# SPIRIT LEVELING IN VERMONT, 1896-1935 

J. G. Stanck, Chief Topographic Engineer

## INTRODUCTION

Scope of report.-This bulletin contains the results of all spirit leveling in Vermont done by the United States Geological Survey, including those heretofore published. ${ }^{1}$ The points for which figures of elevation are given are listed according to the quadrangles in which they occur, and thus the list for each quadrangle includes all points within its boundaries for which these figures have been determined. Following the quadrangle lists, which are arranged alphabetically, is a table in which are listed the positions and figures of elevation of certain points that serve to mark the Vermont-New Hampshire boundary. These points were selected and marked by a special commissioner appointed by the Supreme Court of the United States. Results of spirit leveling other than that done by the Geological Survey, with the exception of those contained in the above-mentioned table, are not included in this bulletin.

Cooperation.-Several quadrangles in the southern part of Vermont were mapped by the United States Geological Survey in cooperation with the State before 1896, the year in which the Federal Survey was authorized to establish benchmarks. Since that time the State, through its cooperating agencies, has contributed financially to the survey of 20 additional quadrangles. The War Department has also cooperated in the work, having contributed funds toward the survey of seven of the nine quadrangles that lie along the boundary between the United States and Canada, namely, Averill, Enosburg Falls; Indian Stream, Irasburg, Island Pond, Jay Peak, and Memphremagog. In 15 other quadrangles the leveling was done by the United States Geological Survey without cooperation from any other organization.

Classification of leveling.--Spirit leveling is classified according to the degree of refinement in the instruments and methods used and according to the closure errors.

[^0]First-order leveling ${ }^{2}$ consists of leveling done with the most improved instruments, all sections being leveled twice, in opposite directions, under varying conditions. Closures are not allowed to exceed the amount in feet represented by the formula $0.017 \sqrt{\text { length }}$ of section in miles. All corrections for rod error, temperature, and unbalanced sights are applied, as well as the orthometric corrections for convergence toward the poles of level surfaces of different elevations.

Second-order leveling, according to regulations of the United States Geological Survey, comprises lines leveled twice with reliable instruments, though not necessarily of the most improved type. Closures are not allowed to exceed $0.035 \sqrt{\text { length of section in miles. }}$

Third-order leveling is made up of lines that are run, either with first-order equipment or with an engineer's wye level and rods of the New York type, in single-line circuits that are required to close within the limits, in feet, of $0.05 \sqrt{\text { length of circuit in miles. This is equiva- }}$ lent to $0.071 \sqrt{\text { length of section }}$ if the line is leveled twice.

All leveling done by the United States Geological Survey in Vermont is of third-order accuracy except as otherwise stated.

Adjustments.-The adjustment of a net of leveling begins with the first-order lines. Most of these lines in both the United States and Canada have already been combined in a general net, and the orthometric differences derived from the observed values by correction for the convergence of level planes toward the north have been adjusted to remove accidental closure errors by the mathematical method known as least squares. The latest adjustment of this kind was made in 1929 by the United States Coast and Geodetic Survey and is known as the "1929 general adjustment of first-order leveling." This adjustment included the first-order lines in Vermont, and the elevations thus derived are the fundamental references for elevations determined by second- and third-order nets. The third-order leveling of the United States Geological Survey in Vermont has been adjusted by determining weighted mean elevations for new junction points and prorating the errors of each link. The weights are taken as the reciprocals of lengths of links. The third-order net has thus been brought into agreement with the best information available for the results of the fundamental first-order leveling, although the published figures of elevation may be changed, slightly by future adjustments of the level net.

Benchmarks.-The benchmarks used by the United States Geological Survey (pl. 1) are of two general classes-principal and supplementary. Principal benchmarks are placed at more or less regular intervals along a level line and are established with the aim of making them as nearly permanent as practicable. They are usually bronze

[^1]or aluminum tablets, iron posts, or copper bolts. Supplementary or auxiliary benchmarks are less formal in design and are placed between the principal benchmarks. Some of the supplementary benchmarks in common use are copper nails fitted with washers, spikes, and marks cut with a chisel on rock or masonry.

The tablets are circular in shape, measure $37 / 8$ inches in diameter, and taper from a thickness of three-eighths of an inch at the center to about a quarter of an inch near the rounded edge. During a short period in the earlier years of the Survey's leveling the tablets set were made of aluminum. The softness of this metal, however, made them susceptible to damage, so that aluminum as a material for tabiets was soon discarded. The earliest tablets set and those now being placed are made of bronze, and bronze is the material now specified for standard tablets. Each tablet is cast with a 3 -inch shank extending from the center of its reverse side, by means of which it is cemented in place, and each bears an inscription on its face. The inscriptions on the tablets already placed differ in many details, because of changes in design at various times. The face of every tablet, however, is cast with the words "U. S. Geological Survey"; a cross at the center, which indicates the fiducial point for position or elevation; and the words "Elevation above sea." On some tablets the inscription indicates that they were set in connection with a project in which a State or other organization cooperated; on some the inscription includes a triangle, which signifies a located point, enclosing the cross at the center. Tablets bearing a triangle enclosing a cross may be used not only as benchmarks but also as triangulationor traverse-station marks. The inscription on most of the tablets already set includes the warning " 250 dollars fine for disturbing this mark", but the latest design omits this phrase and adds the sentence "For information write the Director, Washington, D. C."

If the tablet is to mark a transit-traverse station, the traverseman stamps it with letters indicating this use of it, such as "Prim. Trav. Sta.", "P. T. S.", or "T. T.", as well as his own identifying letter or letters, the serial number of the station, and the year, using steel dies. If the tablet is set as a benchmark, the levelman stamps it with his identifying letter or letters, the serial number, and the year. He may at the same time stamp upon it with steel dies the figures of elevation to the nearest foot, or these figures may be added later. Tablets that serve as benchmarks may have been set as such, or they may have been set to mark traverse stations. Thus many of them serve a dual purpose, but each has stamped upon it the date and the identifying designation of the engineer who established it.

The figures of elevation that appear on a tablet are usually those determined by field computation only. It is sometimes found, therefore, that they do not represent the latest information. This has
happened either because they refer to some independent datum temporarily adopted before first-order trunk lines made standard datum available, or because a later adjustment made in the office has rendered necessary an appreciable change in the figures as determined in the field. It is assumed that engineers and others who require accurate figures of elevation for the marks will use those printed in a bulletin such as this one, instead of accepting the stamped figures. If the appropriate bulletin is not conveniently accessible, a request for the desired information may be addressed to the Director of the United States Geological Survey, Washington, D. C.

The tablets, of whatever style, are cemented into holes drilled in solid rocks or in the walls of public buildings, bridge abutments, or other masonry structures. Where masonry or rock is not available the tablets are set in the tops of reinforced concrete posts, which may be either precast or mixed and molded at the selected site. The posts are about 8 inches square or 8 inches in diameter at the top and larger at the base. They are generally so set as to project about 6 inches above ground and are made sufficiently long to reach below the frost line.

Antedating the concrete posts which are now constructed to hold the tablets in places where masonry or rock is not available are wroughtiron posts, to whose tops are riveted bronze caps of similar design to the tablets. These iron posts measure 4 feet in length and $3 \frac{1}{2}$ inches in outer diameter and are set about 3 feet in the ground. The bottom of the post spreads out to a width of about 10 inches in order to give it a firm footing in the earth. No iron posts have been set in recent years. They have proved impracticable, as they are easily disturbed and are subject to rust at the ground level, which eventually destroys them.

The third form of principal benchmark, set only in the early leveling, is a copper bolt, designed to be wedged into a drill hole in rock or masonry and perhaps further secured with lead or cement. This bolt is 4 inches in length and 1 inch in diameter and has a slot at one end into which fits a brass wedge. The wedge serves to expand the bottom end of the bolt, so that after the bolt has been driven to almost its full length into the hole, it cannot be easily removed. The exposed end of the bolt bears an appropriate inscription, stamped upon it with steel dies. This inscription is made up of the letters "U S G S", the letters indicating the datum used, the abbreviated word "Ft.", and the figures of elevation.

Supplementary benchmarks are of many kinds. One kind consists of a copper nail $1 \%$ inches long supplied with a copper washer seveneighths of an inch in diameter, through which the nail is driven into the root of a tree or some timber structure or cemented into rock after bending the point. The designation "U S G S B M" is stamped
on each washer, and on some washers the abbreviation of the name of the cooperating State is added. Another kind of supplementary benchmark is a chiseled square, used on the horizontal surface of rocks or masonry structures, or a chiseled cross, used on a vertical surface. Nails, track spikes, small capped iron pipes, and, occasionally, easily described and recognized points, such as doorsills and tops of hydrants, also serve as supplementary benchmarks.

Preservation and restoration of benchmarks.-Any person who finds that a principal benchmark has been damaged, disturbed, or destroyed or that it should be reset or redescribed on account of highway or other improvements will render a public service by communicating the facts to the Director, United States Geological Survey, Washington, D. C., before taking any action affecting the location or elevation of the mark. A proper form, accompanied by a return-addressed, franked envelope, will be sent for use in reporting the action taken and in recording the revised description of the mark, if any, and the notes made in obtaining the revised elevation.

Datum.-All elevations determined by the United States Geological Survey and those determined by the United States Coast and Geodetic Survey for inland mapping are referred to mean sea level, which is the level that the sea would assume if the influence of winds, tides, and currents were eliminated. This level is not the elevation determined from the mean of the highest and lowest tides, nor is it the half sum of the mean of all the high tides and the mean of all the low tides, which is called the half-tide level. Mean sea level is the average height of the water, all stages of the tide being considered. It is determined from observations made by means of tidal gages placed at stations where local conditions, such as those due to long, narrow bays, rivers, and like features, will not affect the height of the water. To obtain even approximately correct results these observations must extend over at least one lunar month, and if accuracy is desired they must extend over several years. At ocean stations the half-tide level and the mean sea level usually differ but little. It is assumed that there is no difference between the mean sea levels determined from observations made in the Atlantic Ocean, the Gulf of Mexico, and the Pacific Ocean. ${ }^{3}$

Index map.-The accompanying index map of Vermont (fig. 1) shows the relative position of the quadrangle areas that make up the State, each of which measures 15 minutes in latitude by 15 minutes in longitude. Maps of many of the quadrangles may be purchased at 10 cents each retail or 6 cents wholesale (in lots of 50 or more). Prepayment is required and may be made by money order, payable to the Director of the United States Geological Survey, or in cash-

[^2]

Figure 1.-Index map of Vermont showing the quadrangles into which the State has been divided and the routes followed by levelmen of the United States Geological Survey.

GEOLOGICAL SURVEY BENCHMARKS.
$A$ and $B$, Standard tablets, principal benchmarks, used where masonry or rock is available to hold them. $A$ is used in cooperating States; the State name is inserted at $a . C$, Under side of $A$ and $B$, showing shank used to hold tablet in place. $D$ and $E$, Two views of copper nail and copper washer, a supplementary benchmark, used for points lying between those marked by standard tablets. $F$, Standard iron post fitted with bronze cap similar in design to the standard tablet, formerly used where no rock or masonry was available; superseded by concrete post with tablet set in top.
the exact amount-at sender's risk. Postage stamps should not be sent.

The heavy black lines on the index map indicate the routes of the third-order lines of leveling in Vermont run by the United States Geological Survey. The light dashed lines indicate the routes followed by the first- and second-order leveling of the United States Coast and Geodetic Survey.

Personnel.-The leveling of the U. S. Geological Survey in Vermont was done under the supervision of the several chief geographers or chief topographic engineers who were in administrative charge of the topographic branch during the years when the lines were run. The name of the levelman who ran a particular line and the date when it was run immediately follow the designation of the route of that line and form part of the heading that precedes the descriptions of benchmarks. The adjustment of the third-order level net and the revision, correlation, and compilation of the descriptions and elevations of benchmarks, as well as the assembling of the lists, were done mainly by D. H. Baldwin, geodetic engineer, under the supervision of R. M. Wilson, chief of the section of computing, under the general direction of J. G. Staack, chief topographic engineer.

#### Abstract

From Montpelier quadrangle near Little Elmore Pond north and west along roads to Morrisville, thence southwest along La Porte road (State Highway 100) and back into Montpelier quadrangle (first part of line-to School No. 6by R. G. Clinite in 1927 ; remainder by H. P. Kilby in 1919)

Elmore, 2.7 mi . S. of, 10.8 mi . N. of Worcester, 20 ft . W. of Mont-pelier-Morrisville rd., opposite T-rd. E., on point of ledge, 4 in. above ground; chiseled circle
Elmore, 2.0 mi . S. of, 60 ft . N. and 40 ft . E. from junction of rd. E. marked by sign "East Elmore 4 miles", in orchard, in root on W. side of $16-\mathrm{in}$. forked apple tree; copper nail and washer
$1,250.66$
Elmore, 1.6 mi . S. of, 150 ft . N. of junction of rd. E., on E. side of rd., on ledge; chiseled square

1, 266.81
Elmore, 55 ft . S. and 25 ft . E. from junction of Montpelier-Morrisville rd. and rd. E., at SWW. corner of lawn of corner house, in $12-$ by $16-\mathrm{in}$. concrete block at point 10 in . above ground; standard tablet stamped "Vt 1145 1919" (reset)

1, 145. 143
Reference mark 1, 45 ft . N. of tablet, at NW. corner of above-mentioned lawn; top of granite corner stone.
$1,145.07$
Reference mark 2, 340 ft . N. of tablet, 180 ft . NE. of Elmore Pond Brook, 180 ft . S . of entrance to church, on S . side of stream, in top of large boulder; chiseled square

1, 140. 75
Elmore Pond; surface of water at $2: 45$ p. m. June 11, $1927 \ldots \ldots \ldots .$. ...... 1, 139. 4
Elmore, 1.1 mi . N. of, at Morristown-Elmore town line, in N. angle of junction of rd. NE., on top of stone; chiseled square (found under pile of tanbark)
$1,164.49$
Morrisville, 2.2 mi . SE. of, at junction of T-rd. S., directly opposite and 70 ft . S. of School No. 6, 10 ft . S. of Montpelier-Morrisville rd., on top of rock; chiseled square.
$1,106.41$
Morrisville, 1.4 mi . SE. of monument square, at junction of T-rd. SW., in culvert under rd., on top of rock; chiseled square
Morrisville, at monument square, 20 ft . E. of monument, on top of concrete base of cannon; standard tablet stamped "681 1919".-.-
Morrisville, 2.8 mi . S. of, at farm of W. L. Durgan, 200 ft . S. of barn, 30 ft . E. of rd., in shelf of ledge; standard tablet stamped "Vt 740 1919'
740. 423

Morrisville, 4.3 mi . S. of, 4.4 mi . NE. of Stowe, 0.6 mi . S. of South La Porte School, 100 ft . N. of junction of La Porte rd. and secondclass T-rd. W., 20 ft . E. of rd., on fence line, on top of rock; chiseled square

From Jay Peak quadrangle southwest along road north of North Branch of Lamoille River to point 0.6 mile north of Belvidere Junction, thence north along road east of Streeter Brook and back into Jay Peak quadrangle (by F. I. Shalibo in 1922)

Belvidere Center, 1.4 mi . W. of, 100 ft . W. of barn on edge of highway; 25 ft . N. of center line of highway, on $12-$ by $18-\mathrm{ft}$. boulder protruding 10 ft . above ground; chiseled square
Belvidere Center, 2.4 mi . W. of, about 1 mi . by direct rd. NE. of
Belvidere Junction, 660 ft . N. of rd.forks, at NW. corner of wooden
bridge over North Branch of Lamoille River, in coping stone of
abutment; chiseled square
Belvidere Junction, 0.6 mi . due N. of, 3.0 mi . SW. of Belvidere Center,
opposite junction of T-rd. N., at Belvidere Lumber Co.'s mill, 15
ft . S. of rd., 30 ft . E. of carriage shed, 30 ft . W. of barn, on river
bank, in N. edge of rock ledge; standard tablet stamped " 762 S 8 Vt
1922"
From Jay Peak quadrangle southeast along East Berkshire-Eden road (State
Highway 118) to Eden, thence northeast along Hyde Park-Lowell road (State
Highway 100) into Hard wick quadrangle (by F. L. Shalibo in 1922)

#### Abstract

From Hyde Park quadrangle northwest along Stowe-Bakersfield road (State Highway 108) to Fletcher station, thence north along St. Johnsbury \& Lake Champlain Railroad into Enosburg Falls quadrangle (by E. E. Harris in 1924)

Stowe, about 5 mi . NW. of, 4.4 mi . S. of Smugglers Notch, in NE. corner of rd. forks, at highway bridge over West Branch of Waterbury River, in E. end of S. stone abutment; chiseled square
961. 86

Smugglers Notch, 3.7 mi . S. of, at rd. forks; 130 ft . W. of State Highway 108, on N. side of toll rd. leading to Mount Mansfield, 70 ft . SW. of Lovejoy's toll house, in top of large boulder; standard tablet stamped " 1924 H 1"

1, 301.659

Barnes Camp, 1.8 mi . S. of Smugglers Notch, in SW. corner of crossing of State Highway 108 and Green Mountain Club Trail, in root on S. side of $30-\mathrm{in}$. elm tree; copper nail and washer

1,550. 60
Smugglers Notch, 0.6 mi . S. of, on E. side of highway and N. side of entrance to Big Spring, in top of prominent slate boulder; standard tablet stamped " 1924 H 2"

1, 803. 389
Reference mark, 75.6 ft . N. $20^{\circ} \mathrm{W}$. of tablet, on top of rock outcrop; chiseled square
$1,812.63$

Smugglers Notch, 0.8 mi . N. of, 50 ft . N. of drain crossing, on E. side of highway and N . side of dim rd., on top of large slate boulder; chiseled square

Smugglers Notch, 1.7 mi . N. of, on E. side of highway, 100 ft . N. of shack, at highway bridge over creek, in E. end of N. stone abutment; chiseled square
Smugglers Notch, 2.9 mi . N. of, $1,500 \mathrm{ft}$. S. of sawmill, on E. side of highway, at concrete bridge over main creek, in E. end of N. abutment; standard tablet stamped " 1924 H 3"
$1,111.283$
Reference mark, 26.1 ft . S. $20^{\circ} \mathrm{E}$. of tablet, in E. end of S. abuiment of
above-described bridge; chiseled square----------------------1, 111. 14
Jeffersonville, 4.0 mi . S. of, 4.0 mi . N. of Smugglers Notch, about 1 mi. S. of South Cambridge, 200 ft . N. of dwelling, on E. side of highway, in root on W. side of $15-\mathrm{in}$. maple tree in fence line; copper nail and washer

Reference mark, 69 ft . N. of tablet, on top of NE. wing wall of bridge; chiseled square
East Corinth, 1.1 mi . S. of, 35 ft . SE. of junction of rd. W., at small concrete bridge, on SE. corner of stone foundation; chiseled square . .
East Corinth, about 2 mi . SE. of, near Corinth-Bradford town line, 20 ft . S. of center line of highway, in hollow, in base of $20-\mathrm{in}$. willow tree; copper nail and washer
642. 31

East Corinth, 2.1 mi . S. of, 180 ft . S. of Corinth-Bradford town line, at W. edge of highway, in base on E. side of $15-\mathrm{in}$. pine tree; copper nail and washer
651. 91

East Corinth, 3.1 mi. SE. of, 5.5 mi . NW. of Bradford, 115 ft . N. of forks of Montpelier-Bradford rd. and rd. SW. to South Corinth, 45 ft . NE. of iron bridge over Waits River, on ledge; chiseled square_
602. 72

VERMONT-NEW HAMPSHIRE BOUNDARY MARKS, 1934-36
The figures of elevation here given are taken from the report of Samuel S. Gannett, special commissioner appointed in 1934 by the Supreme Court of the United States to locate and mark the boundary between the State of Vermont and the State of New Hampshire at certain specified points. See "Supreme Court of the United States, October term, 1936, No. 2, Original (290 U. S. 579)." These figures are referred to mean sea level and are based on the 1929 general adjustment of leveling in the United States.

The initial point of Mr. Gannett's survey is a copper bolt in the Mud Turtle monument, the common corner of Vermont and New Hampshire on the north line of Massachusetts. The other marks are tablets, set either in monuments established for this purpose or in already existing substantial structures located on or near the State line as here designated. In the column headed "Mark no." the figures preceded by an asterisk indicate that the marks so designated are set on the actual State line; these are known as line-markel tablets. Marks not so designated are known as reference tablets. The positions of the marks are given in terms of latitude and longitude based on the 1927 North American datum.

Vermont-New Hampshire boundary marks

## SUPPLEMENTAL ELEVATIONS

The table below shows altitudes of well-known features in Vermont, such as summits, water surfaces, and tops of rails at railroad stations, as assembled from the topographic maps of the Geological Survey and from other sources. ${ }^{51}$ These altitudes, with the exception of a few which were determined by spirit leveling along railroads, were obtained by barometric and vertical-angle measurements. The figures given are in accord with the latest information, but they are only approximate and should not be used for accurate work.

[^0]:    ${ }^{1}$ For the results of spirit leveling in Vermont previously published see Triangulation and spirit level ${ }^{2}$ ing-Vermont: U. S. Geol. Survey 18th Ann. Rept., pt. 1, pp. 235-239, 1897; Triangulation and spirit leveling-New Hampshire and Vermont: U. S. Geol. Survey 19th Ann. Rept., pt. 1, pp. 197-199, 1898; Results of spirit leveling in Maine, New Hampshire, and Vermont, 1896 to 1909, inclusive: U. S. Geoh Survey Bull. 437, pp. 46-54, 1910.

[^1]:    ${ }^{3}$ See Avers, H. G., Manual of first-order leveling: U. S. Coast and Geodetic Survey Special Pub. 140, 1929

[^2]:    ${ }^{8}$ See Jones, E. L., Hypsometry-Use of mean sea level as the datum for elevations: U. S. Coast and Geodetic Survey Special Pub. 41, 1917; Manual of tide observations: U. S. Coast and Geodetic Survey Special Pub. 196, 1935.

[^3]:    - Part of this quadrangle lies in New Hampshire.
    ${ }^{8}$ A narrow strip of territory lying just north of latitude $45^{\circ}$, given as the northern limit of this quadrangle, has been included on the map for convenience. This strip extends to the United States-Canada boundary.

[^4]:    ${ }^{6}$ The figures of elevation reported for this point by the International Boundary Commission are 1,102.63; those reported by the Geodetic Survey of Canada are 1,102.621. See International Boundary Commission, Joint report upon the survey and demarcation of the boundary between the United States and Canada from the source of the St. Croix River to the St. Lawrence River, p. 341, Washington, Government Printing Office, 1925; also Montgomery, R. H., Precise leveling in Quebec south of St. Lawrence River: Canada Geodetic Survey Pub. 17, p. 15, 1923.

[^5]:    os Part of this quadrangle Hes in New Hampshire.

[^6]:    ${ }^{1}$ This mark is U. S. C. \& G. S. T. B. M. 8, described as at semaphore 503, which was moved in fall of 1928 about $2,160 \mathrm{ft}$. N. of its former position and renumbered.

[^7]:    7a Permission to remove this mark was granted by the Geological Survey in 1926. Action taken has not been reported.

[^8]:    ${ }^{8}$ Part of this quadrangle lies in New Hampshire.

[^9]:    ${ }^{9}$ Part of this quadrangle lies in New Hampshire.

[^10]:    ${ }^{10}$ The elevation given for this mark by the U. S. Coast and Geodetic Survey, 249.284 ft ., has been rejected.

[^11]:    ${ }^{11}$ The elevation of the center line of the road at a point opposite this tablet is $1,919.5 \mathrm{ft}$.
    ${ }_{12}^{12}$ The elevation of the center line of the road at a point opposite this tablet is 770 ft .
    ${ }^{18}$ Elevations are based upon the 1929 general-adjustment elevation, 108.502 feet, for the Chapman benchmark at Rouses Point, N. Y., and determined by means of information received in February 1800 from Prof. Arthur D. Butterfield, of the University of Vermont. The corresponding elevation of the zero of gage at Fort Montgomery, N. Y., is taken as 93.052 feet by leveling done in 1898-99 under the direction of the Deep Waterways Commission, and the corresponding elevation of the zero of gage at Burlington, vt., is taken as 92.952 feet by using a mean of selected comparisons of gage readings at Fort Montgomery, N. Y., and Burlington, Vt., made in June 1904 by Prof. Butterfield and Prof. H. K. Barrows. Adding to this a small correction of +0.024 foot on account of flow and convergence of level planes to the north gives the accepted elevation for the zero of the Burlington gage, which is 92.976 feet.

[^12]:    ${ }^{180}$ Part of this quadrangle lies in New Hampshire.

[^13]:    ${ }^{14}$ This tablet was reset in the same shoulder of the ledge in which it was originally set bút $\mathrm{S} .22^{\circ} 40^{\prime} \mathrm{W}$. of its original site. No distance nor change in height was reported.

[^14]:    16 A narrow strip of territory lying just north of latitude $45^{\circ}$, given as the northern limit of this quadrangle, has been included on the map for convenience. This strip extends to the United States-Canada boundary.

[^15]:    ${ }^{10}$ Part of this quadrangle lies in Massachusetts.

[^16]:    ${ }^{17}$ Part of this quadrangle lies in New Hampshire.

[^17]:    ${ }_{18}$ Part of this quadrangle lies in New Hampshire.

[^18]:    ${ }^{19}$ Mr. McNair's line, of third-order accuracy, follows the same route as the first-order line of Mr. Campbell, just described, and, like it, has been fitted to the first-order line of the U.S. Coast and Geodetic Survey along this route.
    ${ }^{20}$ A. F. McNair, in 1910, ran a double line west from this benchmark into Woodstock quadrangle.

[^19]:    ${ }^{11}$ Most of this quadrangle lies in New Hampshire; the Vermont portion consists of a small area near Beecher Falls.
    ${ }^{33}$ A narrow area lying just north of latitude $45^{\circ} 15^{\prime}$, given as the northern limit of this quadrangle; has been included on the map for convenience. This area extends north to the United States-Canada boundary. The greater part of the area lying north of latitude $45^{\circ} 5^{\prime}$ and west of longitude $71^{\circ} 25^{\prime}$ is in Canada.

[^20]:    ${ }^{3}$ A narrow strip of territory lying just north of latitude $45^{\circ}$, given as the northern limit of this quadrangle has been included on the map for convenience, This stripextends to the United States-Canada boundary,

[^21]:    ${ }^{4}$ A narrow strip of territory lying just north of latitude $45^{\circ}$, given as the northern limit of this quadcangle, has been included on the map for convenience. This strip extends to the United States-Canada boundary.

[^22]:    ${ }_{25}$ The figures of elevation reported for this point by the Geodetic Survey of Canada are 1,251.813. See Montgomery, R. H., Precise leveling in Quebec south of St. Lawrence River: Canada Geodetic Survey Pub. 17, p. 34, 1929.
    ${ }_{38}$ The figures of elevation reported for this benchmark by the organization which set it, the Geodetic Survey of Canada, are 1,211.000. See Montgomery, R. H., Precise leveling in Quebec south of St. Lawrence River: Canada Geodetic Survey Pub. 17, p. 34, 1929.

[^23]:    ${ }^{37}$ A narrow strip of territory lying just north of latitude $45^{\circ}$, given as the northern limit of this quadrangle ${ }_{\text {. }}$ has been included on the map for convenience. This strip extends to the United States-Canada boundaryo

[^24]:    ${ }_{28}$ The figures of elevation reported for this point by the Geodetic Survey of Canada are 492.963. See Montgomery, R. H., Precise leveling in Quebec south of St. Lawrence River: Canada Geodetic Survey Pub. 17, p. 13, 1929.

[^25]:    ${ }^{20}$ This benchmark was established by Ernest McIntosh, of the Vermont Highway Department, in November 1929, to replace a standard tablet that had disappeared. It is 60 feet north of the site of the tablet but at the same elevation.

[^26]:    ${ }^{11}$ Part of this quadrangle lies in New Hampshire.

[^27]:    From Browns Bridge, near Barton, west along Barton-East Albany road into Hard wick quadrangle near Vance School (by E. C. Wood in 1934)

[^28]:    82 A narrow strip of territory lying just north of latitude $45^{\circ}$, given as the northern limit of this quadrangle, has been included on the map for convenience. This strip extends to the United States-Canada boundary.
    ${ }^{23}$ The figures of elevation reported for this benchmark by the Geodetic Survey of Canada are 683.607. See Montgomery, R. H., Precise leveling in Quebec south of St. Lawrence River: Canada Geodetic Survey Pub. 17, p. 33, 1929.

[^29]:    ${ }^{34}$ This tablet was reset December 22, 1926, by R. G. Clinite. Its present site is about 80 ft . SE. of and

[^30]:    ${ }^{35}$ This benchmark is on the first-order line of N. A, Campbell. For a full descrintion of its site see i] 80.
    8 The bridge was washed away in a flood.
    ${ }^{37}$ This mark is on the corner board at the northeast corner of the old tollhouse, which stands on the site of the Vermont end of the above-mentioned bridge.

[^31]:    ${ }^{29}$ This tablet was reset in November 1929 by F. R. Pyle, of Burlington, Vt. Its present site is 71 ft . east of and 2.780 ft . higher than its original site, which was in a prominent rock ledge southwest of the bridge.

[^32]:    ${ }^{39}$ Part of this quadrangle lies in New York.

[^33]:    ${ }^{40}$ This line is adjusted purposely to close an even 1 foot high at Goshen. One or more of the elevations given are therefore probably 1 foot in error.

[^34]:    ${ }^{41}$ Part of this quadrangle lies in New York.
    ${ }^{42}$ A narrow strip of territory lying just north of latitude $45^{\circ}$, given as the northern limit of this quadrangle, has been included on the map for convenience. This strip extends to the United States-Canada boundary,
    ${ }^{43}$ See U. S. Coast and Geodetic Survey Special Pub. 182.

[^35]:    "Part of this quadrangle lies in New York.
    ${ }^{45}$ Part of this quadrangle lies in New Hampshire, but most of it lies in Massachusetts. The Vermont portion includes only a small area west of the Connecticut River extending south from latitude $42^{\circ} 45^{\prime}$ to the Massachusetts State line.
    ${ }^{10}$ Part of this quadrangle lies in New Hampshire.

[^36]:    ${ }^{47}$ Accurate figures of elevation for this benchmark could not be determined, as the rock in which it was set was later loosened and disturbed by flood. The tablet may therefore be several feet lower than the figures stamped upon it would indicate.

[^37]:    ${ }^{48}$ The accuracy of the figures of elevation here given for this line is doubtful. There were large local divergences between the two runnings, and there was no third running.

[^38]:    ${ }^{40}$ Part of this quadrangle lies in New Hampshire.

[^39]:    ${ }^{50}$ The portion of this line extending from West Newbury Church to Newbury Center was leveled twice.
