1256. Well near Rockbridge, Hocking County.

[Well begun March 30, 1905; completed May 17, 1905. Authority, R. H. Derry and John Huddleston, drillers. Samples preserved. Geologic correlations by S. Sanford.]

This well gives an interesting section in the Sugar Grove pool, the most important natural-gas reservoir in Ohio outside of the Trenton pools. The rocks penetrated range in age from Carboniferous to Silurian. The formations are Pottsville (Pennsylvanian), Logan group, Cuyahoga and Sunbury shale and Berea sandstone (Mississippian), Bedford and Ohio shales and Onondaga limestone (Devonian), Helderberg and Niagara limestones, Clinton limestone and shale (Silurian).

Record of well No. 7 on Charles Wharton farm, Good Hope Township, 3 miles southwest of Rockbridge.

	Feet.
Soft red or orange sand.....	0- 1
Soft orange and yellow sand and clay, a rotten clayey sandstone; landed 8-inch drive pipe at 43 feet.....	1- 43
Pottsville (?) and Logan:	
Soft buff sandstone.....	43- 85
No record or sample.....	85- 125
Soft red, buff, and light-buff sandstone.....	125- 190
Soft white and light-gray sandstone; fresh soft water was struck at 175 feet; at 340 feet the water rises to within 150 feet of surface.....	190- 340
Soft brownish sandstone.....	340- 380
Soft light-gray gritty sandstone.....	380- 420
Harder gray limy sandstone, very gritty.....	420- 440
No record or sample.....	440- 450
Cuyahoga and Sunbury:	
Soft gray shale.....	450- 530
Soft gray limy sandstone.....	530- 550
Soft dark-gray shale.....	550- 620
Soft black shale.....	620- 640
Very soft dark-gray shale.....	640- 660
Berea:	
Hard light-gray limy sandstone; show of oil and a little gas.....	660- 665
Hard dove-colored sandstone—salt water; sandstone is about 33 feet thick.....	665- 685
Bedford:	
Soft gray gritty shale.....	685- 700
Soft red shale.....	700- 780
Ohio:	
Soft black, dark-gray, and black shale.....	780- 875
Soft gray shale.....	875-1,000
Soft black or dark-gray shale.....	1,000-1,165
Soft dark-brown, slightly limy shale.....	1,165-1,205
Harder and darker, more or less limy shale.....	1,205-1,265
Hard gray limy shale.....	1,265-1,285
Hard dark-brown shale.....	1,285-1,305
Hard and soft dark brownish-gray limy shale.....	1,305-1,365
Soft light-gray limy shale.....	1,365-1,370
Soft dark-gray, almost black shaly limestone.....	1,370-1,390
Soft light-gray limy shale.....	1,390-1,504

Onondaga, Helderberg, and Niagara:

	Feet.
Hard gray and white limestone.....	1, 504-1, 565
Hard gray and brownish limestone—little more salt water at 1,585 feet, about five-sixths gallon per minute.....	1, 565-1, 660
Hard brown limestone.....	1, 660-1, 760
Hard brown and gray limestone.....	1, 760-1, 800
Hard dark-gray limestone.....	1, 800-1, 810
Hard gray and brown limestone.....	1, 810-1, 885
Hard brown limestone.....	1, 885-1, 925
Hard brownish, grayish, and brownish limestone; at 1,950 feet hole filled with salt water to within 600 feet of surface.....	1, 925-2, 065
Hard dove-colored limestone.....	2, 065-2, 105
Hard brownish and gray limestone.....	2, 105-2, 165

Clinton:

Soft brownish-gray limy shale.....	2, 165-2, 240
Soft gray limy shale.....	2, 240-2, 270
Soft gray limestone and shale.....	2, 270-2, 280
Soft light-brown limy shale.....	2, 280-2, 294
Clinton sand (hard gritty light-gray limestone and dark-gray shale), 30 feet thick.....	2, 294-2, 324

Diameter of well, 8 inches from 0 to 700 feet; 6½ inches from 700 to 2,135 feet. Length of casing, 2,135 feet. Gas found in Clinton sand; estimated yield, 1,250,000 cubic feet in twenty-four hours.

1269. Well near Ava, Noble County.

[Well completed September 21, 1904. Authority, Jacob Von Gunten, driller. No samples.]

This test hole for coal was sunk on a hill about 3 miles west of Ava. The beds penetrated belong to the Monongahela formation and give an idea of the alternation of sandstone, shale, and limestone found in that portion of the Pennsylvanian series. The coal at 384½ feet may be the Meigs Creek seam, which is thought to be equivalent to the Sewickley of Pennsylvania.

Record of well No. 1 on Morris Danford's farm, Brookfield Township.

	Feet.
Red clay.....	0 - 18
Red shale.....	18 - 100
Gray shale.....	100 - 113

Gray sandstone.....	294 - 307
Gray shale.....	307 - 320
Gray sandstone.....	320 - 384
Coal.....	384 - 384½
Fire clay.....	384½ - 390

Rig used, diamond drill.

1271. Well near Genoa, Ottawa County.

[Well begun and completed in October, 1905. Authority, E. L. Rugh, of Rugh & Delo, contractors. Samples preserved. Geologic correlations by S. Sanford.]

Oil is found in the Trenton limestone (Ordovician). The overlying formations are, in downward order, Helderberg limestone, Niagara limestone and shale, Clinton limestone, and Medina shale (Silurian); and Cincinnati (gray) and Utica (brown) shales (Ordovician).

Record of well 2 miles north of Genoa.

Helderberg, Niagara, and Clinton:	Feet.
Hard gray magnesian limestone.....	25- 210
Soft white limestone.....	210- 390
Hard blue-gray limestone.....	390- 445
Soft gray shale.....	445- 520
Soft light-gray shaly limestone.....	520- 570
Soft gray dolomite.....	570- 600
Medina:	
Soft red shale.....	600- 690
Cincinnati:	
Hard gray shale.....	690- 800
Soft gray shale.....	800-1,075
Utica:	
Hard dark brownish-gray shale.....	1,075-1,299
Trenton:	
Hard brown and gray limestone with light and dark gray shale from 1,314 to 1,325 feet.....	1,299-1,351

Rig used, cable. Diameter of casing, 10 inches from 0 to 25 feet; 8 inches from 25 to 520 feet. Well shot with 240 quarts of nitroglycerin. Initial yield of oil, 76 barrels in twenty-four hours; gravity, 34° B.

1281. Well near Helena, Sandusky County.

[Well begun July 13, 1905; completed August 1, 1905. Authority, O. J. Garn, of Imler, Garn & Co., owners. Incomplete set of samples preserved. Geologic correlations by S. Sanford.]

Helena is near the eastern edge of an irregular oil pool that underlies parts of Sandusky, Wood, and Seneca counties. The oil occurs in the Trenton limestone. The overlying formations below the drift are, in downward order, Niagara limestone and shale, Clinton shale, and Medina shale (Silurian); Cincinnati shale and limestone, Utica shale, and Trenton limestone (Ordovician).

Record of well in the SW. $\frac{1}{4}$ NE. $\frac{1}{4}$ sec. 35, Washington Township.

Drift:	Feet.
Yellow sand and clay.....	0- 7
Niagara:	
Soft white limestone.....	7- 40
Limestone with blue slate (gray sandstone).....	40- 60
Very hard white (to brownish cherty) limestone.....	60- 90
Hard white (to brownish cherty magnesian) limestone.....	90-130
Gray limestone (brownish, magnesian).....	130-170

Soft blue shale (dark gray, slightly limy).....	940- 960
Soft white shale (dark gray and brownish, slightly limy).....	960- 980
Soft white and blue shale (dark gray, slightly limy).....	980-1,000
Soft white shale (dark gray, slightly limy).....	1,000-1,080

Utica:

Soft brown shale (brown and gray, slightly limy).....	1,080-1,320
---	-------------

Trenton:

• Hard light limestone.....	1,337
Hard light-brown, gray, and dark-gray limestone; oil-bearing strata, 1,337-1,355; salt water, 1,365-1,377 feet	1,337-1,377

Rig used, cable. Diameter of well, 10 inches from 0 to 14 feet; 8 inches from 14 to 472 feet; 6 inches from 472 to 1,377 feet. Length of casing, 472 feet. Well yielded 5 barrels of oil, gravity 38° to 40° B., in the first twenty-four hours. From 472 to 1,327 feet hole was so dry that water had to be run in for drilling.

1287. Well east of Akron, Summit County.

[Well begun May 12, 1905; completed July 24, 1905. Authority, James Douglas, contractor. Incomplete set of samples preserved. Geologic correlations by S. Sanford.]

This well, though it found neither oil nor gas in paying quantities, is of interest from its depth, being the deepest reported from Ohio, and also from the great thickness of the salt beds penetrated. The age of these beds is disputed. They have been assigned to the same period as the Cayuga group (Silurian) of New York, but the State geologist was inclined to include them in the Helderberg (latest Silurian). The overlying formations are of Mississippian (lower Carboniferous) and Devonian age and are thus classified: Cuyahoga and Sunbury shales and Berea grit (Mississippian), Onondaga and Helderberg limestones (Devonian and Silurian), Helderberg and Cayuga salt beds (Silurian). The well may also penetrate rocks of the Niagara group (Silurian).

Another well, 1 mile farther west, is said to have struck oil in paying quantities at 2,645 feet.

Record of well 3 miles east of Akron.

	Feet.
Drift:	
Gravel and quicksand	0- 139

Soft shale.....	3, 240-3, 280
Ningara (?):	
Hard limestone.....	3, 280-3, 480
Hard limestone—little oil, gas, and water.....	3, 480-3, 500
Hard white sandstone.....	3, 500-3, 505
Hard limestone.....	3, 505-3, 749
Soft slate.....	3, 749-3, 789

Diameter of casing, 10 inches from top to 139 feet; 8½ inches from 139 to 455 feet. Diameter of well below casing, 8½ inches from 455 to 3,310 feet; 6½ inches from 3,310 to 3,789 feet. No oil nor gas found.

1290. Well at Zoar, Tuscarawas County.

[Well begun August 2, 1905; completed August 19, 1905. Authority, H. H. McKinney, driller. No samples. Geologic correlations by S. Sanford.]

This record, though the well produced neither oil nor gas, is of interest, as no logs of wells in Lawrence Township have been published. The State Survey has noted that a number of wells have been put down there, but the records were not placed at its disposal. The formations penetrated belong to the Pennsylvanian or Coal Measures and Mississippian series of the Carboniferous system. The formations, in descending order, are Allegheny limestone and shale, Pottsville (including Salt sand), Logan group (including Big Injun) and Berea grit.

Record of well No. 1 on John Bimeler farm, 800 feet east of Zoar post-office.

	Feet.
Surface soil.....	0- 7
Allegheny:	
Yellow shale.....	7- 20
Blue limestone; water bearing.....	20- 25
Soft black shale.....	25- 40
Hard blue limestone.....	40- 45

Pottsville:	Feet.
Soft sandstone, salt sand	160-200
Logan:	
Black shale.....	200-230
Sandstone, Big Injun.....	230-344
Cuyahoga and Sunbury:	
Black shale.....	344-430
Shale with alternate layers of sandstone; formation is nearly all shale.....	430-735
Berea:	
Sandstone, Berea grit.....	753-795
Rig used, cable. Casing used, 8-inch to 430 feet; 6½-inch from 430 to 790 feet. A smell of oil and a little show of gas at 775 feet. A large amount of salt water at 790 feet.	

1297. Well at Creston, Wayne County.

[Well begun in April, 1905; completed in June, 1905. Authority, R. Lambie, contractor and driller. Samples preserved. Geologic correlations by S. Sanford.]

This log is fairly typical of some shallow wells in Wayne County developing the oil and gas found in the Berea grit, a sandstone of remarkably constant character that underlies about 15,000 square miles of the State. It occurs in the Mississippian series of the Carboniferous below the Big Injun formation. It is underlain by the Bedford red shale (Devonian) and overlain by the Sunbury and Cuyahoga shales. The record shows that the Berea at this well is very thin.

Record of well No. 1 on Martin Cole farm, one-half mile north of Creston.

Drift:	Feet.
Dark sandy loam.....	0- 1
Soft reddish clay with sand and gravel.....	1- 20
Soft gray sand; water-bearing.....	20- 30
Very soft gray limy clay.....	30-100
Soft gray sand; water-bearing.....	100-163
Soft gray limy clay.....	163-179
Soft dark clay, sand, and gravel.....	179-246
Cuyahoga and Sunbury:	
Soft light and dark gray shale; contains a little water.....	246-440
Berea:	
Coarse light-gray sandstone; gas-bearing, pressure 20 pounds per square inch;	
Berea grit.....	440-441
Soft dark-gray shale.....	441-443
Bedford:	
Soft red shale.....	443-493
Soft gray and reddish shale.....	493-512

Rig used, cable. Diameter of well, 8 and 6 inches. Length of casing (4½-inch), 280 feet; of drive pipe, 256 feet.

OKLAHOMA.**1318. Well near Cleveland, Pawnee County.**

[Well begun and completed in 1905. Authority, J. L. Apple, of Apple, Elyea & Co., owners. No samples.]

This record shows formations underlying the pay horizon of the Cleveland oil pool for nearly 900 feet. The rocks are of Pennsylvanian age. The rocks outcropping for 25 miles west and east and 40 miles north have been grouped together as the Hominy formation (Pennsylvanian), including the Pottawatomie, Douglas, Shawnee, Wabaunsee, Cottonwood, and Neosho formations of the Kansas geologists, and have a thickness of over 1,500 feet. The depth to Mississippian rocks at Cleveland is unknown, but may be 10,000 feet.

The geology of Oklahoma is discussed in Water-Supply and Irrigation Paper No. 148, "Geology and water resources of Oklahoma," by C. N. Gould.

Record of well on C. D. Law farm in the northeast corner of sec. 15, T. 22, R. 7.

	Feet.
River sand.....	0- 32
Slate and sand in alternating beds, with water at 142-182 feet and salt water at 420-440 feet.....	32- 775
Limestone.....	775- 780
Slate, sand, and slate; at 1,070 feet hole filled up 890 feet with salt water	780-1, 350
Limestone, shells, and slate.....	1, 350-1, 500
Sand; enough water to drill; thought to be Cleveland gas sand.....	1, 500-1, 520
Slate; Cleveland oil sand should be near 1,650 feet.....	1, 520-1, 870
Sand; 3 bailers of water.....	1, 870-1, 900
Black shale.....	1, 900-1, 985
Hard limestone.....	1, 985-2, 085
Black shale.....	2, 085-2, 110
Limestone.....	2, 110-2, 155
Shale.....	2, 155-2, 175
Hard shell.....	2, 175-2, 178
Shale.....	2, 178-2, 190
Sand, thought to be horizon of Bartlesville oil; showing of gas and oil at 2,210 feet; shale break at 2,220-2,235 feet.....	2, 190-2, 250
Shale.....	2, 250-2, 410
Limestone.....	2, 410-2, 420
Shale.....	2, 420-2, 450

Casing used, 350 feet of 10-inch; 800 feet of 8½-inch; 1,350 feet of 6½-inch. At 2,450 feet the cable broke, dropping the tools and 2,300 feet of rope; the hole caved over the tools and was abandoned.

PENNSYLVANIA.

1336. Well in Parks Township, Armstrong County.

[Well completed in 1905. Authority, F. H. Oliphant. No samples. Geologic correlations by Charles Butts.]

This skeleton log of a well in Armstrong County is given because of its depth. The drill passed through rocks of Carboniferous and Devonian age, which are included in the Allegheny and Pottsville (Pennsylvanian) and Mauch Chunk and Pocono (Mississippian) of the Carboniferous system and the Catskill and Chemung of the Devonian.

The geology of a large part of Armstrong County and the occurrence of the various oil and gas sands are described in the Kittanning folio (No. 115) and the Rural Valley folio (No. 125) of the Geologic Altas of the United States.

Record of well No. 323 on G. W. Parker farm, Parks Township.

Sand, poor.....	2, 145-2, 230
Sand, poor.....	2, 590-2, 650
Slate and shells.....	2, 650-2, 812

Well was plugged and filled in from 2,812 to 2,102 feet. Gas at 2,018 feet flowed naturally 50,000 cubic feet per day and 130,000 cubic feet twenty-four hours after well was shot.

1345. Well near Waynesburg, Greene County.

[Well completed in March, 1895. Authority, F. H. Oliphant. No samples. Geologic correlations by R. W. Stone.]

This deep well shows the formations underlying the Pittsburg coal for nearly 2,600 feet. The rocks are of Carboniferous—including Permian, Pennsylvanian, and Mississippian—and Devonian age. The formations represented are Washington (Permian); Monongahela, Conemaugh, Allegheny, and Pottsville (Pennsylvanian); and Mauch Chunk and Pocono, or Big Injun (Mississippian). Below the Pocono are sandstones and shales of Devonian age which have not been given formation names, though certain sandstones are recognized by drillers and have been named.

The geology of the region near Waynesburg is discussed in the Waynesburg folio (No. 121) of the Geologic Atlas of the United States.

Record of well No. 1 on H. M. Spragg farm, 6 miles south of Waynesburg.

Dry hole.

1350. Well at State Run, Lycoming County.

[Well begun April 11, 1905; drilling stopped May 11, resumed August 30; well completed September 25, 1905. Authority, W. E. Sandborn, superintendent Tidewater Pipe Company, owner. Samples preserved. Log compiled from samples by S. Sanford. Geologic correlations by R. W. Stone.]

This deep well gives a section in the Blossburg syncline, a broad fold the axis of which passes west of the well. The formations penetrated are of Devonian age and include the lower part of the Catskill-Pocono group (the Cattaraugus formation of Tioga County to the northwest) and part of the Chemung formation. The Cattaraugus formation is characterized by red shale and red, brown, and gray sandstones and the Chemung by gray or greenish shales and sandstones. The character of these rocks in Tioga County is described in the Elkland-Tioga folio (No. 93) of the Geologic Atlas of the United States.

Record of well No. 1 on J. B. Tomb farm.

Cattaraugus:

	Feet.
Hard gray sandy shale; much fresh water.....	50- 106
Hard brownish-red sandy and limy shale.....	106- 146
Hard red and brown sandstone with limy layers.....	146- 161
Hard gray sandy and limy shale.....	161- 166
Hard red limy, shaly sandstone; large pieces of "red rock" and pebbles at 181 feet.....	166- 186
Hard fine drab limy sandstone.....	186- 209
Hard fine brownish-red sandstone.....	209- 229
Hard reddish-gray shaly sandstone to 240 feet, brownish-red below.....	229- 250
Hard red sandy shale to 270 feet, reddish-gray below.....	250- 290
Hard fine gray sandstone.....	290- 310
Hard reddish-gray shaly sandstone to 332 feet, red below.....	310- 350

Cattaraugus—Continued.

	Feet.
Hard red sandy shale	350— 356
Hard reddish-brown shaly sandstone	356— 373
Very hard gray sandstone	373— 396
Very hard red sandy shale or fine argillaceous sandstone	396— 412
Hard rock (no sample)	412— 438
Hard red and gray shaly sandstone; little salt water at 476 feet	438— 476
Hard reddish-gray limy sandstone	476— 500
Hard reddish limy sandstone to 524 feet, gray to 548 and reddish-brown to 560 feet; little salt water at 506 feet; flood of it at 560 feet	500— 560
Hard fine red and reddish-brown sandstone	560— 569
Medium hard reddish-gray limy sandstone	569— 580
Hard red and gray limy, sandy shale to 602 feet, gray below; hole caved at 601 feet	580— 620
 Chemung:	
Hard dark-gray shale and gray limestone	620— 640
Hard gray shaly limestone	640— 660
Hard dark-gray limy shale; from 670 to 680 feet very hard drilling; some salt-sulphur water	660— 680
Gray sandy and limy shale to 774 feet, dark gray below	680— 794
Hard gray shaly limestone	794— 812
Hard dark-gray sandy shale and light-gray shaly limestone	812— 824
Hard gray sandy and limy shale	824— 862
Hard gray limy grit; little gas at 862 feet	862— 868
Soft gray sandy and limy shale	868— 870
Hard dark-gray sandy shale and light-gray sandy limestone	870— 875
Hard gray sandy shale	875— 887
Hard gray sandy limestone	887— 898
Hard gray sandy shale, with limy layers	898— 986
Hard dark-gray sandy shale, gray and limy below 1,004 feet	986—1, 028
Hard gray grit, limy below 1,034 feet	1, 028—1, 040
Hard gray sandy shale, with limy layers	1, 040—1, 070
Hard gray limy grit and sandy magnesian limestone; some gas at 1,086 feet	1, 070—1, 140
Hard light-gray limestone and gray limy grit, softer below 1,142 feet; good gas at 1,142 feet	1, 140—1, 148
Dark-gray limy shale from 1,148 to 1,153 feet; very hard limy sandstone below; struck salt water; well plugged up to 1,153 feet; gas from between 1,142 and 1,153 feet gave 130,000 cubic feet in twenty-four hours; rock pressure of gas in 1,142-foot sand was 910 pounds per square inch; when this gas was exhausted drilling was resumed	1, 148—1, 155½
Fine gray argillaceous sandstone or sandy shale	1, 155—1, 210
Light-gray limy sandstone and dark-gray sandy shale	1, 210—1, 240
Soft, fine gray limy, argillaceous sandstone	1, 240—1, 265
Soft gray shale	1, 265—1, 276
Soft gray sandy and limy shale and limy sandstone	1, 276—1, 335
Hard gray slate (sandy shale with limy streaks)	1, 335—1, 380
Gray shelly slate (gray sandy shale)	1, 380—1, 455
Soft gray slate with hard shells (gray limy and sandy shale)	1, 455—1, 500
Hard slate and sand (sample like preceding)	1, 500—1, 522
Soft gray slate (slightly limy and sandy shale) with hard layers at 1,664 to 1,706 feet	1, 522—1, 745
Gray sand and slate (dark-gray limy and sandy shale)	1, 745—1, 756

Chemung—Continued.

	Feet.
Soft gray slaty sand (slightly sandy and limy shale).....	1,756-1,858
Hard dark-gray argillaceous sandstone and light-gray sandstone to 1,860 feet; hard dark-gray limy, sandy shale to 1,870 feet; limy, sandy shale and shaly sandstone below.....	1,858-1,878
Gray slate and sand (varying proportions of sand, rocks ranging from soft, slightly sandy shale to hard, fine sandstone).....	1,878-1,953
Gray slate (gray sandy shale, slightly limy).....	1,953-2,000
Fine, hard slate (fine, slightly limy, argillaceous sandstone).....	2,000-2,045
Hard gray slate (gray sandy shale, slightly limy).....	2,045-2,128
Soft gray slate (shale much like preceding).....	2,128-2,198
Gray limy, argillaceous sandstone.....	2,198-2,280
Gray sandy shale, more or less limy.....	2,280-2,335
Fine dark-greenish, slightly limy, micaceous sandstone.....	2,335-2,352
Gray sandy and limy rocks, hardness varying with proportion of sand; sandy shales and argillaceous sandstones.....	2,352-2,503

Rig used, cable. Casing used, 601 feet of $6\frac{1}{4}$ -inch. Hole was filled with fresh water from 40 to about 350 feet.

1355. Well near Pocahontas, Somerset County.

[Well completed in 1905. Authority, P. E. Finzel, general manager Piney Run Oil and Gas Company, owner. Samples to 1,174 feet preserved. Log compiled from samples by S. Sanford.]

This is one of the deepest wells drilled in southern Somerset County of which the Survey has record. The well is on the axis of the Deer Park anticline, about midway between Great Savage and Meadow mountains. Apparently the first formation penetrated is the Jennings. This formation in Garrett County, Md., is 3,000 to 5,000 feet thick and is composed of shales, sandy shales, and sandstones. It contains beds corresponding in age to the Chemung, Nunda, and Genesee epochs of the Devonian period. Below it is the Romney formation, also Devonian, 1,600 feet thick, of sandstone and shale.

Record of well in Greenville Township, 1 mile north of Pocahontas.

	Feet.
Dark-gray sandy shale and light-gray limestone.....	45- 85
Light-gray sandstone and dark-gray sandy shale.....	85- 125
Dark-gray sandstone.....	125- 140
No sample.....	140- 175
Dark-gray sandy shale.....	175- 180
No sample.....	180- 200
Brownish limestone and dark-gray sandy shale.....	200- 275
Dark-gray sandy shale and limy sandstone.....	275- 300
Dark-gray, slightly limy, sandy shale.....	300- 325
Dark-gray sandy shale and light-gray limestone.....	325- 535
Dark-gray sandy shale and limy sandstone.....	535- 775
Dark-gray sandy shale.....	775- 800
Light-gray and brown sandstone.....	800- 950
Gray limy sandstone.....	950- 960
Light-gray sandstone and dark-gray sandy shale.....	960- 980
Dark-gray sandy shale and light-gray and brown sandstone.....	980-1,025
Light and dark gray sandy shale and brown sandstone.....	1,025-1,105
Fine gray and brown sandstone.....	1,105-1,115
Gray sandstone.....	1,115-1,174
Slate and limestone.....	1,174-1,400
Chocolate-colored sand; showing of oil	1,400-1,450

	Feet.
Slate.....	1,450-1,500
Sand.....	1,500-1,585
Slate and limestone.....	1,585-2,500

Elevation of well, about 2,200 feet. Casing used, 300 feet of 8½-inch; 600 feet of 6¼-inch; 1,600 feet of 5½-inch. Principal water bed was in gravel at 40 feet. Well abandoned and plugged at 2,500 feet.

1369. Well near Grand Valley, Warren County.

[Well completed February 29, 1888. Authority, J. G. Winger. Incomplete series of samples preserved.]

This is a record of one of the deepest wells put down in the Grand Valley oil field and is of interest as showing the character of the rocks underlying the Third sand, in which most wells in the field stopped. The rocks, including the three oil sands, have been called the "Venango oil group." They belong to the Catskill-Pocono group and their exact age, whether Carboniferous or Devonian, is more or less in doubt.

Record of well No. 1 on Zane farm, lot No. 147, Eldred Township.

	Feet.
Soft yellow clay.....	0- 20
Hard gray and black shale and sand.....	20- 262
Soft, generally black sandy shale.....	262- 411
Soft gray sandstone, Second sand; show of oil and very small show of gas and salt water.....	411- 459
Black and blue soft shale.....	459- 642
Hard red sand, upper part of Third sand; oil and gas are frequently found in this bed near Grand Valley.....	642- 646
Gray sand; hard and contained gas from 646 to 649 feet; soft and slight show of oil below, bottom of Third sand.....	646- 655
Hard black shale.....	655- 765
Soft red and brown shale.....	765- 965
Hard gray and black sand.....	965-1,340
Hard black shale.....	1,340-1,368

Rig used, standard. Casing used, 262 feet of 5½-inch. Fresh water from 50 to 200 feet. Initial yield of gas, 60,000 feet; rock pressure, 30 pounds per square inch.

1371. Well near Grand Valley, Warren County.

[Well begun September 29, 1905; completed October 13, 1905. Authority, Josiah G. Winger, contractor. Samples preserved.]

This carefully kept log of a well in the Grand Valley field mentions an unusual feature, a fall of water from 80 to 160 feet. The well, though shallow, shows the character of the Second and Third sands of the "Venango oil group" at this point. The rocks are included in the Catskill-Pocono group and are of Carboniferous or Devonian age.

Record of Dunderdale well No. 18 in borough of Grand Valley.

	Feet.
Soft yellow clay.....	0 - 15
Soft bluish shale.....	15 - 70
Hard, fine gray sandstone, First or Mountain sand; fresh water at 80 feet rushes into hole and falls to 160 feet, the water level.....	70 - 89
Hard gray shale.....	89 - 310
Hard, fine gray sandstone, first member of Second sand.....	310 - 320
Soft gray muddy shale, second member of Second sand.....	320 - 340
Hard gray sandstone, third member of Second sand.....	340 - 350

	Feet.
Soft black muddy shale, top of Third sand at 547 feet.....	350 -547
Hard, coarse brownish sandstone, with pebbles, first 2 feet of Third sand.....	547 -549
Hard light-gray sandstone and dark-gray shaly sandstone, second 2 feet of Third sand.....	549 -551
Soft, coarse white or brownish sandstone, the pay sand; free flow of oil and gas; this probably overlain by a 1-inch stratum of black shale.....	551 -554
Soft white porous sandstone, pay sand, bottom of pay at 557 feet.....	554 -557
Hard, fine white sandstone—salt water; while drilling this 3 feet oil and water rose in the hole to a height of 100 feet; probably all salt water produced is from this horizon.....	557 -560
Hard grayish-white sandstone, called "Salt sand;" may contain salt water ..	560 -570½
Soft brownish-gray sandstone, bottom of Salt sand at 575 feet.....	570½-575
Soft dark pebbly sandstone and shale, much "broken up" and not regarded by Mr. Winger as a solid sand.....	575 -579
Soft dark-gray shale and light-gray sandstone and conglomerate.....	579 -583
Hard shale, conglomerate, and sand (sample like preceding).....	583 -588½
Soft light-gray sandstone and dark-gray shale and sandstone, bottom of Third sand at 598 feet; sand 51 feet thick.....	588½-598
Soft black shale.....	598 -609½

Rig used, standard. Diameter of well, 16 inches to 15 feet; 8 inches from 15 to 257½ feet; length of casing, 257½ feet. Well shot at 551 feet with 40 quarts of nitroglycerin. Yield first twenty-four hours, 11½ barrels, 45° oil; initial pressure of gas estimated at 60 pounds.

1398. Well near Warren, Warren County.

[Well completed in 1905. Authority, F. B. Jackson, owner. Samples preserved. Log compiled from samples by S. Sanford.]

This is the second deepest well drilled in northern Pennsylvania of which the Survey has a record. The formations penetrated are probably all of Devonian age. The drill passed through the Catskill formation and through the Chemung, Nunda (Portage), Genesee (?), Hamilton, and Marcellus formations (Devonian), if the limestones encountered below 3,395 feet correspond to the Onondaga, of New York. The only other well in the oil fields of northern Pennsylvania to reach the Onondaga is the Conway well, 3,880 feet deep, in Venango County. In the report of the Second Geological Survey of Pennsylvania, Vol. I4, Mr. John F. Carll indicated that the Onondaga might be found under Warren at a depth of about 3,000 feet. The oil-bearing sands found in the wells at Warren underlie, at an interval of about 300 feet, the sands of the "Venango oil group," which contain oil at Grand Valley and elsewhere in the southwestern part of Warren County. Owing to the lack of good evidence, no attempt is made to correlate the sandstones penetrated by this well with those reported from the productive wells at Warren and North Warren. The well started apparently in the "Venango oil group."

Record of well on Greene farm, 3 miles west of Warren.

	Feet.
Sand and gravel.....	0- 100
Dark-gray sandy shale and light-gray argillaceous sandstone, slightly limy..	100- 200

Black shale.....	3, 520-3, 660
Black shale with light limestone.....	3, 660-3, 670

Diameter of well, 7½ inches. Casing used, 406 feet of 8-inch. Well perfectly dry, no water being encountered.

1416a. Well near Thomas, Washington County.

[Well begun November 20, 1905; completed December 31, 1905. Authority, S. D. McCloy, of Lyle & McCloy, contractors. Samples preserved. Log compiled from samples by S. Sanford. Geologic correlations by R. W. Stone.]

This log shows in a general way the character of the formations overlying the "Fifty-foot" sand in the Speer oil pool in Washington County. The formations are of Carboniferous age, including parts of the Pennsylvanian and Mississippian series. They are, in descending order, Monongahela, Conemaugh, Allegheny, and Pottsville (Pennsylvanian); and Mauch Chunk and Pocono (Mississippian). The approximate limits of these formations are indicated.

Record of well No. 1 on John R. McMurray farm, 1½ miles north of Thomas.

	Feet.
Soil.....	0- 12
Monongahela:	
Soft dark-gray and brownish limestone.....	12- 50
Soft, coarse gray micaceous sandstone; water at 65 feet.....	50- 100
Hard brown limestone and coarse gray micaceous sandstone.....	100- 150
Soft, coarse gray sandstone.....	150- 200
Hard brownish-gray limestone.....	200- 250
Soft dark gray and black shale.....	250- 300
Soft dark-gray and greenish, slightly limy shale.....	300- 350
Soft black sandy shale.....	350- 395
Coal (Pittsburg); water.....	395- 402

Conemaugh:

	Feet.
Gray and brown limestone and dark sandy shale; bottomed 10-inch casing at 412 feet.....	402- 450
Soft light and dark gray sandy shale.....	450- 500
Soft red shale and green limy sandstone.....	500- 550
Hard gray, slightly limy sandstone.....	550- 600
Soft greenish-gray shale, darker below 650 feet.....	600- 700
Hard, fine dark-greenish sandstone, with brownish limestone.....	700- 750

Conemaugh and Allegheny:

Soft light-greenish and dark-gray or brownish shale; bottomed 8-inch casing at 775 feet.....	750- 800
Hard brown and gray sandy shale.....	800- 850
Soft dark slate (no sample).....	850- 900
Soft dark gray sandy shale with limy streaks.....	900- 950
Hard gray sandstone with limy streaks.....	950-1,000
Soft light shaly, argillaceous sandstone.....	1,000-1,050
Hard, fine greenish limy sandstone and brown limestone.....	1,050-1,100
Gray, greenish, and brownish sandstone with sandy shale.....	1,100-1,150
Soft gray sandstone and black sandy shale.....	1,150-1,200

Pottsville:

Soft dark shaly, micaceous sandstone.....	1,200-1,250
Hard, coarse light and dark gray and brownish sandstone, slightly limy.....	1,250-1,350

Mauch Chunk:

Soft dark-gray sandy shale and greenish and brownish shale.....	1,350-1,400
Soft black sandy shale.....	1,400-1,450
Gray and brownish shale and brownish limestone, Greenbrier limestone.....	1,450-1,500

Pocono:

Gray sandstone and black argillaceous sandstone and sandy shale.....	1,500-1,550
Hard white, light-gray, and brownish sandstone, upper portion limy	1,550-1,750
Hard, coarse gray sandstone and dark-gray sandy shale.....	1,750-1,800
Hard gray sandstone, dark-gray micaceous, shaly sandstone, and sandy shale.....	1,800-1,850
Hard, medium brown and greenish sandstone, slightly limy, and dark sandy shale.....	1,850-1,900
Soft dark argillaceous sandstone and sandy shale.....	1,900-2,000
Gray and dark-gray micaceous sandstone, with shaly streaks; hard to 2,050 feet; soft and somewhat limy below.....	2,000-2,100

Pocono or Catskill (?):

Hard gray sandstone and dark-gray shaly sandstone.....	2,100-2,150
Hard gray, greenish, and brownish sandstone and dark-gray shaly sandstone.....	2,150-2,200
Gray sandstone, dark-gray shaly sandstone, and sandy shale.....	2,200-2,250
Hard gray sandstone and dark-gray argillaceous sandstone.....	2,250-2,310
Soft, coarse light-gray sandstone and fine dark-gray sandstone.....	2,310-2,342

Rig used, cable. Diameter of well at mouth, 13 inches; at bottom, 6½ inches. Casing used, 412 feet of 10-inch; 700 feet of 8-inch; 1,570 feet of 6½-inch.

SOUTH CAROLINA.

1420. Well at Aiken, Aiken County.

[Well begun and completed in 1905. Authority, Perry Andrews, contractor and driller. Samples preserved to 560 feet. Log compiled from samples by S. Sanford. Geologic correlations by W. B. Clark.]

Aiken is near the western edge of the Atlantic Coastal Plain, and the Coastal Plain deposits are consequently comparatively thin there. This well goes through them and into the underlying granite or gneiss. The sedimentary beds penetrated belong to the Lafayette (Pliocene) and Potomac (early Cretaceous) formations.

Record of well of Carolina Light and Power Company at Aiken.

	Feet.
Lafayette:	
Bright-red clayey sand.....	20
Pale-red clayey sand.....	40
Potomac:

Sand and gravel with brownish clay.....	440
Algonkian (?):	
Coarse granite or gneiss.....	460-560

Rig used, cable. Depth of well, 1,000 feet. No water of moment found; maximum yield of well, 25 gallons per hour.

1425. Well near Otranto, Barnwell County.

[Well begun August 6, 1905; completed in 1905. Authority, Hughes Specialty Well Drilling Company, contractor. Incomplete series of samples preserved. Geologic correlations by W. B. Clark.]

The formations penetrated by this well below 20 feet are of Eocene (Tertiary) and late Cretaceous age.

Record of well 2 miles north of Otranto.

	Feet.
Eocene:	
Tough light marl (gray limy clay or soft clayey limestone).....	20 -140
Phosphate rock (hard black and gray nodules, may be phosphatic).....	140 -142
Shell rock (white to brownish limestone with chert and possibly apatite).....	142 -290
Eocene or Cretaceous (?):	
Gray sand.....	290 -300
Rock (gray, more or less silicified limestone with sand).....	300 -310
Medium-fine gray sand.....	310 -317
Hard rock (gray, more or less silicified limestone, containing dark nodules).....	317 -327
Shell rock (limestone like preceding with dark shaly layers).....	327 -337
Cretaceous:	
Dark-tough marl (limy clay and sand with glauconite).....	337 -380
Tough dark sandy marl (olive-gray sand and clay, containing a few bits of fossil shells).....	380 -400
Tough dark marl (no sample).....	400 -498½
Hard rock (no sample).....	498½ -500
Tough dark marl (no sample).....	500 -600

Cretaceous—Continued.

	Feet.
Hard rock (no sample)	600-605
Soft sandy marl (fine, olive-gray, slightly limy sand)	605-650
Tough dark marl (no sample)	650-830
Soft sandy marl (no sample)	830-850
Hard rock (no sample)	850-855
Sand and shell (coarse gray sand, limestone, and bits of fossil shells)	855-870
Dark and light sand (medium-fine gray, slightly limy sand, containing glauconite)	870-890
Light-gray sand (coarser than preceding, containing glauconite)	890-918

Rig used, rotary. Casing used, 140 feet of 4-inch; 340 feet of 3-inch; 870 feet of 2-inch. Length of strainer, 20 feet. Principal water bed from 870 to 918 feet. Elevation of well mouth, about 50 feet above sea level. Static head of water, +9 feet.

1426. Well at Fort Moultrie, Charleston County.

[Well completed in 1905. Authority, Capt. F. W. Cole, constructing quartermaster. No samples. Geologic correlations by W. B. Clark.]

This is one of the very deep wells to obtain good water from sedimentary formations underlying the Atlantic Coastal Plain. It is thought that the water-bearing sands developed belong to the Potomac formation (early Cretaceous) and that the great mass of "marl," sand, and sandstone above 1,820 feet is of late (marine) Cretaceous age. Beds of Tertiary age may occur down to a depth of over 500 feet. The samples saved were mostly mud which stuck to the drill, and the drillers' use of terms is probably not accurate. Exact identification of horizons and the grouping of strata are impossible, owing to the present imperfect knowledge regarding the deep-lying formations of the South Carolina coast. The log is given because of the depth of the well and the supply of water obtained, and also because it shows the general character of the beds overlying the water-bearing formations.

Record of well at Fort Moultrie.

	Feet.
Recent:	
Sea sand	0 - 7
Tertiary (?):	
Clay and marl	7 - 91
Marl with layers of cemented shells 1 to 8 feet thick	91 - 348
Hard sandstone	348 - 355
Marl with shells	355 - 371
Soft sandstone	371 - 374
Marl with layers of hard sandstone	374 - 417
Hard sandstone with thin layers of marl	417 - 437
Marl	437 - 515
Cemented shell with thin layers of sandstone	515 - 523
Tertiary and Cretaceous (?):	
Marl with thin layers of sandstone	525 - 650
Marl with layers of shell to 720 feet	650 - 780
Sandstone	780 - 790
Marl with thin layers of sandstone	790 - 810
Sandstone with layers of marl 2 to 3 feet thick	810 - 900
Marl and shells with thin layers of sandstone	900 - 955
Sandstone with hard layers	955 - 1,000
Soft sandstone	1,000 - 1,030
Soft, loose sand with layers of marl	1,030 - 1,170
Hard sandstone with layers of marl	1,170 - 1,190
Marl with hard layers of sandstone	1,190 - 1,216
Marl with thin layers of sandstone	1,216 - 1,306

Tertiary and Cretaceous (?)—Continued.

Hard marl with shells.....	1,775 -1,819½
Hard sandstone.....	1,819½-1,820
Potomac (?):	
Soft sandstone; water-bearing.....	1,820 -1,830
Thin layers of hard and soft sandstone; soft water.....	1,830 -1,838
Sandstone; water-bearing.....	1,838 -1,850
Hard sandstone.....	1,850 -1,855
Sandstone; water-bearing.....	1,855 -1,865
Hard sandstone.....	1,865 -1,870
Sandstone with thin layers below 1,880 feet; water-bearing.....	1,870 -1,900
Marl with hard layers of sandstone.....	1,900 -1,920

Rig used, rotary. Casing used, 9-inch to 1,216 feet; 6-inch to 1,820 feet; 4-inch strainer from 1,820 to 1,920 feet. Elevation of well, about 5 feet above mean high tide; of well outlet, about 5 feet above ground. Well flows about 150 gallons per minute. Temperature of water at well mouth, about 98°; quality of water, soft. Pressure at first, about 36 pounds per square inch.

In drilling a puddled-clay water jet was used for the entire depth and no casing (except for about 100 feet near the surface) was placed until a depth of nearly 1,400 feet was reached. Distinctive samples were obtained from only a few of the strata penetrated.

1440. Well near Hampton, Hampton County.

[Well begun in October, 1905; completed November 24, 1905. Authority, J. M. Jennings, contractor. Samples preserved. Geologic correlations by W. B. Clark.]

This record shows care in discriminating and describing formations, and as few records have been published from Hampton County it is of more than average importance. The upper formations described are thought to be of Eocene age; the water-bearing sand may be Cretaceous.

Record of well 6 miles west of Hampton.

Eocene:

Very fine, soft white sand containing some light-gray marl, quicksand; water-bearing.....	Feet. 75-145
Medium-hard gray and greenish limy sandstone.....	145-160
Soft dark-greenish marl, sticky but not gritty; contains bits of shells.....	160-200
Soft grayish marl containing a little very fine sand and very little, if any, water.....	200-300

Eocene or Cretaceous (?):	Feet.
Soft light-grayish marl or limestone composed largely of shell fragments, hard and soft in layers	300-350
Soft grayish sandy marl, about one-half sand, with a few grains of glauconite, hard and soft layers; no water	350-400
Cretaceous:	
Soft grayish sandy marl, softer than preceding	400-440
Medium-hard light brownish-gray marl, some shell fragments, not sticky	440-550
Soft limestone composed largely of shell fragments, with gray, brown, and red clay, a little glauconite, and colorless and greenish quartz grains	550-735
Soft gray sand, slightly micaceous, with considerable glauconite in fine to coarse grains—water-bearing; the formation to which all deep wells about Hampton are sunk. Mr. Jennings says it is in places over 300 feet thick.	735

Rig used, hydraulic. Diameter of well, 2 inches. Casing, 650 feet of 2-inch. Water at 40, 145, and 735 feet. Water rises 75 feet above surface; flows 70 to 80 gallons per minute.

1448. Well at Bishopville, Lee County.

[Well begun July 21, 1905; completed August 1, 1905. Authority, Hughes Specialty Well Drilling Company, contractor. Incomplete series of samples preserved. Geologic correlations by W. B. Clark.]

This well gets water from a gravel bed in the Potomac (fresh-water Cretaceous) group. The Potomac covers the greatest area and is about the most important of all the water-bearing formations in the series of sediments underlying the Atlantic Coastal Plain from New Jersey to Georgia.

Record of well at Bishopville.

Potomac:	Feet.
Pink sandy clay	1- 20
Soft light-buff clay	20- 30
Coarse white sand	30-165
Coarse reddish sand; artesian water	165-185
Sand and clay in layers	185-220
Tough gray pipeclay and sand	220-240
Tough gray pipeclay	240-258
Hardpan rock	258-262
Coarse red gravel; fine supply of good water	262-292

Rig used, rotary. Diameter of well, 8 inches from surface to 160 feet; 6 inches from 160 to 262 feet. Casing to 262 feet. Cook 6-inch strainer, 262 to 292 feet. Water stands at 19 feet below surface. Well yields 19 gallons per minute for each foot head is depressed from 22 to 26 feet.

1449. Well at Orangeburg, Orangeburg County.

[Well begun and completed in June, 1905. Authority, Hughes Specialty Well Drilling Company, contractor. Samples preserved. Geologic correlations by W. B. Clark.]

This is one of a group of three wells. Water is obtained from a bed of sand that was deposited in Eocene time. The formations penetrated are the Lafayette (Pliocene) loam and clay and Eocene marl and sand.

Record of well one-eighth mile east of Atlantic Coast Line station, Orangeburg.

Pliocene:	Feet.
Yellow sandy loam	1- 2
Orange sandy clay	2- 30
Eocene:	
Soft buff marl (no sample)	30- 40
Hard white cherty limestone	40- 45
Tough sticky gray marl	45- 55
Marl rock (light-gray, loosely compacted limestone)	55-160

Eocene—Continued.

	Feet.
Tough gray marl (fossiliferous).....	160-190
Water stratum (gray sand, white sand, and coarse quartz gravel).....	190-208
Fine gray sand and marl.....	208-228

Rig used, rotary and jet. Diameter of wells, 4½ inches. Length of casing, about 60 feet. Water rises to 12 feet from surface; pumping 400 gallons per minute from three wells; depressed head about 80 feet. Quality, hard.

SOUTH DAKOTA.

1455. Well 11 miles west of Carthage, Beadle County.

[Well begun October 30, 1904; completed November 6, 1904. Authority, H. B. Potter, contractor and driller. No samples. Geologic correlations checked by N. H. Darton.]

This flowing well in the southeastern part of Beadle County obtains water from the Dakota sandstone. The formations penetrated are the drift (Pleistocene) and underlying rocks of Cretaceous age, the Pierre shale, and the Niobrara, Benton, and Dakota formations. The geology of the surrounding region and the depths to the water-bearing formations are discussed in the Huron and De Smet folios (Nos. 113 and 114) of the Geologic Atlas of the United States.

Record of well in the SW. ¼ SW. ¼ sec. 26, T. 109, R. 59.

	Feet.
Drift and Pierre:	
Clay and shale.....	1-326
Niobrara:	
Chalk rock.....	326-335
Niobrara and Benton:	
Hard layers with soft material between, black oily substance.....	335-350
Blue shale with hard layers.....	350-500
Sandstone and hard layers.....	500-700
Dakota:	
Cap rock 6 inches thick	767
Dakota sandstone.....	767-818

Rig used, jet. Casing used, 804 feet of 2-inch. Flow, 85 gallons per minute.

1458a. Well near Roswell, Miner County.

[Well begun November 22, 1905; completed December 10, 1905. Authority, H. B. Potter, driller. No samples. Geologic correlations checked by N. H. Darton.]

This well is one of the many in the Dakotas obtaining flowing water from the Dakota sandstone. The formations underlying the Glacial clay, sand, and gravel are of Cretaceous age. Their order, from top to bottom, is as follows: Pierre, Niobrara, Benton, and Dakota.

Record of well in the SE. ¼ sec. 31, T. 107, R. 57.

	Feet.
Drift:	
Clay.....	1- 4
Sand and gravel.....	4- 50
Blue clay.....	50- 90
Pierre:	
Shale.....	90-290
Niobrara:	
Chalk rock.....	290-340
Niobrara and Benton:	
Shale and soft shale.....	340-582
Shale with hard layers, 12 in all, very hard layer at 633-634 feet.....	582-634
Dakota:	
Sandstone.....	634-672
Honeycomb sandstone, very porous.....	672-710

Rig used, jet. Casing used, 696 feet of 2-inch. Well flows 95 gallons per minute; quality of water, soft.

TEXAS.

1521. Well near San Antonio, Bexar County.

[Well begun April 1, 1904; completed June 1, 1905. Authority, J. P. Benkendorfer, contractor and driller. No samples.]

A number of deep artesian wells have been drilled in or near San Antonio. The city lies in a strip of country between the Gulf Coastal Plain and the Edwards Plateau, the strip being a faulted zone in which the flat-lying rocks of the plateau have been more or less broken and tilted. Hence records may show considerable variations, even when wells are but a short distance apart. The rocks are partly in the Gulf series, or Upper Cretaceous, and partly in the Comanche series, or Lower Cretaceous. Those penetrated by this well probably belong to these formations: Uvalde (Pliocene), Taylor marl, Austin chalk, Eagle Ford shales (Upper Cretaceous); Buda limestone, Del Rio clays, Georgetown and Edwards limestones (Lower Cretaceous).

Record of well 4 miles southwest of San Antonio.

	Feet.
Brown loam.....	0- 8
Cement gravel.....	8- 25
Yellow clay.....	25- 60
Blue clay.....	60- 600
Magnesian limestone; strong vein of water containing a little sulphur and oil rose within 50 feet of surface.....	600- 720
Yellow limestone; strong sulphur water.....	720- 800
Blue, gray, or yellow limestone.....	800- 910
"Lignite".....	910- 950
Hard blue and white limestone.....	950-1,000
Rotten blue clay.....	1,000-1,054
Crystalline limestone; water bearing; small flow rose to 12 feet above surface.....	1,054-1,185
"Sulphur rock".....	1,185-1,250
White limestone.....	1,250-1,350
Porous yellow limestone, full of crevices, making it difficult to keep hole in good condition.....	1,350-1,453

Rig used, standard. Casing used, 400 feet of 10-inch; 600 feet of 8-inch; 1,054 feet of 6-inch. All water above 1,054 feet cased off. Main supply has a static head of + 6 feet; flow, about 300 gallons per minute. Quality, soft, slightly iron bearing.

1526. Well at San Antonio, Bexar County.

[Well completed in October, 1902. Authority, Milo M. Garvin, driller. No samples.]

This partial log of a deep well at San Antonio gives the higher water-bearing formations there.

Record of well in South Flores street, San Antonio.

	Feet.
Earth.....	0- 4
Yellow clay.....	4- 44
Gravel and water.....	44- 59
Blue clay.....	59- 900
"Adobe lime".....	900-1,110
Cap-rock sandstone; show of brown, frothy oil and some gas.....	1,110-1,130
White limestone; cold sulphur water at 1,137-1,140 feet; flow; temperature, 72° at well mouth.....	1,130-1,140
Limestone.....	1,140-1,235
Blue clay.....	1,235-1,275
Limestone.....	1,275-1,310

Feet.

Black mud, caves.....	1,310-1,370
Blue limestone.....	1,370-1,410
Yellow "magnesia;" flow	1,410-1,413

Casing used, 60 feet of 10-inch; 669 feet of 8-inch; 975 feet of 6-inch; 435 feet of $5\frac{3}{4}$ -inch. Last flow was in porous rock, "looking like coarse yellow sponge with chalky substance in pores." Finished well flows 4-inch stream of fresh water.

1547. Well near Sauz, Cameron County.

[Well begun in November, 1903; completed in March, 1904. Authority, J. H. Titus, town-site engineer, K. T. and S. Co.]

Sauz is near the center of Cameron County, the southernmost county of Texas. The well shows the character of the formations underlying the surrounding country to a depth of 1,600 feet or more. The rocks penetrated are probably of Tertiary and post-Tertiary age.

Record of well 7 miles southeast of Sauz.

	Feet.
Sand and clay.....	1- 18
White sand; salty water.....	18- 26
Dark clay.....	26- 36
Sand; salty water.....	36- 50
Sandy clay.....	50- 120
Red sand; salty water.....	120- 140
White sandy clay.....	140- 190
Sticky clay and rock.....	190- 370
Black sand; salty water.....	370- 400
Sandy clay and rock.....	400- 446
Sand and lignite.....	446- 465
Sand and loose rock.....	465- 521
Bluish clay; loose boulders and some shell.....	521- 606
Hard rock and flint gravel.....	606- 627
Blue clay 81 feet; blue clay and boulders 52 feet; hard blue clay 25 feet.....	627- 855
Sandstone.....	855- 865
Very hard rock, hard to drill.....	865- 880
Bluish clay and rock.....	880- 953
Very hard rock, hard to drill.....	953- 965
Very dark greenish clay.....	965- 968
Black sand.....	968- 973
Sandstone.....	973- 981
Very fine sand.....	981- 990
Hard rock.....	990- 993
Blue clay.....	993- 995
Hard sandstone.....	995-1,003
Blue clay.....	1,003-1,044
Sandstone.....	1,044-1,360
Very white sandy clay.....	1,360-1,428
Sandstone and blue clay.....	1,428-1,435
Sandy clay, very hard and dry.....	1,485-1,520
Red and blue clay and rock.....	1,520-1,540
Red clay and boulders.....	1,540-1,613

Rig used, jet. Diameter of well, 6 $\frac{1}{2}$ inches at mouth, 4 $\frac{1}{2}$ inches at bottom. Principal supply of water from 1,613 feet. Flows about 135 gallons per minute. Static head not determined. Quality, alkaline, iron bearing. Temperature, not determined; hot.

1550. Well near Henrietta, Clay County.

[Well begun and completed in April, 1904. Authority, J. J. Myers, contractor. No samples.]

This well, according to the contractor, is a fair representative of the wells sunk in what is known as the Henrietta oil field. The sand, as the log shows, is near surface and the wells are mostly small producers. The rocks probably should be included in the Pennsylvanian series of the Carboniferous system. They are part of the "red beds."

Record of well on Lockridge farm.

	Feet.
Reddish sandy soil.....	0- 2
Reddish clay.....	2-263
Sand; oil bearing.....	263-280
Red clay.....	280-375
Sand containing salt water.....	375-385
Soft red shale and clay, dry like joint clay.....	385-476

Rig used, cable. Casing used, 476 feet of 5½-inch. Oil sand yielded 5 barrels in first twenty-four hours. Salt water at 375 feet rises nearly to surface.

1553. Well near Trickham, Coleman County.

[Well begun March 14, 1905; drilling stopped in July, 1905. Authority, Milo M. Garvin, driller. No samples.]

This deep well was drilled for oil. The rocks penetrated are part of the Pennsylvanian (Coal Measures) series, which, in this part of the Texas coal fields, has been divided by the Texas Survey into the Strawn, Canyon, and Cisco groups. The mouth of this well is apparently near the base of the Cisco group, so the rocks mentioned are nearly all in the Canyon group. The total thickness of the Coal Measures may be 4,000 feet.

Record of well on W. F. Guthrie ranch, 1½ miles southwest of Trickham.

	Feet.
Soft red clay.....	0- 12
Soft red sandstone.....	12- 22
Hard blue clay or shale.....	22- 52
Soft dark gravel.....	52- 56
Hard blue limestone.....	56- 61
Soft blue clay or shale.....	61- 66
Hard dark limestone.....	66- 70
Soft dark clay or shale.....	70- 75
Hard light limestone.....	75-130
Black sticky shale.....	130-133
Hard dark limestone.....	133-156
Dark firm shale.....	156-160
Hard dark limestone.....	160-165
Soft black shale.....	165-170
Hard light limestone; gas at 215 feet, burned 1 foot high out of 1-inch pipe; gas comes up through 215 feet of salt water.....	170-278
Soft dark shale.....	278-297
Soft light sharp sandstone; salt water.....	297-328
Light sticky shale.....	328-375
Hard dark limestone.....	375-380
Red sticky clay or shale.....	380-400
Hard gray limestone.....	400-436
Soft blue clay or shale; landed 8½-inch casing at 446 feet.....	436-446
Hard white limestone.....	446-456
Soft dark shale.....	456-470
Hard brown limestone.....	470-474

	Feet.
Firm dark shale.....	474-510
Hard dark limestone.....	510-523
Firm dark shale.....	523-540
Hard white limestone.....	540-571
Firm dark shale.....	571-610
Soft brown shale.....	610-670
Firm dark sandstone.....	670-690
Soft dark shale.....	690-715
Soft yellow shale.....	715-761
Hard gray sandstone.....	761-770
Soft dark shale.....	770-810
Soft brown sandstone.....	810-830
Soft dark shale.....	830-865
Hard gray sandstone.....	865-873
Soft dark shale.....	873-885
Hard gray sandstone.....	885-896
Soft brown shale.....	896-908
Hard gray sandstone.....	908-940

Rig used, cable. Casing used, 446 feet of $8\frac{1}{4}$ -inch; 940 feet of $6\frac{1}{4}$ -inch. Pressure of gas found at 215 feet not tested. Salt water from 297 to 328 feet gave a flow of about 200 gallons per minute.

1566. Well near Dallas, Dallas County.

[Well begun October 15, 1902; completed in January, 1904. Authority, J. M. Bassett, chief engineer Dallas waterworks. No samples. Geologic correlations checked by A. C. Veatch.]

This deep well develops the so-called Trinity sand, which is a water-bearing bed of sand or sandstone near the base of the Lower Cretaceous (Comanche) series. The well starts in rocks of the Upper Cretaceous (Gulf) series. The formations penetrated are in downward order, Austin chalk, Eagle Ford shale, Woodbine sand, Denison, Fort Worth, Preston, and Goodland limestones, and Antler sands, the latter including water-bearing beds that are sometimes differentiated as the Paluxy, Glen Rose, and Trinity sands.

Record of city well, 2 miles northwest of Dallas post-office.

	Feet.
Soil (and alluvium).....	0- 90
Austin chalk and Eagle Ford shale.	
Limestone.....	90- 760
Woodbine:	
Sand; water comes to surface.....	760- 780
Denison, Fort Worth, Preston, and Goodland:	
Blue shale.....	780- 900
Limestone.....	900-1,500
Antlers sands:	
Paluxy sand; flow of good water, 150,000 gallons in twenty-four hours.....	1,500-1,580
Soft marls with hard strata.....	1,580-1,890
Blue shale.....	1,890-1,910
White porous limestone; strong flow, 960,000 gallons in twenty-four hours; pressure 100 pounds; temperature, 96°.....	1,910-1,930
Blue shale.....	1,930-2,180
Sand; another flow, same water.....	2,180-2,210
Variegated clay and sand; no water.....	2,210-2,400
Trinity sand; strong flow from $3\frac{1}{4}$ -inch hole and 4-inch casing; 640,000 gallons in twenty-four hours; pressure, 125 pounds; temperature, 100°; good water.....	2,410-2,585

Rig used, rotary. Casing used, 1,013 feet of 8-inch; 600 feet of 6-inch; 700 feet of 4-inch. Flow, 660 gallons per minute; quality, hard; too mineralized for boiler use.

1569. Well near Carrizo Springs, Dimmit County.

[Well begun in May, 1903; completed in June, 1903. Authority, F. Moehrig, driller. No samples.]

A considerable number of flowing wells have been drilled in the vicinity of Carrizo Springs. The formations penetrated are largely sands and sandstones thought to be of early Tertiary age.

Record of well 3 miles north of Carrizo Springs.

	Feet.
Red sandy loam.....	0- 3
Red clay mixed with sand.....	3- 20
White sand.....	20- 35
Gravel.....	35- 37
Yellow clay.....	37- 40
Blue clay with layers of black material, looked like lignite.....	40-380
Sandstone—well began to flow.....	380-440
Blue rock.....	440-470
Sandstone—struck best flow here.....	470-500
Blue clay.....	500-550

Rig used, cable. Casing used, 330 feet of 5 $\frac{1}{2}$ -inch. Well flows 150 gallons per minute. Quality, soft.

1574. Well near Benavides, Duval County.

[Well begun August 7, 1905; completed September 15, 1905. Authority, Lawson & Knight, contractors and drillers. No samples.]

This log of one of the shallow wells drilled for oil in the Piedras Pintas district, Duval County, shows the character of the rocks overlying the productive formation. These rocks are believed to be of Tertiary age.

Record of well No. 6, on W. A. Tinney farm, in the NW. $\frac{1}{4}$ sec. 8.

	Feet.
Soil.....	0- 2
Hard flint ballast.....	2- 20
Tough yellow clay.....	20- 85
Tough blue clay.....	85-200
Hard shale.....	200-227
Sand with water, oil, and gas; water rose 150 feet.....	227-231
Hard blue clay.....	231-400
Dark-blue clay with gravel; gas.....	400-465
Hard dark-green shale.....	465-498
Shale; oil and gas.....	498-500

Rig used, cable. Casing used, 467 feet of 6-inch. Estimated initial yield of oil, 12 barrels in twenty-four hours. Pressure of gas not tested. Quality of oil, heavy.

1604. Well near Schulenburg, Fayette County.

[Well begun September 2, 1904; completed November 20, 1904. Authority, James Maresh. No samples.]

This log is indefinite, but is given because few well records from Fayette County have been published. The formations penetrated are thought to be of Eocene age and may belong in part to the Fayette formation.

Record of well at Schulenburg.

Blue sand with layers of rock.....	600-670
Boulders and rock.....	670-690
Sand; water-bearing.....	690-700
Blue clay.....	700-720

Rig used, rotary. Casing used, 9½-inch from top to 290 feet; 8½-inch from 290 to 720 feet.

1606. Well near Rosenberg, Fort Bend County.

[Well begun July 10, 1904; completed July 24, 1904. Authority, I. W. Lawson, contractor and driller.]

This shallow well obtains water from a gravel bed thought to be in the Lafayette formation. The supply is good.

Record of well 4½ miles southwest of Rosenberg.

	Feet.
Hard black soil.....	1- 6
Soft red clay.....	6- 18
Quicksand; fine, but little water.....	18- 28
Hard red gumbo.....	28- 85
Coarse gravel; water not alkaline.....	85-125
Soft red clay.....	125-200
Fine blue gravel; water.....	200-260
Hard blue clay.....	260-300

Rig used, rotary. Casing used, 260 feet of 9½-inch. Supply from 200 to 260 feet. Water rises within 30 feet of surface, but is depressed 70 feet by pumping 1,000 gallons per minute. Quality, slightly alkaline.

1620. Well at Schertz, Guadalupe County.

[Well completed in 1903. Authority, J. P. Benkendorfer, driller. No samples.]

Schertz is near the western corner of Guadalupe County, in a region that has not been mapped by the Survey. The formations penetrated by this well are believed to be included in the Upper and the Lower Cretaceous series. A water-bearing horizon at 325 feet may be in the Austin chalk and one at 830 feet in the Edwards formation.

Record of well 300 feet east of Schertz post-office.

	Feet.
Brown sand.....	0- 6
Red clay.....	6- 16
Concrete gravel.....	16- 32
Yellow clay.....	32- 46
Blue clay.....	46-261
Magnesian limestone.....	261-301
White limestone 20 feet; yellow limestone 5 feet; gray limestone 89 feet.....	301-415
"Lignite".....	415-450
Gray limestone.....	450-510
Blue mud.....	510-565
Blue limestone 60 feet; gray limestone 45 feet; blue limestone 50 feet.....	565-720
Gray limestone 82 feet; white limestone 25 feet; gray limestone 45 feet.....	720-872

Casing used, 60 feet of 8-inch; 553 feet of 6-inch. Principal water bed at 830 feet; another at 325 feet. Main supply is salt, sulphur water which rises within 50 feet of surface.

1632. Well near Saratoga, Hardin County.

[Well begun December 22, 1904; completed February 16, 1905. Authority, H. B. Goodrich, manager fuel-oil properties, Gulf Coast and Santa Fe Railway, owner. No samples.]

This is an excellent log of a big gusher in the Saratoga pool. The oil-bearing rocks of this well, as of many others in the Coastal Plain region of southeastern Texas, are of Tertiary age. They are overlain by clays, soft shales, and sands. Here and there the sands are consolidated enough to be sandstones, the sand grains being, in some cases, held together by a limy cement. Such thin beds of limy sandstone probably constitute most of the "rock" reported by drillers. "Gumbo" is a Gulf coast name for sticky clay—blue, gray, yellow, or mottled in color—sometimes containing hard, limy concretions.

An account of the Saratoga and other oil pools is given in Bulletin No. 282, "Oil fields of the Texas-Louisiana Gulf coast," by N. M. Fenneman.

Record of well No. 4A, in southeast corner of Petty tract, one-half mile east of Saratoga.

	Feet.
Surface sand.....	1- 10
Red clay.....	10- 30

Shale and oil sand.....	1,342 -1,350

	Feet.
Oil sand and thin beds of rock, mixed.....	1,350-1,387
Sand.....	1,387-1,430
Gumbo.....	1,430-1,432

Rig used, rotary. Casing used, 12-inch to 4-inch; 1,270 feet of 4-inch; strainer, 163 $\frac{1}{2}$ feet long, with boot leg at 1,224 feet. Well gushed and flowed for sixty days. Initial yield, 5,000 barrels in twenty-four hours. Yield in one year, over 100,000 barrels. Was pumping 100 barrels daily in March, 1906.

1635. Well near Westfield, Harris County.

[Well begun November 10, 1905; completed November 26, 1905. Authority, Harry A. Roberts, driller. Incomplete series of samples preserved.]

This log of a well in northern Harris County gives more details than the logs of many of the wells put down in the oil fields of Louisiana and Texas. "Gumbo," a word frequently used, means sticky clay. "Rock" may be thin layers of sandstone or limestone. Some of the beds of sand contain strata consolidated enough to be sandstone.

The formations penetrated by this well are of Quaternary and Tertiary age and include the Columbia sands (Pleistocene), Lafayette sands, and the underlying beds of clay, sand, sandstone, and limestone of undetermined age, which have been correlated with the Grand Gulf of Alabama and Mississippi.

The character of these formations and the occurrence of oil in the various pools is described in Bulletin No. 282, "Oil fields of the Texas-Louisiana Gulf coast," by N. M. Fenneman.

Record of well No. 3, on Dunn farm, 3 miles northeast of Westfield.

	Feet.

Medium-soft gray gumbo with sand.....	684-698
Soft gray limestone.....	698-715
Medium-soft gray gumbo or marl.....	715-737
Hard gray limestone.....	737-739
Medium-soft gray gumbo or marl.....	739-760
Gray limestone—top soft, bottom hard.....	760-772
Medium-soft gray gumbo or marl with large boulder (presumably limy concretion) from 792 to 794 feet.....	772-794
Soft white sand; water-bearing, with soft gray sandstone from 815 to 818 feet.....	794-830
Medium-soft gray gumbo or marl.....	830-831

Rig used, rotary. Diameter of well, $8\frac{1}{2}$ inches at mouth; $5\frac{1}{2}$ inches at bottom. No oil found and but a very light showing of gas.

1641. Well near Kyle, Hays County.

[Well completed in 1903. Authority, J. E. Donnelly, driller. No samples. Geologic correlations checked by A. C. Veatch.]

This well, drilled for oil 15 miles southeast of Kyle, found at 1,320 feet the same limestone (the Austin chalk) which outcrops in the vicinity of Kyle. The formations penetrated range in age from early Tertiary to middle Cretaceous and include the Lytton formation (Eocene), Webberville formation, Taylor marl, Austin chalk, Eagle Ford clay and limestone (Upper Cretaceous or Gulf series), Buda limestone (Lower Cretaceous or Comanche series). It is not possible from the driller's log to separate the three formations first penetrated. In the "blue clay and bowlders" from 439 to 1,320 feet probably about 200 feet of the Austin chalk, its upper marly beds, are included.

The geology of the country near Austin, including a large part of Travis County and portions of Hays, Bastrop, and Caldwell counties, is described in the Austin folio (No. 76) of the Geologic Atlas of the United States.

Record of well 15 miles southeast of Kyle.

	Feet.

Rock.....	1, 608-1, 620

Rig used, cable. Casing used, 650 feet of $6\frac{1}{2}$ -inch; 670 feet of $5\frac{1}{2}$ -inch.

1650. Well 14 miles northwest of Jasper, Jasper County.

[Well begun June 27, 1905; completed July 21, 1905. Authority, George P. Sweat, of Radium Oil Company, owner. Incomplete series of samples preserved.]

This log of a wild-cat well, though evidently generalized, contains some observations not found in many logs of wells along the Texas Gulf coast. The formations penetrated are mostly of Tertiary age and may include the Lafayette sands, "buried beds," Frio clays, and Fayette sands.

Record of well 14 miles northwest of Jasper.

	Feet.
Soft blue (or dark-gray) shale and limestone.....	100- 200
Hard blue shale with sandstone to 250 feet, containing pyrite below.....	200- 300
Soft blue shale with limestone.....	300- 720
Sand; waterbearing.....	720- 730
Soft blue gumbo.....	730- 935
Soft blue gumbo (dark sandy clay) containing lignite.....	935- 945
Soft, very sticky gumbo.....	945-1, 250
Soft blue shale.....	1, 250-1, 300
Hard blue rock, described as a kind of sandstone with sea shells.....	1, 300-1, 375
Soft blue shale.....	1, 375-1, 520

Rig used, rotary. Casing used, 63 feet of 12-inch; 683 feet of 8-inch. Not a show of oil.

1657. Well at Cleburne, Johnson County.

[Well begun in January, 1903; completed in August, 1903. Authority, J. J. Myers, contractor and driller. No samples. Geologic correlations checked by A. C. Veatch.]

This well obtains water from a permeable bed or reservoir near the base of the Lower Cretaceous (Comanche) series. This bed occurs in what has been termed the Trinity division of the Lower Cretaceous and is one of the so-called Trinity sands. The well penetrates nearly the full succession of beds in the series, these beds being marls, limestones, and clays, with the porous sands or sandstones. The formations, in downward order, are Fort Worth, Preston, Edwards, and Comanche Peak limestones and marl, Paluxy sand, and Glen Rose formation, including the Trinity sand.

Record of Gulf, Colorado and Santa Fe Railway well No. 3.

	Feet.
Rock (probably limestone).....	0- 20
"Soapstone" rock and black shale (probably marl and limestone)	20- 435
Sand; water-bearing; water rose 300 feet (Paluxy)	435- 450
Rock and shale.....	450- 500
Sand; water-bearing; water rose 375 feet (Paluxy)	500- 525
Layers of extremely hard rock underlain by a black shale which caves badly when water touches it.....	525- 660
Soft white rock.....	660- 925
Sand; water-bearing; water rose 750 feet (Trinity).....	925- 950
Rock and sandy blue clay.....	950-1, 004
Very hard sandstone.....	1, 004-1, 008
Sandy shale.....	1, 008-1, 030
Sand; water-bearing (Trinity) shale and rock.....	1, 030-1, 105
Sandstone.....	1, 105-1, 200

Rig used, cable and rotary. Casing in well, 1,135 feet of 6-inch. Main supply of water at 1,060 feet. Well yields 160 gallons per minute by air lift.

1669. Well near Comfort, Kendall County.

[Authority, Adolph Bartel, driller. No samples.]

Kendall County covers a part of the Edwards Plateau. The rocks of the plateau lie almost horizontal. They are of Lower Cretaceous (Comanche) age, but not enough detailed mapping has been done to correlate particular formations with beds reported by drillers.

Record of well 2 miles southwest of Comfort.

	Feet.
Limestone.....	6- 20
Blue clay.....	20- 25
Gray shale.....	25- 45
Hard sandstone; water-bearing.....	45- 50

Green clay.....	190-194
Blue sandstone; red and green sand in cuttings.....	194-218
Very hard rock.....	218-222
Varicolored sand, red, green, black, and white; water-bearing.....	222-224
Very hard rock; dressed bit every 5 inches.....	224-225
Sand; water-bearing.....	225-226

Rig used, cable. Casing used, 90 feet of 6-inch. Water from 225 feet rises within 85 feet of surface.

1678. Well at Lampasas, Lampasas County.

[Well completed in 1903. Authority, W. B. Abney, owner. No samples.]

At Lampasas is a group of noted hot springs that rise from crevices in Carboniferous limestone. This well, according to the driller, went down into granite. The nearest exposure of granite is on Colorado River, 30 miles to the southwest. Little is known of the thickness of the Cambro-Ordovician rocks underlying the Carboniferous, but as they may lie nearly horizontal it is possible that the well goes into granite for the distance given, though the rocks at the base of the Cambro-Ordovician, in Llano County, to the west, are sandstones.

Record of well on block 9, Hanna Springs addition to Lampasas.

	Feet.
Yellow clay.....	0- 25
Gravel; water-bearing.....	25- 30
Yellow clay.....	30- .40
Concrete.....	40- 45
Gray limestone 150 feet; dark limestone 10 feet; gray limestone 235 feet; at 260 feet, salt water which will yield 25 gallons per minute by pumping.....	45- 440
Shale.....	440- 470
Gray limestone; at 540 feet flow of sulphur water, 10 gallons per minute; at 1,110 feet strong vein of salt water which rises within 25 feet of surface; at 1,560 feet another strong salt-water vein.....	470-1,560
Marble.....	1,560-1,920
Granite.....	1,920-2,012

Casing used, 265 feet of 10½-inch; 950 feet of 6-inch. Static head of flow not determined. Temperature, 72° F. Water from combined flows at 540, 1,110, and 1,560 feet is strongly saline.

1686. Well near Dayton, Liberty County.

[Well completed in 1905. Authority, Sun Company, owner. No samples.]

This well, known as the Sun Company Quintette No. 1, on the J. B. Harrison tract, was, up to December 1, 1905, the deepest hole in the Dayton field. The center of development of this field was about one-fourth of a mile farther north. Oil was found there at a depth of about 800 feet. This log shows no striking features; the formations penetrated probably include Columbia and Lafayette sands and the "buried beds." The gravel from 240 to 437 feet is believed to occur in and at the top of the Lafayette.

*Record of well in the northeast corner of 50 acres in the northwest corner of the S. $\frac{1}{2}$ sec. 125,
Houston and Texas Central Railroad survey.*

Blue shale.....	1, 718-1, 763
Dry hole.	

1700. Well near Dunlay, Medina County.

[Well completed January 3, 1903. Authority, Milo M. Garvin, driller. No samples.]

This well was drilled for oil in a region remote from any productive field. The rocks penetrated are parts of the Gulf series (Upper Cretaceous) and of the Myrick formation (Eocene). Of the Cretaceous formations, two, the Anacacho and the Pulliam, carry deposits of asphaltum. These possibly led to the sinking of the well. The Pulliam is below the Anacacho formation and above the Austin chalk.

Record of well on George Haas ranch, 4½ miles southwest of Dunlay.

	Feet.
Soft white limestone.....	0- 15
Soft yellow clay.....	15- 57
Close blue clay; landed 10-inch drive pipe at 211 feet.....	57- 216
Hard gray sandstone.....	216- 220
Soft blue clay.....	220- 227
Soft white sandstone; water-bearing	227- 238
Soft blue clay.....	238- 259
Hard gray sandstone.....	259- 265
Soft blue clay.....	265- 350
Soft gray sandstone.....	350- 356
Soft blue clay.....	356- 366
Soft gray sandstone.....	366- 371
Soft blue clay.....	371- 494
Soft brown sandstone; small show of oil and gas; landed 8-inch drive pipe at 507 feet.....	494- 529
Soft blue clay.....	529- 584
Hard gray sandstone.....	584- 592
Hard blue clay.....	592- 602
Hard blue sandstone.....	602- 639
Very fine and hard gray sandstone.....	639- 659
Hard dark shelly sandstone.....	659- 674
Hard blue sandy clay.....	674- 704
Hard sandstone, dark pebbles.....	704- 739
Soft light-blue sandstone.....	739- 754
Hard sandstone.....	754- 760
Soft blue sandy clay.....	760- 811
Soft blue clay with coarse sand.....	811- 835
Soft blue clay.....	835- 915
Dark open sandstone.....	915- 935
Dark-brown sticky clay.....	935- 975
Soft white limestone, Austin chalk.....	975-1,000

No oil or gas found in paying quantity. The 10-inch drive pipe was left in the well and the sandstone at 227 to 228 feet furnishes about 2½ gallons of soft water per minute by pumping. Well mouth is about 1,000 feet above sea level.

1704. Well near Corsicana, Navarro County.

[Well begun July 30, 1905; completed August 10, 1905. Authority, F. C. Smith, superintendent Corsicana Petroleum Company, owner. Samples preserved. Log compiled from samples by S. Sanford.]

This is the log of a well 5 miles east of Corsicana, in the Powell or heavy-oil field. As a rotary rig was used, the samples are not so representative as those obtained by standard rigs; still, changes in the formations are shown and as the samples apparently were carefully saved the log has more value than if it simply recorded the driller's impressions. The oil-bearing sands are found in blue or dark-gray clay shales—the Taylor marl—which form part of the Upper Cretaceous series.

Record of well No. 22 on B. T. Barry farm, 5 miles east of Corsicana.

	Feet.
Dark-gray, almost black sandy clay and brown limy clay	0-20
Brown sandy and limy shale	20-60
Gray and dark-gray shale	60-80
Soft gray shale	80-100
Soft brownish limy shale	100-120
Dark-gray shale with soft limy streaks	120-140
Dark-gray, more or less limy shale	140-240
Soft dark-brownish, slightly limy and sandy shale	240-280
Dark-gray limy shale	280-340
Dark-brownish, slightly limy shale with streaks of hard red shaly sandstone below 360 feet	340-380
Dark-gray limy shale	380-440
Brownish shale with limy streaks, the latter often dark gray	440-480
Dark-gray shale with limy streaks	480-500
Dark-greenish, slightly limy shale, fossiliferous at 520 to 540 feet	500-560
Dark-gray shale	560-580
Dark-gray, slightly brownish shale, a little limy	580-640
Dark shale with greenish or brownish tints, sample more limy than most of those preceding	640-660
Dark shale, harder and less limy	660-680
Dark-greenish shale, more limy than preceding	680-700
Dark-greenish sandy shale	700-720
Dark greenish-brown limy sandstone	720-780

Driller reported thin layers of rock from 90 to 350 feet at close intervals. Rig used, rotary. Depth of well, 810 feet. Diameter, 6½ inches from 0 to 65 feet; 4 inches from 65 to 720 feet. Strainer from 710 to 810 feet. Initial yield of oil, 10 barrels in twenty-four hours. Quality, 30° to 31° B.

1706. Well near Corsicana, Navarro County.

[Well begun January 1, 1905; completed February 20, 1905. Authority, R. C. Sanders, contractor.
Samples preserved.]

The formations penetrated by this well are of Upper Cretaceous age, the Navarro and Taylor marls, with perhaps an overlying thin layer of Tertiary sands.

Record of well No. 1 on Hodge farm, 12 miles northeast of Corsicana.

	Feet.
Soft, fine white and brownish sand	0 - 10
Dark clay and fine dark-gray sand	10 - 30
Blue clay with fragments of shells	30 - 50
Soft dark clay	50 - 70
Hard dark sand	70 - 100
Soft dark-bluish shale and clay	100 - 754
Sand; gas	754 - 891½
Soft dark-bluish shale and clay	891½ - 964
Sand; gas	964 - 985
Soft dark-bluish shale	985 - 1,000
Sand; gas	1,000 - 1,129

Rig used, rotary. Diameter of well, 6½ inches from 0 to 100 feet; 4 inches from 0 to 1,129 feet. Dry hole.

1708. Well 15 miles west of Corpus Christi, Nueces County.

[Well begun November 17, 1904; completed January 4, 1905. Authority, Thomas Fowler, driller.]

This is the log of a well drilled for water in the southwestern portion of the Gulf Coastal Plain of Texas. Comparatively few well records from that section have been published and as this log was apparently kept with care it is of interest.

The formations penetrated below 132 feet are thought to be of Pliocene (late Tertiary) age and may include beds corresponding to the Reynosa limestone, which outcrops for a long distance in eastern McMullen and Duval counties, and also a few miles west of Corpus Christi. The overlying clays and sands may be the equivalent of the Port Hudson (Quaternary) of Mississippi. Below the Reynosa limestone are the Fayette sands (Eocene).

Record of well 15 miles west of Corpus Christi.

	Feet.
Black waxy soil	0- 4
Soft gray sand	4- 12

Hard clay	271-278
Fine gray sand	278-292
Fine pinkish sand and clay	292-307
Yellow clay	307-312
Soft varicolored clay	312-324
Blue clay	324-330
Soft white rock formation	330-334
Soft yellow and light clay and sand, mostly clay	334-365
Soft rock formation	365-373
Soft sand and clay	373-393
Rock and clay in layers	393-436
Tough pink clay	436-472
Hard gray rock	472-475
Soft ash-colored clay with some sand	475-482
Hard brown clay	482-507
Soft rock and sand	507-510
Tough clay	510-527
Soft gray clay	527-534
Hard yellow clay	534-566
Brownish clay with strata of sand and rock	566-600
Hard gray rock	600-604
Soft blue and pink clay	604-624
Medium-coarse brownish-gray sand; water-bearing	624-656

Rig used, rotary and jet. Diameter of well, 7 inches. Casing used, 629 feet of $5\frac{3}{8}$ -inch; strainer from 629 to 645 feet. Main supply of water from 630 to 645 feet. Well pumps 25 gallons per minute.

1712. Well at Weatherford, Parker County.

[Well completed in 1903. Authority, S. O. Newton, manager Weatherford Water, Light and Ice Company, owner. No samples. Geologic correlations checked by A. C. Veatch.]

The log given beneath is that of an 8-inch well drilled by the company in 1896. A slightly different log of one of the company's wells is given by R. T. Hill.^a The rocks are of Lower Cretaceous age. The formations, in downward order, are Paluxy, Glen Rose, and Trinity.

Record of well on corner of West Lee avenue and Davis street, Weatherford.

	Feet.
Brownish clay and sand.....	0- 30
Bluish clay.....	30- 50
Paluxy:	
Pack sand; water-bearing	50- 60
Glen Rose:	
Bluish shale with streaks of hard limestone or sandstone.....	60- 90
Bluish shale.....	90-120
Blue shale, limestone, and brownish pack sand.....	120-150
Pack sand and bluish shelly limestone.....	150-180
Limestone, rotten from 240 to 270 feet, hard from 300 to 390 feet.....	180-390
Sandy shale and gravel; water from 402 to 425 feet	390-420
Trinity:	
Sandy shale.....	420-450
Red clay.....	450

The company has three wells—10-inch, 8-inch, and 6-inch from top to bottom. Water stands at 310 feet below surface and is lowered to 323 feet by pumping full capacity of pumps. Quality of water, hard. Temperature at well mouth, 68°.

1716. Well 10 miles southwest of Miami, Roberts County.

[Well begun September 20, 1904; completed January 1, 1905. Authority, G. L. Chisum. No samples.]

Roberts County is in what is known as the high-plains region of northern Texas, where the ground water often lies at a considerable depth. The formations penetrated by this well are thought to be of Tertiary age. The well is typical of others in the region near Miami.

Record of well 10 miles southwest of Miami.

	Feet.
Red clay.....	0- 60
Lime rock (may be chalky clay).....	60- 90
Clay and gravel.....	90-120
Clay and sand.....	120-240
Sand; water at 330 feet	240-422

Rig used, cable. Casing used, 422 feet of 5½-inch. Water at 330 feet did not rise when struck. It is not lowered by pumping 10 gallons per minute. Mr. Chisum says, "The amount obtained depends on the size of pump used." Quality of water, soft.

1765. Well near Taylor, Williamson County.

[Well begun May 15, 1903; completed August 21, 1903. Authority, J. Maresh, contractor and driller. No samples.]

This deep well started near the dividing line between the Cretaceous and Eocene formations. The rocks penetrated are of Upper Cretaceous age and include the Webberville formation, Taylor marl, and Austin chalk.

^a Geography and geology of the Black and Grand prairies; Twenty-first Ann. Rep. U. S. Geol. Survey, pt. 7, 1901, p. 456.

Record of well on Charles E. Stauffer farm, 8 miles east of Taylor.

	Feet.
Black soil.....	0- 10
Gravel; water-bearing.....	10- 13
Soft shale or clay mixed with oyster shells.....	13- 980
Hard rock, with gravel.....	980-1, 235
Soft blue clay.....	1, 235-1, 275
Hard rock, with gravel and oyster shells.....	1, 275-1, 500

Rig used, rotary. Diameter of well, 5 inches from top to bottom. No water found except the top seep at 13 feet.

1766. Well in Zavalla County.

[Well begun February 15, 1904; completed April 1, 1905. Authority, E. A. Archibald, contractor and driller. No samples.]

This flowing well, 22 miles north of Carrizo Springs, was obtained by drilling through a water-bearing sandstone, that may be of Eocene age and form part of the Myrick formation.

Record of well 6 miles north of county line and 4 miles west of Nueces River.

	Feet.
Blue clay formation, hard and slakes when touched with water; dry, "all colors, and no two feet alike".....	0 -550
Sand—water-bearing; water rose within 20 feet of surface.....	550 -570
Clay and thin layers of rock; "a foot of rock, a foot of clay, 2 feet of rock, etc.".....	570 -650
Sandstone—water-bearing; flow 5 gallons per minute.....	650 -675
Rock and clay.....	675 -715
Iron pyrite.....	715 -716½
Coarse light sandstone.....	716½ -796
Blue rock.....	796 -810
Coarse gray sandstone.....	810 -905
Gray clay, hard and dry, caving off by chunks, a little rock on top of the clay.....	905 -910

Rig used, cable. Casing used, 720 feet of 8-inch. Principal water bed at 720 feet. Static head of flow, $+2\frac{1}{2}$ feet. Well has to be pumped to start flow and flow can be stopped by lowering the sand bucket in the well. Pumping 100 gallons per minute depresses water 15 feet. Quality of water, slightly sulphuretted. Temperature, 90° F. Elevation of well mouth, 60 feet above Nueces River.

UTAH.**1767. Well at Salt Lake City, Salt Lake County.**

[Well begun June 23, 1905; completed July 7, 1905. Authority, Frank Yeager, contractor and driller. No samples.]

This well gives a characteristic section of the alternating beds of clay, sand, and gravel that were deposited in Pleistocene time in Lake Bonneville, a great sheet of prevailingly fresh water that occupied Salt Lake Valley. Salt Lake is a remnant of Lake Bonneville. The water-bearing sands and gravels of the old lake bed lie in lenticular bodies of varying extent, so that logs of near-by wells often differ decidedly and there are no definite water-bearing horizons. One well may pass through several water-bearing sands and another just as deep a short distance away may not find more than half the number. The character of the lake beds and the supplies of water they may yield are described in Water-Supply and Irrigation Paper No. 157, "Underground waters of the valleys of Utah Lake and Jordan River," by G. B. Richardson.

Record of well at Salt Lake City.

Red clay and sand; blasted pipe at this point with one-half stick of 40 per cent dynamite.....	623-635
Gravel.....	635-642
Blue clay.....	642-650

Rig used, jet. Diameter of well, 3 inches. Length of casing, 638 feet. Well flows 50 gallons of water per minute; static head, +30 feet.

WASHINGTON.

1782. Well near Carley, Benton County.

[Well completed in 1905. Authority, S. L. Gaines, owner. Incomplete series of samples preserved.]

This well, according to the owner, was drilled between two others, one flowing about 200 gallons per minute with little pressure, the other 400 gallons with a closed pressure of 33 pounds per square inch. It was drilled to 280 feet on a flow-or-no-pay contract. As the log shows, no flow was found by going deeper. The formations are of undetermined age. The clay and sand down to 250 feet may correspond to the Ellensburg formation farther north and the basalt below to the Yakima basalt (Miocene).

Record of well in the SE. ¼ sec. 6, T. 4, R. 24; 1½ miles northeast of Carley.

	Feet.
Dark soil.....	0- 3
Clay, sand, and gravel with water.....	3- 70
Dark-gray, micaceous sand or sandstone.....	70- 80
Soft brownish shale or clay.....	80-250
Brown, sandy shale or clay and basalt.....	250-280
Basalt.....	280-415
Honeycomb (or scoriaceous) basalt; water-bearing.....	415-432

Rig used, cable. Casing used, 64 feet of 8-inch; 209 feet of 6½-inch; 814 feet of 4-inch. The 8-inch and 4-inch were pulled. When the "honeycomb" rock was struck the water in the well fell from 33½ feet below surface to 38 feet and the flow through the rock was so free that all drillings were washed away. Quality of water, soft. Elevation of well mouth, 50 feet above Columbia River, about 280 feet above sea.

1797. Well at Fort Flagler, Jefferson County.

[Well begun June 15, 1900; completed May 8, 1903. Authority, Capt. George H. Penrose, constructing quartermaster. No samples.]

Fort Flagler is in the northeast corner of Jefferson County, on a point of land projecting into Admiralty Inlet, the entrance to Puget Sound. The well is about 300 feet from the inlet. The surface materials are clay and sand of glacial origin, and the log shows the great depth of the deposits. The underlying bed rock is of Tertiary age.

Record of well at Fort Flagler.

	Feet.
Clay.....	0- 4
Sand, bottom of 4- by 6-foot pit at 32 feet.....	4- 60

Quicksand containing water.....	1, 448-1, 456
Very hard sandy clay; end of 4½-inch casing at 1,458 feet.....	1, 456-1, 462½

Water in quicksand at 1,448 to 1,456 feet rises to about 60 feet below surface. It is fresh and enters well at the rate of about 1 gallon per minute.

1800. Well 16 miles northwest of Walla Walla, Wallawalla County.

[Well begun October 19, 1905; completed November 27, 1905. Authority, W. S. McCausland, contractor and driller. Samples preserved.]

This well is typical of some that obtain water from porous strata or from crevices in the lava beds of Miocene age that underlie a great area in central and southern Washington.

Record of well in the SE. $\frac{1}{4}$ sec. 2, T. 8, R. 34.

	Feet.
Brown soil and sand.....	0 - 35
Medium-coarse quartz sand and bits of igneous rock.....	35 - 40
Hard black rock.....	40-140
Hard dark igneous rock; may be basalt.....	140-156
Hard dark rock, much like preceding.....	156-166
Hard dark massive igneous rock.....	166-335
Softer dark igneous rock, fine grained or glassy.....	335-350

Driller's log says: "Hard lava rock, 40 to 340 feet; softer lava rock, 340 to 350 feet."

Rig used, cable. Casing used, 40 feet of 5 $\frac{1}{2}$ -inch. "A small seep of water was found at 60 feet and perhaps others below, but all were insufficient. At 340 feet the water rose 90 feet; pumping 10 gallons per minute lowered it 10 feet."

WEST VIRGINIA.**1801. Well near Culloden, Cabell County.**

[Well begun in May, 1905; completed in July, 1905. Authority, J. G. Weiler, of Weiler Brothers, contractors. Samples preserved. Geologic correlations by R. W. Stone.]

This well, in the gas and oil field east of Milton, apparently starts a little below the Pittsburgh coal. It passes through the Conemaugh, Allegheny, and Pottsville formations (Pennsylvanian); and the Mauch Chunk, ending below the bottom of the Pocono (Mississippian). The coal seams penetrated are identified provisionally.

Record of well in Grant Township, 2 miles south of Culloden.

Gray sandstone and dark-gray sandy shale.....	1,565 - 1,590
White to gray, slightly limy sandstone and black shale, top of Big Injun; about 15 gallons of salt water per hour.....	1,590 - 1,610
Hard, coarse white to gray sandstone to 1,630 feet; fine brownish limy sandstone to 1,650 feet; gray sandstone and dark-gray sandy shale; bottom of Big Injun, 1,650 to 1,655 feet.....	1,610 - 1,655
Black sandy shale.....	1,655 - 1,660
White sandstone.....	1,660 - 1,670
Slate and shells (gray limy shale).....	1,670 - 1,700
Slate and shells (gray sandy and slightly limy shale).....	1,700 - 1,730
Slate and shells (dark shale, limy below 1,770 feet).....	1,730 - 1,800
Dark and light brownish limy shale.....	1,800 - 1,830
Dark and light brownish sandy shale.....	1,830 - 1,875

Pocono—Continued.

	Feet.
Dark-brownish limy shale.....	1,875 -1,905
Dark limy and sandy shale.....	1,905 -1,940
Dark shale with limy streaks.....	1,940 -1,980
Gray and brown shale with limy streaks.....	1,980 -2,080
Black shale.....	2,080 -2,100
Gray limy sandstone and dark-gray sandy shale, Berea sand, top at 2,100 feet.....	2,100 -2,110
Gray to brown limy sandstone; gas, estimated at 1,000,000 feet in twenty-four hours; bottom of Berea sand at 2,125 feet.....	2,110 -2,128

Rig used, standard. Diameter of well, 13 inches from 0 to 171 feet; 10 inches from 171 to 1,344½ feet; 8 inches from 1,344½ to 1,675½ feet; and 6½ inches to bottom. Three strings of casing used—10-inch, 8-inch, and 6½-inch.

The gas from the limestone at 1,396 feet, initial flow 261,000 cubic feet, and pressure 400 pounds, was cased off and used for fuel in drilling deeper. Salt water was found at 385 to 405, 940 to 1,344½, and 1,590 to 1,610 feet. At 940 feet well filled with salt water in two hours; estimated inflow, 1,000 barrels in twenty-four hours. Steel-line measurements taken to gas at 1,396 feet, to limestone at 1,519 feet; to bottom of 6½-inch casing at 1,675½ feet, to top of Berea at 2,100 feet, to bottom of Berea at 2,125 feet, and to bottom of hole 2,128 feet. Sand at 2,100 feet shot with 40 quarts of nitroglycerin with good results. Well tubed and shut in.

1803. Well near Bridgeport, Harrison County.

[Well begun June 22, 1904; completed January 11, 1905. Authority, Hope Natural Gas Company, owner. No samples. Geologic correlations by R. W. Stone.]

No record has been published from Harrison County, and few from the State, of a well going deeper below the Pittsburg coal than this. The Wheeling well (4,500 feet), the deepest in the State, went 4,170 feet below the Pittsburg. In the "lime, sand, and shells" from 3,000 to 3,280 feet may be the Speechley sand of Pennsylvania. The Bayard or Sixth sand, regarded as the basal member of the Catskill beds by the West Virginia Survey, does not seem to have been noticed. It lies 2,410 feet below the Pittsburg coal in Marion County and, on the average, 2,433 feet in eastern Greene County, Pa. This well, starting just above the Pittsburg coal, the bottom of which marks the top of the Conemaugh formation of the Pennsylvanian series, passed through the Conemaugh and also the Allegheny and Pottsville formations of the Perinsylvanian, the Mauch Chunk and Pocono of the Mississippian, and then into the Devonian rocks below the Carboniferous, through the "Venango oil group" sands of the Pocono-Catskill group and into the Chemung.

Record of well on George Lancaster farm, 3 miles southeast of Bridgeport.

	Feet.
Pittsburg coal.....	42- 48
Dunkard sand.....	568- 600
Gas sand.....	675- 710
Salt sand (Maxton).....	1,030-1,090

50-foot sand (Squaw?).....	1,778-1,820
Stray sand.....	2,020-2,045
Gordon sand (Nineveh?).....	2,070-2,085
Fifth sand.....	2,355-2,375
Lime and shells.....	2,500-3,000
Lime, sand, and shells.....	3,000-3,280
Sand; salt water at 3,295 feet.....	3,285-3,310
Black slate.....	3,310-3,320
Hard lime.....	3,320-3,340
Black slate.....	3,340-3,371

Casing used, 270 feet of 10-inch; 1,400 feet of 8½-inch. Dry hole.

1806. Well near Farmington, Marion County.

[Well begun July 11, 1905; completed September 13, 1905. Authority, Fayette County Gas Company, owner. No samples. Geologic correlations by R. W. Stone.]

This skeleton log of a big gas well in the Mannington pool shows the depths to the various sands. The well started in the Permian (?) series of the Carboniferous and the pay sands are in the "Catskill" formation of the Devonian. The well consequently penetrated the Permian, Monongahela, Conemaugh, and Allegheny formations (Pennsylvanian) and Maunch Chunk and Pocono formations (Mississippian) of the Carboniferous and entered the Devonian.

Record of well No. 1 on Sarah A. Town farm, 2 miles north of Farmington.

Feet.

Conductor.....	16
Pennsylvanian:	
Mapletown (Sewickley) coal.....	371- 378
Pittsburg coal.....	488- 499
Dunkard sand.....	1,115-1, 150
Gas sand.....	1,302-1, 345
Salt sand.....	1,420-1, 520
Maunch Chunk:	
Pencil Cave.....	1,730-1, 738
Big Lime.....	1,738-1, 814
Pocono:	
Big Injun sand; gas at 1,890 and 1,915 feet.....	1,814-1, 935
Sand.....	2,250-2, 262
Fifty-foot sand; gas at 2,340 feet.....	2,335-2, 350
Pocono or Catskill (?):	
Gantz sand (?).....	2,378-2, 440
Sand.....	2,466-2, 475
Stray sand.....	2,480-2, 490
Gordon sand (?).....	2,495-2, 515
Catskill:	
Fourth sand (?).....	2,698-2, 740
Fifth sand; gas.....	2,857-2, 878

Casing used, 515 feet of 10-inch; 1,478 feet of 8½-inch; 1,820 feet of 6½-inch; 2,858 feet of 4-inch tubing. The big pay was in the Fifth sand at 2,858 feet. When shut in by the 4-inch tubing it showed good, after blowing open four days, for a little more than 16,000,000 cubic feet in twenty-four hours. Initial rock pressure, 760 pounds per square inch; minute pressure, 575 pounds. The other pays showed good for about 2,000,000 feet.

"The Dunkard sand seems to be near the horizon of the Freeport, while the Fifty-foot, Gantz, Gordon, and Fourth are all misnamed, although the Fifth sand seems to be at its proper horizon. These intervals do not fall in the proper place, as determined by the averages of many records in Pennsylvania. Furthermore, the Gantz has been described as above the Fifty-foot rather than below it."—R. W. Stone.

1810. Well in Monongalia County.

[Well completed in 1905. Authority, South Penn Oil Company, owner. No samples. Geologic correlations by R. W. Stone.]

Oil has been found at greater depth in this well than in any other of which the Survey has record. It is believed to be the deepest producing oil well in the world. The log gives little more than the depth and thickness of the various sands. The formations penetrated range in age from Permian (?) to Devonian and should include these: Dunkard group (Permian), Monongahela, Conemaugh, Allegheny, and Pottsville formations (Pennsylvanian), Mauch Chunk, and Pocono, including Big Injun (Mississippian), and oil-bearing sands, including those below the Fifty-foot, of "Catskill" age (Devonian).

Record of well No. 11 on Wilson heirs' farm.

Pottsville:

Hard light-gray, dark-gray, and white sandstone—traces of salt water at 510–530 feet; 4 barrels salt water in twenty-four hours at 550–570 feet; show of oil and more water at 590–600 feet; hole filled with water 250 feet in thirty minutes at 610 feet; hole filled full at 620 feet; coal break at 620 feet; shale break too thin to measure at 660 feet; slate break about 2 feet thick at 812 feet; slate too thin to measure at 880 feet; bottom of Salt sand at 935 feet..... 465– 935

Greenbrier limestone:

Hard black shale and limestone; slate break between Salt sand and Mountain lime..... 935– 942
 Hard black limestone; Big or Mountain lime..... 942– 960
 Hard gray limestone with thin slate, too thin to record..... 960– 978
 Hard gray limestone; slate break at 980 feet..... 978– 984
 Hard white limestone; small showing of gas at 1,084–1,094 feet, would burn up 5 feet out of 6½-inch hole, estimated at 100,000 cubic feet in twenty-four hours..... 984–1, 144
 Hard dark gray limestone; showing of oil at 1,150–1,162 feet..... 1, 144–1, 172

Rig used, standard. Diameter of well, 13 inches from 0 to 132 feet; 10 inches from 132 to 405 feet; 8½ inches from 405 to 942 feet; 6½ inches from 942 to 1,172 feet. Casing used, 132 feet of 10-inch; 405 feet of 8½-inch; 942 feet of 6½-inch.

1815. Well at Far, Wetzel County.

[Well begun April 10, 1905; completed June 5, 1905. Authority, T. L. Dunlap, driller. No samples. Geologic correlations by R. W. Stone.]

This well started in the Washington formation (Permian) and went down through the Monongahela, Conemaugh, Allegheny, and Pottsville formations (Pennsylvanian), and Mauch Chunk and Pocono (Mississippian) of the Carboniferous system into the sands and slates of the Upper Devonian, the so-called Catskill formation. The coal at 275 feet is the Washington, which lies from 435 to 510 feet above the Pittsburg, according to well records published by the West Virginia Survey.

Well No. 1 on Windham farm, 1 mile south of Far.

Washington:

	Feet.

Diameter, 13 inches from 0 to 162 feet; 10 inches from 162 to 1,195 feet; 8 inches from 1,195 to 1,909 feet; 6½ inches from 1,909 to 2,310 feet. Gas struck in Gordon sand. Rock pressure, 800 pounds. Casing used, 162 feet of 10-inch; 1,195 feet of 8-inch; 1,909 feet of 6½-inch; 2,310 feet of 5-inch.	

WISCONSIN.**1826. Well near Manitowoc, Manitowoc County.**

[Well begun in May, 1905; completed in August, 1905. Authority, William Weber, driller. Samples preserved. Geologic correlations by E. O. Ulrich.]

Deep wells near Manitowoc obtain water from several formations. This one tapped the Niagara limestone. The formations are the drift (Pleistocene); Niagara limestone and Clinton iron ore (Silurian), and Maquoketa shale (Ordovician).

Record of well of Northern Grain Company, in sec. 31, T. 19, R. 24.

	Feet.
Drift:	
Yellow sand.....	3- 6
Hard yellow clay.....	6- 20
Medium-hard blue clay.....	20- 85
No sample.....	85- 90
Niagara:	
Medium-hard to very hard brownish and grayish limestone.....	90-148
Hard sandy limestone and dark-gray shale.....	148-180
Medium-hard brownish and grayish limestone.....	180-195
Very hard white limestone.....	195-230
Hard gray limestone; water stands within 30 feet of surface.....	230-237
Very hard white limestone.....	237-287
Soft gray limestone.....	287-315
Hard grayish and brownish limestone, fossiliferous at 328 to 350 and 398 to 410 feet; sulphur water at last depth.....	315-410

Niagara—Continued.

	Feet.
Hard grayish and brownish cherty limestone; water stands within 26 feet of surface at 450 feet.....	410-450
Very soft gray limestone.....	450-470
Hard grayish and brownish limestone; water stands within 22 feet of surface at 505 feet.....	470-505
Soft gray limestone.....	505-513
Soft and very soft grayish limestone; hard stratum at 630 to 650 feet.....	513-735
Hard gray limestone; water stands within 14 feet of surface	735-790
Soft brownish and gray limestone.....	790-825
Clinton:	
Very soft dark-red ferruginous shale.....	825-880
Maquoketa:	
Very soft gray limy shale.....	880-986

Rig used, pole tools. Diameter of well, 10 inches from surface to 150 feet; 7 inches from 150 to 400 feet. Casing used, 113 feet. Well yields by pumping 350 gallons per minute.
