IN REPLY REFER TO:

UT-080-1610-010J

Dear Reader:

Enclosed is the Proposed Resource Management Plan (PRMP) and Final Environmental Impact Statement (FEIS) for the Vernal Field Office. The Bureau of Land Management (BLM) prepared the PRMP/FEIS in consultation with cooperating agencies, taking into account public comments received during this planning effort. This PRMP/FEIS provides a framework for the future management direction and appropriate use of BLM-administered lands and resources located in Daggett, Duchesne, and Uintah Counties, as well as 3,000 acres of public lands in Grand County, Utah. The document contains both land use planning decisions and implementation decisions to guide the BLM's management of the Vernal Field Office. The PRMP/FEIS is open for a 30-day review and protest period beginning the date the U.S. Environmental Protection Agency (EPA) publishes the Notice of Availability of the FEIS in the *Federal Register*.

This PRMP/FEIS has been developed in accordance with the National Environmental Policy Act of 1969 (NEPA) and the Federal Land Policy and Management Act of 1976 (FLPMA). The PRMP/FEIS is largely based on Alternative A, the Preferred Alternative in the Draft RMP and EIS, which was released in January 2005. A Supplement to the Draft RMP/EIS evaluating non-WSA lands with wilderness characteristics was released in October 2007. This PRMP/FEIS contains the proposed plan and potential impacts of the proposed plan. The alternatives presented in the Draft and Draft Supplement RMP/EIS are also provided for comparative purposes. Major comments received during the public review period of the Draft RMP/EIS as well as the Draft Supplement and responses to these comments are provided on an attached CD. To aid the reader, substantive changes made between the Draft RMP/EIS and the PRMP/FEIS are described in Chapter 1 and are detailed in Appendix N.

Pursuant to BLM's planning regulations at 43 CFR 1610.5-2, any person who participated in the planning process for this PRMP and has an interest which is or may be adversely affected by the planning decisions may protest approval of the planning decisions within 30 days from date the Environmental Protection Agency publishes the Notice of Availability in the *Federal Register*. For further information on filing a protest, please see the accompanying protest regulations in the pages that follow (labeled as Attachment 1). The regulations specify the required elements of your protest. Take care to document all relevant facts. As much as possible, reference or cite the planning documents or available planning records (e.g. meeting minutes or summaries, correspondence, etc.). To aid in ensuring the completeness of your protest, a protest check list is attached to this letter (labeled as Attachment 2). If your protest does not include all of the elements outlined in 43 CFR 1610.5-2 the BLM will not respond to your protest.

E-mailed and faxed protests will not be accepted as valid protests unless the protesting party also provides the original letter by either regular or overnight mail postmarked by the close of the protest period. Under these conditions, the BLM will consider the e-mailed or faxed protest as an advance copy and will afford it full consideration. If you wish to provide the BLM with such advance notification, please direct faxed protests to the attention of Brenda Hudgens-Williams- BLM protest coordinator at 202-452-5112, and e-mailed protests to: [Brenda\\_Hudgens-Williams@blm.gov](mailto:Brenda_Hudgens-Williams@blm.gov).

All protests, including the follow-up letter (if e-mailing or faxing) must be in writing and mailed to the following address:

Regular Mail:

Director (210)  
Attention: Brenda Williams  
P.O. Box 66538  
Washington, D.C. 20035

Overnight Mail:

Director (210)  
Attention: Brenda Williams  
1620 L Street, N.W., Suite 1075  
Washington, D.C. 20036

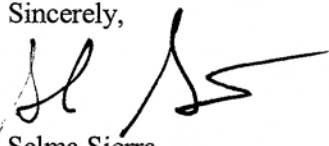

Before including your address, phone number, e-mail address, or other personal identifying information in your protest, be advised that your entire protest – including your personal identifying information – may be made publicly available at any time. While you can ask us in your protest to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so.

The BLM Director will make every attempt to promptly render a decision on each protest. The decision will be in writing and will be sent to the protesting party by certified mail, return receipt requested. The decision of the BLM Director shall be the final decision of the Department of the Interior.

Upon resolution of all land use plan protests, the BLM will issue an Approved RMP and Record of Decision (ROD). The Approved RMP and ROD will be mailed or made available electronically to all who participated in the planning process and will be available to all parties through the “Planning” page of the BLM national website (<http://www.blm.gov/planning>), or by mail upon request.

Unlike land use planning decisions, implementation decisions are not subject to protest under the BLM planning regulations, but are subject to an administrative review process, through appeals to the Office of Hearings and Appeals (OHA), Interior Board of Land Appeals (IBLA) pursuant to 43 CFR, Part 4 Subpart E. Implementation decisions generally constitute the BLM’s final approval allowing on-the-ground actions to proceed. Where implementation decisions are made as part of the land use planning process, they are still subject to the appeals process or other administrative review as prescribed by specific resource program regulations once the BLM resolves the protests to land use planning decisions and issues an Approved RMP and ROD. Implementation-level decisions in the PRMP/FEIS are indicated by *italic text* and an asterisk (\*) in Chapter 2. The Approved RMP and ROD will also clearly identify the implementation decisions made in the plan that may be appealed to the Office of Hearing and Appeals.

Sincerely,

Selma Sierra  
Utah State Director

## Attachment 1

[Code of Federal Regulations]  
[Title 43, Volume 2]  
[Revised as of October 1, 2002]

### TITLE 43--PUBLIC LANDS: INTERIOR

#### CHAPTER II--BUREAU OF LAND MANAGEMENT, DEPARTMENT OF THE INTERIOR

#### PART 1600--PLANNING, PROGRAMMING, BUDGETING--Table of Contents

#### Subpart 1610--Resource Management Planning

#### Sec. 1610.5-2 Protest procedures.

(a) Any person who participated in the planning process and has an interest which is or may be adversely affected by the approval or amendment of a resource management plan may protest such approval or amendment. A protest may raise only those issues which were submitted for the record during the planning process.

(1) The protest shall be in writing and shall be filed with the Director. The protest shall be filed within 30 days of the date the Environmental Protection Agency published the notice of receipt of the final environmental impact statement containing the plan or amendment in the Federal Register. For an amendment not requiring the preparation of an environmental impact statement, the protest shall be filed within 30 days of the publication of the notice of its effective date.

(2) The protest shall contain:

(i) The name, mailing address, telephone number and interest of the person filing the protest;

(ii) A statement of the issue or issues being protested;

(iii) A statement of the part or parts of the plan or amendment being protested;

(iv) A copy of all documents addressing the issue or issues that were submitted during the planning process by the protesting party or an indication of the date the issue or issues were discussed for the record; and

(v) A concise statement explaining why the State Director's decision is believed to be wrong.

(3) The Director shall promptly render a decision on the protest. The decision shall be in writing and shall set forth the reasons for the decision. The decision shall be sent to the protesting party by certified mail, return receipt requested.

(b) The decision of the Director shall be the final decision of the Department of the Interior.

## **Resource Management Plan Protest Critical Item Checklist**

**The following items *must* be included to constitute a valid protest  
whether using this optional format, or a narrative letter.**

**(43 CFR 1610.5-2)**

Before including your address, phone number, e-mail address, or other personal identifying information in your **protest**, be advised that your entire **protest**--including your personal identifying information--may be made publicly available at any time. While you can ask us in your **protest** to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so. All submissions from organizations and businesses, and from individuals identifying themselves as representatives or officials of organizations and businesses, will be available for public inspection in their entirety.

**Resource Management Plan (RMP) or Amendment (RMPA) being protested:**

**Name:**

**Address:**

**Phone Number: (    )**

**Your interest in filing this protest (how will you be adversely affected by the approval or amendment of this plan?):**

**Issue or issues being protested:**

**Statement of the part or parts of the plan being protested:**

**Chapter:**

**Section:**

**Page:**

**(or) Map:**

**Attach copies of all documents addressing the issue(s) that were submitted during the planning process by the protesting party, OR an indication of the date the issue(s) were discussed for the record.**

**Date(s):**

**A concise statement explaining why the State Director's decisions is believed to be wrong:**

## **Abstract**

**Proposed Vernal RMP and Final EIS**

### **Proposed Vernal Resource Management Plan and Final Environmental Impact Statement**

**Lead Agency:** U.S. Department of the Interior, Bureau of Land Management

**Type of Action:** Draft ( ) Final (X)  
Administrative (X) Legislative ( )

**Jurisdiction:** Daggett, Duchesne, Uintah, and a small portion of Grand Counties, Utah

**Abstract:** The Vernal Proposed Resource Management Plan (RMP) and Final Environmental Impact Statement (EIS) describes and analyzes the Proposed RMP and draft alternatives for the planning and management of public lands and resources administered by the Bureau of Land Management (BLM), Vernal Field Office. The Vernal Field Office is located in the northeast corner of Utah and administers lands within Daggett, Duchesne, and Uintah Counties, plus a small portion of Grand County. There are 5,518,859 acres within the boundary of the Vernal Field Office, of which 1,725,512 acres (approximately 30%) are BLM-managed surface lands. The Vernal Field Office administers energy-related mineral activities on 3.9 million acres of Federal mineral lands (includes 1.3 million acres of National Forest Service lands) and post-lease mineral operations on Indian trust mineral lands. The 1,911,000 acres of BLM-managed mineral estate includes the split estate mineral lands within the Hill Creek Extension (consisting of 185,500 acres of mineral estate underlying Indian trust surface).

The Proposed RMP is open for a 30-day review and protest period beginning with the date the U.S. Environmental Protection Agency publishes the Notice of Availability of the Final EIS in the *Federal Register*.

Alternatives A through D were presented in the Draft RMP and EIS. Alternative E was presented in the Supplement to the Draft RMP and EIS. The management direction of **Alternative A (Preferred Alternative)** is generally broad and accommodates a wide variety of values and uses. **Alternative B** provides for most resource uses but would emphasize oil and gas development, where feasible. **Alternative C** would strongly emphasize maintenance of watershed conditions, species viability, properly functioning ecosystems, and a reduction of habitat fragmentation. **Alternative D (Current Management/No Action)** would maintain present uses by continuing current management direction and activities by all new mandates, Executive Orders, and directives that have been implemented since the Books Cliffs and Diamond Mountain RMPs were completed. **Alternative E** gives emphasis to all non-WSA lands with wilderness characteristics, including closure of these areas to mineral leasing and off-road vehicles, exclusion of rights-of-way, protection of undisturbed landscapes, and providing opportunities for primitive and semi-primitive recreation.

The Proposed RMP/Final EIS is primarily based on the Preferred Alternative (Alternative A) from the Draft RMP/EIS. However, it has been modified to include aspects of all alternatives analyzed after careful consideration of both public and internal comments received on the Draft and Supplement RMP/EIS. The major issues addressed consist of: (1) travel management, (2) energy and mineral resource exploration and development, (3) special designations, (4) non-WSA lands with wilderness characteristics, and (5) special status species.

**Protest/Comment:** Protests on the Vernal Proposed Resource Management Plan and Final Environmental Impact Statement Proposed must be postmarked or received no later than 30 days after publication of the EPA Notice of Availability in the *Federal Register*. The 30-day protest period (identified above) will not be extended. The close of the review and protest period will be announced in news releases, newsletters, and on the Vernal RMP/EIS website at <http://www.blm.gov/ut/st/en/fo/vernal/planning.1.html>.

3.12.1.1 Special Recreation Management Areas (SRMAs).....	3-53
3.12.1.2 Extensive Recreation Management (ERMAs).....	3-53
3.12.2 Recreation Types .....	3-54
3.12.2.1 Trails .....	3-54
3.12.2.2 Off-Highway Vehicles (OHVs) .....	3-54
3.12.2.3 Hunting and Wildlife Viewing.....	3-55
3.12.2.4 Scenic Drives .....	3-55
3.12.2.5 River Recreation .....	3-55
3.12.2.6 Boating/Swimming .....	3-56
3.12.3 Management Strategies .....	3-57
<b>3.13 Riparian and Wetland Resources.....</b>	<b>3-57</b>
3.13.1 Regional Overview .....	3-57
3.13.2 Riparian and Wetland Inventory .....	3-58
<b>3.14 Socioeconomics.....</b>	<b>3-58</b>

3.14.1 Regional Overview .....	3-58
3.14.2 Uintah County .....	3-60
3.14.2.1 Social Characteristics.....	3-60
3.14.2.2 Economic Characteristics.....	3-61
3.14.2.3 Government Setting .....	3-67
3.14.3 Duchesne County .....	3-68
3.14.3.1 Social Characteristics.....	3-68
3.14.3.2 Economic Characteristics.....	3-69
3.14.3.3 Government Setting .....	3-74
3.14.4 Daggett County .....	3-74
3.14.4.1 Social Characteristics.....	3-74
3.14.4.2 Economic Characteristics.....	3-76
3.14.4.3 Government Setting .....	3-78
3.14.5 Region-wide Conclusions .....	3-79
<b>3.15 Soil and Water Resources .....</b>	<b>3-79</b>
3.15.1 Regional Overview .....	3-79
3.15.2 Topography .....	3-80
3.15.3 Soil Resources.....	3-80
3.15.3.1 Natural Resource Conservation Service (NRCS) Soil Surveys.....	3-81
3.15.3.2 Soil Characteristics of Greatest Management Concern .....	3-82
3.15.4 Water Resources .....	3-85
3.15.4.1 Surface Water Supply and Use .....	3-85
3.15.4.2 Groundwater Supply and Use .....	3-86
3.15.4.3 Water Quality.....	3-86
<b>3.16 Special Designations .....</b>	<b>3-87</b>
3.16.1 Areas of Critical Environmental Concern (ACEC) .....	3-87
3.16.1.1 Currently Designated ACECs .....	3-87
3.16.1.2 Potential ACECs .....	3-88
3.16.2 Wild and Scenic Rivers.....	3-90
3.16.2.1 Regional Overview .....	3-90
3.16.2.2 River Segments Determined Eligible for Wild and Scenic River Designation .....	3-91
3.16.3 Wilderness Study Areas .....	3-93
3.16.3.1 Overview .....	3-93
3.16.3.2 Planning Area Profile.....	3-93
<b>3.17 Special Status Species .....</b>	<b>3-94</b>
3.17.1 Regional Overview .....	3-94
3.17.1.1 Federally listed Species.....	3-94
3.17.1.2 Federally Endangered, Threatened, Candidate, and Proposed Species .....	3-97
3.17.1.3 State-listed Wildlife Species and BLM-listed Sensitive Plant Species .....	3-102

<b>3.18 Vegetation .....</b>	<b>3-113</b>
3.18.1 Dominant Vegetation Communities .....	3-113
3.18.1.1 Plains Grassland/Herbaceous .....	3-113
3.18.1.2 Desert Shrub.....	3-113
3.18.1.3 Sagebrush/Perennial Grass.....	3-114
3.18.1.4 Pinyon-Juniper .....	3-116
3.18.1.5 Mountain Shrub .....	3-117
3.18.1.6 Conifer Forest: Conifer/Aspen, Aspen/Forb, and Spruce/Fir .....	3-118
3.18.1.7 Riparian Areas and Wetlands.....	3-119
3.18.1.8 Badlands.....	3-119
3.18.2 Invasive Species and Noxious Weeds.....	3-120
<b>3.19 Visual Resources .....</b>	<b>3-124</b>
3.19.1 Visual Resource Management (VRM) Classes.....	3-124
3.19.2 Regional Overview .....	3-124
<b>3.20 Wild Horses .....</b>	<b>3-125</b>
3.20.1 Bonanza Herd Management Area .....	3-125
3.20.2 Winter Ridge Herd Area .....	3-126
3.20.3 Hill Creek Herd Management Area .....	3-127
3.20.3.1 Hill Creek Northwest/Wild Horse Bench .....	3-127
3.20.3.2 Hill Creek Southeast/Agency Draw .....	3-127
<b>3.21 Wildlife and Fisheries Resources.....</b>	<b>3-128</b>
3.21.1 Wildlife Associated with the VPA.....	3-129
3.21.1.1 Mule Deer .....	3-129
3.21.1.2 Rocky Mountain Elk .....	3-130
3.21.1.3 Pronghorn.....	3-132
3.21.1.4 Bighorn Sheep.....	3-133
3.21.1.5 Moose.....	3-133
3.21.1.6 Bison .....	3-134
3.21.1.7 Black Bear.....	3-134
3.21.1.8 Mountain Lion .....	3-135
3.21.1.9 Upland Species.....	3-135
3.21.1.10 Waterfowl, Shorebirds, and Wading Birds .....	3-136
3.21.1.11 Raptors .....	3-136
3.21.1.12 Other Non-Game Species .....	3-137
3.21.1.13 Fisheries and Aquatic Species .....	3-138
3.21.2 Habitat Fragmentation .....	3-138
<b>3.22 Woodlands and Forest Resources .....</b>	<b>3-139</b>
3.22.1 Regional Overview .....	3-139
3.22.2 Woodland and Forest Products .....	3-140

## VOLUME 2

### Table of Contents

<b>CHAPTER FOUR Environmental Consequences.....</b>	<b>4-1</b>
<b>4.1. Introduction.....</b>	<b>4-1</b>
4.1.1. Analytical Assumptions .....	4-1
4.1.2. Assumptions and Methodology for Minerals Development .....	4-2
4.1.3. Assumptions and Methodology for Air Quality Modeling .....	4-6
4.1.4. Types of Impacts to Be Addressed—Direct, Indirect, and Cumulative.....	4-6
4.1.5. Impacts to Critical Elements .....	4-7
4.1.5.1. Impacts of Alternatives on Prime and Unique Farmlands .....	4-7
4.1.5.2. Impacts of Alternatives on Invasive and/or Noxious Non-native Plants .....	4-7
4.1.5.3. Incomplete or Unavailable Information .....	4-7
<b>4.2. Air Quality .....</b>	<b>4-8</b>
4.2.1. Global Climate Change .....	4-8
4.2.2. Impacts Common to the Proposed RMP and All Alternatives .....	4-8
4.2.3. Impacts from the Proposed RMP and All Alternatives .....	4-9
4.2.3.1. Impacts of Cultural, Paleontological, Special Status Species, Visual Resource Management, and Wild Horse Management Decisions.....	4-9
4.2.3.2. Proposed RMP and Alternatives A, B, C, D, and E.....	4-9
4.2.3.3. Impacts of Livestock Grazing, Rangeland Improvement, Riparian Management, Vegetative Management, and Woodland and Forest Management Decisions .....	4-10
4.2.3.4. Impacts of Land and Realty Management Decisions on Air Quality .....	4-11
4.2.3.5. Impacts of Fire Decisions on Air Quality .....	4-11
4.2.3.6. Impacts of Mineral Decisions on Air Quality .....	4-13
4.2.3.7. Discussion .....	4-28
4.2.4. Mitigation Measures .....	4-30
4.2.5. Cumulative Impacts .....	4-30
4.2.5.1. NAAQS .....	4-31
4.2.5.2. PSD Increment Thresholds .....	4-31
4.2.5.3. HAPs Emissions.....	4-31
4.2.5.4. Visibility Analyses .....	4-31
4.2.5.5. Deposition .....	4-32
4.2.5.6. Acid Neutralizing Capacity.....	4-33
4.2.6. Air Quality Impact Summary.....	4-33
4.2.7. Unavoidable Adverse Impacts .....	4-33
4.2.8. Short-term Use Versus Long-term Productivity .....	4-34
4.2.9. Irreversible and Irretrievable Impacts .....	4-34

<b>4.3. Cultural Resources .....</b>	<b>4-35</b>
4.3.1. Impacts Common to the Proposed RMP and All Alternatives .....	4-36
4.3.2. Proposed RMP and Alternative Impacts .....	4-38
4.3.2.1. Impacts of Cultural Resource Decisions on Cultural Resources .....	4-39
4.3.2.2. Impacts of Fire Management Decisions on Cultural Resources .....	4-41
4.3.2.3. Impacts of Lands and Realty Decisions on Cultural Resources .....	4-42
4.3.2.4. Impacts of Mineral Decisions on Cultural Resources.....	4-45
4.3.2.5. Impacts of Non-WSA Lands with Wilderness Characteristics Decisions on Cultural Resources .....	4-57
4.3.2.6. Impacts of Rangeland Management Decisions on Cultural Resources .....	4-58
4.3.2.7. Impacts of Recreation Decisions on Cultural Resources .....	4-61
4.3.2.8. Impacts of Special Designation Decisions on Cultural Resources .....	4-65
4.3.2.9. Impacts of Travel Decisions on Cultural Resources.....	4-68
4.3.2.10. Impacts of Vegetation Decisions on Cultural Resources.....	4-73
4.3.2.11. Impacts of Visual Resource Management Decisions on Cultural Resources .....	4-74
4.3.2.12. Impacts of Wildlife and Fisheries Decisions on Cultural Resources.....	4-76
4.3.2.13. Mitigation Measures .....	4-77
4.3.3. Unavoidable Adverse Impacts .....	4-78
4.3.4. Short-term Uses versus Long-term Productivity .....	4-78
4.3.5. Irreversible and Irretrievable Impacts .....	4-78
<b>4.4. Environmental Justice .....</b>	<b>4-79</b>
4.4.1. The Proposed RMP and Alternatives A, B, C and E .....	4-79
4.4.1.1. Mitigation.....	4-80
4.4.2. Alternative D (No Action) .....	4-80
4.4.2.1. Mitigation.....	4-81
<b>4.5. Fire Management .....</b>	<b>4-82</b>
4.5.1. Impacts Common to the Proposed RMP and All Alternatives .....	4-83
4.5.2. Proposed RMP and Alternatives Impacts .....	4-84
4.5.2.1. Impacts of Fire Decisions on Fire Management.....	4-84
4.5.2.2. Impacts of Mineral Development Decisions on Fire Management .....	4-85
4.5.2.3. Impacts of Non-WSA Areas with Wilderness Characteristics Decisions on Fire Management .....	4-86
4.5.2.4. Impacts of Rangeland Improvement Decisions on Fire Management.....	4-87
4.5.2.5. Impacts of Recreation Decisions on Fire Management .....	4-88
4.5.2.6. Impacts of Travel Decisions on Fire Management.....	4-91
4.5.2.7. Impacts of Woodland and Forest Decisions on Fire Management.....	4-93
4.5.2.8. Summary .....	4-94
4.5.3. Mitigation Measures .....	4-95
4.5.4. Unavoidable Adverse Impacts .....	4-96
4.5.5. Short-term Use versus Long-term Productivity .....	4-96

4.5.6. Irreversible and Irretrievable Impacts .....	4-96
<b>4.6. Hazardous Materials .....</b>	<b>4-97</b>
4.6.1. Impacts Common to the Proposed RMP and All Alternatives .....	4-97
4.6.1.1. Minerals .....	4-97
4.6.1.2. Abandoned Mine Land (AML) .....	4-101
4.6.2. Proposed RMP and Alternative Impacts .....	4-101
4.6.2.1. Impacts of Minerals Decisions on Hazardous Materials .....	4-101
4.6.2.2. Impacts of Non-WSA Areas with Wilderness Characteristics Decisions on Hazardous Materials .....	4-105
4.6.2.3. Summary .....	4-106
4.6.3. Mitigation Measures .....	4-106
4.6.4. Unavoidable Adverse Impacts .....	4-106
4.6.5. Short-term Uses versus Long-term Productivity .....	4-106
4.6.6. Irreversible and Irretrievable Impacts .....	4-106
<b>4.7. Lands and Realty .....</b>	<b>4-107</b>
4.7.1. Impacts Common to the Proposed RMP and All Alternatives .....	4-107
4.7.1.1. Direct Impacts .....	4-107
4.7.1.2. Indirect Impacts .....	4-109
4.7.2. Proposed RMP and Alternatives Impacts .....	4-109
4.7.2.1. Impacts of Lands and Realty Decisions on Lands and Realty .....	4-109
4.7.2.2. Impacts of Mineral Decisions on Lands and Realty .....	4-111
4.7.2.3. Impacts of Non-WSA Areas with Wilderness Characteristics Decisions on Lands and Realty .....	4-113
4.7.3. Mitigation Measures .....	4-113
4.7.4. Unavoidable Adverse Impacts .....	4-113
4.7.5. Short-term Uses versus Long-term Productivity .....	4-113
4.7.6. Irreversible and Irretrievable Impacts .....	4-114
<b>4.8. Livestock and Grazing Management .....</b>	<b>4-115</b>
4.8.1. Impacts Common to the Proposed RMP and All Alternatives .....	4-115
4.8.2. Alternative Impacts .....	4-117
4.8.2.1. Impacts of Fire Management Decisions on Livestock Grazing .....	4-118
4.8.2.2. Impacts of Forage Management Decisions on Livestock Grazing .....	4-119
4.8.2.3. Impacts of Mineral Decisions on Livestock Grazing .....	4-122
4.8.2.4. Impacts of Non-WSA Areas with Wilderness Characteristics Decisions on Livestock Grazing .....	4-126
4.8.2.5. Impacts of Rangeland Improvement Decisions on Livestock Grazing .....	4-127
4.8.2.6. Impacts of Vegetation Management Decisions on Livestock Grazing .....	4-129
4.8.2.7. Summary .....	4-129
4.8.3. Mitigation Measures .....	4-130
4.8.4. Unavoidable Adverse Impacts .....	4-131

4.8.5. Short-term Uses versus Long-term Productivity .....	4-131
4.8.6. Irreversible and Irretrievable Impacts .....	4-131
<b>4.9. Minerals and Energy Resources .....</b>	<b>4-132</b>
4.9.1. Impacts Common to the Proposed RMP and All Alternatives .....	4-132
4.9.1.1. Oil and Gas Resources .....	4-133
4.9.1.2. Locatable Mineral Resources .....	4-133
4.9.1.3. Mineral Materials .....	4-135
4.9.1.4. Alternative Energy .....	4-135
4.9.2. Proposed RMP and Alternative Impacts .....	4-135
4.9.2.1. Impacts of Mineral Decisions on Mineral Resources .....	4-136
4.9.2.2. Impacts of Cultural Resource Decisions on Mineral Resources .....	4-149
4.9.2.3. Impacts of Non-WSA Areas with Wilderness Characteristics Decisions on Mineral Resources .....	4-150
4.9.2.4. Impacts of Recreation Resource Decisions on Mineral Resources .....	4-151
4.9.2.5. Impacts of Soil Resources Decisions on Mineral Resources .....	4-153
4.9.2.6. Impacts of Special Designations Decisions on Mineral Resources .....	4-154
4.9.2.7. Impacts of Special Status Species Resource Decisions on Mineral Resources .....	4-157
4.9.2.8. Impacts of Wildlife Decisions on Mineral Resources .....	4-169
4.9.2.9. Impacts of Visual Management Decisions on Mineral Resources .....	4-170
4.9.2.10. Summary of Impacts from Alternatives .....	4-173
4.9.3. Mitigation Measures .....	4-174
4.9.4. Unavoidable Adverse Impacts .....	4-174
4.9.5. Short-term Uses versus Long-term Productivity .....	4-174
4.9.6. Irreversible and Irretrievable Impacts .....	4-174
<b>4.10. Non-WSA Lands with Wilderness Characteristics .....</b>	<b>4-175</b>
4.10.1. Impacts Common to the Proposed RMP and All Alternatives .....	4-175
4.10.1.1. Fire Management .....	4-175
4.10.1.2. Lands and Realty .....	4-177
4.10.1.3. Livestock and Grazing Management .....	4-177
4.10.1.4. Minerals .....	4-178
4.10.1.5. Recreation .....	4-178
4.10.1.6. Riparian and Wetland Resources .....	4-179
4.10.1.7. Special Designations .....	4-179
4.10.1.8. Visual Resources .....	4-180
4.10.1.9. Wildlife and Fisheries .....	4-180
4.10.2. Alternative Impacts .....	4-181
4.10.2.1. Impacts of Cultural Resources Decisions on Non-WSA Lands with Wilderness Characteristics .....	4-181
4.10.2.2. Impacts of Fire Management Decisions on Non-WSA Lands with Wilderness Characteristics .....	4-183

4.10.2.3. Impacts of Lands and Realty Management Decisions on Non-WSA Lands with Wilderness Characteristics .....	4-186
4.10.2.4. Impacts of Livestock and Grazing Management on Non-WSA Lands with Wilderness Characteristics.....	4-188
4.10.2.5. Impacts of Minerals and Energy Resources on Non-WSA Lands with Wilderness Characteristics.....	4-190
4.10.2.6. Impacts of Non-WSA Lands with Wilderness Characteristics Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-228
4.10.2.7. Impacts of Recreation Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-232
4.10.2.8. Impacts of Travel, Roads, and Trails Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-239
4.10.2.9. Impacts of Riparian/Soils/Watershed Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-246
4.10.2.10. Impacts of Special Designation Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-248
4.10.2.11. Impacts of Vegetation Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-263
4.10.2.12. Impacts of Visual Resource Management Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-267
4.10.2.13. Impacts of Wild Horse Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-273
4.10.2.14. Impacts of Woodland and Forest Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-277
4.10.2.15. Summary of Impacts from the Proposed RMP and Alternatives.....	4-281
4.10.3. Mitigation Measures .....	4-283
4.10.4. Unavoidable Adverse Impacts .....	4-285
4.10.5. Short-term Use versus Long-term Productivity .....	4-285
4.10.6. Irreversible and Irretrievable Impacts .....	4-286
<b>4.11. Paleontology .....</b>	<b>4-287</b>
4.11.1. Impacts Common to the Proposed RMP and All Alternatives .....	4-288
4.11.1.1. Fire Management and Woodland/Forest.....	4-288
4.11.1.2. Livestock and Grazing .....	4-288
4.11.1.3. Minerals .....	4-288
4.11.1.4. Paleontology .....	4-289
4.11.1.5. Rangeland Improvements .....	4-289
4.11.1.6. Recreation .....	4-289
4.11.2. Proposed RMP and Alternatives Impacts .....	4-289
4.11.2.1. Impacts of Fire Management Decisions on Paleontological Resources .....	4-290
4.11.2.2. Impacts of Lands and Realty Decisions on Paleontological Resources .....	4-291
4.11.2.3. Impacts of Mineral Decisions on Paleontological Resources.....	4-292
4.11.2.4. Impacts of Non-WSA Lands with Wilderness Characteristics Decisions on Paleontological Resources .....	4-295
4.11.2.5. Impacts of Paleontological Decisions on Paleontological Resources.....	4-296

4.11.2.6. Impacts of Rangelands Improvement Decisions on Paleontological Resources .....	4-296
4.11.2.7. Impacts of Recreation Decisions on Paleontological Resources .....	4-298
4.11.2.8. Impacts of Travel Decisions on Paleontological Resources .....	4-301
4.11.2.9. Impacts of Visual Resource Management Decisions on Paleontological Resources .....	4-303
4.11.3. Unavoidable Adverse Impacts .....	4-306
4.11.4. Short-term Uses versus Long-term Productivity .....	4-306
4.11.5. Irreversible and Irretrievable Impacts .....	4-306
<b>4.12. Recreation.....</b>	<b>4-307</b>
4.12.1. Impacts Common to the Proposed RMP and All Alternatives .....	4-307
4.12.2. Proposed RMP and Alternatives Impacts .....	4-310
4.12.2.1. Impacts of Cultural Resource Decisions on Recreation .....	4-310
4.12.2.2. Impacts of Fire Management Decisions on Recreation .....	4-312
4.12.2.3. Impacts of Land and Realty Management Decisions on Recreation .....	4-312
4.12.2.4. Impacts of Minerals Decisions on Recreation .....	4-315
4.12.2.5. Impacts of Non-WSA Lands with Wilderness Characteristics Decisions on Recreation .....	4-318
4.12.2.6. Impacts of Paleontology Decisions on Recreation .....	4-319
4.12.2.7. Impacts of Recreation Decisions on Recreation .....	4-320
4.12.2.8. Impacts of Special Designation Decisions on Recreation .....	4-330
4.12.2.9. Impacts of Travel/Roads and Trails Decisions on Recreation.....	4-336
4.12.2.10. Impacts of Visual Resource Management Decisions on Recreation .....	4-339
4.12.2.11. Summary .....	4-341
4.12.2.12. Mitigation Measures .....	4-343
4.12.3. Unavoidable Adverse Impacts .....	4-344
4.12.4. Short-term Use versus Long-term Productivity .....	4-344
4.12.5. Irreversible and Irretrievable Impacts .....	4-344
<b>4.13. Riparian and Wetland Resources.....</b>	<b>4-345</b>
4.13.1. Impacts Common to All.....	4-345
4.13.2. The Proposed RMP and Alternatives Impacts .....	4-349
4.13.2.1. Impacts of Fire Management Decisions on Riparian Resources .....	4-349
4.13.2.2. Impacts of Forage and Wild Horse Management Decisions on Riparian Resources .....	4-350
4.13.2.3. Impacts of Lands and Realty Decisions on Riparian Resources.....	4-350
4.13.2.4. Impacts of Livestock and Grazing Decisions on Riparian Resources .....	4-351
4.13.2.5. Impacts of Minerals Decisions on Riparian Resources .....	4-352
4.13.2.6. Impacts of Non-WSA Areas with Wilderness Characteristics Decisions on Riparian Resources .....	4-353
4.13.2.7. Impacts of Rangeland Improvement Decisions on Riparian Resources .....	4-354
4.13.2.8. Impacts of Recreation Decisions on Riparian Resources .....	4-354
4.13.2.9. Impacts of Riparian Management Decisions on Riparian Resources .....	4-356
4.13.2.10. Impacts of Soils and Watershed Decisions on Riparian Resources .....	4-357

4.13.2.11. Impacts of Special Designation Decisions on Riparian Resources .....	4-358
4.13.2.12. Impacts of Special Status Species Decisions on Riparian Resources.....	4-359
4.13.2.13. Impacts of Vegetation Management Decisions on Riparian Resources .....	4-361
4.13.2.14. Impacts of Visual Resource Management Decisions on Riparian Resources .....	4-361
4.13.2.15. Impacts of Woodlands and Forest Management Decisions on Riparian Resources .....	4-362
4.13.2.16. Summary .....	4-363
4.13.3. Mitigation Measures .....	4-363
4.13.4. Unavoidable Adverse Impacts .....	4-363
4.13.5. Short-term Uses versus Long-term Productivity .....	4-363
4.13.6. Irreversible and Irretrievable Impacts .....	4-363
<b>4.14. Socioeconomics .....</b>	<b>4-364</b>
4.14.1. Summary and General Assumptions.....	4-364
4.14.1.1. Proportional Impacts .....	4-364
4.14.1.2. Qualitative versus Quantitative Data .....	4-364
4.14.2. Impacts Common to the Proposed RMP and All Alternatives .....	4-364
4.14.2.1. Livestock and Grazing Management .....	4-365
4.14.2.2. Lands and Realty.....	4-365
4.14.2.3. Minerals .....	4-365
4.14.2.4. Recreation .....	4-366
4.14.3. Proposed RMP and Alternatives Impacts .....	4-367
4.14.3.1. Impacts of Livestock and Grazing Management on Socioeconomics .....	4-367
4.14.3.2. Impacts of Minerals Development on Economic Conditions .....	4-367
4.14.3.3. Impacts of Minerals Development on Social Conditions .....	4-380
4.14.3.4. Impacts of Non-WSA lands with Wilderness Characteristics decisions on Socioeconomics .....	4-381
4.14.3.5. Effect of Paleontology on Socioeconomics .....	4-384
4.14.3.6. Impacts of Recreation on Socioeconomics .....	4-384
4.14.3.7. Impacts of Special Designations on Socioeconomics.....	4-389
4.14.3.8. Impacts of Travel Decisions on Socioeconomics .....	4-390
4.14.3.9. Impacts of Visual Resource Management decisions on Socioeconomics .....	4-392
4.14.3.10. Impacts of Wild Horses on Socioeconomics .....	4-393
4.14.3.11. Impacts of Wildlife and Fisheries on Socioeconomics .....	4-394
4.14.3.12. Impacts of Woodland and Forests on Socioeconomics .....	4-394
4.14.4. Summary .....	4-394
4.14.4.1. Proposed RMP .....	4-394
4.14.4.2. Alternative B .....	4-395
4.14.4.3. Alternative C .....	4-395
4.14.4.4. Alternative D (No Action) .....	4-395
4.14.4.5. Alternative E .....	4-396
4.14.5. Unavoidable Adverse Impacts .....	4-396
4.14.6. Short-term Uses versus Long-term Productivity .....	4-396

4.14.7. Irreversible and Irretrievable Impacts .....	4-396
<b>4.15. Soil and Water Resources .....</b>	<b>4-397</b>
4.15.1. Impacts Common to the Proposed RMP and All Alternatives .....	4-398
4.15.1.1. Impacts Common to All Fire Management Decisions.....	4-398
4.15.1.2. Impacts Common to All Lands and Realty Management Decisions .....	4-399
4.15.1.3. Impacts Common to All Livestock and Grazing, Forage, and Wild Horse Management Decisions .....	4-399
4.15.1.4. Impacts Common to All Minerals Management Decisions .....	4-400
4.15.1.5. Impacts Common to All Rangeland Improvement Decisions .....	4-401
4.15.1.6. Impacts Common to All Recreation Management Decisions.....	4-402
4.15.1.7. Impacts Common to All Riparian Management Decisions .....	4-402
4.15.1.8. Impacts Common to All Soil and Water Management Decisions .....	4-402
4.15.1.9. Impacts Common to All Special Designations .....	4-403
4.15.1.10. Impacts Common to All Special Status Species Management Decisions ..	4-403
4.15.1.11. Impacts Common to All Travel Management Decisions.....	4-403
4.15.1.12. Impacts Common to All Vegetation Management Decisions.....	4-404
4.15.1.13. Impacts Common to All Visual Resource Management Decisions.....	4-404
4.15.1.14. Impacts Common to All Wildlife Management Decisions.....	4-404
4.15.1.15. Impacts Common to All Woodlands and Forest Management Decisions ..	4-404
4.15.2. Proposed RMP and Alternatives Impacts .....	4-405
4.15.2.1. Impacts of Fire Management Decisions on Water and Soils .....	4-405
4.15.2.2. Impacts of Forage Management Decisions on Water and Soils .....	4-405
4.15.2.3. Impacts of Lands and Realty Decisions on Water and Soils .....	4-406
4.15.2.4. Impacts of Minerals Decisions on Water and Soils .....	4-406
4.15.2.5. Impacts of Non-WSA Lands with Wilderness Characteristics on Water and Soils.....	4-412
4.15.2.6. Impacts of Rangeland Improvement Decisions on Water and Soils.....	4-413
4.15.2.7. Impacts of Recreation Decisions on Water and Soils.....	4-414
4.15.2.8. Impacts of Riparian Management Decisions on Water and Soils.....	4-415
4.15.2.9. Impacts of Soils and Water Resources Decisions on Water and Soils .....	4-416
4.15.2.10. Impacts of Special Designation Decisions on Water and Soils .....	4-417
4.15.2.11. Impacts of Special Status Species Decisions on Water and Soils .....	4-418
4.15.2.12. Impacts of Travel Decisions on Water and Soils.....	4-418
4.15.2.13. Impacts of Visual Resource Management Decisions on Water and Soils ..	4-420
4.15.2.14. Impacts of Wildlife and Fisheries Management Decisions on Water and Soils.....	4-421
4.15.2.15. Impacts of Woodlands and Forest Management Decisions on Water and Soils.....	4-421
4.15.2.16. Summary .....	4-422
4.15.3. Mitigation Measures .....	4-424
4.15.4. Unavoidable Adverse Impacts .....	4-424
4.15.5. Short-term Use versus Long-term Productivity .....	4-424
4.15.6. Irreversible and Irretrievable Impacts .....	4-424

### Table of Contents

<b>CHAPTER FIVE Consultation and Coordination .....</b>	<b>5-1</b>
<b>5.1. Introduction.....</b>	<b>5-1</b>
<b>5.2. Consultation and Coordination with Tribes, State and Local Governments, and         Federal Agencies .....</b>	<b>5-2</b>
5.2.1. Native American Interests and Tribes.....	5-3
5.2.2. Summary of Results .....	5-5
5.2.2.1. Jicarilla Apache Tribe .....	5-9
5.2.2.2. Navajo Nation .....	5-9
5.2.2.3. Kaibab Paiute Tribe .....	5-10
5.2.2.4. Paiute Indian Tribe of Utah.....	5-10
5.2.2.5. San Juan Southern Paiute Tribe .....	5-10
5.2.2.6. Hopi Tribe.....	5-10
5.2.2.7. Pueblo of Acoma.....	5-10
5.2.2.8. Pueblo of Cochiti .....	5-10
5.2.2.9. Pueblo of Isleta .....	5-11
5.2.2.10. Pueblo of Jemez .....	5-11
5.2.2.11. Pueblo of Laguna .....	5-11
5.2.2.12. Pueblo of Nambe.....	5-11
5.2.2.13. Pueblo of Picuris .....	5-11
5.2.2.14. Pueblo of Pojoaque .....	5-11
5.2.2.15. Pueblo of San Felipe .....	5-11
5.2.2.16. Pueblo of San Ildefonso .....	5-12
5.2.2.17. Pueblo of San Juan.....	5-12
5.2.2.18. Pueblo of Santa Clara.....	5-12
5.2.2.19. Pueblo of Santa Ana.....	5-12
5.2.2.20. Pueblo of Santo Domingo.....	5-12
5.2.2.21. Pueblo of Sandia .....	5-12
5.2.2.22. Pueblo of Taos .....	5-13
5.2.2.23. Pueblo of Tesuque.....	5-13
5.2.2.24. Pueblo of Zia.....	5-13
5.2.2.25. Pueblo of Zuni.....	5-13
5.2.2.26. Duck Valley Shoshone-Paiute Tribe.....	5-13
5.2.2.27. Duckwater Shoshone Tribe.....	5-13
5.2.2.28. Eastern Shoshone Tribe .....	5-14
5.2.2.29. Ely Shoshone Tribe.....	5-14
5.2.2.30. Confederated Tribes of Goshute Nation .....	5-14
5.2.2.31. Shoshone-Bannock Tribes .....	5-14
5.2.2.32. Skull Valley Band of Goshute Indians.....	5-14
5.2.2.33. Te-Moak Tribe of Western Shoshone Indians .....	5-14
5.2.2.34. Uintah and Ouray Ute Indian Tribe .....	5-15
5.2.2.35. Southern Ute Tribe.....	5-15

5.2.2.36. White Mesa Ute Tribe.....	5-15
5.2.2.37. Ute Mountain Ute Tribe.....	5-15
5.2.3. Environmental Protection Agency .....	5-15
5.2.4. U.S. Fish and Wildlife Service .....	5-16
5.2.5. State Agency Coordination .....	5-16
5.2.6. Cooperating Agency Involvement .....	5-17
<b>5.3. Consistency with Other Plans .....</b>	<b>5-17</b>
<b>5.4. Public Outreach and Participation .....</b>	<b>5-64</b>
5.4.1. Scoping and Notice of Intent to Plan (NOI) .....	5-64
5.4.2. Notice of Availability (NOA) of Draft RMP/EIS .....	5-64
5.4.3. Mailing List.....	5-65
5.4.4. Website .....	5-65
5.4.5. Public Meetings .....	5-66
<b>5.5. Public Comments on the Vernal DRMP/EIS and Supplemental DRMP/EIS.....</b>	<b>5-66</b>
5.5.1. Process and Methodology .....	5-66
5.5.2. Comment Analysis.....	5-67
5.5.3. Public Comments .....	5-67
5.5.4. Summary of Comments .....	5-74
5.5.4.1. DEIS/RMP Comment Period.....	5-74
5.5.4.2. ACEC Comment Period.....	5-75
5.5.4.3. Supplement to the DEIS/RMP Comment Period.....	5-76
5.5.5. Public Comments and Responses .....	5-77
<b>5.6. Distribution List for the Proposed RMP/Final EIS.....</b>	<b>5-500</b>
<b>5.7. List of Preparers .....</b>	<b>5-508</b>
<b>5.8. Record of Decision .....</b>	<b>5-509</b>
<b>5.9. Vernal RMP/EIS Meeting and Coordination Log.....</b>	<b>5-510</b>

## EXECUTIVE SUMMARY

---

### ES.1 INTRODUCTION

The Vernal Field Office (VFO) of the Bureau of Land Management (BLM) Utah is revising and integrating the Book Cliffs and Diamond Mountain Resource Management Plans (RMPs) into a single new RMP. The revised RMP will be called the Vernal Field Office Resource Management Plan (VFO RMP) and will provide planning guidance for public land and the federal mineral estate managed by the VFO in Daggett, Duchesne, and Uintah counties, as well as in a small portion of Grand County in northeastern Utah. The consolidated Diamond Mountain and Book Cliffs areas will be referred to as the Vernal Planning Area (VPA) or the VFO.

There are 5,518,859 acres within the boundary of the VFO, of which 1,725,512 acres (approximately 30%) are BLM-managed surface lands. The VFO administers energy-related mineral activities on 3.9 million acres of federal mineral lands, including 1.3 million acres of U.S. Forest Service (USFS) lands, and post-lease mineral operations on Indian Trust mineral lands. The 1,911,000 acres of BLM-managed mineral estate includes the split-estate mineral lands within the Hill Creek Extension, comprising 185,500 acres of mineral estate underlying Indian Trust surface. Table 1.4.1 clarifies in detail land ownership in the VPA and surrounding areas.

Most of the land that the BLM manages is in the eastern and southern portions of the VPA and is generally characterized by habitats associated with the Uinta Basin and Colorado Plateau. Other agencies managing land in the vicinity of the VFO include the USFS, Bureau of Indian Affairs (BIA), National Park Service (NPS), U.S. Fish and Wildlife Service (USFWS), Utah Division of Wildlife Resources (UDWR), and Utah Division of Lands and Forestry. Additional lands are held in private ownership or in trust by the U.S. for the Ute Indian Tribe or for individual Native Americans.

The Diamond Mountain portion of the VPA includes BLM-administered lands and minerals in Daggett and Duchesne counties and a portion of Uintah County northwest of the Green River. The plan is responsible for the administration of public land in Browns Park and the Diamond Mountain Plateau for the Little Snake Field Office of Colorado. The Little Snake Field Office administers public land in Browns Park for some resources. Administration of these agreed-upon resources is in accordance with the parent resource area's management plan. There is also a fire-suppression agreement between the VFO and Little Snake Field Office.

The Book Cliffs portion of the VPA is located in northeastern Utah. It is bounded by the Utah–Colorado state line on the east, the Book Cliff Mountains to the south, the Green River to the west, and Blue Mountain to the north (see Map Figure 1). The Book Cliffs area includes public land and minerals in Uintah and Grand counties. The VFO boundary officially ends at the Uintah County line; however, a small portion of the public lands in Grand County of the Moab Field Office are administered by the VFO under a memorandum of understanding (MOU).

A small portion of the Flume Canyon Wilderness Study Area (WSA) lies within the VPA. However, this WSA is managed by the Moab Field Office due to easier access to this area from Moab.

A small portion of the West Cold Springs and Diamond Breaks WSAs lie within the Vernal Planning Area. A Memorandum of Understanding (MOU) is in place between the Little Snake Field Office in Craig, Colorado, and the VFO. The Little Snake Field Office has administrative responsibility for managing both of these areas.

A small number of grazing allotments straddle the Utah/Colorado border. An MOU is in place between the White River Field Office and the Vernal Field Office, where each office, depending on the allotment boundaries, administers livestock grazing for the other office.

Land ownership patterns within both the Diamond Mountain and Book Cliffs planning areas range from large blocks of BLM-administered public lands to small, privately owned blocks. This is complicated by lands where BLM administers a fractional percentage of the minerals, while other owners hold the other interests in the land. Land ownership, surface administration and mineral management responsibilities within the VPA are shown in Map Figure 1 and described in Table 1.4.1.

Decisions and actions of the RMP only apply to BLM lands. In the case of split estate lands, such as lands within the planning area that are split between the BLM and the Uintah and Ouray Indian Tribe, actions affecting the surface must be coordinated with the surface owner. Undertakings conducted on lands not wholly or partly administered by the BLM are subject to the laws, regulations, conditions, and policies of the relevant land management agency or other landowner.

## **ES.2 PURPOSE AND NEED FOR THE ACTION**

### **ES 2.1 PURPOSE**

The purpose of this project is to revise and integrate the Book Cliffs and Diamond Mountain RMPs into a new single comprehensive RMP that will guide management of public lands in the VPA. Mineral development in the VPA is one of the major issues driving this land use planning effort. However, due to mineral development, many of the other decisions necessary to complete a comprehensive resource management plan needed to be updated and revised.

In 2002, the BLM prepared a projected reasonable foreseeable development (RFD) scenario in order to project environmental impacts across a 15-year period; this RFD has been modified (2008) for oil and gas development only in order to project environmental impacts for up to five years. Development projections included in-depth reviews of potential for occurrence, past well production, current well production, and future potential for production. During the pendency of this planning effort (beginning with public meetings in 2001 and 2002 for scoping purposes through the notice of availability of the Draft RMP/EIS published in the Federal Register on January 14, 2005), the RFD scenario, which is a planning tool and not a prediction or limit to development, did not track completely with the pace of development in the Uinta Basin. The BLM has carefully monitored industry trends and believes that the RFD used as an analytical tool in this Proposed RMP can be considered accurate up to approximately five years from the time the Record of Decision (ROD) is signed.

Within the next five years, the BLM will monitor impacts to resources of continued development in the VPA and ensure that the impacts disclosed in this Proposed RMP are not exceeded by the pace of development.

## **ES 2.2 NEED**

Current management of these public lands is guided by the Book Cliffs and Diamond Mountain RMPs. This RMP revision process is necessary because of the dated nature of the Book Cliffs RMP, completed in 1985, and to ensure consistency between the Book Cliffs and Diamond Mountain RMPs. Significant changes have occurred since completion of the Diamond Mountain and Book Cliff RMPs. Population growth and increased need for resource development has occurred, while concern for the environment has also increased. In addition to traditional consumptive uses (e.g., oil and gas development, mining and livestock grazing), there is now an increased interest in uses that emphasize aesthetic values such as open space and increased recreational opportunities. These often conflicting uses need to be addressed in terms of how they affect local communities; national, regional, and state interests; and ecosystem health. Additionally, policy guidance has resulted in the initiation or completion of local and national activity plans, recovery plans, and Programmatic Environmental Impact Statements (PEISs) that have changed land management direction in the VFO since the Book Cliffs RMP was written.

A large block of 188,500 acres of federal mineral estate within the Hill Creek Extension of the Uintah and Ouray Indian Reservation has not been previously analyzed for oil and gas leasing. This issue has been addressed as part of this RMP revision.

Ownership of federal land formerly managed by the Department of Navy and, more recently, by the Department of Energy (DOE) was transferred to the Ute Indian Tribe. The BLM managed certain resource programs for the Department of Energy on these 47,978 acres. This Vernal RMP will not analyze management of these programs.

These changes have been addressed as part of this RMP revision and integration process. See Section 1.5 for a description of the BLM's land use planning process.

## **ES.3 PLANNING ISSUES**

Key planning issues identified through the scoping process that have been addressed in the RMP are:

- Air Quality
- Cultural and Paleontological Resources
- Fire Management
- Lands and Realty
- Minerals Management
- Non-WSA Lands with Wilderness Characteristics
- Off-highway Vehicle (OHV) Use and Transportation
- Rangeland Management and Health
- Recreation Resource Management
- Special Management Designations
- Visual Resource Management

- Watershed Management, Soils, and Vegetation
- Wild Horse Management
- Wildlife Habitat and Fisheries Management
- Woodland and Forest Management

## **ES.4 PROPOSED RMP AND DRAFT RMP ALTERNATIVES**

Five management alternatives were developed to address the major planning issues and to provide direction for resource programs influencing land management. Each alternative emphasizes a different combination of resource uses, allocations, and restoration measures to address issues and resolve conflicts among uses to allow program goals to be accomplished in varying combinations across the alternatives. Management scenarios for programs not tied to major planning issues and/or mandated by law often contain few or no differences in management between alternatives.

Alternative D, continuation of current management (No Action), is based on existing planning decisions that remain valid, as well as on current direction and policy. The remaining alternatives were developed with input received during scoping and with expertise from the interdisciplinary planning team and input from local, state, federal, and tribal governments.

The alternatives were developed in response to the issues identified in the public scoping process and the planning criteria.

The BLM recognizes that social, economic, and environmental issues cross land ownership lines and that extensive cooperation is needed to actively address issues of mutual concern. To the extent possible, the alternatives were crafted using the input from public scoping comments and from comments submitted by Duchesne, Daggett, and Uintah county representatives and other cooperating agencies, including the Ute Indian Tribe.

All management under any of the alternatives would comply with state and federal regulations, laws, standards, and policies. Management items common to all and a more detailed discussion for each alternative may be found in Tables 2.1.1 through 2.1.27.

A comparison of the alternatives regarding these key management decisions are given in Tables ES.1 through ES.5 below.

### **Proposed RMP**

The Proposed RMP/Final EIS is primarily based on the decisions from the Preferred Alternative (Alternative A) from the Draft RMP/EIS (January 14, 2005). However, it has been modified to include aspects of all alternatives analyzed after careful consideration of public comments, cooperating agency review, and internal review. The reviews were provided on the Draft RMP/EIS; call for information on Areas of Critical Environmental Concern (ACECs) (Federal Register Notice, December 13, 2005); and, Alternative E from the supplement that was issued on October 5, 2007, analyzing the management of non-WSA lands with wilderness characteristics. These alternatives are combined in the Proposed RMP/Final EIS. Some changes to the draft alternatives have been made in response to the public comments received during the comment period. These changes are limited, for the most part, to correcting mistakes and refining technical

points. Changes in the Proposed RMP/Final EIS from the Draft RMP/EIS Alternative A (Draft RMP/EIS Preferred Alternative) are summarized for the reader in Appendix N.

### **Alternative A (Draft RMP/EIS Preferred Alternative)**

Management direction is generally broad and accommodates a wide variety of values and uses. The VPA would be managed to provide a sustainable flow of resources for human use, while protecting important watersheds and providing viable populations of native and desirable non-native plants species, and to provide wildlife habitat and opportunities for recreation use.

### **Alternative B**

This alternative provides for most resource uses but would emphasize oil and gas development, where feasible. Renewable resources would be protected by balancing the development of mineral resources with focused and prudent mitigation measures.

### **Alternative C**

The natural succession of ecosystems would be allowed to proceed in select management areas. This alternative would strongly emphasize maintenance of watershed conditions, species viability, properly functioning ecosystems, and a reduction of habitat fragmentation.

### **Alternative D (Current Management/No Action)**

Maintain present uses by continuing present management direction and activities while abiding by all new mandates, executive orders, and directives that have been implemented since the previous RMPs were completed.

### **Alternative E**

Alternative E gives emphasis to protection of all non-WSA lands with wilderness characteristics, including closure of these areas to mineral leasing and off-road vehicles, avoidance of rights-of-way, protection of undisturbed landscapes, and providing opportunities for primitive and semi-primitive recreation. The natural succession of ecosystems would be allowed to proceed in these and other select management areas. This alternative strongly emphasizes maintenance of watershed conditions, species viability, properly functioning ecosystems, and a reduction of habitat fragmentation. It also includes designation of ACECs and determinations for wild and scenic river suitability, while still providing for resource uses in other parts of the VFO, including mineral and energy development and motorized recreation use.

Alternative E is the same as Alternative C, except that it adds a protective management prescription to 277,596 acres of land in 25 areas that comprise non-WSA lands with wilderness characteristics. Alternative E, however, applies to all public lands within the VPA. The proposed decisions that apply to the lands outside of non-WSA lands with wilderness characteristics remain the same as those in Alternative C.

**Table ES.1. Proposed RMP and Alternatives Comparison: Oil and Gas and Coal-bed Methane Leasing (acres)**

Leasing Category	Proposed RMP	Draft RMP/EIS Alternative A (Preferred)	Alternative B	Alternative C	Alternative D (No Action)	Alternative E
Open	860,651	983,905	1,113,116	858,619	918,315	818,891

## **ES.5 AFFECTED ENVIRONMENT**

Resources within the VPA include mineral resources, wildlife, fisheries, botanical (including listed and non-listed sensitive species), rangeland, wild horses, wilderness, cultural resources, water resources, wetlands and riparian resources, visual resources, and recreational resources. Land use and economic resources include oil and gas, phosphate, tar sands, gilsonite, livestock grazing, woodland products, building stone, and rights-of-way. Opportunities for hunting, sightseeing, hiking, viewing historic sites, camping, fishing, and OHV use provide public enjoyment, as well as additional revenues to businesses in and adjacent to the VPA. Unique features within the VPA include the White and Green rivers; Browns Park, which provides crucial deer winter range and a high density of cultural and historical sites; the Pariette Wetlands, which provide habitat for over 100 species of wildlife; Red Mountain, with its high mountain vistas and plentiful recreational opportunities; Nine Mile Canyon, with its Fremont rock art; and the Book Cliffs, an area rich in resources with abundant management opportunities.

## **ES.6 ENVIRONMENTAL IMPACTS**

The environmental impacts of the project alternatives are summarized in Table 2.2 of Chapter 2 of this EIS.

## **ES.7 SUMMARY OF CHANGES MADE BETWEEN THE DRAFT RMP/EIS AND THE PROPOSED RMP/FINAL EIS**

The BLM has made numerous changes between the Draft RMP/EIS and the Proposed RMP/Final EIS. These changes are described below and detailed in Appendix N. BLM has prepared this Appendix to document if changes between the Draft RMP/EIS and the Proposed RMP/Final EIS resulted in a significant change in circumstances or conditions, or if the Proposed RMP/Final EIS contains different information from that which was presented to the public in the Draft RMP/EIS. Finally, in order to confirm that all changes made to the Proposed RMP/Final EIS fall within the range of alternatives presented and analyzed in the Draft RMP/EIS and the Supplement to the Draft RMP/EIS.

The regulation controlling whether or not a supplement is required is found at 40 CFR 1502.9(c), which provides that agencies:

*Shall prepare supplements to either draft or final environmental impact statements if:*  
*The agency makes substantial changes in the proposed action that are relevant to environmental concerns; or*  
*There are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impact.*

*May also prepare supplements when the agency determines that the purposes of the Act will be furthered by doing so.*

*Shall adopt procedures for introducing a supplement into its formal administrative record, if such a record exists.*

*Shall prepare, circulate, and file a supplement to a statement in the same fashion (exclusive of scoping) as a draft and final statement unless alternative procedures are approved by the Council.*

All changes to the Vernal Field Office Draft RMP/EIS were made in response to public comment and/or internal review. The majority of the changes were editorial changes made to add clarity to the document. In some cases, alternatives presented in the Draft RMP/EIS were modified in the Proposed RMP to reflect technical corrections and data updates. In other cases, such as in Chapter 3, incorporation of updated information was necessary to refine the analysis in Chapter 4 that was incomplete or needed augmentation.

None of the changes described above and further detailed in Appendix N meet the regulatory definition for significance as found in 40 CFR 1508.27(a) and (b). These regulations require an agency preparing a NEPA document to review the changes for significant new circumstances or information relevant to environmental concerns and bearing on the Proposed RMP or its impacts, using context and intensity as the trigger for significance. The BLM has reviewed each substantive change through this regulatory standard and has determined that none of the changes, individually or collectively, require a supplement to this Final EIS.

Following is an executive summary of the major changes between the Draft RMP/EIS and the Proposed RMP/Final EIS. The summary of changes has been broken into two parts:

- Summary of Changes to Decisions Between the Draft RMP/EIS Preferred Alternative (Alternative A) and the Proposed RMP/Final EIS
- Summary of Editorial Changes Made Between the Draft RMP/Draft EIS and Proposed RMP/Final EIS.

#### **ES 7.1 SUMMARY OF CHANGES TO DECISIONS BETWEEN THE DRAFT RMP/EIS PREFERRED ALTERNATIVE (ALTERNATIVE A) AND THE PROPOSED RMP/FINAL EIS**

- **Air Quality** decisions were refined based upon State of Utah, Department of Air Quality correspondence included in Appendix O.
- The Draft RMP alternatives made proposed decisions for **Combined Hydrocarbon Areas/Special Tar Sand Areas**. The Proposed RMP now defers those decisions to the Programmatic Tar Sands Oil Shale EIS discussed in Section 1.10.9 of Chapter 1.
- **Wild horses** will no longer be permitted in the Winter Ridge Herd Area and Hill Creek Herd Area due to disease (e.g., Equine Infectious Anemia) and trespass of private horses because of mixed surface ownership with the Ute Indian Tribe, State of Utah, and privately held lands. The Draft RMP Preferred Alternative allocated 2,340 AUMs for wild horses in the Winter Ridge Herd Area and the Hill Creek Herd Area.
- The Proposed RMP provides **Greater Sage-grouse** additional protection during lekking, nesting, brooding, and during winter by selecting the protections in Alternative C.

- All or portions of 15 areas, approximately 106,178 acres, would be managed as **non-WSA lands with wilderness characteristics**: Beach Draw, Bourdette Draw, Bull Canyon, Cold Spring Mountain, Daniels Canyon, Dead Horse Pass, Diamond Breaks, Diamond Mountain, Lower Flaming Gorge, Moonshine Draw, Mountain Home, Stuntz Draw, Vivas Cake Hill, White River, and Wild Mountain. The Draft RMP Preferred Alternative did not specifically provide management for non-WSA lands with wilderness characteristics. The Proposed RMP preserves and maintains management prescriptions in these areas and does not allow for surface-disturbing activities.
- Bitter Creek, Coyote Basin, Lower Green River Expansion **ACECs** were not brought forward from the Draft RMP Preferred Alternative.
- White River, Browns Park, and Nine Mile Canyon **ACECs** were brought forward, with a reduction in acreage.
- Manage 24,259 acres in Red Mountain-Dry Fork as a **SRMA** to provide for maintenance and development of OHV or non-OHV trails, minimal facilities necessary for human health and safety, watershed values, relict vegetation communities, and crucial deer and elk winter habitat. An activity plan for the SRMA would be developed to determine what areas are appropriate for day use only.
- The Draft RMP Preferred Alternative proposed 24,183 acres as the White River **SRMA**. The Proposed RMP identified 2,831 acres as a SRMA. A portion of the lands not included in the SRMA in the Proposed RMP are being carried forward for management as non-WSA with wilderness characteristics.
- The Draft RMP Preferred Alternative recommended two segments of the White River, the Upper Green River and the Lower Green River, for inclusion in the **National Wild and Scenic River System** as well as the Upper and Lower Green River. The Proposed RMP recommends only the Upper and Lower Green River.
- In the Draft RMP Preferred Alternative, the BLM identified the **Hill Creek Extension** as available for leasing. The BLM, in cooperation with Ute Indian Tribe, identified in the Proposed RMP specific oil and gas leasing constraints for the Hill Creek Extension.

## ***ES 7.2 SUMMARY OF EDITORIAL CHANGES MADE BETWEEN THE DRAFT RMP/DRAFT EIS AND PROPOSED RMP/FINAL EIS***

### **Throughout the Plan**

- The Supplement to the Draft RMP/EIS has been merged into the Proposed RMP/Final EIS. The Supplement presents an analysis of the effects of managing non-Wilderness Study Area (WSA) lands with wilderness characteristics in a protective manner. This analysis is identified as Alternative E in the combined RMP.
- Acreage numbers and figures have been revised and clarified based on refined GIS techniques throughout all chapters.

### **Chapter 1**

- Chapter 1 has been rewritten to emphasize the decisions brought forward in the Proposed RMP/Final EIS.

- Discussion on monitoring and evaluation and how it plays into the planning process has been added in Chapter 1.
- Chapter 1, Language Added: Utah Division of Wildlife Resources (DWR) Wildlife Habitat Classification System Change and included specific language regarding exceptions, modifications and waivers (Appendix K). This information has been graphically displayed on all maps highlighting wildlife habitat.

## **Chapter 2**

- In Chapter 2 an additional column has been added to the matrices Tables 2.1.1 through 2.1.27 reflecting the Proposed RMP.
- All implementation-level decisions in Tables 2.1.1 through 2.1.27 have been italicized and asterisked with a footnote at the bottom of the page as follows: \*This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information on protesting.
- Language provided by the State of Utah regarding Air Quality has been added to Chapter 2, Table 2.1.2 “Common to All” section.
- Language provided by the State of Utah concerning compressor engine emission controls has been added to Chapter 2, Table 2.1.9.
- Revised the WSR “Common to All” management actions in Table 2.1.19 to work with upstream and downstream water users and applicable agencies to ensure that water flows are maintained at a level sufficient to sustain the values from which affected river segments were designated.
- Table 2.4 in Chapter 2 of the Draft RMP/EIS was removed in the Proposed RMP/Final EIS.

## **Chapter 3 & 4**

- Completely revised the Socioeconomics section of Chapters 3 and 4 to include the information provided by the State of Utah and cooperating counties included in the new Appendix M.

## **Chapter 5**

- Chapter 5 – Table 5.7 has been added to show consistency findings between the Proposed RMP/EIS, Utah state law, and county plans.

## 1.0 INTRODUCTION, PURPOSE AND NEED

---

### 1.1 INTRODUCTION

This chapter contains background information on the planning process and sets the stage for the information that is presented in the rest of the document. There are 11 main sections in Chapter 1, including:

- Background
- Purpose and Need for the Plan
- Planning Area Description
- Planning Process
- Scoping
- Identification of Issues
- Issues Beyond the Scope of the Plan
- Planning Criteria and Legislative Constraints
- Related Plans
- Summary of Changes Made between the Draft RMP/Draft EIS and the Proposed Plan/Final Environmental Impact Statement (EIS)

### 1.2 BACKGROUND

On March 12, 2001, the Bureau of Land Management (BLM) issued a Notice of Intent (NOI) in the Federal Register to prepare an RMP and an associated EIS for public lands administered by the VFO. As defined by the Federal Land Policy and Management Act of 1976, as amended, the "public lands" are those federally owned lands and interests in lands (for example, federally owned mineral estate) that are administered by the Secretary of the Interior, specifically through the BLM.

The approved RMP would meet the BLM statutory requirement for a land-use plan (LUP) as mandated by Section 202 of the Federal Land Policy and Management Act (FLPMA), which specifies the need for a comprehensive LUP consistent with multiple-use and sustained-yield objectives. The RMP/EIS also fulfills requirements of the National Environmental Policy Act (NEPA) of 1969, as amended, to disclose and address environmental impacts of proposed major federal actions through a process that includes public participation and cooperation with other agencies.

The BLM is the lead agency in preparing the RMP/EIS. Uintah (August 2003), Daggett (May 2002), and Duchesne (April 2002) counties have been cooperating agencies in this effort as local governments with special expertise. The Ute Indian Tribe and the Bureau of Indian Affairs (BIA) also became cooperating agencies with special expertise in September 2004. The State of Utah

became a cooperating agency in this effort in January 2003. The BLM is also coordinating closely with the U.S. Fish and Wildlife Service (USFWS) of the Department of Interior (DOI), the U.S. Forest Service (USFS), the National Park Service (NPS), the U.S. Environmental Protection Agency (EPA), and the Utah Division of State History in this planning effort.

## **1.3 PURPOSE AND NEED FOR THE PLAN**

### **1.3.1 PURPOSE**

The purpose for this project is to revise and integrate the Book Cliffs and Diamond Mountain RMPs into a single new comprehensive RMP that would guide management of public lands in the Vernal Planning Area (VPA). Through completion of an RMP/EIS, the BLM proposes to provide a single, comprehensive LUP that would guide management of the public lands and interests administered by the VFO into the future. The revised RMP, also referred to as the Vernal Field Office Resource Management Plan (VFO RMP), would coordinate the management of the VPA with other BLM offices. As appropriate, the VFO would collaborate with other land management agencies and private entities, including the State of Utah; the NPS; the USFS; the BIA; Daggett, Duchesne, and Uintah counties; and municipalities would be conducted. The revised RMP would also coordinate the management of federal subsurface mineral estates with private landowners, the Ute Indian Tribe, or other nonfederal surface owners.

### **1.3.2 NEED**

Current management of these public lands is guided by the Book Cliffs and Diamond Mountain RMPs. This RMP revision process is necessary because of the dated nature of the Book Cliffs RMP, completed in 1985, and to ensure consistency between the Book Cliffs and Diamond Mountain RMPs. Significant changes have occurred since completion of the Diamond Mountain and Book Cliff RMPs. Population growth and increased need for resource development has occurred, while concern for the environment has also increased. In addition to traditional consumptive uses (e.g., oil and gas development, mining and livestock grazing), there is now an increased interest in uses that emphasize aesthetic values such as open space and increased recreational opportunities. These often conflicting uses need to be addressed in terms of how they affect local communities; national, regional, and state interests; and ecosystem health. Additionally, policy guidance has resulted in the initiation or completion of local and national activity plans, recovery plans, and Programmatic Environmental Impact Statements (PEISs) that have changed land management direction in the VFO since the Book Cliffs RMP was written.

A large block of 188,500 acres of federal mineral estate within the Hill Creek Extension of the Uintah and Ouray Indian Reservation has not been previously analyzed for oil and gas leasing. This issue has been addressed as part of this RMP revision.

Ownership of federal land formerly managed by the U.S. Department of the Navy and more recently the Department of Energy (DOE) was transferred to the Ute Indian Tribe. The BLM managed certain resource programs for the DOE on these 47,978 acres. This Vernal RMP will not analyze management of these programs.

These changes have been addressed as part of this RMP revision and integration process. See Section 1.5 for a description of the BLM's land-use planning process.

## **1.4 PLANNING AREA DESCRIPTION**

### **1.4.1 GEOGRAPHIC SETTING**

The VFO is located in the northeast corner of Utah and administers lands within Daggett, Duchesne, and Uintah counties, plus a small portion of Grand County. The VFO also has Native American Trust responsibilities for Northern Ute Tribe and allotted mineral trust lands located within these counties.

There are 5,518,859 acres within the boundary of the VFO, of which 1,725,512 acres (approximately 30%) are BLM-managed surface lands. The VFO administers energy-related mineral activities on 3.9 million acres of federal mineral lands (including 1.3 million acres of USFS lands) and post-lease mineral operations on Indian trust mineral lands. The 1,911,000 acres of BLM-managed mineral estate includes the split estate mineral lands within the Hill Creek Extension (comprises 185,500 acres of mineral estate underlying Indian trust surface).

Most of the land that the BLM manages is in the eastern and southern portions of the planning area and is generally characterized by habitats associated with the Uinta Basin and Colorado Plateau. Other agencies that manage land in the vicinity of the VFO include the USFS, BIA, NPS, USFWS, Utah Division of Wildlife Resources (UDWR), and Utah Division of Lands and Forestry. Additional lands are held in private ownership or in trust by the United States for the Ute Indian Tribe or for individual Native Americans.

The Diamond Mountain portion of the planning area includes BLM-administered lands and minerals in Daggett and Duchesne counties and a portion of Uintah County northwest of the Green River. The plan is responsible for the administration of public land in Browns Park and the Diamond Mountain Plateau for the Little Snake Field Office of Colorado. The Little Snake Field Office administers public land in Browns Park for some resources. Administration of these agreed-upon resources is in accordance with the parent resource area's management plan. There is also a fire-suppression agreement between the VFO and Little Snake Field Office.

The Book Cliffs portion of the planning area is located in northeastern Utah. It is bounded by the Utah–Colorado state line on the east, the Book Cliff Mountains to the south, the Green River to the west, and Blue Mountain to the north (see Map Figure 1). The Book Cliffs area includes public land and minerals in Uintah and Grand counties. The VFO boundary officially ends at the Uintah County line; however, a small portion of the public lands in Grand County of the Moab Field Office are administered by the VFO under a memorandum of understanding (MOU).

A small portion of the Flume Canyon Wilderness Study Area (WSA) lies within the VPA. However, this WSA is managed by the Moab Field Office due to easier access to this area from Moab.

A small portion of the West Cold Springs and Diamond Breaks WSAs lie within the VPA. An MOU is in place between the Little Snake Office in Craig, Colorado, and the VFO. The Little Snake Office has administrative responsibility for managing both of these areas.

A small number of grazing allotments straddle the Utah–Colorado border. An MOU is in place between the White River Field Office and the VFO, where each office, depending on the allotment boundaries, administers livestock grazing for the other office.

Land ownership patterns within both the Diamond Mountain and Book Cliffs planning areas range from large blocks of BLM-administered public lands to small, privately owned blocks. This is complicated by lands where the BLM administers a percentage of the minerals, while other owners hold the other interests in the land. Land ownership, surface administration, and mineral management responsibilities within the VPA are shown in Map Figure 1 and described in Table 1.4.1.

Decisions and actions of the RMP only fully apply to BLM lands. In the case of split estate lands, such as lands within the planning area that are split between the BLM and the Uintah and Ouray Indian Tribe, actions affecting the surface must be coordinated with the surface owner. Undertakings conducted on lands not wholly or partly administered by the BLM are subject to the laws, regulations, conditions, and policies of the relevant land management agency or other landowner.

### **1.4.2 RESOURCE SETTING**

The Energy Policy Act of 2005 directed the implementation of management guidance that would allow energy-related minerals to be leased, explored for, and developed in an environmentally responsible manner. Programmatic EISs have been initiated and completed to carry out the following programs: Oil Shale/Tar Sands Development, West-wide Energy Corridors, and Wind/Solar Energy Development. A series of interim and permanent policy guidance were formulated and released under the policy act direction. These incorporated best management practices (BMPs), application processing timeframes, increased NEPA document consistency, and timeliness. In addition, under the policy act, the VFO was designated as a pilot office. Additional positions were identified for the VFO to provide needed expertise in renewable resource specialties and energy-related exploration, development, and monitoring. Memorandums of understanding were signed with the U.S. Department of Agriculture, the EPA, and the Army Corp of Engineers. Transferred funds were used to identify employees of these entities who would provide to the VFO needed expertise for consultations and other regulatory issues.

Resources within the VPA include botanical (including listed and non-listed sensitive species), cultural resources, fisheries, mineral resources, paleontological resources, rangeland, recreational resources, riparian resources, visual resources, water resources, wetlands, wild horses, wilderness, and wildlife. Land-use and economic resources include building stone, Gilsonite, livestock grazing, oil and gas, phosphate, rights-of-way tar sands, and woodland products. Opportunities for camping, fishing, hiking, hunting, off-highway vehicle (OHV) use, sightseeing, and viewing historic sites provide public enjoyment, as well as additional revenues to businesses

in and adjacent to the VPA. Unique features within the planning area include the Book Cliffs, an area rich in resources with abundant management opportunities; Browns Park, which provides crucial big game winter range and a high density of cultural and historical sites; Nine Mile Canyon, with its rock art; the Pariate Wetlands, which provide habitat for over 100 species of wildlife; Red Mountain, with its high mountain vistas and plentiful recreational opportunities; and the White and Green rivers.

**Table 1.4.1. Land Ownership in the VPA and the Surrounding Area**

<b>Federal</b>	<b>Acres</b>	<b>Percent</b>
Bureau of Land Management (BLM) Vernal Field Office (VFO)	1,697,039	30.75%
BLM Moab Field Office (MFO)	28,473	0.52%
Forest Service (USFS)	1,248,651	22.63%
National Park Service (NPS)	50,113	0.91%
Fish and Wildlife Service (USFWS)	10,898	0.20%
Bureau of Reclamation (BOR)	3,046	0.06%
Bureau of Indian Affairs [BIA (Indian Trust Lands for the benefit of the Ute Indian Tribe and Allottees)]	846,669	15.34%
<b>Total</b>	<b>3,884,889</b>	<b>70.39%</b>
<b>State of Utah</b>	<b>Acres</b>	<b>Percent</b>
Utah Division of Wildlife Resources (UDWR)	32,210	0.58%
School and Institutional Trust Lands Administration (SITLA)	377,969	6.85%
<b>Total</b>	<b>410,179</b>	<b>7.43%</b>
<b>Private</b>	<b>Acres</b>	<b>Percent</b>
<b>Total</b>	<b>1,223,791</b>	<b>22.17%</b>
<b>Total Acreage in Vernal Planning Area (VPA)</b>	<b>5,518,859</b>	<b>100.00%</b>

## 1.5 PLANNING PROCESS

The RMP is the master LUP that guides the management of public lands in a particular area or administrative unit. Resource management plans are usually prepared to cover the lands administered by a certain field office.

An approved RMP establishes the following items in a written document:

- Resource condition goals and objectives
- Allowable resource uses and related levels of production or use to be maintained
- Land areas to be managed for limited, restricted, or exclusive resource uses or for transfer from BLM administration
- Program constraints and general management practices and protocols
- General implementation schedule or sequences
- Intervals and standards for monitoring the plan

Preparation of an RMP involves several interrelated steps as illustrated and described below. Teams typically develop planning documents and complete other planning activities. The shapes in the image below represent minimum planning requirements, with different shapes representing different activities and documents.

The BLM frequently goes above and beyond the minimum requirements. For example, BLM strives to involve the public throughout the planning process—not just during the formal comment periods. Field offices may produce a wide variety of documents in addition to those shown below in Figure 1.5.1. The white rectangles represent planning documents. The green ovals represent the point at which the BLM is required to issue Federal Register Notices. The orange hexagons are minimum requirements for public comment and review. The purple ovals are other required steps.

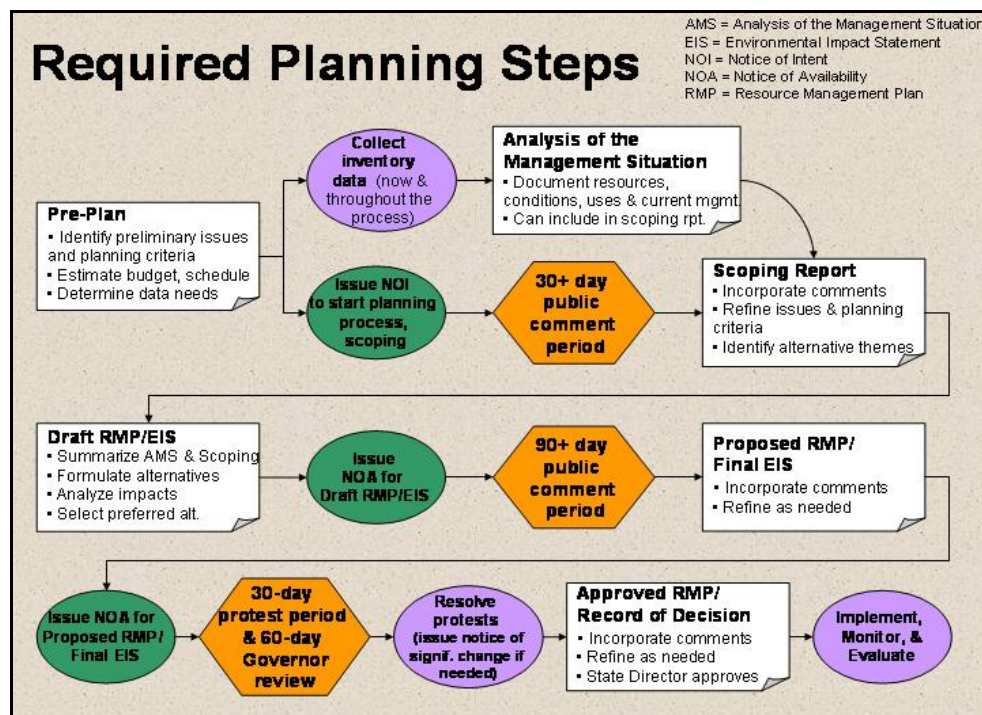

Figure 1.5.1. Required planning steps.

Steps in the BLM Land-use Planning Process	
<b>Step 1</b> Identification of Issues	This planning step is designed to identify major problems, concerns, or opportunities associated with public land management in the planning area. Issues are identified by the public, the BLM, and other governmental entities. The planning process is then focused on resolving the planning issues.
<b>Step 2</b> Development of Planning Criteria	Planning criteria are identified to guide development of the RMP and prevent the collection of unnecessary information and data.

Steps in the BLM Land-use Planning Process	
<b>Step 3</b> Collect and Compile Inventory Data	This planning step involves the collation and collection of various kinds of environmental, social, economic, resource, and institutional data. In most cases, this process is limited to information needed to address the issues. The data required for land-use planning decisions is usually at a broader scale than data required in implementation level planning and analyses.
<b>Step 4</b> Analysis of the Management Situation	This step calls for the deliberate assessment of the current situation. It identifies the way lands and activities are currently managed in the planning area, describes conditions and trends across the planning area, identifies problems and concerns resulting from the current management, and identifies opportunities to manage these lands differently. It also forms the basis for the "No Action" alternative.
<b>Step 5</b> Formulate Alternatives	During this step, the BLM formulates a reasonable range of alternatives for managing resources in the planning area. Alternatives include a continuation of current management (No Action) alternative and other alternatives that strive to resolve the major planning issues while emphasizing different management scenarios. Alternatives usually vary by the amounts of resource production or protection that would be allowed, or in the emphasis of one program area over another.
<b>Step 6</b> Estimation of Effects	This step involves estimating the physical, biological, economic, and social effects of implementing each alternative in order to provide a comparative evaluation of impacts in compliance with Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR 1500).
<b>Step 7</b> Selection of Preferred Alternative	Based on the information resulting from the estimation of effects, the BLM identifies a Preferred Alternative. The Draft RMP/EIS is then prepared for printing and distributed for a 90-day public review.
<b>Step 8</b> Selection of RMP	<p>Following review and analysis of public comments on the Draft RMP/EIS, the BLM makes adjustments as warranted and selects a Proposed Plan. The Proposed Plan and a Final EIS is then published. A final decision is made after a 60-day Governor's Consistency Review and a 30-day public protest period are completed. The BLM then publishes the Record of Decision (ROD) and prepares the approved RMP.</p> <p>When the BLM prepares the final RMP and ROD, it may select one of the alternatives in its entirety or management actions from more than one of the alternatives analyzed in the planning process. With respect to management of the non-WSA lands with wilderness characteristics, it means the BLM may choose to protect all, some, or none of the non-WSA lands with wilderness characteristics, or select all or some of the actions of the protective management prescription.</p>

Steps in the BLM Land-use Planning Process	
<b>Step 9</b> Monitoring and Evaluation	<p>Step 9 is the monitoring and evaluation process. Monitoring is the repeated measurement of activities and conditions over time. Evaluation is a process in which the plan and monitoring data are reviewed to see if management goals and objectives are being met and if management direction is sound. Monitoring data gathered over time is examined and used to draw conclusions on whether management actions are meeting stated objectives, and if not, why. Conclusions are then used to make recommendations on whether to continue current management or what changes need to be made in management practices to meet objectives.</p> <p>The two types of monitoring that are tied to the planning process include implementation and effectiveness monitoring. Land-use plan monitoring is the process of (1) tracking the implementation of land-use planning decisions and (2) collecting and assessing data/information necessary to evaluate the effectiveness of land-use planning decisions. The two types of monitoring are described below.</p> <p><b>Implementation Monitoring:</b> Implementation monitoring is the most basic type of monitoring and simply determines whether planned activities have been implemented in the manner prescribed by the plan. Some agencies call this compliance monitoring. This monitoring documents the BLM's progress toward full implementation of the LUP decision. There are no specific thresholds or indicators required for this type of monitoring.</p> <p><b>Effectiveness Monitoring:</b> Effectiveness monitoring is aimed at determining if the implementation of activities has achieved the desired goals and objectives. Effectiveness monitoring asks the question: Was the specified activity successful in achieving the objective? This requires knowledge of the objectives established in the RMP as well as indicators that can be measured. Indicators are established by technical specialists in order to address specific questions, and thus avoid collection of unnecessary data. Success is measured against the benchmark of achieving desired future conditions established by the plan.</p> <p>Regulations at 43 CFR 1610.4-9 require that the Proposed Plan establish intervals and standards, as appropriate, for monitoring and evaluation of the plan, based on the sensitivity of the resource decisions involved. Progress in meeting the plan objectives and adherence to the management framework established by the plan is reviewed periodically. CEQ regulations implementing NEPA state that agencies may provide for monitoring to assure that their decisions are carried out and should do so in important cases (40 CFR 1505.2(c)). To meet these requirements, the BLM will review the plan on a regular schedule in order to provide consistent tracking of accomplishments and provide information that can be used to develop annual budget requests to continue implementation.</p> <p>Land-use plan evaluations will be used by the BLM to determine if the decisions in the RMP, supported by the accompanying NEPA analysis, are still valid. Evaluation of the RMP will generally be conducted every five years per BLM policy, unless unexpected actions, new information, or significant changes in other plans, legislation, or litigation triggers an evaluation. Land-use plan evaluations determine if decisions are being implemented, whether mitigation measures are satisfactory, whether there are significant changes in the related plans of other entities, whether there is new data of significance to the plan, and if decisions should be changed through amendment or revision. Evaluations will follow the protocols established by the BLM Land-use Planning Handbook H-1601-1 in effect at the time the evaluation is initiated. Specific monitoring and evaluation needs are identified by resource/uses throughout Chapter 2.</p>

## 1.6 SCOPING

### 1.6.1 THE SCOPING PROCESS

Early in the planning process, the public and other agencies were invited to help the BLM identify planning issues and concerns relating to the management of BLM-administered lands and resources in the planning area. The formal scoping period began with publication of the Notice of Intent (NOI) in the Federal Register in March 2001. The scoping process included five scoping meetings conducted in locations within and outside of the planning area March 12, 2001 through December 31, 2001. News releases and radio announcements were also used to notify the public of the planning process and how to become involved. Management concerns were identified through discussions with BLM resource specialists.

As part of this scoping process, the following public meetings were held to solicit input:

- Duchesne County Courthouse, Duchesne, Utah; October 17, 2001
- Vernal Western Park, Vernal, Utah; October 18, 2001
- Utah Department of Natural Resources, Salt Lake City, Utah; October 25, 2001
- Daggett County Courthouse, Manila, Utah; November 1, 2001
- Green River City Offices, Green River, Utah; November 8, 2001

On January 14, 2005, the BLM published a notice of availability (NOA) of the Draft RMP/EIS in the Federal Register to announce and solicit public comment on the alternatives and impacts and effects of those alternatives on the human environment. The BLM distributed to relevant agencies and the interested public the Draft RMP/EIS for review and comment. The comment period ended April 14, 2005. The comments and the BLM's responses thereto are addressed in Chapter 5 of this Proposed Plan/Final EIS (PRMP/FEIS, or the Proposed Plan). The BLM received approximately 360 substantive letters during this comment period. Out of these comment letters, approximately 320 comments necessitated changes to the Draft RMP/Draft EIS. A more detailed breakdown of the letters and comments received are shown in the chart below.

Separate from the Draft RMP and EIS for the VFO planning area, the BLM published a NOA in the Federal Register on December 13, 2005, announcing the availability of information on existing and potential Areas of Critical Environmental Concern (ACECs) considered within the Draft RMP and EIS, as required in 43 CFR 1610.7-2. The Code of Federal Regulations (CFR) also provided an associated 60-day comment period beginning December 13, 2005. The BLM received 5 substantive letters during this comment period. Out of these comment letters, 10 comments necessitated changes to the Draft RMP/Draft EIS. A more detailed breakdown of the letters and comments received are shown in the chart below.

In order to adequately address the management of non-WSA lands with wilderness characteristics, a supplemental EIS (SEIS) fifth alternative (Alternative E) was published by the BLM in 2007. An NOA of the SEIS was published in the Federal Register on October 5, 2007. The 90-day public comment period to solicit public comment on Alternative E began October 5, 2007, and ended on January 3, 2008. The BLM received 191 substantive letters during this

comment period. Out of these comment letters, approximately 500 comments necessitated changes to the Draft RMP/Draft EIS. A more detailed breakdown of the letters and comments received are shown in the chart below.

**Table 1.6.1 Letters and Comments Breakdown**

	Draft RMP/Draft EIS	ACEC Comment Period	Supplement to the Draft RMP/Draft EIS
Total Substantive Letters	Approximately 320	5	Approximately 52
Total Non-Substantive Letters	Approximately 1,774	6,835	Approximately 20,000+
Total Letters	Approximately 2,094	6,840	Approximately 20,000+
Total Substantive Comments	Approximately 2,500	30	Approximately 500
Total Non-Substantive Comments	Approximately 438	32	Approximately 65
Total Comments	Approximately 2,938	37	Approximately 565
Total Comments that Changed the RMP	Approximately 320	10	Approximately 34

## 1.7 IDENTIFICATION OF ISSUES

The key planning issues identified as a result of the scoping process for developing alternatives in the RMP and EIS are outlined below.

### 1.7.1 AIR QUALITY

*How can natural resources such as air quality be addressed in order to comply with the State of Utah and the EPA standards?*

### 1.7.2 CULTURAL AND PALEONTOLOGICAL RESOURCES

*How can cultural and paleontological resources be protected from resource uses such as motorized recreation, livestock grazing, and mineral development?*

**Note:** The Proposed Plan provides for enhanced management of cultural and paleontological resources in the planning area. Many new discoveries, excavations, and analyses in the field of paleontology have occurred. These new findings are enhancing the BLM's understanding of these resources in the VPA.

### 1.7.3 RELATED CULTURAL AND PALEONTOLOGICAL ISSUES

- *What management practices (i.e., method of development and location) can be applied to human activities and uses in order to protect cultural and paleontological resources?*

- *Where can cultural and paleontological resources be used for scientific, educational, recreational, and traditional purposes?*

#### **1.7.4 FIRE MANAGEMENT**

*Where is fire desired and not desired, and in what areas could fire be used as a management tool for vegetative treatments?*

**Note:** Fire management planning is necessary to address high risk areas, fire prevention, prescribed burns, rehabilitation and restoration, hazardous fuels reduction, protection of life and property, and other wildfire-related issues.

#### **1.7.5 LANDS AND REALTY**

*What lands within the VPA should be identified as targets for acquisition, disposal, or withdrawal?*

**Note:** As mandated by Section 102 (a)(1) of FLPMA (43 U.S.C. § 1701), public lands are retained in federal ownership, the exception being those public lands that have future potential for disposal (i.e., sale or exchange), as described under Section 203(a) and Section 206 of FLPMA (43 U.S.C. §§ 1713 and 1716). Public lands cannot be effectively administered without legal and physical access. Therefore, public lands have potential for disposal when they are isolated and/or difficult to manage. Lands identified for disposal must meet public objectives, such as community expansion and economic development. The preferred method of disposal is land exchange. Other lands can be considered for disposal on a case-by-case basis. Disposal actions are usually in response to a public request or an application and result in a title transfer, wherein the lands leave the public domain.

Methods used to acquire legal rights to lands that meet resource management needs include negotiated purchase, donation, and exchange. In a withdrawal of lands, an area of public land is withheld from settlement, sale, location, or entry, for the purpose of limiting activities in order to maintain other public values.

#### **Related Lands and Realty Issues**

- How will transportation and utility right-of-way corridors (including avoidance areas and exclusion areas) be managed?
- What specific land-use authorization decisions will be determined to be appropriate in meeting specific resource goals and objectives?
- How will access needs and tenure adjustment proposals (all lands identified for disposal or retention) be addressed?
- How will land-tenure adjustments or ownerships and management agreements be addressed when they have not previously been addressed because they occurred since the completion of previous planning? (For example, Hill Creek federal minerals and private

lands were acquired as a part of the Book Cliffs initiative and the lands near the mouth of Nine Mile Creek were acquired as mitigation.)

### **1.7.6 MINERALS MANAGEMENT**

*What areas will be available for mineral development, and what restrictions should be imposed?*

**Note:** Historically, the mineral industry has been an important aspect of the local economy in the VPA. Mineral development is considered a major issue for this planning area not only for economic reasons but also for the degree to which it can potentially affect other resources.

#### **Related Minerals Management Issues**

- How can hazardous materials issues be identified when they arise due to proposed oil, gas, and mineral development that are regulated by the state?
- How can conflicts be reduced between mineral development and increasing recreation?
- Where can mineral leasing and development occur, while protecting other resources?
- What are the economic benefits of mineral development?

### **1.7.7 NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

*How should non-WSA lands with wilderness characteristics be managed?*

**Note:** Certain non-WSA lands in the area managed by the VFO are proposed by members of Congress and/or members of the public for wilderness designation. After updating its wilderness inventory, the BLM found that some of these lands have wilderness characteristics as defined in Section 2(c) of the Wilderness Act of 1964, and others do not.

The Land-use Planning Handbook H-1601-1 guides the consideration of non-WSA lands with wilderness characteristics in land-use planning. The handbook provides that the BLM may not establish new WSAs. However, the BLM may consider information on wilderness characteristics in land-use planning efforts and manage such lands in a way that would protect or preserve some or all of those characteristics. This may include protecting certain lands in their natural condition and providing outstanding opportunities for solitude and primitive and unconfined types of recreation.

### **1.7.8 OHV USE AND TRANSPORTATION**

*How can increased recreation use, especially motorized vehicle access, be managed while protecting natural resource values?*

**Note:** Growth of OHV use has become a significant issue within the planning area due to increased conflicts between OHV users and other recreationists, as well as the potential for increased soil damage, while protecting the natural and cultural values of the public lands. With the number of visitors growing, recreation is expanding further into the backcountry, while

resource and user conflicts are becoming more common. Although all recreational uses need to be managed, OHV use needs particular attention, including identifying areas to be open, restricted, or closed for the protection of other resource values.

### **1.7.9 RELATED OHV AND TRANSPORTATION ISSUES**

- *Which areas should be designated as open, limited, or closed to OHV use, and which OHV routes should be designated within the limited category?*
- *What types of recreation travel should be available on which designated routes and under what limitations?*

### **1.7.10 RANGELAND MANAGEMENT AND HEALTH**

*Are there areas where grazing should not be allowed due to resource conflicts?*

**Note:** The Secretary of the Interior, through the BLM, manages approximately 264 million acres of public rangelands throughout the western U.S. The Taylor Grazing Act of 1934, the FLPMA, and the Public Rangelands Improvement Act of 1978 together guide the BLM's management of livestock grazing on public lands. The objectives for grazing administration regulations are to "promote healthy sustainable rangeland ecosystems; to accelerate restoration and improvement of public rangelands to properly functioning condition; to efficiently and effectively administer domestic livestock grazing; and to provide for the sustainability of the western livestock industry and communities that are dependent upon productive, healthy public rangelands" (43 CFR Part 4100.0-2).

Resource concerns and potential conflicts have arisen regarding the allocation and season of use of forage within the planning area. The BLM's grazing regulations recognize suspended non-use if carried on a permit prior to 1995. If a permit is reduced after 1995, the animal unit months (AUMs) are not carried on the permit. A permittee may apply for temporary non-renewable AUMs; however, the BLM must determine if forage is available. Isolated instances of resource degradation have occurred in site-specific areas particularly associated with seasons of use and forage allocation.

The BLM incorporates standards for rangeland health by:

- Evaluating adjustments in livestock and wildlife numbers and seasons of use.
- Evaluating forage allocation and carrying capacity for wildlife, wild horses, and livestock.
- Evaluating range capability, including potential impacts to range health for both wildlife and wild horse populations and permitted livestock use.

### **Related Rangeland Management and Health Issues**

- *How should grazing be managed during times of drought?*
- *How should grazing be managed in riparian areas?*

### 1.7.11 RECREATION RESOURCES AND MANAGEMENT

*Where should adaptive management practices be applied in response to unacceptable resource impacts?*

**Note:** Recreation management is of significant concern within the planning area because it contains world-class recreational resources. Use has grown rapidly and is expected to continue to grow. This increase in recreational activities may bring additional risk of wildfire within Wildland Urban Interface (WUI) areas. Recreation uses and projected needs are reviewed on all lands to determine appropriate management for the following:

- **Special Recreation Management Areas (SRMAs)** requiring enhanced or special management for recreational uses, or for protection of recreation-related resource values;
- **Extensive Recreation Management Areas (ERMAs)** are areas where dispersed recreation is encouraged and where visitors have recreational freedom of choice with minimal regulatory constraint. These areas usually receive very little recreation use.

#### **Related Recreation Resource Management Issues**

- *How should recreational uses be managed to limit conflicts among recreational users?*
- *How should camping, human waste, fires, and wood collection be managed?*
- *Where should SRMAs be managed for recreational uses or for protection of recreation-related values?*
- *How should conflicts with other, non-recreational uses be reduced?*
- *What management actions should be implemented to mitigate damage caused by recreational uses, including vehicles, on other resources and sensitive areas, especially riparian areas?*
- *How should recreation in the VPA be managed to ensure public health and safety?*
- *Where and under what circumstances should permitted recreation uses be available?*
- *What types of recreational facilities and uses should be available, and what limitations should be required?*

### 1.7.12 SPECIAL MANAGEMENT DESIGNATIONS

*What areas should have special designations such as ACECs and Wild and Scenic Rivers (WSR)?*

**Note:** FLPMA and BLM policy require the BLM to give priority to designation and protection of ACECs during the land-use planning process. The Wild and Scenic River Act directs federal agencies to consider the potential for including watercourses into the National Wild and Scenic Rivers System during the land-use planning process.

As a cooperating agency involved with the development of the VFO RMP/EIS, the State of Utah has proposed that a statewide WSR review be completed. In accordance with Section 5(d) of the

Wild and Scenic Rivers Act, the BLM would continue to make WSR recommendations through the land-use planning process.

### **Related Special Management Designation Issues**

- *What management prescriptions should be applied to areas with special designations?*
- *What resources need the protection provided by a special designation?*

### **1.7.13 VISUAL RESOURCE MANAGEMENT (VRM)**

*How will visual resources be managed?*

**Note:** Changes in visitor use patterns and frequency, as well as intensive development, are causing concerns in some areas and enhanced protection of visual resources may be necessary. The VRM designations would be consistent with overall management plan goals and objectives.

### **1.7.14 WATERSHED MANAGEMENT, SOILS, AND VEGETATION**

*How can resources such as watersheds, soils, and vegetation be protected, maintained, or restored?*

**Note:** Some resource uses (i.e., grazing, mineral development, OHV use, and recreation) can affect the natural function and condition of watersheds. A healthy cover of perennial vegetation stabilizes the soil, increases infiltration of precipitation, reduces runoff, provides clean water to adjacent streams, and minimizes noxious weed invasion. Plant communities provide habitat for wildlife as well as forage for domestic animals.

### **Related Watershed Management, Soils, and Vegetation Issues**

- *Which watersheds may require special protection?*
- *Where and with what methods can noxious weeds be controlled?*
- *How should activities and uses be managed during drought?*
- *How should soil and vegetative resources be managed?*
- *What management prescriptions should be in place to allow for appropriate consideration to water quality concerns related to activities on public lands, including but not limited to, the requirements mandated by the Clean Water Act and the state water classifications in the 303D state water inventories, as well as at-risk water quality due to naturally occurring formations?*
- *What management prescriptions should be in place to ensure compliance with the Safe Drinking Water Act, the Unified Federal Policy for a Watershed Approach, and the Colorado River Basis Salinity Control Act?*
- *What management prescriptions are appropriate and consistent for flood plain protection?*

- *How will the VFO management for the inventory and protection of riparian areas in accordance with current BLM policy?*

### **1.7.15 WILD HORSE MANAGEMENT**

*How should wild horses be managed in the VPO?*

**Note:** Management of wild horses remains difficult due to disease (e.g., EIA), trespass of private horses, and manageability of the herd. The Proposed Plan addresses the following:

- *Wild or feral horses will be gathered and removed.*
- *Forage allocation has been allocated until removal.*

### **1.7.16 WILDLIFE HABITAT AND FISHERIES MANAGEMENT**

*How can wildlife habitat and fisheries be managed to be protected, maintained, or restored?*

#### **Related Wildlife Habitat and Fisheries Management Issues**

- *What restrictions could be placed on resource uses in identified areas to maintain the existence or promote the recovery of threatened and endangered species, or to prevent the listing of additional species?*
- *How should wildlife corridors and unfragmented, crucial wildlife habitat be protected or improved?*
- *What considerations should be made for state-listed sensitive plant and animal species and their associated habitats?*
- *What consideration should be made for animal damage control within the scope of the national and local MOU with Animal Plant Health Inspection Service (APHIS) and UDWR?*
- *What consideration should be made for reintroduction or transplants of native fish and wildlife species into the planning area that were not addressed during the previous planning efforts, including allocating AUMs, where appropriate?*
- *What consideration should be made for species not recognized during the previous planning efforts—such as newly listed threatened and endangered species, species proposed for listing, candidate species, and other non-listed special status species, including those on the Utah BLM State Director's Sensitive Species List?*

### **1.7.17 WOODLAND AND FOREST MANAGEMENT**

*What treatments and management prescriptions will be employed to address forest health, land health, sustainability, and resiliency to disturbances, fuel loadings, fire hazard, composition, structure, and function?*

**Note:** Treatments across the planning area would need to be implemented to meet desired future conditions. Existing RMPs also do not address special forest vegetation product management such as seed collection [private and commercial]. In recent years the public demand for these types of products has grown significantly.

### **Related Woodland and Forest Management Issues**

*What areas should be available for fuel wood harvesting?*

## **1.8 ISSUES BEYOND THE SCOPE OF THE PLAN**

Issues beyond the scope of the RMP planning process include all issues not related to decisions that would occur as a result of the planning process. They include decisions that are not under the jurisdiction of the MFO or are beyond the capability of the BLM to resolve as part of the planning process. Issues identified in this category include:

- The State of Utah, Uintah, Duchesne and Daggett counties may hold valid existing rights-of-way in the planning area pursuant to Revised Statute (RS) 2477, Act of July 28 1866, Chapter 262, 8, 14 Stat. 252, 253, codified at 43 USC 932. On October 21, 1976, Congress repealed R.S-2477 through passage of FLPMA. This RMP does not adjudicate, analyze, or otherwise determine the validity of claimed rights-of-way. However, nothing in the RMP extinguishes any valid right-of-way or alters in any way the legal rights the state and counties have to assert and protect RS-2477 rights or to challenge in federal court or other appropriate venue any use restrictions imposed by the RMP that they believe are inconsistent with their rights.
- New wilderness or WSA proposals.
- Eliminating grazing, mineral development, and OHV use on all public lands.
- Activities and uses beyond the jurisdiction of the BLM.
- Changing existing laws, policies, and regulations.
- Availability of funding and personnel for managing programs.
- Considering alternative energy sources as substitutes for activities related to mineral development.

## **1.9 PLANNING CRITERIA**

The FLPMA is the primary authority for the BLM's management of public lands. This law provides the overarching policy by which public lands would be managed and establishes provisions for land-use planning, land acquisition and disposition, administration, range management, rights-of-way, designated management areas, and the repeal of certain laws and statutes. The National Environmental Policy Act (NEPA) provides the basic national charter for environmental responsibility and requires the consideration and public availability of information regarding the environmental impacts of major federal actions significantly affecting the quality of the human environment. In concert, these two laws provide the guidance for administration of all BLM activities.

Planning criteria are the standards, rules, and guidelines that help to guide data collection, alternative formulation, and alternative selection in the RMP development process. In conjunction with the planning issues, planning criteria assures the planning process is focused. The criteria also help guide the final plan selection and provide a basis for judging the responsiveness of the planning options.

The following criteria were developed by the BLM and reviewed by the public as part of the scoping process:

- The principles of multiple use and sustained yield as set forth in the Federal Land Policy and Management Act have been applied in the RMP.
- The RMP has complied with applicable federal and state laws and regulations.
- All decisions made in the RMP and subsequent implementation decisions would be subject to valid, existing rights.
- The RMP is accompanied by an EIS that would comply with NEPA requirements.
- RMP decisions apply to lands under jurisdiction of the VFO.
- The RMP relies on available inventories of public lands and their resources.
- Boundaries and recommendations on WSAs identified as a result of inventory conducted prior to October 21, 1993, under Section 603 of FLPMA and awaiting action by Congress would not be changed by the RMP.
- Although the formal Section 603(a) wilderness review process expired on October 21, 1993, the BLM has continuously maintained an inventory of current public land attributes, including lands that may have wilderness character, but which were either not analyzed in earlier planning efforts as having those characteristics, or which were determined presently to have these characteristics that may not have been present during earlier inventory efforts. It is not within the BLM's authority to designate additional WSAs.
- The RMP incorporates the Standards for Rangeland Health and Guidelines for Livestock Grazing as set out by the RAC.
- The RMP considers provisions of the Vernal Fire Management Plan.
- The RMP considers the existing recovery plans and management strategies and guidelines in place for federally listed threatened and endangered species that use the planning area. State management plans have been considered for delisted species.
- The RMP has considered conservation and management strategies developed for the protection, conservation, and restoration of westslope cutthroat trout, fluvial arctic grayling, and Greater Sage-grouse.
- The RMP recognizes the State of Utah's responsibility to manage fish and wildlife populations, including hunting and fishing uses.
- The RMP recognizes the State of Utah's authority regarding Utah water law and water rights.

- RMP decisions are compatible to the extent possible with the plans and mandates of other agencies and governments that have jurisdiction in the region.
- The RMP recognizes private land owner obligations under applicable tribal treaties and laws or executive orders relating to Native American reserved rights, religious freedoms, and traditional use areas.
- The RMP considers and integrates local, statewide, and national interests.

## 1.10 RELATED PLANS

The BLM's planning regulations require that plans be consistent with officially approved or adopted resource-related plans of other federal, state, local, and tribal governments to the extent those plans are consistent with federal laws and regulations applicable to public lands. Plans formulated by federal, state, local and tribal governments that relate to management of lands and resources have been reviewed and considered as the RMP/EIS has been developed.

Management of federal and state lands immediately adjacent to public land administered by the BLM was considered in the formulation of alternative management scenarios and land-use allocations. As cooperating agencies in development of the Vernal RMP, Uintah, Daggett, and Duchesne counties have evaluated consistency with appropriate county plans as the Proposed Plan/Final EIS has been developed. The main major planning documents of other federal, state, local, and tribal governments considered in development of the RMP are included below. (Note: This may not be a complete list.)

### 1.10.1 COUNTY LAND-USE PLANS

Daggett County, Utah	Daggett County General Plan
Duchesne County, Utah	Duchesne County General Plan
	Duchesne County Public Land Implementation Plan
Grand County, Utah	Grand County General Plan
Uintah County, Utah	Uintah County General Plan
	Uintah County Plan for Management of the Book Cliffs Resource Area Ordinance No. 9-25-2000A, Wild Horse Habitat on Public Land
Garfield County, Colorado	Garfield County General Plan
Moffat County, Colorado	Moffat County General Plan
Rio Blanco County, Colorado	Rio Blanco County General Plan
Sweetwater County, Wyoming	Sweetwater County General Plan

**1.10.2 STATE OF UTAH**

Division of State Parks and Recreation, Steinaker, and Red Fleet State Plans
2003. State Comprehensive Outdoor Recreation Plan
2001. Utah's Water Resources Planning for the Future
1999. Uintah Basin Water Plan
1990. Utah State Water Plan

**1.10.3 OTHER FEDERAL PLANS**

Ashley National Forest Land-use Plan
Dinosaur National Monument Plan
Ouray National Wildlife Refuge Plan
Browns Park National Wildlife Refuge Plan
Price BLM Field Office RMP
Moab BLM Field Office RMP
Green River BLM Field Office RMP
Little Snake BLM Field Office RMP
White River BLM Field Office RMP
Park City Management Framework Plan (Salt Lake City BLM Field Office)

**1.10.4 ACTIVITY PLANS**

1979. Desolation & Gray Canyons on the Green River—River Management Plan
1988–1989. John Jarvie Historic District Site Management Plan, completed in 1988 and amended in 1989
1994. Recreation and Cultural Management Plan for Nine-Mile Canyon; Joint Management Plan; Vernal and Price Field Offices
1996. Green River Management Plan; Joint Management Plan; VFO and Ashley National Forest

**1.10.5 HABITAT MANAGEMENT PLANS**

1979. Myton Habitat Management Plan
1983. Diamond Mountain/Ashley Creek Habitat Management Plan
1987. Browns Park Habitat Management Plan

**1.10.6 ENDANGERED SPECIES RECOVERY PLANS**

1983. Northern States Bald Eagle Recovery Plan
1987. The Recovery Implementation Plan for the Endangered Fish Species in the Upper Colorado River Basin
1988. Black-footed Ferret Recovery Plan
1990. Bonytail Chub Recovery Plan
1990. Humpback Chub Recovery Plan
1990. Uinta Basin Hookless Cactus Recovery Plan
1991. Colorado Squawfish Recovery Plan
1999. Razorback Sucker Recovery Plan
1995. Mexican Spotted Owl Recovery Plan
1995. Draft Ute Ladies-tresses Recovery Plan
2003. Conservation and Research Plans for Four Plant Species in Northeastern Utah (White River Beardtongue, Goodrich Beardtongue, Graham Beardtongue, and Horseshoe Milkvetch)

**1.10.7 EXISTING ENVIRONMENTAL IMPACT STATEMENTS**

1983. Uinta Basin Synfuels Development EIS
1983. Wild and Scenic River Study, Green and Yampa Rivers EIS
1984. Utah Combined Hydrocarbon Leasing Regional EIS
1985. PR Spring Combined Hydrocarbon Lease Conversion EIS
1990. Utah BLM Statewide Wilderness EIS

**1.10.8 DOCUMENTS INCORPORATED BY REFERENCE**

1991. Final Environmental Impact Statement Vegetation Treatment on BLM Lands in Thirteen Western States and associated Records of Decision. BLM Wyoming State Office, Casper Wyoming (BLM-WY-ES-91-036-4320)
2007. Final Vegetation Treatments on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Impact Statement and associated Record of Decision. USDI, Bureau of Land Management (FES 07-21)
2007. Final Vegetation Treatments on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Report. USDI, BLM (FES07-21)

### 1.10.9 NATIONAL PROGRAMMATIC EIS FOR TAR SANDS AND OIL SHALE RESOURCES

The VFO contains areas of tar sands and oil shale resources. The tar sand resources have been, and currently are, available for lease under the Combined Hydrocarbon Leasing Act of 1981 and in accordance with decisions in the existing BLM LUPs/plan amendments. There are, at present, no regulations in place to allow for leasing oil shale, nor any existing commercial oil shale leases upon BLM-managed lands. The VFO contains one research and development oil shale lease.

In Utah, the major tar sand resources lie within 11 designated Special Tar Sands Areas (STSAs) managed by the Vernal, Price, Richfield, and Monticello Field Offices. One of these STSAs lies within the Grand Staircase–Escalante National Monument where leasing is prohibited. The VFO wholly or in part manages seven of the remaining 10 STSAs.

Lands containing oil shale resources were originally identified through an inventory that portrayed the occurrence of the Green River geologic formation in Utah, Wyoming, and Colorado. Once identified, lands containing oil shale resources were withdrawn from mineral entry through a 1930 Executive Order, which was later modified to allow for oil, gas, sodium leasing, and leasing of U<sub>A</sub> U<sub>B</sub> Oil Shale tracts. Since that time, the economic potential for the oil shale resource has been further defined, now comprising a much smaller area in Utah, primarily in the southern part of the BLM VFO area with a small area in the northeast portion of the lands managed by the Price Field Office.

When the Vernal RMP revision was initiated in 2001, there was no reasonable foreseeable development (RFD) expectation for tar sands or oil shale over the life of the plan. The mineral report identified these resources, but did not foresee any leasing or development due to prevailing and anticipated economic factors.

Since the start of this RMP revision, Congress enacted the Energy Policy Act of 2005. Section 369 of the Energy Policy Act requires the Secretary of Interior to "complete a programmatic environmental impact statement for a commercial leasing program for oil shale and tar sands resources on public lands, with an emphasis on the most geologically prospective lands within each of the States of Colorado, Utah, and Wyoming." On December 13, 2005, the BLM published a Notice of Intent in the Federal Register initiating a Programmatic Environmental Impact Statement (PEIS) to support a commercial oil shale and tar sands leasing program on federal lands in these three states. Since that time, the scope of the PEIS has been revised. The BLM is no longer using the PEIS as the document that supports the NEPA requirements for leasing. Given that the development technologies for *in situ* production of oil shale are just emerging, there is a lack of information regarding resource use and associated impacts. Consequently, the BLM has changed this document to a resource allocation document that identifies the BLM-managed lands for which applications to lease oil shale and tar sands resources would be accepted in the future. However, although applications would be accepted, additional NEPA analysis would be performed before any leasing of the area would be considered.

All land-use planning decisions related to oil shale and tar sands resources (areas open to application for potential leasing) in this RMP will be made by the ongoing PEIS for oil shale and tar sands resources. The ROD on the final PEIS will amend the existing Diamond Mountain and

Book Cliffs RMP or the Vernal RMP by making land-use planning decisions on whether or not lands will be available for future application, leasing, and development of oil shale and tar sands on public lands for those areas where the resource is present. Additional site-specific NEPA analysis will be completed on each lease application before any leases would be issued.

As part of the site-specific NEPA analysis, the environmental consequences to specific resource values and uses within the areas and any alternative actions would be analyzed. Any decision to offer the lands for lease would be made based on a full disclosure of the impacts. If a decision is made to offer the lands for lease, specific mitigation measures will be developed to ensure that the commercial operations use practices that minimize or mitigate impacts.

This pre-leasing NEPA analysis would include the same opportunities for public involvement and comment that are part of this PEIS process and every other land-use planning and NEPA process the BLM undertakes. The decisions associated with the PEIS will be incorporated into the Vernal RMP as it is finalized or will amend the Vernal RMP. Additional opportunities for public involvement and comment will occur when the Proposed Plan Amendment/ Final PEIS is available.

This RMP will, however, provide allocation and leasing decisions for conventional oil and gas leasing in the STSAs and oil shale areas.

#### ***1.10.10 RELATIONSHIP TO THE PRESIDENT'S NATIONAL ENERGY POLICY AND THE SCIENTIFIC INVENTORY OF ONSHORE FEDERAL LANDS' OIL AND GAS RESOURCES AND RESERVES, AND THE EXTENT AND NATURE OF RESTRICTIONS OR IMPEDIMENTS TO THEIR DEVELOPMENT***

The President's comprehensive National Energy Policy, issued in May 2001, directed the Secretary to "...examine land status and lease stipulation impediments to federal oil and gas leasing, and review and modify those where opportunities exist (consistent with the law, good environmental practice and balanced use of other resources)."

Under this directive the assistant secretary for Lands and Minerals Management delivered to Congress an inventory of U.S. oil and gas resources in five western basins, as well as the extent and nature of any restrictions or impediments to their development. This report was prepared at the request of Congress under the provisions of the 2000 EPCA).

In April 2003, the BLM specified four EPCA integration principles as follows:

- Environmental protection and energy production are both desirable and necessary objectives of sound land management practices and are not to be considered mutually exclusive priorities.
- The BLM must ensure the appropriate amount of accessibility to energy resources necessary for the nation's security while recognizing that special and unique non-energy resources can be preserved.

- Sound planning would weigh the relative resource values consistent with the Federal Land Policy and Management Act.
- All resource impacts, including those associated with energy development and transmission, would be mitigated to prevent unnecessary or undue degradation.

By July 29, 2003, the BLM started to provide direction necessary to outline a strategy for integrating EPCA inventory results into LUPs.

The VFO is located partially within the Uinta–Piceance oil and gas basin, one of seven areas identified as priority basins in the EPCA inventory. The VFO and their contractors conducted an extensive review of the inventory data regarding energy resources within the planning area. That data is profiled in the Proposed Vernal RMP and consists primarily of two types of information as outlined in EPCA: 1) data on oil and gas resources (volumetric data), and 2) data on leasing constraints. This data is considered an important part of the BLM's administrative record for the RMP.

The EPCA volumetric data is documented in the Affected Environment section of the EIS. The BLM also considered many other sources of energy-related data, including USGS and Utah Geologic Survey (UGS) information, industry information, as well as some academic work completed on oil and gas plays and areas with potential for occurrence of mineral resources. This information is part of the more detailed Mineral Potential Report prepared in support of the planning effort.

In 2002, the BLM prepared a projected reasonable foreseeable development (RFD) scenario to project environmental impacts across a 15-year period; this RFD has been modified (2008) for oil and gas development only to project environmental impacts for up to 5 years. Development projections included in-depth reviews of potential for occurrence, past well production, current well production, and future potential for production. During the pendency of this planning effort (beginning with public meetings in 2001 and 2002 for scoping purposes through the notification in the Federal Register on January 14, 2005, of the availability of the Draft RMP/EIS), the RFD scenario, which is a planning tool and not a prediction or limit to development, did not track completely with the pace of development in the Uinta Basin. The BLM has carefully monitored industry trends and believes that the RFD used as an analytical tool in this Proposed RMP can be considered accurate up to approximately 5 years from the time the Record of Decision (ROD) is signed.

Within the next 5-year timeframe, the BLM would monitor the impacts to resources of continued development in the VPA and ensure that the impacts disclosed in this Proposed RMP are not exceeded by the pace of development.

The BLM also conducted additional support work regarding energy-related management and energy benefits in the Analysis of the Management Situation (AMS), as well as the Socioeconomic Baseline Report; these characterize the significant beneficial impacts of energy and mineral development for the Uinta Basin.

Also, as part of EPCA, a review was provided outlining existing leasing constraints within the focus areas. Data on proposed and existing leasing constraints specific to the proposed Vernal RMP are provided in Table 2.1.9 (Minerals and Energy Resources) as found in Chapter 2.

### **1.10.11 ENERGY POLICY ACT OF 2005 AND THE WEST-WIDE ENERGY CORRIDOR PROGRAMMATIC EIS (PEIS)**

Section 368 of the Energy Policy Act of 2005 (designation of West-wide energy corridors) is being implemented via the current development of an interagency, Programmatic EIS (PEIS). The Final PEIS could amend numerous RMPs in the western U.S., providing decisions that would address numerous energy corridor-related issues, including the use of existing corridors (with enhancements and upgrades), identification of new corridors, supply and demand considerations, and compatibility with other corridor and project planning efforts.

## **1.11 SUMMARY OF CHANGES MADE BETWEEN THE DRAFT RMP/EIS AND THE PROPOSED RMP/FINAL EIS**

The BLM has made numerous changes between the Draft RMP/EIS and Proposed RMP/Final EIS. These changes are described below and detailed in Appendix N. BLM has prepared this Appendix to document if changes between the Draft RMP/EIS and the Proposed RMP/Final EIS resulted in a significant change in circumstances or conditions, or if the Proposed RMP/Final EIS contains different information from that which was presented to the public in the Draft RMP/EIS. Finally, BLM wanted to confirm that all changes made to the Proposed RMP/Final EIS fall within the range of alternatives presented and analyzed in the Draft RMP/EIS and the Supplement to the Draft RMP/EIS.

The regulation controlling whether or not a supplement is required is found at 40 CFR 1502.9(c), which provides that agencies:

- (1) *Shall prepare supplements to either draft or final environmental impact statements if:*
  - (i) *The agency makes substantial changes in the proposed action that are relevant to environmental concerns; or*
  - (ii) *There are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impact.*
- (2) *May also prepare supplements when the agency determines that the purposes of the Act will be furthered by doing so.*
- (3) *Shall adopt procedures for introducing a supplement into its formal administrative record, if such a record exists.*
- (4) *Shall prepare, circulate, and file a supplement to a statement in the same fashion (exclusive of scoping) as a draft and final statement unless alternative procedures are approved by the Council.*

All changes to the Vernal Field Office Draft RMP/EIS were made in response to public comment and/or internal review. The majority of the changes were editorial changes made to add clarity to the document. In some cases, alternatives presented in the Draft RMP/EIS were modified in the Proposed RMP to reflect technical corrections and data updates. In other cases, such as in

Chapter 3, incorporation of updated information was necessary to refine the analysis in Chapter 4 that was incomplete or needed augmentation.

None of the changes described above and further detailed in Appendix N meet the regulatory definition for significance in 40 CFR 1508.27(a) and (b). These regulations require an agency preparing a NEPA document to review the changes for significant new circumstances or information relevant to environmental concerns and bearing on the Proposed RMP or its impacts, using context and intensity as the trigger for significance. BLM has reviewed each substantive change through this regulatory standard and has determined that none of the changes, individually or collectively, require a supplement to this Final EIS.

Following is an executive summary of the major changes between the Draft RMP/EIS and the Proposed RMP/Final EIS. The summary of changes has been broken into two parts:

- Summary of Changes to Decisions Between the Draft RMP/EIS Preferred Alternative (Alternative A) and the Proposed RMP/Final EIS
- Summary of Editorial Changes Made Between the Draft RMP/Draft EIS and Proposed RMP/Final EIS.

#### **1.11.1 ES.7.1. SUMMARY OF CHANGES TO DECISIONS BETWEEN THE DRAFT RMP/EIS PREFERRED ALTERNATIVE (ALTERNATIVE A) AND THE PROPOSED RMP/FINAL EIS**

- **Air Quality** decisions were refined based upon State of Utah, Department of Air Quality correspondence included in Appendix O.
- The Draft RMP alternatives made proposed decisions for **Combined Hydrocarbon Areas/Special Tar Sand Areas**. The Proposed RMP now defers those decisions to the Programmatic Tar Sands Oil Shale EIS discussed in Section 1.10.9 of Chapter 1.
- **Wild horses** would no longer be permitted in the Winter Ridge Herd Area and Hill Creek Herd Area due to disease (e.g., EIA) and trespass of private horses because of mixed surface ownership with the Ute Indian Tribe, State of Utah, and privately held lands. The Draft RMP Preferred Alternative allocated 2,340 AUMs for wild horses in the Winter Ridge Herd Area and the Hill Creek Herd Area.
- The Proposed RMP provides **Greater Sage-grouse** additional protection during breeding, nesting, brooding, and during winter by selecting the protections in Alternative C.
- All or portions of 15 areas, approximately 106,178 acres, would be managed as **non-WSA lands with wilderness characteristics**: Beach Draw, Bourdette Draw, Bull Canyon, Cold Spring Mountain, Daniels Canyon, Dead Horse Pass, Diamond Breaks, Diamond Mountain, Lower Flaming Gorge, Moonshine Draw, Mountain Home, Stuntz Draw, Vivas Cake Hill, White River, and Wild Mountain. The Draft RMP Preferred Alternative did not specifically provide management for non-WSA lands with wilderness characteristics. The Proposed RMP preserves and maintains management prescriptions in these areas and does not allow for surface disturbing activities.

- Bitter Creek, Coyote Basin, Lower Green River Expansion **ACECs** were not brought forward from the Draft RMP Preferred Alternative.
- White River, Browns Park, and Nine Mile Canyon **ACECs** were brought forward, with a reduction in acreage.
- Manage 24,259 acres in Red Mountain-Dry Fork as a **SRMA** to provide for maintenance and development of OHV or non-OHV trails, minimal facilities necessary for human health and safety, watershed values, relict vegetation communities, and crucial deer and elk winter habitat. An activity plan for the SRMA would be developed to determine what areas are appropriate for day use only.
- The Draft RMP Preferred Alternative proposed 24,183 acres as the White River **SRMA**. The Proposed RMP identified 2,831 acres as a SRMA. A portion of the lands not included in the SRMA in the Proposed RMP are being carried forward for management as non-WSA with wilderness characteristics.
- The Draft RMP Preferred Alternative recommended two segments of the White River, the Upper Green River and the Lower Green River, for inclusion in the **National Wild and Scenic River System** as well as the Upper and Lower Green River. The Proposed RMP recommends only the Upper and Lower Green River.
- In the Draft RMP Preferred Alternative, the BLM identified the **Hill Creek Extension** as available for leasing. The BLM, in cooperation with Ute Indian Tribe, identified in the Proposed RMP specific oil and gas leasing constraints for the Hill Creek Extension.

### **1.11.2 ES.7.2. SUMMARY OF EDITORIAL CHANGES MADE BETWEEN THE DRAFT RMP/DRAFT EIS AND PROPOSED RMP/FINAL EIS**

#### **Throughout the Plan**

- The Supplement to the Draft RMP/EIS has been merged into the Proposed RMP/Final EIS. The Supplement presents an analysis of the effects of managing non-Wilderness Study Area (WSA) lands with wilderness characteristics in a protective manner. This analysis is identified as Alternative E in the combined RMP.
- Acreage numbers and figures have been revised and clarified based on refined GIS techniques throughout all chapters.

#### **Chapter 1**

- Chapter 1 has been rewritten to emphasize the decisions brought forward in the Proposed RMP/Final EIS.
- Discussion on monitoring and evaluation and how it plays into the planning process has been added in Chapter 1.
- Chapter 1, Language Added: Utah Division of Wildlife Resources (DWR) Wildlife Habitat Classification System Change and included specific language regarding exceptions, modifications and waivers (Appendix K). This information has been graphically displayed on all maps highlighting wildlife habitat.

## **Chapter 2**

- In Chapter 2 an additional column has been added to the matrices Tables 2.1.1 through 2.1.27 reflecting the Proposed RMP.
- All implementation-level decisions in Tables 2.1.1 through 2.1.27 have been italicized and asterisked with a footnote at the bottom of each page as follows: \*This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.
- Language provided by the State of Utah regarding Air Quality has been added to Chapter 2, Table 2.1.2 “Common to All” section.
- Language provided by the State of Utah concerning compressor engine emission controls has been added to Chapter 2, Table 2.1.9.
- Revised the WSR “Common to All” management actions in Table 2.1.19 to work with upstream and downstream water users and applicable agencies to ensure that water flows are maintained at a level sufficient to sustain the values from which affected river segments were designated.
- Table 2.4 in Chapter 2 of the Draft RMP/EIS was removed in the Proposed RMP/Final EIS.

## **Chapter 3 & 4**

- Completely revised the Socioeconomics section of Chapters 3 and 4 to include the information provided by the State of Utah and cooperating counties included in the new Appendix M.

## **Chapter 5**

- Chapter 5 – Table 5.7 has been added to show consistency findings between the Proposed RMP/EIS, Utah state law, and county plans.

## **2.0 PROPOSED RMP AND ALTERNATIVES**

---

### **2.1 INTRODUCTION**

Chapter 2 contains the Proposed Resource Management Plan (RMP) and alternatives that describe different approaches to the management of public lands and resources in the Vernal Planning Area (VPA) that considered issues and concerns raised during the scoping period (see Chapter 1, Identification of Issues), planning criteria, and the guidance applicable to the resource uses. Each alternative as well as the Proposed RMP represents a complete and reasonable set of objectives, actions, and allocations to guide future management of public lands and resources in the VPA.

The Proposed RMP and five alternatives are presented in this chapter. The Proposed RMP specifies what management would be carried forward into future management. Alternative D (No Action Alternative) describes the continuation of current, existing management. The No Action Alternative is required by Council on Environmental Quality (CEQ) regulations and provides a baseline for comparison of the other alternatives. Four other alternatives (A, B, C, and E) describe proposed changes to current management.

This chapter provides a brief introduction followed by Tables 2.1.1 through 2.1.27, which summarize the differences between the Proposed RMP and the alternatives. The Proposed RMP as well as the alternatives within this RMP share many goals, objectives, standards, and guidelines that ensure protection of resources and compliance with applicable laws. A “Goals and Objectives” section is at the beginning of each resource, followed by “Management Common to All” in order to avoid redundancy. Each category then includes several subsections, each of which focuses on a particular resource, resource use, or program.

### **2.2 DEVELOPMENT OF THE PROPOSED RMP AND DRAFT RMP ALTERNATIVES**

The development of the Proposed RMP and the Draft RMP alternatives for the Vernal RMP and Environmental Impact Statement (EIS) was guided by provisions of the Federal Land Policy and Management Act (FLPMA) and the National Environmental Policy Act (NEPA), as well as by planning criteria listed in Chapter 1. Other laws, as well as Bureau of Land Management (BLM) planning regulations and policy, directed alternative considerations and focused the alternatives on appropriate decisions made at the level of the land use plan (LUP). To begin the alternative development process, goals and desired future conditions were identified by the planning team after carefully considering public comments received throughout the scoping period, as well as direction established by BLM national policy guidance.

The Proposed RMP/Final EIS is primarily based on the components from the Preferred Alternative (Alternative A) of the Draft RMP/EIS (January 14, 2005). However, it has been modified to include aspects of all alternatives analyzed after careful consideration of public comments, cooperating agency review, and internal review.

The Draft RMP, which includes the Supplement to the Draft, developed five management alternatives to address the major planning issues and to provide direction for resource programs influencing land management. Each alternative emphasizes a different combination of resource uses, allocations, and restoration measures to address issues and resolve conflicts among uses, to allow program goals to be accomplished in varying combinations across the alternatives. Management scenarios for programs not tied to major planning issues and/or mandated by law often contain few or no differences in management between alternatives.

Alternative D, continuation of current management (No Action), is based on existing planning decisions that remain valid, as well as on current direction and policy. The remaining alternatives were developed with input received during scoping and with expertise from the interdisciplinary planning team and input from local, state, federal, and tribal governments.

### **2.2.1 GENERAL DESCRIPTION OF THE PROPOSED RMP/FINAL EIS**

The Proposed RMP/Final EIS is primarily based on the decisions from the Preferred Alternative (Alternative A) from the Draft RMP/EIS (January 14, 2005). However, it has been modified to include aspects of all alternatives analyzed after careful consideration of public comments, cooperating agency review, and internal review. The reviews were provided on the Draft RMP/EIS; call for information on Areas of Critical Environmental Concern (ACECs) (Federal Register Notice, December 13, 2005); and, Alternative E from the supplement that was issued on October 5, 2007, analyzing the management of non-WSA lands with wilderness characteristics. These alternatives are combined in the Proposed RMP/Final EIS. Some changes to the draft alternatives have been made in response to the public comments received during the comment period. These changes are limited, for the most part, to correcting mistakes and refining technical points. Changes in the Proposed RMP/Final EIS from the Draft RMP/EIS Alternative A (Draft RMP/EIS Preferred Alternative) are summarized for the reader in Appendix N.

### **2.2.2 GENERAL DESCRIPTION OF THE DRAFT RMPEIS ALTERNATIVES**

The alternatives were developed in response to the issues identified in the public scoping process and the planning criteria.

The BLM recognizes that social, economic, and environmental issues cross land ownership lines and that extensive cooperation is needed to actively address issues of mutual concern. To the extent possible, the alternatives were crafted using the input from public scoping comments; from comments submitted by Duchesne, Daggett, and Uintah county representatives; and from input from other cooperating agencies such as the Northern Ute Tribe.

All management under any of the Proposed RMP and alternatives would comply with state and federal regulations, laws, standards, and policies. Management items common to all and a more detailed discussion for the Proposed RMP and the alternatives may be found in Table 2.1.1 through 2.1.27.

### **2.2.1.1 DRAFT RMP/EIS PREFERRED ALTERNATIVE (ALTERNATIVE A)**

Management direction is generally broad and accommodates a wide variety of values and uses. The VPA would be managed to provide a sustainable flow of resources for human use, while protecting important watersheds and providing viable populations of native and desirable non-native plants species, as well as to provide opportunities for recreational use and wildlife habitat.

### **2.2.1.2 ALTERNATIVE B**

This alternative provides for most resource uses but would emphasize oil and gas development, where feasible. Renewable resources would be protected by balancing the development of mineral resources with focused and prudent mitigation measures.

### **2.2.1.3 ALTERNATIVE C**

The natural succession of ecosystems would be allowed to proceed in select management areas. This alternative would strongly emphasize maintenance of watershed conditions, species viability, properly functioning ecosystems, and a reduction of habitat fragmentation.

### **2.2.1.4 ALTERNATIVE D (CURRENT MANAGEMENT/NO ACTION)**

This alternative would maintain present uses by continuing present management direction and activities while abiding by all new mandates, executive orders, and directives that have been implemented since the previous RMPs were completed.

### **2.2.1.5 ALTERNATIVE E**

Alternative E gives emphasis to protection of all non-WSA lands with wilderness characteristics, including closure of these areas to mineral leasing and off-road vehicles, avoidance of rights-of-way, protection of undisturbed landscapes, and providing opportunities for primitive and semi-primitive recreation. The natural succession of ecosystems would be allowed to proceed in these and other select management areas. This alternative strongly emphasizes maintenance of watershed conditions, species viability, properly functioning ecosystems, and a reduction of habitat fragmentation. It also includes designation of ACECs and determinations for wild and scenic river suitability, while still providing for resource uses in other parts of the VFO, including mineral and energy development and motorized recreation use.

Alternative E is the same as Alternative C, except that it adds a protective management prescription to 277,596 acres of land in 25 areas that comprise non-WSA lands with wilderness characteristics. Alternative E, however, applies to all public lands within the VPA. The proposed decisions that apply to the lands outside of non-WSA lands with wilderness characteristics remain the same as those in Alternative C.

## 2.3 ALTERNATIVES AND MANAGEMENT OPTIONS CONSIDERED BUT ELIMINATED FROM DETAILED ANALYSIS

Several organizations and individuals provided components of alternatives and management actions as possible ways of resolving individual resource management issues and conflicts. However, none of the submittals addressed the BLM's purpose and need (outlined in Chapter 1) and multiple-use requirements as identified in the Federal Lands Policy and Management Act (FLPMA). These submissions were considered during alternative development; however, none provided the full range of protections required. The following alternatives and management options were considered as possible ways of resolving resource management issues and conflicts but were eliminated from detailed analysis because they were unreasonable or not practical as a result of technical, legal, regulatory, or policy issues.

### 2.3.1 NO GRAZING ALTERNATIVE

An alternative that proposes to make the entire planning area unavailable for grazing would not meet the purpose and need of this RMP/Draft EIS. The National Environmental Policy Act (NEPA) requires that agencies study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources. No issues or conflicts have been identified during this land-use planning effort which requires the complete elimination of grazing within the planning area for their resolution. Where appropriate, removal of livestock and adjustments to livestock use have been incorporated into the alternatives on an allotment or area basis to address issues identified in this planning effort. Since the BLM has considerable discretion through its grazing regulations to determine and adjust stocking levels, seasons-of-use, and grazing management activities, and to allocate forage to uses of the public lands in RMPs, the analysis of an alternative to entirely eliminate grazing is not needed.

An alternative that proposes to make the entire planning area unavailable for grazing would also be inconsistent with the intent of the Taylor Grazing Act, which directs the BLM to provide for livestock use of BLM lands; to adequately safeguard grazing privileges; to provide for the orderly use, improvement, and development of the range; and to stabilize the livestock industry dependent upon the public range. The Federal Land Policy and Management Act (FLPMA) requires that public lands be managed on a "multiple use and sustained yield basis" (FLPMA Sec. 302(a) and Sec. 102(7)) and includes livestock grazing as a principal or major use of public lands. While multiple-use does not require that all lands be used for livestock grazing, complete removal of livestock grazing on the entire planning area would be arbitrary and would not meet the principle of multiple use and sustained yield.

Livestock grazing is and has been an important use of the public lands in the planning area for many years and is a continuing government program. Although the Council on Environmental Quality (CEQ) guidelines for compliance with NEPA requires that agencies analyze the No Action Alternative in all EISs, for purposes of this NEPA analysis, the No Action Alternative is to continue the status quo, which includes livestock grazing (CEQ Forty Most Asked Questions, Question 3). For this reason and those stated above, a no grazing alternative for the entire planning area has been dismissed from further consideration in this RMP/EIS.

### **2.3.2 LIVESTOCK GRAZING ADJUSTMENTS ALTERNATIVE**

During scoping and comment on the Draft EIS, it was suggested that the BLM consider adjustments to livestock numbers, livestock management practices, and the kind of livestock grazed on allotments within the Vernal Field Office (VFO) to benefit wildlife and protect and promote land health, including soils, hydrologic cycles, and biotic integrity.

The BLM's policy regarding adjustments to the levels of livestock use authorized is to monitor and inventory range conditions under existing stocking levels and make adjustments to livestock use as indicated by this data to help assure that standards for rangeland health and resource objectives are met. Regulations at 43 CFR 4130.3 require that the terms and conditions under which livestock are authorized "ensure conformance with the provisions of subpart 4180" (Standards for Rangeland Health) and further that "livestock grazing use shall not exceed the livestock carrying capacity of the allotment." It would be inappropriate and unfeasible to estimate and allocate the available forage, design-specific management practices, and determine if changes to the kind of livestock are necessary for each allotment in the VFO or in the area as a whole in the RMP/EIS. Such changes would not be supportable considering the type and amount of data required and the analysis necessary to make such changes.

According to BLM policy decisions regarding authorized livestock use levels and the terms and conditions under which they are managed is an implementation decision (H-1610-1, Appendix C, p. 15). The BLM assesses rangeland health, conducts monitoring and inventories, and evaluates this data on a periodic basis, normally on an allotment and/or watershed basis. After NEPA analysis, necessary changes to livestock management and implementation of Guidelines for Rangeland Management on Public Lands in Utah are implemented through a proposed decision in accordance with 43 CFR 4160. These decisions determine the exact levels of use by livestock in conformance with the LUP and to meet resource objectives and maintain or enhance land health. For these reasons this alternative has been dismissed from further consideration in this LUP revision.

### **2.3.3 GREATER DINOSAUR/BOOK CLIFFS HERITAGE PLAN**

The BLM did not incorporate this plan in whole, but elements of the plan were incorporated in its action alternatives, particularly Alternatives C and E. The BLM has also incorporated several elements of this plan in its Proposed RMP/Final EIS. The Proposed RMP/Final EIS contains similar objectives in Management Common to All; they are:

- Mitigate or reduce long-term habitat fragmentation through avoidance and site-specific reclamation in order to return disturbed areas to productive levels.
- Ensure that management of native and naturalized plant species enhances and restores, and does not reduce, the biological and genetic diversity of natural ecosystems.
- Conserve and protect special status species and enhance their habitats.

### **2.3.4 NO LEASING ALTERNATIVE**

During scoping and/or the comment period for the Draft RMP/EIS, commenters suggested that the BLM should address a “No-Leasing Alternative” because the No-Leasing Alternative is the equivalent of the No Action Alternative that must be analyzed in all EISs.

The No-Leasing Alternative in an RMP revision is actually an action alternative because where lands have already been leased, the no-action for NEPA purposes continues to allow for (honor) valid existing rights. Proposing a No-Leasing Alternative would require revisiting existing leases and either buying them back from the lessee or allowing them to expire on their own terms. The first option (buying back) is outside the scope of any RMP. This is a political decision that the BLM has no authority to undertake in planning. As a result, the BLM does not regularly include a No-Leasing Alternative. The second alternative (lease expiration) would occur to some degree under any alternative.

The purpose and need for the LUP is to identify and resolve potential conflicts between competing resource uses rather than to eliminate a principle use of the public lands in the VFO Area. Leasing of the public lands for oil and gas exploration and production is required by the Mineral Leasing Act of 1920, as amended, and the BLM’s current policy is to apply the least restrictive management constraints to the principal uses of the public lands necessary to achieve resource goals and objectives. A field office-wide “No-Leasing Alternative” would be an unnecessarily restrictive alternative for mineral exploration and production on the public lands.

The National Environmental Policy Act (NEPA Section 102 [E]) requires that agencies “study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources.” No issues or conflicts have been identified during this land-use planning effort that requires the complete elimination of oil and gas leasing within the planning area for their resolution. The BLM’s Land Use Planning Handbook (BLM MANUAL Rel. 1-1693) requires that LUPs identify areas as open or unavailable for leasing.

Given the potential range of decisions available in the Draft RMP/Draft EIS, the analyzed alternatives include no leasing for certain areas; but a field office-wide No-Leasing Alternative is not necessary in order to resolve issues and protect other resource values and uses.

As mentioned above, a No-Leasing Alternative should not be confused with the No Action Alternative for purposes of NEPA compliance. Leasing and no-leasing on the public lands has previously been analyzed in several NEPA documents. In 1973, the Department of Interior published the Final EIS on the Federal Upland Oil and Gas Leasing Program (USDI, 1973). The Proposed Action was to lease federal lands for production of oil and natural gas resources. Alternatives included the No Action Alternative, which at initiation of the program was the No-Leasing Alternative. To supplement that EIS, the BLM prepared a series of environmental assessments (EAs, then referred to as environmental analysis records, or EARs), including the Vernal District Oil and Gas Program Environmental Analysis Record (EAR) of 1975, which addressed oil and gas leasing for the public lands in the VFO area. Alternatives again included the No Action or No-Leasing alternative. The outcome was a category system for leasing that

categorized all public and USFS lands into four groups: 1) open to leasing with standard lease stipulations, 2) special stipulations to address special concerns, 3) no surface occupancy, and 4) no leasing. Since completion of the EAR in 1975, oil and gas leasing in the VFO area has been an ongoing federal program under the established categories.

The CEQ (Section 1502.14[d] of NEPA) requires the alternatives analysis in an EIS to "include the alternative of no action," but explains that there are two distinct interpretations of "no action" that must be considered, depending on the nature of the proposal being evaluated. "The first situation might involve an action such as updating a land management plan where ongoing programs initiated under existing legislation and regulations will continue, even as new plans are developed. In these cases "no action" is "no change" from current management direction or level of management intensity. To construct an alternative that is based on no management at all would be a useless academic exercise. Therefore, the No Action Alternative may be thought of in terms of continuing with the present course of action until that action is changed (CEQ Forty Most Asked Questions, Question 3). Therefore, for the Vernal Draft RMP/Draft EIS and the Proposed RMP/Final EIS, the No-Action Alternative is to continue the status quo, which is to lease under the oil and gas stipulations (formerly categories) established in the Diamond Mountain RMP and the Book Cliffs RMP.

## 2.4 BRIEF SUMMARY OF THE PROPOSED RMP AND DRAFT RMP / EIS ALTERNATIVES IN TABLES 2.1.1 THROUGH 2.1.27

The major resources and uses where issues were identified during scoping were travel management, recreation, oil and gas leasing and development, special designations (ACECs and Wild and Scenic Rivers [WSR]), special status species, wildlife, and non-WSA lands with wilderness characteristics. These resources and uses, among others, are displayed under a range of management alternatives that set forth different priorities and measures to emphasize uses or resource values over other uses or resource values to achieve specific goals or objectives outlined in detail in Table 2.1.1 through 2.1.27. Below is a brief summary of the range of alternatives for those major resources and uses brought forward during scoping. Much more detail for each of these resources and uses, among others, and their proposed management is in Table 2.1.1 through 2.1.27. For ease of reference, the following list is provided:

Table Number	Table Title	Page

### 2.4.1 TRAVEL MANAGEMENT

All public lands are required to have off-highway vehicle (OHV) area designations. Areas must be classified as open, limited, or closed to motorized travel activities. Off-highway vehicle designation areas, or categories, are listed by alternative. Within the Limited category, routes would be limited to "designated roads and trails" (43 CFR Part 8340.0-5(g)). Specific routes are being designated as open to motorized use by alternative as part of implementation-level planning. Table 2.1.22 portrays how travel and access management would be designated under the Proposed RMP and each alternative.

### 2.4.2 OIL AND GAS LEASING AND DEVELOPMENT

One of the major decisions in a LUP is to determine which areas should be:

- Open to leasing subject to the terms and conditions of the standard lease form stipulations.
- Open to leasing, subject to moderate constraints such as timing limitations (TL) or controlled surface use (CSU) restrictions.
- Open to leasing subject to major constraints such as no surface occupancy (NSO) stipulations.
- Administratively unavailable to leasing (closed).

All of these proposed decisions must be consistent with the goals and objectives of other resources and uses for each alternative. Table 2.1.9 depicts how oil and gas leasing would be managed under the Proposed RMP and each alternative.

In addition, this planning revision proposes to apply the same oil and gas stipulations to all other surface-disturbing activities where they are not contrary to laws, regulations, or policy under the Proposed RMP and all of the alternatives. For example, if an area has a timing stipulation on it for oil and gas development, it would also apply that same timing stipulation on a right-of-way (ROW) construction proposal or an organized recreational event. Appendix K contains proposed stipulations for surface-disturbing activities and applicable Waivers, Exceptions, and Modifications.

### 2.4.3 SPECIAL DESIGNATIONS—POTENTIAL ACECS

A Federal Register Notice of Availability (December 2005) announced the availability of information on existing and potential ACECs considered within the Draft RMP and EIS, as required in 43 CFR 1610.7-2. The CFR also provided an associated 60-day comment period

beginning December 13, 2005. In order to be considered and carried forward into the range of alternatives for planning, an ACEC must meet the relevance and importance criteria in 43 CFR 1610.7-2(a), and must require special management. The relevance and importance criteria encompass scenery, sensitive plant species, rare plants, cultural and historic resources, wildlife, fish, natural systems, and natural hazards. Table 2.1.18 shows the numbers and acres of ACECs considered by the Proposed RMP and alternatives. Where ACECs are designated, special management attention would be directed at the relevant and important values, resources, natural systems, and/or natural hazards.

#### **2.4.4 WILD AND SCENIC RIVERS**

During planning, the BLM must assess all eligible river segments and determine which are suitable or non-suitable per Section 5(d)(1) of the Wild and Scenic Rivers Act of 1968, as amended. The VFO reviewed all river segments for WSR eligibility and suitability as part of the RMP process. The BLM Manual 8351 directs the BLM to provide tentative classifications of Wild, Scenic, or Recreational to the eligible river segments. The information considered by alternative and brought forward in the Proposed RMP is in Table 2.1.19. Where rivers are determined as suitable, protection of the outstandingly remarkable values, tentative classification, and free-flowing nature would be provided until a determination is made by Congress.

#### **2.4.5 SPECIAL STATUS SPECIES**

Land use plan decisions must be consistent with the BLM's mandate to recover listed species and must be consistent with objectives and recommended actions in approved recovery plans, conservation agreements and strategies, MOUs, and applicable biological opinions for threatened and endangered species. Currently, the VFO has one federally listed bird species (and one candidate species), two federally listed mammal species, four federally listed fish species, and six federally listed plant species (and one candidate species). The information considered by alternative and brought forward in the Proposed RMP is in Table 2.1.21. Species conservation measures (Appendix L) have been developed in coordination with the U.S. Fish and Wildlife Service (USFWS). They will be implemented under the Proposed RMP and all alternatives. In addition, there are federally listed as well as state sensitive species where TLs and CSU stipulations are applied.

The BLM will work with UDWR, USFWS, and others to ensure that plans and agreements are updated as necessary to reflect the latest scientific data.

#### **2.4.6 NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

During planning, the VFO identified decisions to protect, preserve, and maintain non-WSA lands with wilderness characteristics (naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation). There are 15 areas totaling 106,178 acres that were identified as non-WSA lands with wilderness characteristics that were

brought forward in the Proposed RMP. The total acreage considered, by alternative, is shown in Table 2.1.10.

**THIS PAGE INTENTIONALLY LEFT BLANK**

Table 2.1.1 Proposed RMP and Alternatives – Management Common to the Proposed RMP and All Alternatives

Table 2.1.1 Proposed RMP and Alternatives – Management Common to the Proposed RMP and All Alternatives					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES					
<b>INTRODUCTION</b> The Proposed RMP and all alternatives within this RMP share several goals, objectives, standards, and guidelines that ensure protection of resources and compliance with applicable laws. In order to avoid redundancy within the Proposed RMP and alternatives, these types of guidance are categorized as “Management Common to All.”					
<b>GOALS AND OBJECTIVES COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>Utah BLM Rangeland Health Standards, described below, apply to all resource programs and authorized activities:<ul style="list-style-type: none"><li>Upland soils exhibit permeability and infiltration rates that sustain or improve site productivity, considering the soil type, climate, and landform.</li><li>Riparian and wetland areas are in properly functioning condition. Stream channel morphology and functions are appropriate to soil type, climate, and landform.</li><li>Desired species, including native, threatened, endangered, and special-status species, are maintained at a level appropriate for the site and species involved.</li><li>The BLM would apply and comply with water quality standards established by the State of Utah (R317-2) and the Federal Clean Water and Safe Drinking Water Acts. Activities on BLM lands would support the designated beneficial uses described in the Utah Water Quality Standards (R317-2) for surface water and groundwater.</li></ul></li><li>Joint monitoring and evaluation strategies would be implemented by the BLM and permittees to measure progress in accordance with Utah BLM Rangeland Health Standards based on site-specific conditions. Site-specific conditions must be documented in order to warrant modification of prescriptions.</li><li>The BLM recognizes that not all activities authorized by implementation of the Proposed RMP or any of the alternatives would comply with Rangeland Health Standards. All authorized activities would require reclamation and rehabilitation actions to ensure sustainability and productivity of the site.</li><li>Assure that counties and others, such as Native American tribes whose interests might be affected have a sufficient opportunity for productive participation in the BLM's planning and resource management decision-making.</li></ul>					
<b>CLIMATE CONSIDERATIONS</b> The BLM would continue to regularly monitor and evaluate climatic and vegetative data. This data would be shared and compiled with other land managing agencies of the VPA. Using a cooperative and collaborative approach, should the analysis of such data reveal a substantial shift (either upward or downward) in both the timing and level of production of native rangelands, either planning-area-wide or on specific sites within the VPA, the BLM would initiate actions to ensure any permitted/allowed use of such resources would not adversely affect the long-term productivity of such areas.					
<b>EDUCATION, INTERPRETATION, AND RESEARCH</b> The BLM would work with its partners, including local school districts and universities to develop a variety of opportunities to promote education, research, and interpretation on public lands. -					
<b>FIRE, DROUGHT, AND NATURAL DISASTERS</b> <ul style="list-style-type: none"><li>The BLM would coordinate appropriate management responses (AMR) with affected parties where natural resources may be impacted by fire, drought, insects and diseases, or natural disasters. A variety of emergency or interim actions may be necessary to minimize land health degradations, such as reduced forage allocations; reductions in the number of livestock; wildlife; increased mitigation measures to ensure reclamation; limitations on energy field activities; and recreational uses.</li><li>Current Utah BLM Rangeland Health Standards would be incorporated, as appropriate, across all resource programs as a minimum. Management prescriptions in the form of constraints to use, terms and conditions, and stipulations may be needed to sustain rangeland health and viability. Management prescriptions would consider the following:<ul style="list-style-type: none"><li>Livestock Grazing — Use would be allowed in both quantity and timing that would not result in a downward shift in rangeland health. The BLM would work cooperatively to affect a grazing strategy specific to a grazing permittee's individual grazing allotment(s), and make changes to the grazing authorizations as appropriate within the limits of the existing permit and in accordance with the grazing regulations. In the case of drought, the last recourse for the BLM would be to temporarily close the range, or portions of it, to livestock grazing.</li><li>Off Highway/Road Vehicles (OHV) — OHV use during period of prolonged dryness would be further restricted to existing routes; or, if site-specific conditions warrant, closure to OHVs would be implemented to minimize vehicle-induced injury or damage to rangeland and/or woodlands and forest and to minimize the potential of spark caused fires.</li><li>Recreation — During periods of prolonged dryness or drought, the BLM, in cooperation with local and state fire management agencies, would limit campfires to established fire rings or fully contained fires. The last resort would be to close the public lands to campfires of any kind.</li><li>Surface-disturbing Activities — These would be closely monitored to ensure compliance with authorizations/permits, conditions of approval, or terms and conditions. Actions minimizing new surface disturbance allowed by regulations, as well as actions insuring successful reclamation, would be of paramount concern. During periods of drought, the BLM would require additional actions such as changes to standard seed mix compositions, amounts of seed, and method of application. Methods to ensure successful revegetation following disturbance may include hydromulching, installation of drip irrigators, or fencing to exclude ungulate grazing/browsing.</li><li>Wild Horse Management — Wild or feral horses will be gathered and removed. Forage allocation has been allocated until removal.</li><li>Wildlife Management — During periods of prolonged dryness or drought, to the extent that wildlife grazing ungulate populations cannot be sustained due to competition for water and available forage, the BLM would enter into discussions with the Utah Division of Wildlife Resources (UDWR) regarding herd numbers and overall management options to ensure that rangeland health is maintained and to address the effects of drought.</li></ul></li></ul>					
<b>INTEGRATED PEST MANAGEMENT</b> <ul style="list-style-type: none"><li>Appropriately manage noxious and invasive weeds and prevent introduction of new invasive species through the implementation of a comprehensive weed program per national guidance and local weed management plans, including coordination with partners; prevention and early detection; education; inventory and monitoring; and using the principles of integrated pest management.</li><li>All projects that involve ground-disturbing activities should incorporate best management practices (BMPs) for control of weeds with an emphasis on prevention.</li><li>Use of pesticides and herbicides shall comply with the applicable federal and state laws. Pesticides and herbicides shall be used only in accordance with their registered uses and within limitations imposed by the Secretary of the Interior.</li><li>Prior to the use of pesticides, project proponents shall obtain from the Authorized Officer written approval of Pesticide Use Proposal, which is a plan showing the type and quantity of material to be used; pest(s) to be controlled; method of application;</li></ul>					

Table 2.1.1 Proposed RMP and Alternatives – Management Common to the Proposed RMP and All Alternatives

Table 2.1.1 Proposed RMP and Alternatives – Management Common to the Proposed RMP and All Alternatives					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES					
location of storage and disposal of containers; and any other information deemed necessary by the Authorized Officer. Emergency use of pesticides shall be approved in writing by the Authorized Officer prior to use. In addition, within 24 hours of any pesticide application, a Pesticide Application Record must be completed. A similar procedure is required for the release of biological control agents.					
MANAGEMENT PRESCRIPTIONS					
The VPA includes a wide array of geographical landscapes and ecosystems. The expansive nature of the RMP mandates a broad scale of decision-making.					
SURFACE STIPULATIONS APPLICABLE TO ALL SURFACE-DISTURBING ACTIVITIES					
<ul style="list-style-type: none"><li>Appendix K lists by alternative surface stipulations referred to throughout the Final RMP/EIS.</li><li>Surface stipulations (including exceptions, modifications, and waivers), would be applied to all land use authorizations, permits, and leases issued on BLM-administered lands.</li></ul>					
MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ACTION ALTERNATIVES, BY RESOURCE PROGRAM					
GOALS AND OBJECTIVES					
<ul style="list-style-type: none"><li>The goals and objectives described below apply to the Proposed Plan and Action Alternatives A, B, C, and E, not to the No Action Alternative D.D.</li><li>Goals and objectives for Alternative D are contained in the 1994 Diamond Mountain RMP and the 1985 Book Cliffs RMP. Acreage figures for Alternative D may reflect different sum totals, as calculations were determined using different technology.</li></ul>					

Table 2.1.10 Proposed RMP and Alternatives – Non-WSA Lands with Wilderness Characteristics

Table 2.1.10 Proposed RMP and Alternatives – Non-WSA Lands with Wilderness Characteristics					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS					
<b>GOALS AND OBJECTIVES</b> Protect, preserve and maintain the wilderness characteristics (i.e., appearance of naturalness, outstanding opportunities for primitive and unconfined recreation or solitude) of non-WSA lands with wilderness characteristics. Manage these primitive and backcountry landscapes for their undeveloped character and provide opportunities for primitive recreational activities and experiences of solitude.					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> There are no non-WSA lands with wilderness characteristics actions common to the Proposed RMP and all alternatives.					
<ul style="list-style-type: none"><li>Approximately 106,178 acres would be managed as non-WSA lands with wilderness characteristics for the following areas: Beach Draw, Bourdette Draw, Bull Canyon, Cold Spring Mountain, Daniels Canyon, Dead Horse Pass, Diamond Breaks, Diamond Mountain, Lower Flaming Gorge, Moonshine Draw, Mountain Home, Stuntz Draw, Vivas Cake Hill, White River, and Wild Mountain.</li><li>They would be managed with the following common prescriptions:<ul style="list-style-type: none"><li>VRM Category II</li><li>Closed to oil and gas leasing, except for the White River area that would be open to leasing, subject to major constraints, (NSO).</li><li>Closed to solid mineral leasing.</li><li>Closed to disposal of mineral materials.</li><li>Closed to woodland product harvest.</li><li>Avoidance area for rights-of-way.</li><li>OHVs would be limited to designated routes, except for the upper portion of the Lower Flaming Gorge wilderness characteristics area, which would be closed.</li><li>No motorized vehicles would be allowed to travel on a single path up to 300 feet from designated routes to access a camp.</li><li>Retain public lands in federal ownership.</li></ul></li><li>When compatible with the goals and objectives for management of non-</li></ul>	No specific actions are specifically prescribed to protect the wilderness characteristics of non-WSA lands with wilderness characteristics.	Same as Alternative A.	Same as Alternative A. Table 2.1.10 Proposed RMP and Alternatives – Non-WSA Lands with Wilderness Characteristics					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS					
WSA lands with wilderness characteristics: <ul style="list-style-type: none"><li>Permit vegetation and fuel treatments using prescribed fire, mechanical and chemical treatments, and other actions compatible with the Healthy Lands Initiative (HLI).</li><li>Permit construction of wildlife water and livestock facilities, and minimal recreation facilities.</li></ul>					goals and objectives for management of non-WSA lands with wilderness characteristics: <ul style="list-style-type: none"><li>Permit vegetation and fuel treatments using prescribed fire</li><li>Permit construction of wildlife waters, livestock facilities, and minimal recreation facilities</li><li>Permit excavation of cultural resources sites.</li><li>Permit excavation of paleontological resources.</li><li>No actions would be allowed that would degrade the wilderness characteristics.</li></ul>

Table 2.1.11 Proposed RMP and Alternatives – Paleontology Resources

Table 2.1.11 Proposed RMP and Alternatives – Paleontology Resources					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
PALEONTOLOGY RESOURCES					
<b>GOALS AND OBJECTIVES</b> Locate, evaluate, and manage paleontological resources, and protect them where appropriate. Facilitate suitable scientific, educational, and recreational uses of fossils. Ensure that significant fossils are not inadvertently damaged, destroyed, or removed from public ownership as a result of surface disturbance or land exchanges. Foster public awareness and appreciation of the area's paleontological heritage.					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>Recreational collectors may collect and retain reasonable amounts of common invertebrate and plant fossils for personal, non-commercial use. Surface disturbance must be negligible, and mechanized tools may not be used.</li><li>Vertebrate fossils may be collected only under a permit issued to qualified individuals. Vertebrate fossils include bones, teeth, eggs, and other body parts of animals with backbones such as dinosaurs, fish, turtles, and mammals. Vertebrate fossils also include trace fossils, such as footprints, burrows and dung.</li><li>Fossils collected under a permit remain the property of the federal government and must be placed in a suitable repository (such as a museum or university) identified at the time of permit issuance.</li><li>Lands identified for disposal or exchange would be evaluated to determine whether such actions would remove significant fossils from federal ownership. In areas where surface disturbance, either initiated by the BLM or by other land users, may threaten significant fossils, the BLM would follow its policy (see Manual and Handbook 8270-1) to assess any threat and mitigate damage. The BLM Washington Office Instruction Memorandum No. 2008-009, Potential Fossil Yield Classification (PFYC) System for Paleontological Resources on Public Lands, dated October 15, 2007, revised the classification system of Handbook 8270-1.</li><li>The BLM would work with local communities, interest groups, individuals, and other agencies to enhance the public's understanding and enjoyment of paleontological resources.</li><li>Where scientifically significant fossils are threatened by natural hazards or unauthorized collection, the BLM would work with permittees and other partners to salvage specimens and reduce future threats to resources at risk.</li><li>Implement regular patrols as feasible to protect areas where unauthorized use may occur.</li><li>Modify the existing General Agreement between the VFO, the NPS, the Vernal Field House of Natural History, and the Friends of Paleontology Chapter to encourage protection of paleontological resources planning-area wide. The modified agreement would ensure proper storage and curation of paleontological resources and include methods to promote interpretation and education.</li></ul>					
<ul style="list-style-type: none"><li>Areas with significant fossils would be identified through predictive modeling and broad-scale sampling.</li><li>Assessment and mitigation would be required as needed in these areas.</li></ul>	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>Damage to significant fossils would be prevented through lease notices, stipulations, and other requirements.</li><li>Impacts would be mitigated in response to reports of finds</li></ul>	Same as Alternative A, but would require assessment and mitigation in all Class 4 or Class 5 areas and in Class 3 areas as needed	Assessment of fossil resources would be required on a case-by-case basis; mitigation would be required as necessary before and/or during surface disturbance.	<ul style="list-style-type: none"><li>Areas with significant fossils would be identified through predictive modeling and broad-scale sampling.</li><li>Assessment and mitigation in all Class 4 or Class 5 areas and in Class 3 areas would be applied as needed.</li></ul>
Information on fossils and collecting rules would be provided to public through websites, publications, and personal contacts.	Same as the Proposed RMP.	Same as Alternative D.	<ul style="list-style-type: none"><li>Interest groups and public land users would be contacted to provide information about fossils and appropriate uses.</li><li>Class 4 or Class 5 areas that receive high levels of development or visitor use would be identified and monitored.</li></ul>	Reports of theft or damage to fossil resources would be responded to.	Same as Alternative C.
Written and web-based information would be provided about fossils, hobby collecting, and local interpretive sites to promote visitor education.	Written and web-based information would be provided about fossils, hobby collecting, and local interpretive sites.	Same as Alternative D.	<ul style="list-style-type: none"><li>New websites and publications would be developed and maintained to promote visitor education.</li><li>The BLM would assist in development of local museum exhibits on paleontology.</li></ul>	Written information about fossils and hobby fossil collecting would be provided.	Same as Alternative C.
Paleontological Resources Use permits would be issued for scientific study, promoting or supporting investigations in poorly known areas.	Same as the Proposed RMP.	Same as Alternative D.	<ul style="list-style-type: none"><li>Paleontological Resources Use permits would be issued for scientific study, promoting or supporting investigations in poorly known areas.</li><li>The BLM would support investigations in lesser-known areas and in areas where surface disturbance is occurring or anticipated.</li></ul>	Paleontological Resource Use permits for scientific study would be issued.	Same as Alternative C.
<ul style="list-style-type: none"><li>Collection of common invertebrate and plant fossils would be allowed for personal, non-commercial use.</li><li>Areas for hobby collection would be</li></ul>	<ul style="list-style-type: none"><li>Collection of common invertebrate and plant fossils would be allowed for personal, non-commercial use.</li><li>Areas for hobby collection would be</li></ul>	Same as Alternative D.	Same as the Proposed RMP.	Collection of common invertebrate and plant fossils for personal, non-commercial use would be allowed.	Same as the Proposed RMP.

identified, publicized, and monitored. <ul style="list-style-type: none"><li>Areas with rare and significant invertebrate and plant fossils would be closed to hobby collection.</li></ul>	identified, publicized, and monitored.				
Permit excavation of fossils in non-WSA lands with wilderness characteristics, when compatible with the goals and objectives for management of the non-WSA lands with wilderness characteristics.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the current management plans.	Same as the Proposed RMP.

Table 2.1.12 Proposed RMP and Alternatives – Rangeland Improvements

Table 2.1.12 Proposed RMP and Alternatives – Rangeland Improvements					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RANGELAND IMPROVEMENTS					
<b>GOALS AND OBJECTIVES</b> Restore, maintain and/or improve rangeland conditions and productivity to maintain, meet or make substantial progress towards meeting rangeland health standards while meeting forage obligations in grazing permits and grazing preference decisions, as well as wildlife habitat.					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> Specific improvements to rangeland health would include, but are not limited to, vegetation treatments, fencing, spring development, reservoirs, guzzlers, pipelines, and wells.					
Part or all of the following measures would be implemented to meet resource objectives for habitat enhancement: <ul style="list-style-type: none"><li>Fencing (69 Miles)</li><li>Vegetation Treatment (34,640 Acres)</li></ul> Water Developments: <ul style="list-style-type: none"><li>812 Guzzlers/Reservoirs</li><li>Pipeline (38 Miles)</li><li>51 Wells/Springs</li></ul>	Same as the Proposed RMP.	Part or all of the following measures would be implemented to meet resource objectives for habitat enhancement: <ul style="list-style-type: none"><li>Fencing (369 Miles)</li><li>Vegetation Treatment (50,900 Acres)</li></ul> Water Developments: <ul style="list-style-type: none"><li>1,165 Guzzlers/Reservoirs</li><li>Pipeline (51 Miles)</li><li>78 Wells/Springs</li></ul>	Part or all of the following measures would be implemented to meet resource objectives for habitat enhancement: <ul style="list-style-type: none"><li>Fencing (129 Miles)</li><li>Vegetation Treatment (45,860 Acres)</li></ul> Water Developments: <ul style="list-style-type: none"><li>811 Guzzlers/Reservoirs</li><li>Pipeline (30 Miles)</li><li>87 Wells/Springs</li></ul>	Part or all of the following measures would be implemented to meet resource objectives for habitat enhancement: <ul style="list-style-type: none"><li>Fencing (65 Miles)</li><li>Vegetation Treatment (40,390 Acres)</li></ul> Water Developments: <ul style="list-style-type: none"><li>775 Guzzlers/Reservoirs</li><li>Pipeline (35 Miles)</li><li>74 Wells/Springs</li></ul>	Same as Alternative C.
Permit use of prescribed fire in non-WSA lands with wilderness characteristics for vegetation treatments, when compatible with the goals and objectives for management of the non-WSA lands with wilderness characteristics. Rehabilitation fire lines and other surface disturbances following completion of the burning operation.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the current management plans.	Same as the Proposed RMP.
Permit construction of rangeland improvements in non-WSA lands with wilderness characteristics, when compatible with the goals and objectives for management of the non-WSA lands with wilderness characteristics.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the current management plans.	Same as the Proposed RMP.

Table 2.1.13 Proposed RMP and Alternatives – Recreational Resources

Table 2.1.13 Proposed RMP and Alternatives – Recreational Resources					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RECREATION RESOURCES — MAP FIGURES 27 AND 28					
<p><b>GOALS AND OBJECTIVES</b></p> <ul style="list-style-type: none"><li>• Ensure the continued availability of quality outdoor recreation opportunities and experiences that are not readily available from other sources; protect the health and safety of visitors; protect natural, cultural, and other resources; encourage public enjoyment of public lands; and enhance recreational opportunities.</li><li>• Work collaboratively with affected user groups and organizations, state and local officials, and other interested parties to provide for site-specific or area-specific comprehensive integrated activity level planning.</li><li>• Assure there is a spectrum of recreation opportunities and settings through comprehensive integrated activity level planning. Such plans would include, but are not limited to the following:<ul style="list-style-type: none"><li>◦ Recreation use allocations</li><li>◦ Group size or seasonal limitations</li><li>◦ Opportunities for dispersed or organized camping, including large events</li><li>◦ Facility development</li><li>◦ Opportunities for interpretation or other signage</li><li>◦ Campfire restrictions</li><li>◦ Establish limits of acceptable change or other environmental indicators in order to provide for adaptive management</li></ul></li></ul>					
<p><b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b></p> <ul style="list-style-type: none"><li>• Continue to implement public education and environmental awareness programs such as Tread Lightly and the Leave No Trace.</li><li>• Continue to manage 1,014 acres at Pelican Lake as a Special Recreation Management Area (SRMA). The area would be open to oil and gas leasing subject to major constraints such as No Surface Occupancy (NSO) stipulations and closed to mineral materials sales.</li><li>• Manage 24,259 acres in Red Mountain-Dry Fork as a SRMA to provide for maintenance and development of OHV or non-OHV trails, minimal facilities necessary for human health and safety, watershed values, relict vegetation communities, and crucial deer and elk winter habitat. An activity plan for the SRMA would be developed to determine what areas are appropriate for day use only.</li><li>• BLM lands within Dry Fork Canyon would be closed to the shooting of firearms.</li><li>• Areas not managed as SRMAs would be managed for dispersed recreational uses that require minimum facility development.</li><li>• Special Recreation Permits (SRPs) would continue to be considered on a case-by-case basis. All proposed applications for permits would be evaluated to determine compliance with the goals and objectives of this plan.</li><li>• Motorized camping vehicles would be allowed to travel off designated routes on a single path up to 300 feet to access an existing disturbed dispersed campsite, except in non-WSA lands with wilderness characteristics and WSA lands. In designated travel route areas, an activity level plan would be used to identify areas suitable for camping that would allow motorized vehicles to travel from those designated routes. The BLM would monitor dispersed camping activities and would work with user groups to address adverse environmental conditions if warranted. If use is such that undue environmental impacts are taking place, the BLM would close and rehabilitate damaged areas. If monitoring indicates that developed camping is needed, the BLM would evaluate the viability of developed campsites.</li><li>• Where routes would remain available for motorized use within, such use could continue on a conditional basis. Use of the existing routes in the WSAs (“ways” when located within WSAs — see Glossary) could continue as long as the use of these routes does not impair wilderness suitability, as provided by the IMP (BLM 1995). If Congress designates the area as wilderness, the routes will be closed. In the interim, if use and/or non-compliance are found through monitoring efforts to impair the area’s suitability for wilderness designation, the BLM would take further action to limit use of the routes, or close them. The continued use of these routes, therefore, is based on user compliance and non-impairment of wilderness values.</li><li>• Establish signed pull-off wildlife viewing areas along the Book Cliffs Divide Ridge Road.</li><li>• Develop comprehensive activity plans for Blue Mountain, Fantasy Canyon, and Pelican Lake. These plans would address appropriate levels of use and facility development.</li><li>• Continue to implement the 1979 Green River Management Plan for Desolation and Gray Canyons to protect the Desolation Canyon National Historic Landmark within VFO and the Upper Green Recreation Management Plan to provide appropriate use levels while protecting other resources.</li><li>• The Upper Green River from Little Hole to the Colorado state line would limit all surface-disturbing activities within line of sight up to one-half mile, except within established corridors or unless related to recreational infrastructure support.</li><li>• All developed recreation sites within VFO would be closed to the shooting of firearms, closed to grazing, and all forms of surface-disturbing activities not directly related to recreation development.</li><li>• Special recreation permit holders using horses in connection with their operation within Herd Management Areas would be required to have them tested for Equine Infectious Anemia (EIA) until all wild horses have been gathered and removed from the area.</li><li>• Special recreation permit holders using horses from out of state would be required to test them for EIA per state law.</li><li>• If cave resources are identified on public lands, then the VFO would develop a cave management plan that results in appropriate management to protect them from damage.</li><li>• Maintain or expand infrastructure of all recreational sites, including, but not limited to, cabins, restrooms, campsites, and trail head development and ensure their safety for public use.</li><li>• Stabilize and preserve Chipeta, Moonshine, Rat Hole, and Trujillo cabins.</li><li>• Mountain bike use would be limited to designated roads and trails.</li></ul> <p><b>BLM RECREATION GUIDELINES</b></p> <p>The following recreation management guidelines were developed to help achieve and maintain healthy public lands as defined by the Rangeland Health Standards. They are listed below with the standard that they apply to.</p> <p><u>Light and Sound</u></p> <p>BLM-contracted fixed wing and helicopter aircraft would not be authorized to fly over Dinosaur National Monument unless warranted by an emergency situation or approved in advance.</p>					

Table 2.1.13 Proposed RMP and Alternatives – Recreational Resources

BROWN'S PARK					
<ul style="list-style-type: none"><li>Brown's Park (18,490 acres) would continue to have an SRMA designation that would provide for outstanding scenic, riparian, fisheries, special status species resource values, water quality, water based recreation, wildlife viewing opportunities, hunting, comprehensive trail system for hiking, biking, horseback riding, and OHV use, camping, cultural and historic interpretation and facility development.</li></ul> <p><b>Note:</b> Acreage figures for the Proposed RMP may reflect different sum totals, as calculations were determined using different technology.</p>	<ul style="list-style-type: none"><li>Brown's Park (52,720 acres) would be managed as a SRMA to provide for outstanding scenic vistas and enhancement of resources and associated activities such as, riparian, fisheries, special status species, water quality, water-based recreation, hunting, comprehensive trail system for hiking, biking, horseback riding, and OHV use, camping, cultural and historic interpretation and facility development.</li><li>The south side of the river between Little Hole and Fire Flat extending around the Taylor Flat subdivision to Rye Grass Draw in the east would be managed for primitive recreation values, VRM I, and closed to surface-disturbing activities, except for activities that complement recreation values.</li><li>The area would be closed to OHV use.</li><li>The historic wagon route in Sears Canyon would be evaluated and analyzed along with other routes (i.e., Crouse Canyon and Rye Grass), to determine if an opportunity exists to provide a loop route for OHV use.</li></ul>	Same as Alternative D.	Same as Alternative A.	Brown's Park (17,000 acres) would continue to have an SRMA designation that would provide for outstanding scenic, riparian, fisheries, special status species resource values, water quality, water based recreation, hunting, comprehensive trail system for hiking, biking, horseback riding, and OHV use, camping, cultural and historic interpretation and facility development.	<ul style="list-style-type: none"><li>Brown's Park (52,720 acres) would be managed as a SRMA to provide for outstanding scenic vistas and enhancement of resources and associated activities such as, riparian, fisheries, special status species, water quality, water-based recreation, hunting, comprehensive trail system for hiking, biking, horseback riding, and OHV use, camping, cultural and historic interpretation and facility development.</li><li>The south side of the river between Little Hole and Fire Flat extending around the Taylor Flat subdivision to Rye Grass Draw and in the east would be managed for primitive recreation values, VRM I, and closed to surface-disturbing activities, except for activities that complement recreation values.</li><li>The area would be closed to OHV use.</li><li>The historic wagon route in Sears Canyon would be evaluated and analyzed along with other routes (i.e., Crouse Canyon and Rye Grass), to determine if an opportunity exists to provide a loop route for OHV use.</li><li>Non-WSA lands with wilderness characteristics in the SRMA would be managed for primitive and non-motorized/non-mechanized forms of recreation, and the settings required to support those types of activities and experiences.</li></ul>
FANTASY CANYON					
<ul style="list-style-type: none"><li>Fantasy Canyon (69 acres) would be managed as an SRMA.</li><li>An activity management plan would be developed and implemented consistent with overall management objectives.</li><li>In the recreation portion of the plan,</li></ul>	An activity management plan would be prepared for Fantasy Canyon (69 acres) to protect the unique geological formations and to address health and human safety consideration.	Fantasy Canyon would not be managed as an SRMA nor have an activity management plan prepared for it.	Fantasy Canyon (69 acres) would be managed as a SRMA to provide for the following uses: guided or self-guided tours, hiking, and interpretation.	Unspecified in the current management plans.	Same as Alternative C.

Table 2.1.14 Proposed RMP and Alternatives – Recreation: Special Recreation Management Areas

Table 2.1.14 Proposed RMP and Alternatives – Recreation: Special Recreation Management Areas					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RECREATION — SPECIAL RECREATION MANAGEMENT AREAS (SRMA)					
the following uses would be emphasized: protection of the unique geological formations, health and human safety considerations, guided or self-guided tours, hiking, and interpretation.					
NINE MILE CANYON					
Nine Mile Canyon (44,168 acres) would continue to have an SRMA designation and recreational opportunities would be managed to protect high-value cultural resources and scenic vistas.  <b>Note:</b> Acreage figures for the Proposed RMP may reflect different sum totals, as calculations were determined using different technology.	Nine Mile Canyon (81,168 acres) would be managed as a SRMA to protect high-value cultural resources and scenic vistas.	Same as Alternative D.	Same as Alternative A	Nine Mile Canyon (44,181 acres) would continue to have an SRMA designation and recreational opportunities would be managed to protect high-value cultural resources and scenic vistas.	<ul style="list-style-type: none"><li>Nine Mile Canyon (81,168 acres) would be managed as a SRMA to protect high-value cultural resources and scenic vistas.</li><li>Non-WSA lands with wilderness characteristics in the SRMA would be managed for primitive and non-motorized/non-mechanized forms of recreation, and the settings required to support those types of activities and experiences.</li></ul>
WHITE RIVER					
<ul style="list-style-type: none"><li>The White River (2,831 acres) would be managed as an SRMA from where the river exits the White River non-WSA land with wilderness characteristics and to where the river leaves Section 18, T10S, R23E.</li><li>An integrated activity plan would be developed and implemented consistent with overall management objectives.</li><li>Recreational activities would be identified in the activity plan. These activities would include but are not limited to canoeing, rafting, primitive camping, and hiking.</li><li>NSO would be within line of sight from the centerline, up to one-half mile either side of the river from where the river enters Section 28, T10S, R23E, to where it leaves Section 18, T10S, R23.</li></ul>	<ul style="list-style-type: none"><li>24,183 acres along the White River from where the river enters Section 12, T10S, R24E, to where it leaves Section 18, T10S, R23E, would be managed as a Special Recreation Management Area (SRMA).</li><li>An integrated activity plan would be developed and implemented.</li><li>In the recreational portion of the plan, some of the following uses would be provided for canoeing, rafting, camping, wildlife viewing, hunting, fishing, historic interpretation, and day hiking. (This would not exclude other recreational opportunities.)</li></ul>	Same as Alternative D.	<ul style="list-style-type: none"><li>The White River (47,130 acres) would be managed as an SRMA along the White River from where the river enters Utah to the reservation boundary.</li><li>An integrated activity plan would be developed and implemented consistent with overall management objectives.</li><li>In the recreational portion of the plan, some of the following uses would be provided for canoeing, rafting, camping, wildlife viewing, hunting, fishing, historic interpretation, and day hiking. (This would not exclude other recreational opportunities.)</li></ul>	Recreational use with minimal management oversight would continue to be provided for.	Same as Alternative C except the non-WSA lands with wilderness characteristics in the SRMA would be managed for primitive and non-motorized/non-mechanized forms of recreation, and the settings required to support those types of activities and experiences.

Table 2.1.15 Proposed RMP and Alternatives – Recreation: Trail Maintenance and Development

Table 2.1.15 Proposed RMP and Alternatives – Recreation: Trail Maintenance and Development					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RECREATION — TRAIL MAINTENANCE AND DEVELOPMENT					
Up to 400 miles of hiking, horseback riding, and mechanized (non-motorized) trails would be signed, improved, and/or developed in the following areas: Bitter Creek, Boulevard Ridge, Burnt Timber Canyon, Centennial Book Cliffs Trail, Chipeta Canyon, Daniels Canyon, Devils Hole, Green River, Dry Fork, Ely/Rainbow Park, Home Mountain, Little Mountain, Nine Mile, Rat Hole Canyon, Spitzenberg/Warren Ridge, Taylor Canyon, Westwater Point, Willow Creek, Yellow Pine, other additional trails.	Same as the Proposed RMP.	Hiking, horseback riding, and mechanized (non-motorized) trails would not be developed.	Same as the Proposed RMP.	About 55 miles of hiking and/or horseback trails would be developed in the following areas: <ul style="list-style-type: none"><li>Ashley Creek, Beaver, Green River, Nine Mile, Willow, other places in the resource area.</li><li>Approximately 2 miles of mountain bicycle trails would be established using existing rural road and trails.</li><li>A non-motorized trail along Sears Canyon would be established.</li></ul>	<ul style="list-style-type: none"><li>Up to 400 miles of hiking, horseback riding, and mechanized (non-motorized) trails would be signed, improved, and/or developed in the following areas:<ul style="list-style-type: none"><li>Bitter Creek, Boulevard Ridge, Burnt Timber Canyon, Centennial Book Cliffs Trail, Chipeta Canyon</li><li>Daniels Canyon, Devils Hole</li><li>Green River, Dry Fork, Ely/Rainbow Park, Home Mountain, Little Mountain, Nine Mile, Rat Hole Canyon, Spitzenberg/Warren Ridge, Taylor Canyon, Westwater Point, Willow Creek, Yellow Pine, other additional trails</li></ul></li><li>Where these trail projects cross non-WSA lands with wilderness characteristics, uses would be limited to primitive and non-mechanized form of recreation, and the settings required to supports those activities and experiences.</li></ul>
Up to 800 miles of motorized routes would be signed, improved, and/or developed.	Same as the Proposed RMP.	Same as the Proposed RMP.	Up to 800 miles of motorized routes would not be improved and/or developed.	The Red Mountain trail would be managed and maintained as a motorized trail.	Same as Alternative C.
OHV use for big game retrieval off designated routes would not be allowed.	Same as the Proposed RMP.	Big game retrieval off designated routes would be allowed within 24 hours after a tag has been punched. (Limited to one vehicle).	Same as the Proposed RMP.	Unspecified in the current management plans.	<ul style="list-style-type: none"><li>OHV use for big game retrieval off designated routes would not be allowed.</li><li>In WSAs and non-WSA lands with wilderness characteristics, there would be no off-road motorized access to dispersed campsites.</li></ul>
<ul style="list-style-type: none"><li>The BLM would work in conjunction with the National Park Service to minimize noise and light pollution adjacent to Dinosaur National Monument using best available technology.</li><li>Movement of operations to mitigate sound and light impacts would be required to be at least 200 meters from the Monument boundary unless otherwise designated by oil and gas leasing constraint or a determination is made that natural barriers or view sheds would meet these mitigation objectives.</li></ul>	<ul style="list-style-type: none"><li>The BLM would work in conjunction with the National Park Service to minimize noise and light pollution adjacent to Dinosaur National Monument using best available technology, such as installation of multi-cylinder pumps, hospital sound-reducing mufflers, and placement of exhaust systems to direct noise away from the monument.</li><li>There would be a requirement to reduce light pollution by using methods such as limiting height of light poles, timing of lighting</li></ul>	<ul style="list-style-type: none"><li>Same as Alternative A.</li></ul>	<ul style="list-style-type: none"><li>The BLM would work in conjunction with the National Park Service to minimize noise and light pollution adjacent to Dinosaur National Monument using best available technology, such as installation of multi-cylinder pumps, hospital sound-reducing mufflers, and placement of exhaust systems to direct noise away from the monument.</li><li>There would be a requirement to reduce light pollution by using methods such as limiting height of light poles, timing of lighting</li></ul>	Unspecified in the current management plans.	<ul style="list-style-type: none"><li>The BLM would work in conjunction with the National Park Service and energy companies to minimize noise and light pollution adjacent to Dinosaur National Monument using best available technology, such as installation of multi-cylinder pumps, hospital sound-reducing mufflers, and placement of exhaust systems to direct noise away from the monument.</li><li>There would be a requirement to reduce light pollution by using methods such as limiting height of light poles, timing of lighting</li></ul>

RECREATION — TRAIL MAINTENANCE AND DEVELOPMENT					
	<p>operations (meaning limiting lighting to times of darkness associated with drilling and work over or maintenance operations), limiting wattage intensity, and constructing light shields.</p> <ul style="list-style-type: none"><li>• Movement of operations to mitigate sound and light impacts would be required to be at least 200 meters from the Monument boundary for VRM Classes II, III, and IV, unless otherwise designated by oil and gas leasing constraint or a determination is made that natural barriers for view sheds would meet these mitigation objectives.</li></ul>		<p>operations (meaning limiting lighting to times of darkness associated with drilling and work over or maintenance operations), limiting wattage intensity, and constructing light shields.</p> <ul style="list-style-type: none"><li>• Lands would be open to oil and gas leasing, subject to major constraints such as No Surface Occupancy (NSO) for one-half mile from the monument boundary.</li><li>• VRM Class designations would be I, II, and III.</li></ul>		<p>operations (meaning limiting lighting to times of darkness associated with drilling and work over or maintenance operations), limiting wattage intensity, and constructing light shields.</p> <ul style="list-style-type: none"><li>• Lands would be open to oil and gas leasing, subject to major constraints such as No Surface Occupancy (NSO) for one-half mile from the monument boundary.</li><li>• VRM Class designations would be I, II, and III.</li><li>• Non-WSA lands with wilderness characteristics contiguous to Dinosaur National Monument and the Moonshine Draw WSA would be managed as VRM I, and closed to mineral leasing, OHV use and biking.</li></ul>

Table 2.1.16 Proposed RMP and Alternatives – Riparian Resources

Table 2.1.16 Proposed RMP and Alternatives – Riparian Resources					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RIPARIAN RESOURCES					
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>Maintain, restore, improve, protect, and expand riparian-wetland areas so they are in Proper Functioning Condition (PFC) and meet Utah Rangeland Health Standards for their productivity, biological diversity, and sustainability, and achieve an advanced (late-climax seral stage) ecological status, except where resource management would require an earlier ecological status for such purposes as vegetation diversity.</li><li>PFC is the minimum acceptable riparian goal. However, PFC may not provide the streamside and aquatic conditions to meet goals for other resources. These include, but are not limited to, fisheries habitat, migratory bird habitat, unique recreational values, and/or forage. Specific objectives and management actions such as those stated below would be implemented in order to meet riparian goals.<ul style="list-style-type: none"><li>Maintain the natural configuration of all streams.</li><li>Stream bank damage caused by livestock would be less than 10% of a stream segment within an allotment/pasture.</li><li>Site-specific plans, where appropriate, would be prepared in collaboration with affected livestock operators, the UDWR, the Central Utah Water Conservancy Districts, and other interested parties, agencies, or organizations to identify desired plant communities, establish specific management objectives, and recommend practices to be employed to achieve desired results.</li><li>Monitoring and evaluation strategies would be implemented to measure progress in accordance with Utah’s Rangeland Health Standards and Guidelines for Grazing Management.</li></ul></li><li>Certain situations may occur that would allow the BLM to modify specific grazing objectives set forth in this plan.</li></ul>					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>Appropriate management actions to meet riparian objectives could include fencing, herding, change of livestock class, temporary closures, and/or change of season.</li><li>Allow no new surface-disturbing activities within active flood plains, public water reserves, or 100 meters of riparian areas unless:<ul style="list-style-type: none"><li>There are no practical alternatives.</li><li>Impacts would be fully mitigated.</li><li>The action was designed to enhance the riparian resources.</li></ul></li><li>Acquire and expand riparian-wetland areas through exchange, donation, or purchase as opportunities arise.</li><li>Restore and/or re-establish cottonwood, willow, and other riparian species along major riparian and other wetland areas.</li><li>Development of springs and seeps to improve livestock and wildlife distribution would be designed and constructed to protect ecological processes and functions.</li><li>Restrict or mitigate those surface-disturbing activities that would adversely affect wetlands.</li><li>Adjust livestock management practices on riparian areas that do not satisfactorily respond to improved grazing management after all other options have been pursued.</li><li>Where feasible, fence spring sources and any other areas that may need special protection (such as amphibian ecosystems) on a site-by-site basis.</li><li>The following mitigation measures would be included as applicable:<ul style="list-style-type: none"><li>Keep construction of all new stream crossings to a minimum. Stream crossings with culverts would be designed and constructed to allow fish passage, where needed. All stream crossings would be designed and constructed to keep impacts to riparian and aquatic habitat to a minimum.</li><li>Relocate existing routes out of riparian areas where feasible or necessary to restore watershed and riparian stability.</li></ul></li><li>As identified in the preliminary riparian inventory, maintain 295 miles and 3,674 acres of riparian areas currently in proper functioning condition. Improve 133 miles and 1,452 acres functioning at risk and 79 miles and 1,213 acres not in properly functioning condition. <b>Note:</b> These are preliminary numbers and they may change as the inventory is completed.</li></ul>					
The following management strategies would be employed in riparian areas that are not achieving proper functioning condition: <ul style="list-style-type: none"><li>Key streamside herbaceous riparian vegetation, where stream bank stability is dependent upon it, would have a minimum stubble height at the end of the growing season capable of trapping and assuring retention of sediment during high flows</li><li>Management actions could be based on residual stubble height or utilization of current year's growth at the end of the growing season.</li><li>An initial management action would</li></ul>	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	<ul style="list-style-type: none"><li><b>Diamond Mountain:</b> Where grazing is allowed on riparian areas, the objective would be to maintain an average minimum herbage stubble height of 3 inches after livestock grazing in order to provide sufficient herbaceous biomass to meet requirements of plant, vigor, maintenance, bank protection, and sediment entrapment.</li><li><b>Book Cliffs:</b> Unspecified in the current management plan.</li></ul>	Same as the Proposed RMP.

Table 2.1.16 Proposed RMP and Alternatives – Riparian Resources

Table 2.1.16 Proposed RMP and Alternatives – Riparian Resources

PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RIPARIAN RESOURCES					
<p>be to set a stubble height of 4 inches or 30% utilization on key species if riparian conditions in that reach are to be maintained and 6 inches or &lt;20% utilization if riparian conditions need to be improved.</p> <ul style="list-style-type: none"><li>This initial stubble height or utilization level would need to be monitored to verify if it provides for maintenance or improvement objectives, with adjustments in allowable utilization or stubble height being made as needed.</li></ul>					
<ul style="list-style-type: none"><li>Key herbaceous riparian vegetation in riparian areas, other than the stream banks, would not be grazed more than would allow for trapping and retention of sediment during high water events.</li><li>Management actions would be based on residual stubble height or utilization of current year's growth at the end of the growing season.</li><li>An initial management action that has been shown to obtain riparian goals is to set a stubble height of 4 inches or 30% utilization if riparian conditions in that reach are to be maintained and 6 inches or &lt;20% utilization if riparian conditions need to be improved.</li><li>This initial stubble height or utilization level would need to be monitored to verify if it provides for maintenance or improvement objectives, with adjustments in allowable utilization or stubble height being made as needed.</li></ul>	Same as the Proposed RMP.	Key herbaceous riparian vegetation in riparian areas, other than the stream banks, would not be grazed more than 50% during the growing season, or 60% during the dormant season.	Same as the Proposed RMP.	<ul style="list-style-type: none"><li><b>Diamond Mountain:</b><ul style="list-style-type: none"><li>Where grazing is allowed on riparian areas, the objective would be to maintain an average minimum herbage stubble height of 3 inches after livestock grazing in order to provide sufficient herbaceous biomass to meet requirements of plant, vigor, maintenance, bank protection, and sediment entrapment.</li></ul></li><li><b>Book Cliffs:</b><ul style="list-style-type: none"><li>Unspecified.</li></ul></li></ul>	Same as the Proposed RMP.
<ul style="list-style-type: none"><li>Key riparian woody vegetation would not be browsed more than allows for the adequate recruitment to maintain or recover the woody component. Specifically, more plants in the combined sprout and young categories would be managed for than in the combined mature and dead categories.</li><li>Management action would be based on utilization of the current annual twig growth that is within reach of the animals.</li></ul>	Same as the Proposed RMP.	Key riparian woody vegetation would not be used more than 50% of the current annual twig growth that is within reach of the animals.	Same as the Proposed RMP.	Unspecified in the current management plans.	Same as the Proposed RMP.

Table 2.1.16 Proposed RMP and Alternatives – Riparian Resources					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RIPARIAN RESOURCES					
<ul style="list-style-type: none"><li>An initial management action that has been shown to obtain riparian goals is to set a woody vegetation utilization level of 30%.</li><li>The specific utilization would need to be monitored to verify if it provides for maintenance or improvement objectives, with adjustments in allowable utilization being made as needed.</li></ul>					

Table 2.1.17 Proposed RMP and Alternatives – Soils and Water Resources

Table 2.1.17 Proposed RMP and Alternatives – Soil and Water Resources

PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SOIL AND WATER RESOURCES					
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>Eliminate or reduce discharge of pollutants into surface waters and achieve water quality that provides protection and propagation of fish, amphibians, wildlife, livestock, and recreation in and on the water. Implement BMPs, as applicable, adopted by UDEQ to limit surface discharges into water. Implement BMPs, as applicable, adopted by Utah Division of Environmental Quality (“DEQ”) to limit surface discharges into water.</li><li>Restore and maintain the chemical, physical and biological integrity of the area’s waters as required by the State of Utah’s and EPA’s water quality standards.</li><li>Restore and maintain soil quality and long-term productivity through the implementation of applicable BMPs, guidelines for rangeland health and other soil protection measures.</li><li>Reduce salinity loading where possible to accomplish the goals outlined in the Colorado River Basin Salinity Control Act.</li><li>Pipeline crossings of perennial, intermittent, and ephemeral stream channels should be constructed to withstand 100-year floods to prevent breakage and subsequent accidental contamination of runoff during high flow events. Design pipeline crossings through riparian areas and across stream channels to minimize impacts to these resources. Guidance may be updated over the life of the plan, but current technical guidance can be found in BLM Technical Note 423: Hydraulic Considerations of Pipelines Crossing Stream Channels (Fogg 2007), which as of April 2008, was available at <a href="ftp://ftp.blm.gov/pub/nstc/TechNotes/TechNote423.pdf">ftp://ftp.blm.gov/pub/nstc/TechNotes/TechNote423.pdf</a>. Specific recommendations regarding surface and subsurface crossings are found in Guidance for Pipeline Crossings (See Appendix B).</li><li>VFO would operate under the unified policy to protect water quality and aquatic ecosystems on federal lands (Unified Federal Policy for a Watershed Approach to Federal Land and Resource Management). This policy guides protection of water quality and aquatic ecosystem health through the reduction of polluted runoff, the improvement of natural resources stewardship, and an increase in public involvement in watershed management on federal lands.</li></ul>					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>Collaborate with the USFS, state, counties, Native American tribes, and the Division of Water Rights when possible to protect and enhance priority watersheds.</li><li>Cooperate with states and Native American tribes to review processes for issuing and renewing use authorizations and licenses when these uses/licenses may affect watershed condition and water quality. Revise these processes if necessary to ensure that they address watershed protection, improvement, and monitoring and water quality compliance needs.</li><li>Continue partnership with State of Utah, Daggett County, UDWR, USFS, Wyoming Fish and Game, and Rock Springs BLM to develop a watershed activity plan for Red Creek in Daggett County.</li><li>Restore and protect water quality and severe and critical erosion areas by restricting or mitigating surface disturbance.</li><li>Comply with standards identified in “The Surface Operating Standards for Oil and Gas Exploration and Development” (Gold Book) unless otherwise specified in the plan.</li><li>The BLM would adhere to criteria outlined in the Colorado River Salinity Control Act.</li><li>The BLM implements multiple types of water uses on public lands that require water rights from the State of Utah, such as livestock watering, wildlife watering and habitat, wild horse watering, recreation facilities, and fire suppression. The BLM will continue to implement actions to maintain its current water rights for these purposes, such as filing proofs of beneficial use, filing diligence claims, changing existing water rights to fit new uses and projects, and filing protests as necessary to protect existing BLM water rights. The BLM will also file for new water rights in accordance with and when allowed under state water law procedures. Situations in which the BLM will file for new water rights include locations where existing water rights are insufficient or not in place to support the water use, or when existing water rights cannot be changed to support the water use on public land.</li><li>Work in partnership with the State of Utah and others to reduce potential effects of selenium loading on the Ouray National Wildlife Refuge and Pariette Wetlands.</li><li>Ensure the physical presence and legal availability of water on public lands. Ensure that those waters meet or exceed established federal and state water quality standards for specific uses, and mitigate activities to prevent water quality and watershed degradation.</li><li>Reduce sediment and salinity production on important watersheds and critical soils through intensive management and construction measures to reduce water degradation of the Green River, White River, and their tributaries.</li><li>The State of Utah’s Non-Point Source Management Plan would be used as a standard to reduce potential non-point source of pollution impacts. Coordinate with the Utah Division of Water Quality as needed.</li><li>On a case-by-case basis, major water developments would be permitted if they are consistent with the plan.</li></ul> <b>BIOLOGICAL SOIL CRUSTS</b> <ul style="list-style-type: none"><li>Measures would be taken to identify and avoid biological soil crust areas when possible by considering the following factors: disturbance type, intensity, timing, frequency, duration, or event. Monitor on-going investigations regarding the values of biological soil crusts and relationships of other ecosystem parameters.</li><li>Specific activities that would include biological crust considerations would be prescribed fire, post-fire management, invasive weed control, energy development, grazing, OHV use, and range improvement projects. Biological crusts will be considered along with all other resource values in site-specific NEPA analyses.</li></ul>					
<ul style="list-style-type: none"><li>The “Surface Operating Standards for Oil and Gas Exploration and Development” (Gold Book), would be used as a guide for surface-disturbing proposals on steep slopes/hillsides.</li><li>Specific to oil and gas activities, steep hillsides should be avoided in the construction of routes, pipelines, and flowlines.</li><li>If surface-disturbing activities cannot be avoided on slopes 21-40%, an approved plan would be required prior to construction and maintenance that would include:</li></ul>	<ul style="list-style-type: none"><li>Same as the Proposed RMP.</li></ul>	<ul style="list-style-type: none"><li>The “Surface Operating Standards for Oil and Gas Exploration and Development” (Gold Book), would be used as a guide for surface-disturbing proposals on steep slopes/hillsides.</li><li>Specific to oil and gas activities, steep hillsides should be avoided in the construction of routes, pipelines, and flowlines.</li><li>If surface-disturbing activities cannot be avoided on slopes greater than 20%, an approved plan would be required prior to construction and maintenance that would include:</li></ul>	<ul style="list-style-type: none"><li>The “Surface Operating Standards for Oil and Gas Exploration and Development” (Gold Book), would be used as a guide for surface-disturbing proposals on steep slopes/hillsides.</li><li>Specific to oil and gas activities, steep hillsides should be avoided in the construction of routes, pipelines, and flowlines.</li><li>If surface-disturbing activities cannot be avoided on slopes 21-40%, an approved plan would be required prior to construction and maintenance that would include:</li></ul>	For minerals only, no occupancy or other surface disturbance would be allowed on slopes in excess of 40%.	Same as Alternative C.

Table 2.1.19 Proposed RMP and Alternatives – Special Designations: Wild and Scenic Rivers

Table 2.1.19 Proposed RMP and Alternatives – Special Designations: Wild and Scenic Rivers (WSRs)					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SPECIAL DESIGNATIONS — WILD AND SCENIC RIVERS (WSR)					
<b>GOALS AND OBJECTIVES</b> Determine eligibility and suitability for designation into the National Wild and Scenic River System.					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>Continue to manage previously recommended segments of the Upper Green and Lower Green Rivers to protect their outstandingly remarkable values and the tentative scenic classification until such time that a designation decision is made.</li><li>New river segments found suitable and recommended for designation would be managed in accordance with the Wild and Scenic River Act to prevent impairment of outstandingly remarkable values within line of sight up to one-quarter mile from high water mark on each side of the river not to exceed 320 acres per mile (see Appendix C for classifications).</li><li>The BLM would work with the State of Utah, local and tribal governments, and other federal agencies, in a statewide study, to reach consensus regarding recommendations to Congress for the inclusion of rivers in the National Wild and Scenic Rivers System. Besides applying consistent criteria across agency jurisdictions, the joint study would avoid subdividing of river segments in logical watershed units in the state. The study would evaluate, in detail, the possible benefits and effects of designation on the local and state economies, agricultural and industrial operations and interests, outdoor recreation, natural resources (including the outstandingly remarkable values for which the river was deemed suitable), water rights, water quality, water resource planning, and access to and across river corridors within, and upstream and downstream from the proposed segments(s). Actual designation of river segments would only occur through congressional action or as a result of Secretarial decision at the request of the Governor in accordance with provisions of the Wild and Scenic Rivers Act (the Act). The BLM will work with the state, local, and tribal governments, and the agencies involved to coordinate its decision making on wild and scenic river issues and to achieve consistency wherever possible.</li></ul> <p>The BLM recognizes that water resources on most river and stream segments within the State of Utah are already fully allocated. Before stream segments that have been recommended as suitable under this Proposed RMP are recommended to Congress for designation, the BLM will continue to work with affected local, state, federal, and tribal partners to identify in-stream flows necessary to meet critical resource needs, including values related to the subject segments(s). Such quantifications would be included in any recommendation for designation. The BLM would then seek to jointly promote innovative strategies, community-based planning, and voluntary agreements with water users, under state law, to address those needs.</p> <p>Should designations occur on any river segment as a result of Secretarial or congressional action, existing rights, privileges, and contracts would be protected. Under Section 12 of the Act, termination of such rights, privileges, and contracts may happen only with the consent of the affected non-federal party. A determination by the BLM of eligibility and suitability for the inclusion of rivers on public lands to the Wild and Scenic Rivers System does not create new water rights for the BLM. Federal reserved water rights for new components of the Wild and Scenic Rivers System are established at the discretion of Congress. If water is reserved by Congress when a river component is added to the Wild and Scenic Rivers System, it would come from water that is not appropriated at the time of designation, in the amount necessary to protect features that led to the river's inclusion into the system. The BLM's intent would be to leave existing water rights undisturbed and to recognize the lawful rights of private, municipal, and state entities to manage water resources under state law to meet the needs of the community. Federal law, including Section 13 of the Act and the McCarren Amendment (43 U.S.C. 666), recognizes state jurisdiction over water allocation in designated streams. Thus, it is the BLM's position that existing water rights, including flows apportioned to the State of Utah interstate agreements and compacts, including the Upper Colorado River Compact, and developments of such rights would not be affected by designation or the creation of the possible federal reserved water right. The BLM would seek to work with upstream and downstream water users and applicable agencies to ensure that water flows are maintained at a level sufficient to sustain the values for which affected river segments were designated.</p>					
UPPER GREEN RIVER					
The segment from Little Hole to the Utah state line would continue to be managed as previously recommended as a suitable scenic segment to protect its outstandingly remarkable values. Management would include: <ul style="list-style-type: none"><li>Oil and Gas Leasing – Closed and NSO</li><li>Mineral Materials – Closed</li><li>OHV – Closed and limited to designated routes.</li><li>VRM – Class II</li></ul>	The segment from Little Hole to the Utah state line would continue to be managed as previously recommended as a suitable scenic segment to protect its outstandingly remarkable values. Table 2.1.2 Proposed RMP and Alternatives – Abandoned Mine Lands

Table 2.1.2 Proposed RMP and Alternatives – Abandoned Mine Lands					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
ABANDONED MINE LANDS					
<p><b>GOALS AND OBJECTIVES</b></p> <ul style="list-style-type: none"><li>• In conformance with the BLM’s long-term strategies and National Policies regarding Abandoned Mine Lands (AML), this RMP recognizes the need to work with our partners toward identifying and addressing physical safety and environmental hazards at all AML sites on public lands. In order to accomplish this long-term goal, the following criteria would be established to assist in determining priorities for site and area mitigation and reclamation.</li><li>• The criteria that would be used to establish physical safety hazard program priorities are:<ul style="list-style-type: none"><li>◦ AML physical safety program’s highest priority would be the cleaning up of those AML sites where (a) a death or injury has occurred, (b) the site is situated on or in immediate proximity to developed recreation sites and areas with high visitor use, and (c) upon formal risk assessment, a high or extremely high risk level is indicated.</li><li>◦ AML would be factored into future recreation management area designations, land-use planning assessments, and all applicable use authorizations.</li><li>◦ The site is presently listed or is eligible for listing in the Abandoned Mine Land Inventory System (AMLIS).</li><li>◦ AML hazards should be, to the extent practicable, mitigated or remediated on the ground during site development.</li></ul></li><li>• The criteria used to establish water-quality-based AML program priorities are:<ul style="list-style-type: none"><li>◦ The state has identified the watershed as a priority based on (a) one or more water laws or regulations; (b) threat to public health or safety; and (c) threat to the environment.</li><li>◦ The project reflects a collaborative effort with other land managing agencies.</li><li>◦ The project would be funded by contributions from collaborating agencies.</li></ul></li><li>• These priorities would be maintained and updated as needed in the state AML strategy.</li><li>• The BLM Utah State Office would continue to consult and collaboratively work together with the State of Utah Division of Oil, Gas and Mining (UDOGM) concerning the Abandoned Mine Land program.</li></ul>					

Table 2.1.20 Proposed RMP and Alternatives – Special Designations: Wilderness Study Areas

Table 2.1.20 Proposed RMP and Alternatives – Special Designations: Wilderness Study Areas (WSAs)					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SPECIAL DESIGNATIONS — WILDERNESS STUDY AREAS (WSA)					
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>Preserve the wilderness character of Wilderness Study Areas (WSAs) until Congress designates them or releases them.</li><li>Manage the existing WSAs listed below (53,058 acres) as directed in the Interim Management Policy (IMP) for Lands under Wilderness Review (H-8550-1) in a manner that does not impair their suitability for designation as wilderness. Allow temporary uses that create no new surface disturbance nor involve permanent placement of structures. Temporary, non-disturbing activities, as well as activities governed by valid existing rights, may generally continue in WSAs.<ul style="list-style-type: none"><li>Book Cliffs Mountain Browse Natural Area (400 acres)</li><li>Bull Canyon (600 acres)</li><li>Daniels Canyon (2,496 acres)</li><li>Diamond Breaks (3,900 acres)</li><li>West Cold Springs (3,200 acres)</li><li>Winter Ridge (42,462 acres)</li></ul></li></ul>					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES (INCLUDING THE NO ACTION ALTERNATIVE)ALTERNATIVE)</b> <ul style="list-style-type: none"><li>WSAs are right-of-way exclusion areas.</li><li>WSAs are closed to oil and gas leasing.</li><li>Fire activities and projects in WSAs will follow the IMP.</li></ul>					
<ul style="list-style-type: none"><li>All WSAs designated as VRM Class I (53,058 acres)</li><li>Closed to OHV travel.</li></ul>	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>All WSAs managed to a VRM Class I objective (53,058).</li><li>OHV would be managed as follows:<ul style="list-style-type: none"><li>Book Cliffs Mountain Browse Natural Area - Closed</li><li>Bull Canyon - Limited</li><li>Daniels Canyon - Limited</li><li>Diamond Breaks - Closed</li><li>West Cold Springs – Limited and Closed</li><li>Winter Ridge - Open and Limited</li></ul></li><li>Where routes would remain available for motorized use within, such use could continue on a conditional basis. Use of the existing routes in the WSAs (“ways” when located within WSAs — see Glossary) could continue as long as the use of these routes does not impair wilderness suitability, as provided by the IMP (BLM 1995). If Congress designates the area as wilderness, the routes will be closed. In the interim, if use and/or non-compliance are found through monitoring efforts to impair the area’s suitability for wilderness designation, the BLM would take further action to limit use of the routes, or close them. The continued use of these routes, therefore, is</li></ul>	Same as the Proposed RMP.

SPECIAL DESIGNATIONS — WILDERNESS STUDY AREAS (WSA)					
				based on user compliance and non-impairment of wilderness values.	
SPECIAL DESIGNATIONS — WILDERNESS STUDY AREAS-IF RELEASED BY CONGRESS					
If any WSA is released by Congress from wilderness consideration and management during the life of the RMP, those lands would be managed with the following prescriptions in this plan until a LUP amendment is necessary.					
BOOK CLIFFS MOUNTAIN BROWSE (400 ACRES)					
Should any WSA, in whole or in part, be released from wilderness consideration, such released lands would be managed in accordance with the goals, objectives, and management prescriptions established in this RMP, unless otherwise specified by Congress in its releasing legislation. The BLM would examine proposals in the released areas on a case-by-case basis, but would defer all actions that are inconsistent with RMP goals, objectives, and prescriptions, until it completes a land use plan amendment. (Because any released lands would continue to be managed consistent with the prescriptions identified in this plan, unless and until the plan is amended, no separate analysis is required to address impacts to the released lands.)	Manage lands in the ISA according to the following prescription: <ul style="list-style-type: none"><li>• Fire management category C</li><li>• Oil and gas category timing and CSU</li><li>• As part of the Book Cliffs SRMA and Bitter Creek ACEC</li><li>• OHVs limited to designated routes</li><li>• VRM Class II</li><li>• Livestock grazing allowed</li></ul>	Manage lands in the ISA according to the following prescription: <ul style="list-style-type: none"><li>• Fire management category C</li><li>• Oil and gas category: timing and CSU</li><li>• As part of the Book Cliffs SRMA</li><li>• OHVs limited to designated routes</li><li>• VRM Class IV</li><li>• Livestock grazing allowed</li></ul>	Manage lands in the ISA according to the following prescription: Same as Alternative A.	Manage lands in the ISA according to the following prescription: <ul style="list-style-type: none"><li>• Fire management category C</li><li>• Oil and gas category no leasing</li><li>• OHVs limited to designated routes</li><li>• VRM Class I</li><li>• Livestock grazing allowed</li></ul>	If the existing ISA is released from wilderness consideration and management by Congress during the life of the RMP, the released WSA would be managed to protect wilderness characteristics.  These lands will be managed in accordance with the following prescriptions: VRM Class I <ul style="list-style-type: none"><li>• Closed to OHV use</li><li>• Closed to oil and gas leasing</li><li>• Closed to solid mineral leasing</li><li>• Closed to disposal of mineral materials</li><li>• Proposed for withdrawal from mineral entry</li><li>• Retained in federal ownership</li><li>• Exclusion area for rights-of-way</li><li>• Closed to permitted commercial and personal-use wood cutting and seed collection</li><li>• Closed to road construction</li><li>• Permit maintenance of existing facilities</li><li>• When compatible with the goals and objectives for management of non-WSA lands with wilderness characteristics:<ul style="list-style-type: none"><li>◦ Permit vegetation and fuel treatments using prescribed fire</li><li>◦ Permit construction of wildlife waters, livestock facilities, and minimal recreation facilities</li><li>◦ Permit excavation of cultural resources sites.</li><li>◦ Permit excavation of paleontological resources</li></ul></li></ul> No actions would be allowed that would

Table 2.1.21 Proposed RMP and Alternatives – Special Status Species					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SPECIAL STATUS SPECIES					
Special Status Species — Plants					
<p><b>GOALS AND OBJECTIVES</b></p> <ul style="list-style-type: none"><li>• Conserve and protect special status species and enhance their habitats.</li><li>• Implement recovery measures for special status species, including listed species and the ecosystems on which they depend.</li><li>• Mitigate or reduce long-term habitat fragmentation through avoidance and site-specific reclamation to return areas to productive levels.</li><li>• Manage all listed T&amp;E plant species and the habitats upon which they depend in such a manner as to conserve and recover these species to the point where protection under the ESA is no longer necessary.</li><li>• Manage non-listed sensitive species and the habitats upon which they depend in such a manner as to preclude the need to list them as either threatened or endangered under the Endangered Species Act. The guidance for this management is put forth in the BLM 6840 Manual.</li><li>• Implement the specific goals and objectives of recovery plans, conservation agreements and strategies, and approved activity level plans. The BLM would continue to work with USFWS and others to ensure that plans and agreements are updated as necessary to reflect the latest scientific data.</li><li>• Implement the direction contained in the Northwest National Fire Plan Project Design and Consultation Process and the Counterpart Regulations, including Alternative Consultation Agreements.</li><li>• Implement the management necessary to increase populations of special status species, including federally listed animal species, and restore them to their historic ranges by enhancing, protecting, and restoring known and potential habitat.</li></ul>					
<p><b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b></p> <ul style="list-style-type: none"><li>• The BLM would continue to implement the specific goals and objectives of all recovery plans, conservation plans and strategies, and activity level plans.</li><li>• The BLM would continue to work with USFWS and others to ensure that plans and agreements are updated as necessary to reflect the latest scientific data. Recovery plans have been finalized for Uinta Basin hookless cactus, shrubby reed–mustard, and clay reed-mustard. A draft plan is being developed by the USFWS for Ute ladies’ tresses. A Conservation Plan has been prepared for <i>Astragalus equisolensis</i>, <i>Penstemon goodrichii</i>, <i>Penstemon grahamii</i>, and <i>Penstemon scarious</i> var. <i>albifluvis</i>.</li><li>• Where special status plant species, including listed T&amp;E plant species, occur on public lands in the VPA, the BLM would collaborate with affected local, state, and federal agencies and researchers in the implementation of approved recovery plans and conservation strategies to protect, stabilize, and recover such species and their habitats. In addition to on-the-ground actions, strategies would be developed to provide public education on species at-risk, significance of the species to the human and biological communities, and reasons for protective measures that would be applied to the lands involved. Continue or develop monitoring studies in order to determine population dynamics and trends.</li><li>• Complete inventories and map current occupied and potential habitats for all listed and non-listed special status plant species.</li><li>• Develop relevant species-specific plans utilizing USFWS guidelines where applicable. This may include habitat management plans, conservation agreements, or other suitable plans.</li></ul>					
Special Status Species — Wildlife					
<p><b>GOALS AND OBJECTIVES</b></p> <ul style="list-style-type: none"><li>• Conserve and recover all state special status species, including federally listed species and the ecosystems on which they depend.</li><li>• Mitigate or reduce long-term habitat fragmentation through avoidance and site-specific reclamation to return areas to productive levels.</li><li>• Manage all listed T&amp;E animal species and the habitats upon which they depend in such manner as to conserve and recover these species to the point where protection under the ESA is no longer necessary.</li><li>• Manage non-listed sensitive species and the habitats upon which they depend in such a way as to preclude the need to list them as either threatened or endangered under the Endangered Species Act. The guidance for this management is put forth in the BLM 6840 Manual.</li><li>• Implement the direction contained in the Northwest National Fire Plan Project Design and Consultation Process and the Counterpart Regulations, including Alternative Consultation Agreements.</li><li>• The BLM would continue to work with USFWS and others to ensure that plans and agreements are updated as necessary to reflect the latest scientific data. Recovery plans have been finalized for six species (black-footed ferret, Mexican spotted owl, bonytail, Colorado pikeminnow, humpback chub, and razorback sucker). Two recovery plans were finalized for the peregrine falcon species and the bald eagle, which has been delisted.</li><li>• Implement the management necessary to increase populations of special status species, including federally listed animal species, and restore them to their historic ranges by enhancing, protecting, and restoring known and potential habitat.</li><li>• In cooperation with UDWR and USFWS, continue to implement the goals of the Black-footed Ferret Recovery Plan by augmenting existing population in the Snake John Wash area.</li></ul>					
<p><b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b></p> <ul style="list-style-type: none"><li>• Collaborate with the appropriate local, state, and federal agencies to promote public education on species, their importance to the human and biological community, and reasons for protective measures that would be applied to the lands involved.</li><li>• Continue inventories and map current occupied and potential habitats for all special status animal species.</li><li>• In collaboration with the USFWS, DWR, and other partners, develop and implement habitat management plans or conservation strategies for sensitive species.</li><li>• As additional data are collected over the life of the RMP, land managers would continually re-evaluate population and habitat status. Management emphasis would be to accumulate ecological information and distributional data to enhance the BLM's ability to protect, conserve, recover, and manage these species in the future.</li><li>• The BLM would continue to implement the specific goals and objectives of all Recovery Plans, Conservation Plans and Strategies, and activity level plans. Recovery Plan revisions or new Recovery Plans would also be implemented.</li><li>• The BLM will work with UDWR and other partners to implement conservation actions identified in the State Wildlife Action Plan (Comprehensive Wildlife Conservation Strategy) (UDWR, 2005), which identified priority wildlife species and habitats, assessed threats to their survival, and identified long-term conservation action needs (per WO IM 2006-114).</li><li>• Conservation Measures developed during the consultation on existing LUPs (June 2007) would be implemented as part of committed mitigation on new oil and gas leases. Appendix L contains lease notices developed from the conversation measures.</li><li>• Enhance habitat and remove or control of non-native fish that threaten various life stages of the special status species fish.</li></ul> <p><b>BLACK-FOOTED FERRET:</b></p> <p>The BLM would manage the black-footed ferret consistent with the 1999 Black-footed Ferret Reintroduction Plan Amendment and those portions of the Cooperative Plan for the Reintroduction and Management of Black-footed Ferret in Coyote Basin, Uintah County, Utah that are consistent with the Black-footed ferret plan amendment.</p>					

Table 2.1.21 Proposed RMP and Alternatives – Special Status Species

Table 2.1.21 Proposed RMP and Alternatives – Special Status Species					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SPECIAL STATUS SPECIES					
<p><b>WHITE-TAILED PRAIRIE DOG:</b> In conjunction with the USFWS and UDWR, participate in the development of a conservation plan for the white-tailed prairie dog.</p> <p><b>BONYTAIL, COLORADO PIKEMINNOW, HUMPBACK CHUB, AND RAZORBACK SUCKER:</b> Implement recovery plans actions for bonytail, Colorado pikeminnow, humpback chub, and razorback sucker.</p> <p><b>COLORADO RIVER CUTTHROAT TROUT:</b> Implement Conservation Agreement and Strategy for Colorado River cutthroat trout in the states of Colorado, Utah, and Wyoming (signed April 2001), or more recent revisions of this agreement of which the BLM is a signatory. The following measures from the agreement would be implemented:</p> <ul style="list-style-type: none"><li>• Monitor vegetation with low level infra-red photography</li><li>• Continue macro-invertebrate sampling</li><li>• Fencing</li><li>• Stream bank stabilization</li><li>• Stream flow modifications</li><li>• Pursue in flow agreements</li></ul> <p><b>BLUEHEAD SUCKER, FLANNELMOUTH SUCKER, AND ROUNDTAIL CHUB:</b> Implement range-wide conservation agreement for bluehead sucker (<i>Catostomus discobolus</i>), flannemouth sucker (<i>Catostomus latipinnis</i>), and roundtail chub (<i>Gila robusta</i>).</p> <p><b>YELLOW-BILLED CUCKOO:</b></p> <ul style="list-style-type: none"><li>• Restore and conserve riparian areas and develop specific riparian vegetation objectives that would benefit bird species dependent on riparian areas</li><li>• Fence riparian areas to reduce or eliminate grazing pressure on young trees, especially willow and cottonwood.</li><li>• Apply rotation grazing or consider eliminating hot-season grazing in riparian areas to allow young trees to become established.</li><li>• Control or eliminate non-native plant species in riparian habitats.</li></ul>					
COLORADO RIVER CUTTHROAT TROUT					
Per the Conservation Agreement/Conservation and Sportfishing Management Strategy for the Colorado River cutthroat trout, habitat would be provided, maintained and/or enhanced in Beaver, Bitter, Crouse, Davenport, Jackson, Sears, Sweetwater Creeks, Tolivers, and Upper Willow (Brown's Park), including tributaries for the reintroduction of Colorado River cutthroat trout.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	Suitable habitat would be provided and maintained to reintroduce Colorado River cutthroat trout in Upper Willow (Brown's Park), Beaver, Sears, Crouse, Tolivers, Davenport, Jackson, and Argyle Creeks as found applicable.	Same as the Proposed RMP.
Special Status Species — Raptors					
<p><b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b></p> <p><b>BALD EAGLE:</b> Protect and restore cottonwood bottoms for Bald Eagle winter habitat along the Green and White rivers, at Pelican Lake, and at the Cliff Creek Bald Eagle roost site, as well as any new roost sites discovered in the future.</p> <p><b>BURROWING OWL AND SHORT-EARED OWL:</b> In cooperation with UDWR, maintain nesting habitat and maintain/enhance prey-base habitat.</p> <p><b>FERRUGINOUS HAWK:</b> In cooperation with UDWR, maintain and enhance white-tailed prairie dog and other foraging habitat to provide primary food sources for the Ferruginous Hawk.</p> <p><b>MEXICAN SPOTTED OWL:</b></p> <ul style="list-style-type: none"><li>• Establish Protected Activity Centers (PACs) at all known Mexican Spotted Owl nest sites.</li><li>• Maintain habitat to support small mammal populations as a prey base for Mexican Spotted Owls in occupied and suitable owl habitats.</li><li>• Retain large down logs, large trees, and snags as prey habitats in occupied and suitable Mexican Spotted Owl habitats.</li></ul> <p><b>PEREGRINE FALCON:</b></p>

Table 2.1.22 Proposed RMP and Alternatives – Roads and Trails					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
TRAVEL — ROADS AND TRAILS — MAP FIGURES 33–38					
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>Establish working partnerships with local and state agencies, user groups, commercial providers, and other interested parties that would facilitate effective OHV program development, including the planning for and implementation of successful trail systems and use areas.</li><li>Provide areas for OHV and motorized use, while protecting other resource values.</li><li>The Proposed RMP and all alternatives would comply with the BLM’s National OHV Policy.</li></ul>					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>In collaboration with interested parties, the BLM would make future route adjustments based on access needs, recreational opportunities, and natural resource constraints. These adjustments would occur only in areas with open and/or limited route designations and would be analyzed at the activity planning level.</li><li>The BLM, in preparing its RMP designations and its implementation-level travel management plans, is following policy and regulation authority found at: 43 C.F.R. Part 8340; 43 C.F.R. Subpart 8364; and 43 C.F.R. Subpart 9268.</li><li>Where the authorized officer determines that OHVs are causing or would cause considerable adverse impacts, the authorized officer shall close or restrict such areas. The public would be notified.</li><li>The BLM could impose limitations on types of vehicles allowed on specific designated routes if monitoring indicates that a particular type of vehicle is causing disturbance to the soil, wildlife habitat, cultural or vegetative resources, especially by off-road travel in an area that is limited to designated routes.</li><li>Where routes would remain available for motorized use within WSAs, such use could continue on a conditional basis. Use of the existing routes in the WSAs (“ways” when located within WSAs — see Glossary) could continue as long as the use of these routes does not impair wilderness suitability, as provided by the IMP (BLM 1995). If Congress designates the area as wilderness, the routes will be closed. In the interim, if use and/or non-compliance are found through monitoring efforts to impair the area’s suitability for wilderness designation, the BLM would take further action to limit use of the routes, or close them. The continued use of these routes, therefore, is based on user compliance and non-impairment of wilderness values.</li><li>As per the State of Utah v. Andrus, October 1, 1979 (Cotter Decision), the BLM would grant the State of Utah reasonable access to state lands for economic purposes, on a case-by-case basis.</li></ul>					
<b>SCENIC BACKWAYS AND BYWAYS</b> <ul style="list-style-type: none"><li>Continue to manage Nine Mile Canyon as a National Backcountry Byway.</li><li>Crouse Canyon would be managed as a State of Utah Scenic Byway.</li><li>The Flaming Gorge–Uintas Scenic Byway and the Dinosaur Diamond Prehistoric Highway would be managed as National Scenic Byways.</li></ul>					
* <i>The Chipeta Canyon road would be open up to the Chipeta cabin.</i>	Same as the Proposed RMP.	Same as the Proposed RMP.	The Chipeta Canyon road would be closed at the mouth of Chipeta Canyon.	Unspecified in the current management plan	Same as Alternative C.
Newly permitted routes would be obliterated and/or returned to their original condition when they no longer serve their permitted purpose or public interest.	Same as the Proposed RMP.	Newly permitted routes would not be obliterated if the route serves a public interest.	Newly permitted routes would be obliterated when they no longer serve their permitted purpose.	Unspecified in the current management plan	Same as Alternative C.
<ul style="list-style-type: none"><li>Routes causing resource damage would be repaired by maintenance, upgrade, or realignment.</li><li>BLM routes would be closed if none of the above is economically feasible.</li></ul>	Same as the Proposed RMP.	Routes causing resource damage would be maintained, upgraded, and/or realigned.	Routes causing resource damage would be maintained, upgraded, realigned, and/or closed.	Unspecified in the current management plan	Same as Alternative C.
OHV travel would be limited to designated routes or closed except for managed open areas. <ul style="list-style-type: none"><li>Acres that would be open to OHV travel: 6,202</li><li>Acres that would be limited to OHV travel: 1,643,475</li><li>Acres that would be closed to OHV travel: 75,845</li></ul> This includes: all WSAs and ISA; the White River area (SRMA, river corridor); Lears Canyon ACEC, the Nine Mile Acquired Area; and the upper portion of the Lower Flaming Gorge non-WSA lands with wilderness	Same as the Proposed RMP.	OHV travel would be limited to designated routes or closed except for managed open areas. <ul style="list-style-type: none"><li>Acres that would be open to OHV travel: 5,434</li><li>Acres that would be limited to OHV travel: 1,659,901</li><li>Acres that would be closed to OHV travel: 60,187</li><li>Miles of routes that would be designated to OHV travel: 4,861</li></ul>	OHV travel would be limited to designated routes or closed except for managed open areas. <ul style="list-style-type: none"><li>Acres that would be open to OHV travel: 5,434</li><li>Acres that would be limited to OHV travel: 1,353,529</li><li>Acres that would be closed to OHV travel: 366,559</li><li>Miles of routes that would be designated to OHV travel: 4,707</li></ul>	OHV travel would be open, limited to designated routes, or closed. <ul style="list-style-type: none"><li>Acres that would be open to OHV travel: 787,859</li><li>Acres that would be limited to OHV travel: 887,275</li><li>Acres that would be closed to OHV travel: 50,388</li><li>Miles of routes not designated.</li></ul>	OHV travel would be limited to designated routes or closed except for managed open areas: <ul style="list-style-type: none"><li>Acres that would be open to OHV travel: 5,434</li><li>Acres that would be limited to OHV travel: 1,326,024</li><li>Acres that would be closed to OHV travel: 392,818</li><li>Miles of routes that would be designated to OHV travel: 4,654</li></ul>

Table 2.1.23 Proposed RMP and Alternatives – Vegetation Resources											
PROPOSED RMP		Alternative A (Preferred Alternative)		Alternative B		Alternative C		Alternative D Current Management (No Action)		Alternative E	
VEGETATION RESOURCES											
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>• Ensure that management of native and naturalized plant species enhances, restores, and does not reduce the biological and genetic diversity of natural ecosystems.</li><li>• Maintain and/or enhance soil and watershed conditions and forage production.</li><li>• Achieve a desired ecological stage or desired plant community structure.</li><li>• Appropriately control and manage noxious weeds, poisonous and invasive plants, and insects.</li><li>• Protect special status plant species and their habitats.</li></ul>											
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>• Allow mechanical, fire, biological, or chemical control of noxious weeds and insect infestations within the resource planning area with restrictions to protect desired ground cover and water quality. Use the type of manipulation appropriate to and consistent with other land use objectives.</li><li>• Continue implementation of noxious weed and invasive species control actions as per national guidance and local weed management plans in cooperation with state, federal, affected counties, adjoining private landowners and other partners or interests directly affected.</li><li>• Utilize principles of integrated pest management for control and management of noxious weeds and invasive species. This includes prevention, control through mechanical, cultural, biological, and chemical methods.</li><li>• Manage the vegetation to attain the ecological stage that would benefit wildlife in crucial habitat and livestock grazing. Manage vegetation in remaining areas that results in high vegetation species diversity.</li><li>• Allow mechanical, fire, biological, cultural, or chemical methods for vegetation manipulation, using the type of manipulation appropriate to and consistent with other land use objectives, and incorporating standard operating procedures and BMPs, as spplicable, to protect other resources.</li><li>• Continue implementation of noxious weed and invasive species control actions as per national guidance and local weed management plans in cooperation with state, federal, affected counties, adjoining private landowners and other partners or interests directly affected.</li><li>• Manage the vegetation to attain the ecological stage that would benefit wildlife in crucial habitat and livestock grazing. Manage vegetation in remaining areas that results in high vegetation species diversity.</li><li>• Use of pesticides and herbicides shall comply with the applicable federal and state law. Prior to the use of pesticides, project proponents shall obtain from the Authorized Officer written approval of Pesticide Use Proposal, which is a plan showing the type and quantity of material to be used; pest(s) to be controlled; method of application; location of storage and disposal of containers; and any other information deemed necessary by the Authorized Officer. Emergency use of pesticides shall be approved in writing by the Authorized Officer prior to use. In addition, within 24 hours of any pesticide application, a Pesticide Application Record must be completed. A similar procedure is required for the release of biological control agents.</li><li>• Manage the vegetation to attain the ecological stage that would:<ul style="list-style-type: none"><li>◦ Ensure sustainability</li><li>◦ Meet authorized use allocations (livestock, wildlife).</li><li>◦ Ensure species diversity</li></ul></li><li>• Manage the following vegetative types to achieve the desired mix of seral stages, as outlined below</li></ul>											
Existing Seral Stages by Vegetation Type					Desired Seral Stages by Vegetation Type

PROPOSED RMP	Alternative A (Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
VISUAL RESOURCE MANAGEMENT — MAP FIGURES 39–44					
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>Manage the public lands in such a way as to preserve those scenic vistas, which are deemed to be most important:<ul style="list-style-type: none"><li>In their impact on the quality of life for residents and communities in the areas.</li><li>In their contribution to the quality of recreational visitor experiences.</li><li>In supporting the regional tourism industry and segments of the local economy dependent on public land resources.</li></ul></li><li>Seek to complement the rural, agricultural, historic, and urban landscapes on adjoining private, state, and tribal lands by maintaining the integrity of background vistas on the public lands.</li></ul>					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <p>Maintain or improve the scenic quality of the landscape and design and mitigate visual intrusions consistent with the objectives established for the specific visual resource management classes outlined in the BLM Handbook H-8410-1.</p>					
Approximately 57,776 acres would be managed as VRM Class I.  All WSAs and ISA  <b>Note:</b> Acreage differences between the alternatives are the result of management prescriptions within the alternatives.	63,136 acres would be managed as VRM Class I.  <b>Note:</b> The VRM acreage numbers under Alternative A have been changed to reflect BLM-administered lands only. In the Draft RMP/EIS, lands controlled by other surface management entities were included in the numbers for Alternative A. This change does not impact the analysis of the document.	53,058 acres would be managed as VRM Class I.	145,781 acres would be managed as VRM Class I.	53,086 acres would be managed as VRM Class I.	334,516 acres would be managed as VRM Class I.
Approximately 231,911 acres would be managed as VRM Class II.  <b>Note:</b> Acreage differences between the alternatives are the result of management prescriptions within the alternatives.	294,773 acres would be managed as VRM Class II.  <b>Note:</b> The VRM acreage numbers under Alternative A have been changed to reflect BLM-administered lands only. In the Draft RMP/EIS, lands controlled by other surface management entities were included in the numbers for Alternative A. This change does not impact the analysis of the document.	114,030 acres would be managed as VRM Class II.	362,660 acres would be managed as VRM Class II.	113,686 acres would be managed as VRM Class II.	259,694 acres would be managed as VRM Class II.
Approximately 786,612 acres would be managed as VRM Class III.  <b>Note:</b> Acreage differences between the alternatives are the result of management prescriptions within the alternatives.	716,186 acres would be managed as VRM Class III.  <b>Note:</b> The VRM acreage numbers under Alternative A have been changed to reflect BLM-administered lands only. In the Draft RMP/EIS, lands controlled by other surface management entities were included in the numbers for Alternative A. This change does not impact the analysis of the document.	199,179 acres would be managed as VRM Class III.	580,846 acres would be managed as VRM Class III.	199,192 acres would be managed as VRM Class III.	535,586 acres would be managed as VRM Class III.
Approximately 643,641 acres would be managed as VRM Class IV.  <b>Note:</b> Acreage differences between the alternatives are the result of management prescriptions within the alternatives.	645,845 acres would be managed as VRM Class IV.  <b>Note:</b> The VRM acreage numbers under Alternative A have been changed to reflect BLM-administered lands only. In the Draft RMP/EIS, lands controlled by other surface management entities were included in the numbers for Alternative A. This change does not impact the	1,353,967 acres would be managed as VRM Class IV.	630,653 acres would be managed as VRM Class IV.	1,353,976 acres would be managed as VRM Class IV.	590,140 acres would be managed as VRM Class IV.

PROPOSED RMP	Alternative A (Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WILD HORSES — MAP FIGURE 45					
<b>GOALS AND OBJECTIVES</b>					
Provide for interim management of wild horses as the goals and objectives of the Proposed RMP for gathering and removal is completed.					
BONANZA					
This Herd Area will not be managed for wild horses. Any horses present are in trespass.	This Herd Area will not be managed for wild horses.	Same as Alternative A	The Book Cliffs Resource Management Plan Amendment involving the Bonanza Wild Horse Herd Area would be implemented.	There would be no horses managed for in the Bonanza HA.	Same as Alternative C.
This Herd Area will not be managed for wild horses. Any horses present are in trespass.	This Herd Area will not be managed for wild horses.	Same as Alternative A.	A herd of 40 horses, allowing for a maximum of 85, would be re-established that would have the following physical and conformation characteristics: <ul style="list-style-type: none"><li>• Color — bay, buckskin, palomino, red and blue roan, brown, dunn, sorrel, black, and grulla.</li><li>• Markings — Spanish mustang indicators, such as dorsal and zebra stripes.</li><li>• Size — 13 to 15 hands high and weighing 800 to 1,000 pounds.</li><li>• Breed-mixed, including Appaloosa and Spanish mustang.</li></ul>	There would be no horses managed for in the Bonanza HA.	Same as Alternative C.
The Bonanza HA delineation will continue.	Do not maintain Herd Management Area (HMA).	Same as Alternative A.	<ul style="list-style-type: none"><li>• The HMA would be maintained with horses.</li><li>• In an area/s identified where wild horses would be maintained and managed, protect them from unauthorized capture, branding, harassment, or death.</li><li>• Provide for the appropriate number by:<ul style="list-style-type: none"><li>◦ Reducing reproductive rates to levels which would accommodate a minimum four-year gather schedule to allow for maintenance of the AML;</li><li>◦ Maintaining the desired sex structure for herds;</li><li>◦ Establishing a more “normal distribution” through selective removal; and</li><li>◦ Managing horse populations to reflect allocated or available forage.</li></ul></li><li>• Maintain herd characteristics and genetic diversity.</li><li>• Periodically introduce new animals to maintain genetic viability.</li></ul>	There would be no horses managed for in the Bonanza HA.	Same as Alternative C.

Table 2.1.25 Proposed RMP and Alternatives – Wild Horses					
PROPOSED RMP	Alternative A (Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WILD HORSES — MAP FIGURE 45					
			<ul style="list-style-type: none"><li>• Maintain healthy wild horse populations and continue appropriate testing protocols through close coordination with the State of Utah Veterinarian.</li><li>• Limit management of wild horses to the projected occurrence area of the Herd Management Area (HMA).</li><li>• Manage habitat to:<ul style="list-style-type: none"><li>◦ Sustain established wild horse populations.</li><li>◦ Achieve and maintain a desired plant community that would provide palatable, nutritious forage for wild horses while sustaining rangeland health and a thriving natural ecological balance.</li></ul></li></ul>		
This Herd Area will not be managed for wild horses. Any horses present are in trespass.	This Herd Area will not be managed for wild horses.	Same as Alternative A.	<ul style="list-style-type: none"><li>• Establish an AML of 85 wild horses with a minimum herd of 40.</li><li>• Adjustments in the interim AML would be in accordance with criteria outlined under the Forage section.</li></ul>	There would be no horses managed for in the Bonanza HA.	Same as Alternative C.
Gap fences would not be constructed.	Same as the Proposed RMP.	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>• Three miles of gap fences would be constructed where cliffs on the north rim of the White River would not provide natural barriers.</li><li>• Cattle guards would be placed on routes where needed to ensure integrity of the fences.</li></ul>	There would be no horses managed for in the Bonanza HA.	Same as Alternative C.
Additional water developments would not be provided for wild horses.	Same as the Proposed RMP.	Same as the Proposed RMP.	25 additional water developments consisting of a combination of reservoirs, shallow wells, and guzzlers would be provided.	There would be no horses managed for in the Bonanza HA.	Same as Alternative C.
Up to 15 reservoirs outside of, but in close proximity to, the Herd Area (HA) boundary would not be fenced.	Same as the Proposed RMP.	Same as the Proposed RMP.	The need to fence up to 15 reservoirs in proximity to the Herd Area (HA) boundary would be determined under the Herd Area Management Plans.	There would be no horses managed for in the Bonanza HA.	Same as Alternative C.
There would be no horses managed for in this HA. Any horses present are in trespass.	There would be no horses managed for in this HA.	Same as Alternative A.	A gathering plan would be prepared and approximately 45 horses would be removed every four years; gathered horses would be available for adoption under the BLM's Adopt-A-Horse program.	There would be no horses managed for in the Bonanza HA.	Same as Alternative C.
There would be no horses managed for in this HA. Any horses present are in trespass.	There would be no horses managed for in this HA.	Same as alternative A	A Wild Horse Herd Area Management Plan would be prepared within three years after the Record of Decision (ROD) is signed.	There would be no horses managed for in the Bonanza HA.	Same as Alternative C.

unpopulated. • The area would only be managed as a HA with no specific management plan for wild horses. • Any horses present are in trespass.	be removed approximately every four years. • Gathered horses would be available for adoption under the BLM's Adopt-A-Horse program.			• Gathered horses would be available for adoption under the BLM's Adopt-A-Horse program.	
• All wild horses would be removed, the area would be declared unpopulated. • The area would only be managed as a HA with no specific management plan for wild horses. • Any horses present are in trespass.	The HA would be designated as a HMA.	There would be no horses managed for in this HA.	Same as Alternative A.	The HA would not be designated as a HMA.	Same as Alternative A.
• All wild horses would be removed, the area would be declared unpopulated. • The area would only be managed as a HA with no specific management plan for wild horses. • Any horses present are in trespass.	A Wild Horse Herd Management Area Monitoring Plan would be prepared after the ROD is signed.	There would be no horses managed for in this HA.	Same as Alternative A.	A Wild Horse Herd Management Area Monitoring Plan would not be prepared.	Same as Alternative A.

Table 2.1.26 Proposed RMP and Alternatives – Wildlife and Fisheries Resources

Table 2.1.26 Proposed RMP and Alternatives – Wildlife and Fisheries Resources					
PROPOSED RMP	Alternative A (Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WILDLIFE AND FISHERIES RESOURCES					
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>Provide, maintain, enhance, and protect habitats for a diversity of fish and wildlife species within the VPA.</li><li>Maintain, restore, enhance, and protect crucial habitats for all fish and wildlife species and restore degraded habitats. Manage for unfragmented blocks of continuous habitat that would provide the life cycle requirements of a variety of wildlife species.</li><li>Identify species and habitats most in need of conservation.</li><li>Coordinate with UDWR and other partners to accomplish the population and habitat goals and objectives of current, revised, and/or future big game Herd Management Plans that are consistent with and meet the goals and objectives of this LUP.</li></ul>					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>The BLM would consider habitat banking (i.e., off-site mitigation) as a method to compensate for habitat loss due to surface-disturbing activities.</li><li>Coordinate with Animal and Plant Health Inspection Service (APHIS) to prepare an annual operating plan for predator control within the VPA.</li><li>Enlist APHIS’ continued support to provide predator control within the black-footed ferret reintroduction area and provide carnivore samples for on-going disease monitoring.</li><li>The VFO would assist in implementing the strategic plan for Utah’s Initiative on Blue Ribbon Fisheries by managing aquatic and riparian habitats along the Green River, from the Ashley National Forest border to the Colorado/Utah border, for a quality cold-water sport fishery and Pelican Lake for a quality warm water sport fishery. In addition, any aquatic and riparian habitats along other waters identified as Blue Ribbon Fisheries would be managed for quality sport fisheries. The VFO would implement this initiative to the extent consistent and appropriate with the Vernal RMP and other land use authorizations.</li><li>Reduce habitat fragmentation by requiring oil and gas field development plans and encouraging such activities as well clustering, multiple drilling from a single pad, utilization of existing routes and pipelines, and other measures to minimize surface impacts.</li><li>In accordance with Executive Order 13186, incorporate conservation measures for the protection of migratory birds, as outlined in the Utah Partners-In-Flight Avian Conservation Strategy and other scientific information, into all surface-disturbing activities.</li><li>Manage habitat to prevent the need for additional listing of species under the Endangered Species Act and to contribute to the recovery of those species already listed.</li><li>The BLM will approach compensatory mitigation on an “as appropriate” basis where it can be performed on-site, and on a voluntary basis where it is performed off-site, or, in accordance with current guidance.</li><li>Minor adjustments to crucial wildlife habitat boundaries periodically made by the Utah Division of Wildlife Resources (UDWR) would be accommodated through plan maintenance.</li></ul>					
<b>HABITAT IMPROVEMENTS</b> <ul style="list-style-type: none"><li>Wildlife habitat improvement projects would require consultation with UDWR on job design, construction techniques, and project feasibility. Revise the Pariette Wetlands portion of the Myton Habitat Management plans.</li><li>Work with permittees to provide water to wildlife on all BLM water developments, including troughs, after livestock are removed from an allotment or pasture. Wildlife escape devices would be installed on all new and existing water troughs in the VPA.</li><li>Existing Habitat Management Plans (e.g., Brown’s Park, Myton, and Diamond Mountain-Ashley Creek) would continue to be implemented and revised, and new ones would be developed as necessary.</li><li>Develop antelope and upland game guzzlers on a case-by-case basis considering the effects to migratory birds, wildlife, and livestock.</li><li>Encourage coordination with oil and gas companies to inform the BLM and USFWS of plans for workovers in order to protect species from disturbances during critical time periods.</li></ul>					
<b>HABITAT PROTECTION</b> <ul style="list-style-type: none"><li>Do not allow activities that would result in adverse impacts to antelope from May 1 through June 30 on currently identified 7,800 acres of antelope fawning ground in Antelope Flat. This restriction does not apply if antelope are not present or if impacts would be mitigated through other management actions. This restriction also does not apply to maintenance and operations of existing facilities.</li><li>Modify existing fences on public lands where wildlife are adversely affected. Work with other surface management agencies or surface owners toward modifying wildlife-restricting fences that border public lands to improve natural movement of wildlife.</li><li>All applications to pave roads would be evaluated in the site-specific NEPA analysis to determine the need for fencing. Applicants receiving a ROW grant would be required to fence the road if it is determined necessary to protect human and livestock health and safety.</li><li>In order to protect crucial elk calving and deer fawning habitat, exploration, drilling, and other development activity would not be allowed from May 15 through June 30. Maintenance of producing wells would be allowed.</li></ul>					
<b>RAPTORS</b> <ul style="list-style-type: none"><li>Cooperate with utility companies, UDWR, and USFWS to prevent electrocution of raptors.</li><li>Spatial and temporal buffers applied to disturbances in the vicinity of nesting raptors should be tailored to the individual raptor species involved and based on factors such as line of sight distance between nest and disturbance, type and duration of disturbance, nest structure security, sensitivity of the species to disturbance, observed responses to related disturbances, and the amount of other disturbances already occurring in the vicinity.</li><li>Pursue a partnership between industries, local governments, USFWS, UDWR, the BLM, USFS, NRCS, and others as appropriate to establish a raptor management fund to be utilized for raptor population monitoring and habitat enhancement.</li></ul>					
<b>MOUNTAIN LION AND BLACK BEAR</b> <ul style="list-style-type: none"><li>In consultation with UDWR, promote appropriate habitat enhancement to contribute to maintaining a healthy predator population within the existing suitable habitat, while considering human safety, economic concerns, and other wildlife species.</li><li>Placement of bear bait on public land would require a permit.</li></ul>					
<b>MULE DEER, ROCKY MOUNTAIN ELK, AND PRONGHORN</b> <ul style="list-style-type: none"><li>Improve or increase forage through vegetation treatments that would setback the seral stage of crucial use areas, and, if necessary, re-seed areas with a variety of native and adapted non-native plant species.</li><li>It is preferred that surface-disturbing actions within crucial deer winter range would be located in pinyon juniper rather than browse where both vegetation types occur.</li><li>Acquire and protect crucial wildlife habitat through sale or exchange.</li><li>Establish new and maintain all existing guzzlers and other water sources to improve habitat and distribution in the VPA.</li></ul>					
<b>NEOTROPICAL MIGRATORY BIRDS</b> <ul style="list-style-type: none"><li>Provide habitat for cavity-nesting non-game wildlife species and other species that utilize standing snags during a portion of their life cycles.</li><li>In cooperation with permittees, manage grazing to allow regeneration of riparian tree species and to protect natural water sources.</li><li>Prevent the spread of non-native plants, especially cheatgrass, salt cedar, and Russian olive.</li></ul>					

Table 2.1.26 Proposed RMP and Alternatives – Wildlife and Fisheries Resources

Table 2.1.26 Proposed RMP and Alternatives – Wildlife and Fisheries Resources					
PROPOSED RMP	Alternative A (Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WILDLIFE AND FISHERIES RESOURCES					
<ul style="list-style-type: none"><li>Strive for a dense understory with a reduction in salt cedar and improvement of cottonwood regeneration.</li></ul> <b>REINTRODUCTIONS</b> <ul style="list-style-type: none"><li>Reintroduction of native fish and wildlife species into appropriate habitats would be accomplished through coordination with UDWR, counties, and interested publics through appropriate public participation processes. Reintroductions would involve, but may not be limited to, native species such as Rocky Mountain big horn sheep, moose, bison, and Colorado River cutthroat trout, and wild turkey.</li><li>Implement the guidelines outlined in the Rocky Mountain Bighorn Sheep Reintroduction Cooperative Agreement between the BLM, Diamond Mountain Resource Area, Vernal District and UDWR Northeastern Region (1993), and the Vernal District Rocky Mountain Big Horn Sheep Guidance Plan (1987).</li><li>Allotments near current or potential Rocky Mountain bighorn sheep habitat, where future transplants are likely to occur, should be considered for conversion from domestic sheep grazing to cattle grazing, as cattle are the preferred livestock within 10 miles of bighorn sheep habitat areas. Conversion would only be done in cooperation with affected parties.</li><li>Potential reintroduction of gray wolves would be made in consultation with the UDWR, USFWS, Ute Tribe, counties, and private landowners through the Resource Advisory Council process for public involvement. The BLM will follow the State of Utah's management plan for wolves (Utah Division of Wildlife Resources Publication #: 05-17-- Prepared by the Utah Division of Wildlife Resources and The Utah Wolf Working Group).</li></ul> .					
No surface-disturbing activities would be allowed from April 15 through May 31 within McCook and Monument Ridge mule deer migration corridors (Figure 46).	Same as the Proposed RMP.	Same as the Proposed RMP.	No surface-disturbing activities would be allowed from April 15 to May 31 and September 1 to October 15 within McCook and Monument Ridge mule deer migration corridors (Figure 46).	For minerals only, no surface-disturbing activities would be allowed within the Monument Ridge mule deer migration corridor from May 11-May 31 and within the McCook Ridge mule deer migration corridor from October 2-May 31.	Same as Alternative C.
Habitat and forage would be provided for the emigration and/or reintroduction of Rocky Mountain bighorn sheep in the following areas: <ul style="list-style-type: none"><li>Ashley Gorge</li><li>Beaver Creek/Willow Creek Area</li><li>Big Brush Creek</li><li>Brown's Park/Green River Corridor that includes Red Creek Canyon</li><li>Crouse Canyon</li><li>Diamond Mountain ridgetops</li><li>Goslin Mountain</li><li>Island Park /Dry Fork area</li><li>Little Brush Creek</li><li>Nine Mile Canyon</li><li>Richard's Mountain</li><li>Sears Creek Canyon</li><li>Teepee Mountain</li><li>Toliver's Creek</li><li>White River</li><li>Upper Book Cliffs (Willow Creek drainage upstream from Wood Canyon and the Bitter Creek drainage upstream from the Sweetwater confluence)</li></ul> Forage required for Rocky Mountain Bighorn sheep would be included in the AUMs allocated for wildlife.	Same as the Proposed RMP.	Same as the Proposed RMP except the BLM would only support Rocky Mountain bighorn sheep if natural emigration occurs.	Same as the Proposed RMP.	<ul style="list-style-type: none"><li><b>Book Cliffs:</b> Suitable habitat exists for bighorn sheep.</li><li><b>Diamond Mountain:</b> Bighorn sheep would be re-established in Brown's Park.</li><li>Forage and cover would be provided to annually support an average population of about 300-400 animals on public lands in the HMP area.</li></ul>	Same as the Proposed RMP.
The BLM would continue to work cooperatively with UDWR and other entities to revise and implement the Book Cliffs Bison Management Plan.	<ul style="list-style-type: none"><li>Habitat and forage would be provided for the emigration and/or reintroduction of bison in the Southern Book Cliffs.</li><li>Forage required for bison would be</li></ul>	The BLM would not support bison in the Southern Book Cliffs.	Same as Alternative A.	Unspecified in the current management plans.	Same as Alternative A.

Table 2.1.26 Proposed RMP and Alternatives – Wildlife and Fisheries Resources

Table 2.1.26 Proposed RMP and Alternatives – Wildlife and Fisheries Resources					
PROPOSED RMP	Alternative A (Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WILDLIFE AND FISHERIES RESOURCES					
	included in the AUMs allocated for wildlife.				
<ul style="list-style-type: none"><li>Habitat and forage would be provided for the emigration and/or reintroduction of moose populations.</li><li>Forage required for moose would be included in the AUMs allocated for wildlife.</li></ul>	Same as the Proposed RMP.	The BLM would not support moose in the Upper Book Cliffs.	Same as the Proposed RMP.	Unspecified in the current management plans.	Same as Alternative A.
The BLM will approach compensatory mitigation on an “as appropriate” basis where it can be performed on-site, and on a voluntary basis where it is performed off-site, or in accordance with current guidance.	Disturbance within sagebrush habitat on crucial deer winter range would be reclaimed at or enhanced at a ratio of 1.5:1.	Disturbance within sagebrush habitat on crucial deer winter range would be reclaimed at or enhanced at a ratio of 1:1.	Disturbance within sagebrush habitat on crucial deer winter range would be reclaimed or enhanced at a ratio of 3:1.	Unspecified in the current management plans.	Same as Alternative C.
<ul style="list-style-type: none"><li>Activities that would result in adverse impacts to deer and elk within crucial winter range would not be allowed from December 1 through April 30.</li><li>This restriction would not apply if deer and/or elk are not present, or if it is determined through analysis and coordination with UDWR that impacts could be mitigated</li><li>Factors to be considered would include snow depth, temperature, snow crusting, location of disturbance, forage quantity and quality, animal condition, and expected duration of disturbance.</li></ul>	<ul style="list-style-type: none"><li>Activities that would result in adverse impacts to deer and elk within crucial winter range would not be allowed from November 15 through April 30.</li><li>This restriction would not apply if it is determined through analysis and coordination with UDWR that impacts could be mitigated.</li><li>Factors to be considered would include snow depth, temperature, snow crusting, location of disturbance, forage quantity and quality, animal condition, and expected duration of disturbance.</li></ul>	<ul style="list-style-type: none"><li>Disturbance activities would not be allowed from December 15 through March 15 that would displace deer and elk from more than 10% of their total winter habitat at any given time.</li><li>Waivers would be granted if deer and elk are not present, topography or other attributes screen the activity sufficiently so that the proposed activity would not displace the subject species, or disturbance resulting from the proposed activity could be mitigated.</li></ul>	Same as the Alternative A.	<ul style="list-style-type: none"><li><b>Book Cliffs:</b><ul style="list-style-type: none"><li>In order to protect crucial winter elk habitat, surface-disturbing activities would not be allowed from November 1 through March 31.</li><li>No surface-disturbing activities would be allowed on McCook Ridge October 2 through May 31 to protect the crucial winter deer and elk habitat.</li></ul></li><li><b>Diamond Mountain:</b><ul style="list-style-type: none"><li>Activities that would result in adverse impacts to deer and elk within crucial winter range would not be allowed from December 1 to April 30.</li><li>This restriction would not apply if deer and/or elk are not present, or impacts could be mitigated through other management actions.</li></ul></li></ul>	Same as Alternative A.
<ul style="list-style-type: none"><li>Within crucial deer winter range, no more than 10% of such habitat would be subject to surface disturbance and remain un-reclaimed at any given time.</li></ul>	New Surface disturbance of up to 560 acres per township would be allowed, prorated based on the percentage of the crucial deer winter range within the township.	Same as the Proposed RMP.	Total surface disturbance (new and existing) of 560 acres per township would be allowed, prorated based on percentage of the crucial deer winter range within the township.	Unspecified in the current management plans.	Same as Alternative C.
Raptor management would be guided by the use of Best Management Practices for Raptors and Their Associated Habitats in Utah (Utah BLM, 2006, Appendix A), utilizing seasonal and spatial buffers, as well as mitigation, to maintain and enhance raptor nesting and foraging habitat, while allowing other resource uses.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the current management plans.	Same as Alternative C.

PROPOSED RMP	Alternative A (Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WOODLANDS AND FOREST RESOURCES —MAP FIGURES 48 AND 49					
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>Follow national BLM Forest Health and Forest Management Standards and Guidelines to assess conditions and guide management actions for the forest and woodland resource.</li><li>Allow public utilization of forest and woodland species before/after vegetative treatments that would be conducted to achieve desired future conditions. Allow the utilization of forest and woodland species as a tool for vegetative treatments.</li><li>Manage forests and woodlands for long-term healthy habitat for animal and plant species, forest and woodland health, and riparian restoration and enhancement. Provide for timber production where feasible and compatible with forest health and other resource management objectives.</li><li>Restore productivity and biodiversity in forest, woodland, and riparian areas. Allow for the harvest of pinyon/juniper for fuel wood, biomass, posts, pinyon nuts, Christmas and ornamental live trees, and special forest products. Manage pinyon/juniper to control encroachment and to improve wildlife habitat, woodland health, and watershed conditions.</li><li>Manage oak by sustaining and enhancing some of the trees in the older age classes in areas that are suitable for maintaining and increasing acorn yields. Manage aspen to maintain diversity of age classes and to allow for species reestablishment.</li><li>Encourage utilization of woodland products, including biomass, from lands that would be converted to other resource uses and salvage of woodland products where compatible with other resource management objectives.</li><li>Pursue partnerships to provide social and economic benefits to local residents, businesses, and future generations. Encourage stewardship contracting in some areas to achieve various resource management objectives.</li><li>Identify, maintain, and restore forest and woodland old-growth stands to a pre-fire suppression condition. The VFO would adopt the USFS old-growth definitions and identification standards as per the USFS document “Characteristics of Old-Growth Forests in the Intermountain Region (April 1993).” In instances where the area of application in the previous document does not apply to specific species (for example, <i>Pinus edulis</i>), use the document, “Recommended Old-Growth Definitions and Descriptions, UDSA Forest Service Southwestern Region, (Sept.1992).”</li></ul>					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>Develop a forest and woodland management plan incorporating the goals and objectives listed below:<ul style="list-style-type: none"><li>Allow for reforestation of forest and woodland sites after disturbances, where needed for stabilization, rehabilitation, restoration, and succession of ecosystems; restoration of native species; and seed sources lost in a stand replacement fire or other stand replacing events.</li><li>Areas determined to need re-seeding would be treated with a variety of plant species that are desirable for wildlife habitat, livestock, and watershed management, while maintaining vegetation species diversity. The use of site adapted native plant species is encouraged.</li><li>Forests and woodlands would be managed using timber harvest and/or woodcutting in conjunction with pre-commercial thinning, prescribed fire, chaining and other techniques to achieve site-specific objectives of restoring and maintaining forest health, biodiversity, and wildlife habitat; insect and disease control; as a tool for hazard fuel reduction and WUI projects; riparian restoration and; and other resource management goals.</li><li>Forest and woodland treatments and harvests would continue to be designed in accordance with silvicultural prescriptions. Irregular boundaries of treatment and harvest areas would be required to reduce the detrimental impacts to the scenic values.</li><li>Pinyon / juniper and oak management would be implemented to maintain commodity production, enhance resource values, and reduce pinyon/juniper dominance. Priority areas for pinyon/juniper treatments would be aspen stands, productive grasslands, forested areas, and shrublands where loss of vegetative diversity is likely. The treatments would be conducted to provide a mosaic pattern to meet wildlife habitat requirements.</li><li>Oak stands on suitable sites would be managed to maintain and increase the size, vigor and productivity of individual trees to increase acorn yields. Methods may include cutting, pruning, and burning.</li><li>Aspen stands would be managed to maintain or enhance distribution, density, regeneration and sustainability, and to favor regeneration of aspen where deemed appropriate. Stands would be managed for maintenance or enhancement using a variety of methods, including harvest cutting or burning.</li><li>Allow for the harvesting, cutting, and pruning, of forest and woodland species that are a hazard to public safety, private property, structures, and cultural resources.</li><li>Allow for the collection of common native seed and non-barrel cacti, except in periods of low vegetative or seed production.</li></ul></li><li>Allow for the maintenance and enhancement of relict stands, picnic areas, and other stands of special significance by methods such as chemical, mechanical, and prescribed fire.</li><li>Allow for the management of cottonwood and other species to restore, enhance, and maintain riparian vegetation.</li></ul>					
<ul style="list-style-type: none"><li>Forests and woodlands would be managed to maintain and restore ecosystems to a condition in which biodiversity is preserved and occurrences of fire, insects, disease and other disturbances would not exceed levels normally expected in healthy forests and woodlands.</li><li>Relict stands would be maintained for biological and genetic diversity.</li><li>Forests and woodlands would be managed under the principles of multiple use and sustained yield without permanent impairment of the productivity of the land and the quality of the environment; use of</li></ul>	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>Public utilization of forest and woodland species before and after vegetative treatments would be allowed to achieve desired future conditions.</li><li>The utilization of forest and woodland species as a tool for vegetative treatments would be allowed.</li><li>Public harvesting of forest and woodland species would be allowed to achieve the greatest output of forest and woodland products. This would be achieved by harvesting stands that have reached culmination of mean annual</li></ul>	<ul style="list-style-type: none"><li>Forests and woodlands would be managed to maintain and restore ecosystems to a condition in which biodiversity is preserved and occurrences of fire, insects, disease and other disturbances do not exceed levels normally expected in healthy forests and woodlands.</li><li>Forests and woodlands would be managed under the principles of multiple use and sustained yield without permanent impairment of the productivity of the land and the quality of the environment; use of forest, woodlands and certain</li></ul>	Unspecified in the current management plans.	<ul style="list-style-type: none"><li>Forests and woodlands would be managed to maintain and restore ecosystems to a condition in which biodiversity is preserved and occurrences of fire, insects, disease and other disturbances do not exceed levels normally expected in healthy forests and woodlands.</li><li>Relict stands would be maintained for biological and genetic diversity.</li><li>Forests and woodlands would be managed under the principles of multiple use and sustained yield without permanent impairment of the productivity of the land and the quality of the environment; use of</li></ul>

AIR QUALITY					
<b>INTRODUCTION</b> The VPA is located in an area designated as attainment or unclassifiable for all pollutants (40 CFR 81.345; 2002).					
<b>GOALS AND OBJECTIVES</b> Ensure that authorizations granted to use public lands and the BLM's own management programs comply with and support applicable local, state, and federal laws, regulations, and implementation plans pertaining to air quality.					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>• Prescribed burns would be consistent with the Utah Department of Environmental Quality (UDEQ) permitting process and timed to minimize smoke impacts.</li><li>• The BLM is required to be in compliance with all local, state, federal and tribal air quality regulations and will do so with Utah regulations, including Utah Administrative Code (UAC) Regulations as determined applicable by the State of Utah.</li><li>• Section R307-205-3 and 205-4 are relevant sections of UAC dealing with fugitive dust and offering some dust abatement mechanisms.</li><li>• UAC R446-1, the best air quality control technology, provided by the Utah Division of Air Quality (UDAQ), would be applied as needed to meet air quality standards.</li><li>• Comply with the appropriate UAC Regulations R307-205-5 through R307-205-7, which prohibit the use, maintenance, or construction of roadways without taking appropriate dust abatement measures. Compliance would be obtained through special stipulations as a requirement on new projects and through the use of dust abatement control techniques in problem areas.</li><li>• Comply with the current Smoke Management Memorandum of Agreement (MOU) between the BLM, USFS, and UDAQ. The MOU (in accordance with UAC regulation R446-1-2.4.4), requires reporting size, date of burn, fuel type, and estimated air emissions from each prescribed burn.</li><li>• The BLM will continue to work cooperatively with state, federal, and tribal entities in developing air quality assessment protocols to address cumulative impacts and regional air quality issues.</li><li>• The BLM will continue to work cooperatively with the Utah Airshed Group to manage emissions from wildland and prescribed fire activities.</li><li>• National Ambient Air Quality Standards are enforced by the Utah Department of Environmental Quality, Division of Air Quality (UDEQ-DAQ), with EPA oversight. Special requirements to reduce potential air quality impacts will be considered on a case-by-case basis in processing land use authorizations.</li><li>• The BLM will utilize BMPs and site specific mitigation measures, when appropriate, based on site specific conditions, to reduce emissions and enhance air quality. Examples of these types of measures can be found in the Four Corners Air Quality Task Force Report of Mitigation Options, November 1, 2007.</li><li>• Project specific analyses will consider use of quantitative air quality analysis methods (i.e. modeling), when appropriate as determined by the BLM, in consultation with state, federal, and tribal entities.</li></ul>

PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
CULTURAL RESOURCES					
<b>INTRODUCTION</b> The VPA encompasses a large and diverse assemblage of prehistoric archaeological sites, historical archaeological sites and localities, and sites with traditional cultural values.					
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>• Preserve and protect a representative array of significant cultural resources, including but not limited to traditional cultural properties, traditional use areas, rock art, and ceremonial sites, and ensure that they are available for appropriate uses by present and future generations.</li><li>• Preserve and protect cultural resources in accordance with existing laws, regulations, and Executive Orders (EO), in consultation with designated contacts from Native American tribes and the State Historic Preservation Office (SHPO) to ensure that they are available for appropriate uses by present and future generations.</li><li>• Preserve and conserve cultural resources by conducting activities in a way that protect values and provide for the following benefits: education, research, public use, conservation for future use, and interpretation.</li></ul>					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>• Protect burial sites, associated burial goods, and sacred items in accordance with the Native American Graves Protection and Repatriation Act and the Archaeological Resources Protection Act.</li><li>• Evaluate cultural resources according to National Register criteria (36 CFR Part 60.4) and assign cultural resources to appropriate use categories as the basis for management decisions.</li><li>• Encourage public/volunteer involvement in the management of cultural resources by establishing site stewardship and other programs.</li><li>• Specific plans would be developed for culturally sensitive areas unless included in other integrated activity plans. Such plans would include protective measures, Native American Consultation, and regulatory compliance. These plans would also include but not be limited to developing a site monitoring system; identifying sites in need of stabilization, restoration, and protective measures (e.g., fences, surveillance equipment); developing research designs for selected sites/areas; designating sites/areas for interpretive development; identifying areas for cultural inventory where federal undertakings are expected to occur; and developing specific mitigation measures. The plan would designate sites, districts, landmarks, and landscapes that would be nominated for inclusion on the National Register of Historic Places.</li><li>• Limit land-disturbing activities within selected Native American traditional cultural and religious sites for continued use by tribes. Traditional cultural sites would be selected in consultation with interested Native American tribes and communities.</li><li>• Consult with Native American tribes for the protection of areas and items of traditional life-ways and religious significance that includes but is not limited to burials, rock art, traditional use areas, religiously active areas, and sacred sites.</li><li>• Pursue appropriate National Register designation, including but not limited to currently eligible sites under current policy and guidance.</li><li>• Conduct an inventory according to professional standards commensurate with the land-use activity, environmental conditions, and the potential for cultural resources.</li><li>• Pro-actively reduce hazardous fuels or mitigate the potential hazard around archaeological and cultural sites that are susceptible to destruction by fire from prescribed fire activities.</li><li>• Conduct consultation process to identify both the resource management concerns and the strategies for addressing them through an interactive dialogue with appropriate Native American communities.</li><li>• Reduce or eliminate imminent threats from natural or human-caused deterioration or conflict with other resource uses.</li><li>• Identify priority geographic areas for new field inventory based upon a probability for unrecorded significant resources.</li><li>• Ensure that all authorizations for land and resource use would comply with Section 106 of the National Historic Preservation Act, consistent with and subject to the objectives established in the RMP for the proactive use of cultural properties in the public interest.</li><li>• The BLM, in coordination with the appropriate county, would continue to identify, evaluate, and nominate historic routes for inclusion into the National Register of Historic Places.</li><li>• When new sites are discovered, interim protection may be applied, if warranted.</li><li>• Provide for legitimate field research by qualified scientists and institutions.</li><li>• Allow for reconstruction, stabilization, maintenance, and interpretation of selected sites for public enjoyment and education.</li><li>• Continue to implement, maintain, and revise as necessary the Nine Mile Canyon Recreation/Cultural Management Plan that includes developing interpretive facilities at appropriate archeological and cultural sites at Nine Mile Canyon in cooperation with the Price Field Office, the Nine Mile coalition team, and the counties. Promote collaborative partnerships to assist in meeting management goals and objectives for cultural resources.</li><li>• Should National Register–eligible cultural resources be found during an inventory, impacts to them would be mitigated, generally through avoidance. Should it be determined the cultural resources cannot be avoided; consultation with the State Historic Preservation Officer (SHPO) would be initiated. A program on mitigation would be developed via consultation between VFO, the SHPO, and the Advisory Council on Historic Preservation.</li><li>• VFO would continue to allocate cultural sites, including ethnographic properties, to one of six management categories: experimental, discharged, public, scientific, traditional, and conservation.</li><li>• Implement regular patrols as feasible to monitor and protect known cultural sites.</li><li>• Establish and implement protective measures for sites, structures, objects, and traditional use areas that are important to Native American tribes with historical and cultural connections to the land, in order to maintain the view shed, intrinsic values, and the auditory, visual, and aesthetic settings of the resources. Protection measures for undisturbed cultural resources and their natural setting would be developed in compliance with regulatory mandates and Native American consultation.</li><li>• Nominate eligible sites, districts, landscapes, and traditional cultural properties for inclusion in the National Register of Historic Places. Manage National Register listed and eligible sites for their local, regional, and national significance.</li></ul>					
<b>JOHN JARVIE HISTORIC SITE</b> Revise the 1989 plan for John Jarvie Historic Site to provide for: <ul style="list-style-type: none"><li>• Maintaining the integrity of the National Historic District through reconstruction, stabilization and restoration of important cultural features, and the elimination or separation of other features that are not culturally significant.</li><li>• Providing adequate protection and management of site.</li><li>• Managing the site for public education and enjoyment by developing educational and interpretive programs and keeping the site open for public viewing during normal visitor use periods.</li></ul>					
On- and off-site interpretive facilities would be developed at appropriate archeological, historical, and cultural sites in a manner that would not	Same as the Proposed RMP.	On- and off-site interpretive materials would be developed at appropriate archeological, historical, and cultural sites only when considered mitigation for	On- and off-site interpretive facilities would be developed for all appropriate archeological, historical, and cultural resources only if it would not adversely	<ul style="list-style-type: none"><li>• Interpretative facilities would be developed at the Old Rock Saloon and Nine Mile Canyon archaeological sites.</li></ul>	On- and off-site interpretive facilities would be developed for all appropriate archeological, historical, and cultural resources only if they would not

Table 2.1.5 Proposed RMP and Alternatives – Fire Management					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
FIRE MANAGEMENT — MAP FIGURES 3 & 4					
<b>INTRODUCTION</b> A National Environmental Policy Act (NEPA)-compliant Fire Management Plan (FMP) was completed for the VPA in 1998. The FMP reflects the goals and objectives for vegetation management and fire's role in maintaining healthy ecosystems and is incorporated into this EIS. The FMP was updated in 2005 and will be signed once the Vernal RMP ROD has been signed for the VFO.					
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>Firefighter safety and public safety would be the first priority in every fire management activity. Property values and critical resource values would be the next priority.</li><li>The primary goal and objective of fire management is to help restore natural systems to their proper functioning condition by restoring fire to its legitimate role in the ecosystem, including managing wildland fire for other resource benefits.</li></ul>					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>All alternatives would attempt to restore natural fire regimes in fire dependent/adapted ecosystems primarily through the use of prescribed fire and managed wildland fire. Where social and/or resource constraints preclude or limit the use of fire, mechanical and/or chemical treatments would be used.</li><li>The Fire Management Plan has been updated and amended to meet the direction and objectives of the RMP. The FMP has been revised to comply with the Interagency Template for Fire Management Plans and identifies Fire Management Units (FMUs) that describe the mix of management activities that can be used to meet the desired future conditions and land use objectives.</li></ul>					
<b>EMERGENCY STABILIZATION AND RESTORATION</b> <ul style="list-style-type: none"><li>Following any wildland fire event, the VFO manager would select an Interdisciplinary Emergency Stabilization and Restoration (ESR) team that would evaluate any burned areas to determine if ESR treatments are needed. ESR treatments would follow the procedures outlined in the BLM Manual Handbook H-1742-1 (including supplemental guidance dated 11/27/2002). If the interdisciplinary team determined that ESR treatments were necessary, the team would develop an ESR plan with site-specific measures designed to minimize resource losses, both on-and off-site, following the wildfire. Consideration would be given to sensitive resource values in preparation of the ESR plan, including WSAs, special emphasis areas, critical soils, cultural resources, and special status species habitat. ESR treatments may include, but would not be limited to seeding, seedbed preparation practices, fencing, chemical applications, water retention structures, and control of livestock, and wildlife grazing. Site-specific ESR plans would be tiered to the existing Normal Fire Year Rehabilitation Plan for the VPA.</li><li>Criteria for developing ESR actions would consist of:<ul style="list-style-type: none"><li>Areas where the risk of imminent soil loss is high.</li><li>Areas that contain T&amp;E Species or state sensitive species habitat.</li><li>Areas that contain municipal watersheds; and areas where there is a high potential for invasive species establishment.</li></ul></li></ul>					
<b>HAZARDOUS FUELS</b> <ul style="list-style-type: none"><li>Hazardous fuel reduction activities would be implemented primarily through the use of prescribed fire and managed wildland fire. In some cases, chemical and/or mechanical treatments would be used in conjunction with fire. Where social and/or resource constraints preclude the use of fire, mechanical and/or chemical treatments would be used.</li><li>Criteria for developing hazardous fuel reduction priorities would consist of the following:<ul style="list-style-type: none"><li>Areas of Fire Regime Condition Class 2 and 3.</li><li>Areas where the potential risk of losing keystone ecosystem species is present.</li><li>Areas where threats to private/public property exist.</li></ul></li><li>All fire-management planning activities would comply with the National Fire Plan, including the streamlined Section 7 Consultation procedures.</li><li>Fire Regime and Condition Classes for the VPA have been designated and mapped (Map Figures 3 and 4 respectively). The FMP would be updated and amended to meet the direction of the Vernal RMP and adjusted to meet the Department of the Interior's Federal Wildland Fire Management Policy.</li><li>In partnership with the State of Utah, the Utah Indian Tribe, and the counties, the BLM would develop WUI Projects.</li><li>The VPA is divided into fire management categories. Fire suppression activities and the Appropriate Management Response (AMR) would be implemented through the guidance developed under the ABCD polygons as outlined in Handbook-1601. Criteria used in development of the categories were determined through an Interdisciplinary Team of resource specialists. Criteria for each category is described below:<ul style="list-style-type: none"><li><b>Category A</b> — Areas where unplanned fire is not desired at all. This category includes the salt desert shrub vegetation type where the risk of cheatgrass invasion is high following fire events. Also included are the major river corridors where fire results in the loss of Fremont cottonwood, a keystone species in present decline. Other constraints to fire management activities include cultural resource sites, high recreational use, and highly developed oil and gas fields.</li><li><b>Category B</b> — Areas where unplanned fire is not desired because of current conditions. Prescribed fire use is allowed to obtain resource management objectives; mechanical/chemical treatments would be utilized where social and/or resource constraints preclude the use of prescribed fire. This category includes the five identified WUI areas for the VFO, including adjacent urban interfaces, cultural resources, crucial deer winter range, and crucial Sage-grouse habitat. Within this habitat, Wyoming sagebrush is identified as a keystone species, which has been in a continual state of decline due to widespread drought and invasive species encroachment.</li><li><b>Category C</b> — Areas where wildland fire is desired. Prescribed fire is allowed and may be extensive to obtain resource management objectives; mechanical/chemical treatments would be utilized where social and/or resource constraints preclude the use of prescribed fire. This category contains the pinyon-juniper vegetation type, along with aspen/Douglas fir, mountain browse, and non-crucial areas of sagebrush. Other constraints to fire management activities include a limited amount of oil and gas development, non-crucial Sage-grouse habitat, a limited amount of T&amp;E species habitat, and a limited amount of cultural resources.</li><li><b>Category D</b> — Areas where wildland fire is desired, and there are few or no constraints for its use. This category contains non-crucial Sage-grouse habitat, a limited amount of T&amp;E species habitat, non-WSA lands with wilderness characteristics, and a limited amount of cultural resources.</li></ul></li></ul>					

Table 2.1.5 Proposed RMP and Alternatives – Fire Management											
PROPOSED RMP		Alternative A (Draft RMP/EIS Preferred Alternative)		Alternative B		Alternative C		Alternative D Current Management (No Action)		Alternative E	
FIRE MANAGEMENT — MAP FIGURES 3 & 4											
Hazardous Fuel Targets				Wildland Fire Use Targets				Allowable Wildland Fire Acres Burned per Decade

Category D	53,117	0	0			Category D	30,000				
WILDLAND URBAN INTERFACE (WUI)											
<ul style="list-style-type: none"><li>For Wildland Urban Interface (WUI) areas, the objective would be to reduce hazardous fuels adjacent to these at-risk areas through mechanical, prescribed fire, or chemical treatments, or a combination thereof. In partnership with the State of Utah, the Ute Indian Tribe, and the counties, the BLM would develop WUI Projects.</li><li>WUI areas within the VFO area have been identified in NFPORS. These are communities/developed areas that are located within the vicinity of federal lands and are at risk from potential wildland fire events. The intent is to reduce the hazardous fuels adjacent to these at-risk areas through mechanical, prescribed, or chemical fire or a combination of these treatments. The priority areas identified for WUI projects are Browns Park, Deadman Bench, Deep Creek, Diamond Mountain, and Dry Fork.</li></ul>											
Prescribed burning would be allowed for approximately 156,425 acres per decade.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>Prescribed burns would be employed on up to 27,950 acres in the Book Cliffs RMP area.</li><li>For the Diamond Mountain RMP, 22,950 acres of pinyon-juniper woodlands and sagebrush communities would be manipulated (methods would include prescribed burning).</li></ul>	Same as the Proposed RMP.					
<ul style="list-style-type: none"><li>The use of prescribed fire in non-WSA lands that are managed for wilderness characteristics would be permitted for forest, woodland, and vegetation treatments, and for reduction of fuels, when compatible with the goals and objectives for management of the areas.</li><li>Fire lines and other surface disturbances would be rehabilitated following completion of the burning operation.</li></ul>	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the current management plans.	<ul style="list-style-type: none"><li>The use of prescribed fire in non-WSA lands with wilderness characteristics would be permitted for forest, woodland, and vegetation treatments, and for reduction of fuels, when compatible with the goals and objectives for management of the areas.</li><li>Fire lines and other surface disturbances would be rehabilitated following completion of the burning operation.</li></ul>

Table 2.1.6 Proposed RMP and Alternatives - Forage					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
FORAGE — ALL LOCALITIES — MAP FIGURE 5					
<b>GOALS AND OBJECTIVES</b> Maintain or improve the total forage resource using techniques that are compatible with the use and development of other resources and that would maintain, meet, or make substantial progress towards meeting Utah BLM Rangeland Health Standards.					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>Monitoring would be used to determine the amount of forage available for livestock, wildlife, and wild horses. Results of monitoring would be used to adapt management strategies to prevent deterioration of rangelands, to achieve desired resource conditions, and to meet other resource objectives.</li><li>Any adjustment in forage assignments to either livestock or wildlife would be based on analysis of monitoring data, including long-term vegetation trend, actual use, climate, and utilization. Additionally forage would not be allocated in areas where forage production is less than 25 pounds per acre, which equates to 32 acres per AUM. Areas that are seldom or never grazed by livestock due to physical factors such as slopes greater than 50% and areas that are in excess of four miles from water would not be included in the livestock forage allocation. An exception for areas in excess of four miles of water if water is hauled or the area would be grazed when snow is on the ground. Adjustments would involve permittees and would be implemented through documented mutual agreement or decision.</li><li>Increases or reductions associated with joint monitoring of base allocations would be evaluated against the established grazing permits and UDWR herd unit objectives to determine needed adjustments to animal numbers, adjustments in seasons of use, etc. Unless specified elsewhere in the plan, changes in forage allocation would be as follows:<ul style="list-style-type: none"><li>When all other management options have been exhausted and it is determined that rangeland standards are not being met, reductions would be made to the species of grazing animal shown to be causing the problem.</li><li>If additional forage is determined to be available, it would be proportionally allocated to grazing animals according to their dietary need or would be allocated to watershed, riparian, or other resource values, unless specified elsewhere in the plan.</li><li>Increases in available forage resulting from conservation practices, improved range condition, or development of improvements by the livestock permittee, DWR, or other organizations, would be credited to that entity unless specified elsewhere in the plan.</li></ul></li><li>Should a permittee apply for reinstatement of suspended use, it would only be considered if:<ul style="list-style-type: none"><li>Adjustment of suspended use would follow policy, regulation, and guidelines.</li><li>The allotment/s is/are being grazed at full permitted use in order to adequately assess the carrying capacity of the range resource;</li><li>Adequate monitoring data is in place to assess AUMs; and</li><li>A signed agreement is in place that outlines at least a subsequent five-year monitoring protocol.</li></ul></li><li>AUMs would be adjusted downward for livestock, wildlife, or wild horses (or any combination thereof) when monitoring shows that rangeland objectives are not being met and that the long-term forage availability is not adequate to support the permitted uses.</li><li>If it is determined through monitoring that livestock grazing is beneficial to other resource values, it would be allowed on 16 miles of river corridor along the Upper Green River in Brown's Park following an adequate evaluation and assessment. If such use is allowed, it would be of short duration and would not detract from recreation and/or riparian values along the river.</li><li>Grazing preference is retired on the following allotments: Red Creek Flat, Taylor Flat, Watson, Rye Grass, Marshall Draw, South Warren Draw, and Sears Canyon. Applications for livestock grazing would only be approved on a non-renewable, short duration basis following an adequate evaluation and assessment to determine if it would enhance wildlife values.</li><li>When the Vernal RMP becomes effective, the active AUMs permitted to The Nature Conservancy (TNC) (4,232) and Rocky Mountain Elk Foundation (RMEF) (4,026) would be allocated to wildlife. Ranchers (grazing permittees) other than TNC and RMEF also have permits in the allotments where these AUMS are relinquished; they would continue to graze cattle in accordance with their permitted use. <b>Note:</b> Further review of TNC and RMEF grazing permits indicate that TNC's AUMs were actually 7 less (4,239 to 4,232) and RMEF was 1 more (4,025 to 4,026) than the figures stated in the Vernal Draft RMP/EIS. This revision will not impact the management decision.</li></ul>					
Unless otherwise specified by a management plan, up to 50% utilization of forage on uplands would be allowed.	Same as the Proposed RMP.	Unless otherwise specified by a management plan, up to 60% utilization of forage on uplands would be allowed.	Same as the Proposed RMP.	Unspecified in the current management plans.	Same as the Proposed RMP.
AUMs would be allocated as follows: <ul style="list-style-type: none"><li>138,402 AUMs for livestock</li><li>104,865 AUMs for wildlife</li><li>2,340 AUMs for wild horses</li></ul> <b>Note:</b> The Book Cliffs RMP/EIS ROD did not allocate any AUMs for wild horses in the Bonanza area. The 1,020 AUMs for wild horses in the Bonanza area should not have been carried forward in Alternative D in the Vernal Draft RMP/EIS. The Proposed RMP does not include these AUMs.	AUMs would be allocated as follows: <ul style="list-style-type: none"><li>137,838 AUMs for livestock</li><li>104,871 AUMs for wildlife</li><li>2,940 AUMs for wild horses</li></ul>	AUMs would be allocated as follows: <ul style="list-style-type: none"><li>139,163 AUMs for livestock</li><li>104,871 AUMs for wildlife</li><li>0 AUMs for wild horses</li></ul>	AUMs would be allocated as follows: <ul style="list-style-type: none"><li>77,294 AUMs for livestock</li><li>106,196 AUMs for wildlife</li><li>3,960 AUMs for wild horses</li></ul>	AUMs would be allocated as follows: <ul style="list-style-type: none"><li>146,161 AUMs for livestock</li><li>96,607 AUMS for wildlife</li><li>2,340 AUMs for wild horses</li></ul>	Same as Alternative C.
FORAGE–BONANZA LOCALITY					
If forage allocation reductions are necessary to make significant progress towards or sustain rangeland health, the following criteria would be followed to make the needed reductions:					

Table 2.1.6 Proposed RMP and Alternatives - Forage					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
o Demonstrated Conflicts Between Wildlife And Livestock					
<ul style="list-style-type: none"><li>• Sheep and/or cattle and pronghorn would be reduced proportionately.</li><li>• Pronghorn use would not be reduced below 502 AUMs.</li></ul>	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>• Pronghorn use would be reduced, but not below 502 AUMs.</li><li>• Appropriate reductions in big game would be made prior to making needed reductions in livestock numbers.</li></ul>	<ul style="list-style-type: none"><li>• Livestock use would be reduced.</li><li>• Pronghorn use would not be reduced.</li><li>• Deer or other big game use would not be reduced.</li></ul>	Unspecified in the current management plans.	Same as Alternative C.
If additional forage is available and rangeland health is being sustained, or if significant progress is being made towards sustaining rangeland health, increased use would be considered based on the following criteria:					
o Additional Forage Meets the Dietary Needs of Livestock and Wildlife					
<ul style="list-style-type: none"><li>• Forage increases would be divided proportionately between livestock and big game.</li><li>• Wildlife AUMs that are made available would go to pronghorn and deer.</li></ul>	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>• Up to 502 AUMs of forage would be provided for pronghorn and sheep and/or cattle use would be increased in accordance with available forage.</li><li>• If the additional AUMs are not needed for livestock or pronghorn, any remaining AUMs would be allocated to deer.</li></ul>	<ul style="list-style-type: none"><li>• Wildlife use would be increased in accordance with available forage.</li><li>• Livestock use would not be increased above permitted use.</li></ul>	<ul style="list-style-type: none"><li>• Optimum wildlife levels would be provided for where conflicts with livestock do not exist.</li><li>• Specific to deer, habitat would be managed to support significantly increased levels; and specific to pronghorn, habitat would be managed to support increased levels.</li><li>• Target livestock AUM figures are not final stocking levels.</li><li>• All livestock use adjustments would be implemented through documented mutual agreement or by decision.</li><li>• When livestock use adjustments would be implemented by decision, it would be based on operator consultation and monitoring of resource conditions.</li><li>• Any necessary adjustments in stocking levels or other management practices, including changes or additions to existing management facilities, would be based on allotment evaluations.</li></ul>	Same as Alternative C.
FORAGE — BONANZA WILD HORSE HERD AREA LOCALITY					
This Herd Area will not be managed for wild horses.	Same as the Proposed RMP.	Same as the Proposed RMP.	Allocate 1,020 AUMs for wild horses.	Not applicable. Same as Proposed RMP.  <b>Note:</b> The proposed Bonanza Wild Horse Herd Plan Amendment was rescinded and never implemented.	Same as Alternative C.
If forage allocation reductions are necessary to make significant progress towards or sustain rangeland health, the following criteria would be followed to make the needed reductions:					
o Demonstrated Conflicts between Wildlife and livestock					
Would proportionately reduce sheep and pronghorn use; however, pronghorn use would not be reduced below 239 AUMs.	Same as the Proposed RMP.	Wildlife use would be reduced; however, pronghorn use would not be reduced below 239 AUMs nor deer use below 147 AUMs.	<ul style="list-style-type: none"><li>• Livestock use would be reduced.</li><li>• Wildlife use would not be reduced.</li></ul>	<ul style="list-style-type: none"><li>• Pronghorn use would not be reduced below 289 AUMs.</li><li>• Sheep use would be reduced.</li></ul>	Same as Alternative C.
o Demonstrated Conflicts with Wild Horses and Livestock					
This Herd Area will not be managed for	Same as the Proposed RMP.	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>• Livestock use would be reduced.</li></ul>	Same as the Proposed RMP.	Same as Alternative C.

Table 2.1.6 Proposed RMP and Alternatives - Forage					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
wild horses.			<ul style="list-style-type: none"><li>Wild horse use would be reduced, but not below 480 AUMs.</li></ul>		
o Demonstrated Conflicts with Wild Horses and Wildlife					
This Herd Area will not be managed for wild horses.	Same as the Proposed RMP.	Same as the Proposed RMP.	Wild horse and wildlife use would be proportionately reduced.	Same as the Proposed RMP.	Same as Alternative C.
If additional forage is available and rangeland health is being sustained, or if significant progress is being made towards sustaining rangeland health, increased use would be considered based on the following criteria:					
o Additional Forage Meets the Dietary Needs of Livestock and Wildlife					
Sheep and wildlife use would be increased proportionately in accordance with available forage.	Same as the Proposed RMP.	Sheep and cattle use would be increased in accordance with available forage.	<ul style="list-style-type: none"><li>Pronghorn and deer use would be increased in accordance with available forage.</li><li>Livestock would not be increased above permitted use.</li></ul>	<ul style="list-style-type: none"><li>Pronghorn use would be increased until there are conflicts with sheep.</li><li>Sheep use would increase in accordance with available forage.</li></ul>	Same as Alternative C.
o Additional Forage Meets the Dietary Needs of Horses, Sheep, or Pronghorn					
<ul style="list-style-type: none"><li>This Herd Area will not be managed for wild horses.</li><li>Sheep and wildlife use would be increased proportionately in accordance with available forage.</li></ul>	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>This Herd Area will not be managed for wild horses.</li><li>Sheep and cattle use would be increased in accordance with available forage.</li></ul>	<ul style="list-style-type: none"><li>Would not increase AML.</li><li>Would increase pronghorn use until there are conflicts with sheep.</li><li>Would increase sheep use in accordance with available forage.</li></ul>	<ul style="list-style-type: none"><li>Would increase pronghorn use until there are conflicts with sheep.</li><li>Would increase sheep use in accordance with available forage.</li></ul>	Same as Alternative C.
o Additional Forage Meets the Dietary Needs of Horses and Sheep					
<ul style="list-style-type: none"><li>This Herd Area will not be managed for wild horses.</li><li>Sheep would be increased proportionately in accordance with available forage.</li></ul>	Same as the Proposed RMP.	Same as the Proposed RMP.	Would increase horse use in accordance with available forage.	Unspecified in the current management plans.	Same as Alternative C.
FORAGE — BOOK CLIFFS LOCALITY					
CRIPPLE COWBOY					
1,325 unallocated AUMs acquired by acquisition of private lands (Cripple Cowboy) would be reserved for watershed.  Although wildlife and livestock would not be excluded from utilizing these lands, no additional AUMs would be allocated.	Same as the Proposed RMP.	1,325 unallocated AUMs acquired by acquisition of private lands (Cripple Cowboy) would be allocated to livestock.	1,325 unallocated AUMs acquired by acquisition of private lands (Cripple Cowboy) would be allocated to wildlife.	Unspecified in the current management plans.	Same as Alternative C.
WINTER RIDGE HERD AREA/HILL CREEK HERD MANAGEMENT AREA					
<ul style="list-style-type: none"><li>No long-term management prescriptions for wild horses. No wild horses due to disease (e.g. EIA), trespass of private horses, and manageability of the horses.</li><li>Initially wild horses would be authorized in the Winter Ridge HA/Hill Creek HMA and 2,340 AUMs would be allocated until the horses are removed.</li><li>The 2,340 AUMs no longer needed for wild horses would be allocated through a future planning process.</li></ul>	<ul style="list-style-type: none"><li>1,200 AUMs would be allocated for wild horses in the Winter Ridge Herd Area.</li><li>1,740 AUMs would be allocated for wild horses in the Hill Creek HMA.</li></ul>	Forage for wild horses would not be allocated in Winter Ridge Herd Area or Hill Creek HMA.	Same as Alternative A.	2,340 AUMs would be allocated for wild horses in the Hill Creek Herd Management Area.	Same as Alternative A.

Table 2.1.6 Proposed RMP and Alternatives - Forage					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
If monitoring shows that reductions are necessary in all areas except the Wild Horse Herd Areas because of:					
o Demonstrated Conflicts between Wildlife and Livestock					
Reductions in grazing use would be divided proportionately between livestock and big game.	Same as the Proposed RMP.	Big game use would be reduced.	Livestock use would be reduced.	Unspecified in the current management plans.	Same as Alternative C.
If monitoring shows that reductions are necessary in the Wild Horse Herd Areas because of:					
o Demonstrated Conflicts between Big Game, Livestock, and Wild Horses					
<ul style="list-style-type: none"><li>No wild horses would be permitted in the Winter Ridge HA and Hill Creek HMA due to disease (e.g., EIA) and trespass of private horses.</li><li>Any reductions in grazing due to demonstrated conflicts between livestock and big game would be divided proportionately.</li></ul>	Reductions in grazing use would be divided proportionately between livestock, big game, and wild horses.	<ul style="list-style-type: none"><li>This Herd Area will not be managed for wild horses.</li><li>Big game use would be reduced.</li></ul>	Livestock use would be reduced.	Unspecified in the current management plans.	Same as Alternative C.
o Demonstrated Conflicts between Big Game and Livestock					
<ul style="list-style-type: none"><li>No wild horses would be permitted in the Winter Ridge HA and Hill Creek HMA due to disease (e.g., EIA) and trespass of private horses.</li><li>Any reductions in grazing due to demonstrated conflicts between livestock and big game would be divided proportionately.</li></ul>	Reductions in grazing use would be divided proportionately between livestock and big game.	Big game use would be reduced.	Livestock use would be reduced.	Unspecified in the current management plans.	Same as Alternative C.
o Demonstrated Conflicts between Livestock and Wild Horses					
This Herd Area and Herd Management Area will not be managed for wild horses.	Reductions in grazing use would be divided proportionately between livestock and wild horses.	Same as the Proposed RMP.	Livestock use would be reduced.	Unspecified in the current management plans.	Same as Alternative C.
o Demonstrated Conflicts between Big Game and Wild Horses					
This Herd Area and Herd Management Area will not be managed for wild horses.	Reductions in grazing use would be divided proportionately between wild horses and big game.	Same as the Proposed RMP.	Same as Alternative A.	Unspecified in the current management plans.	Same as Alternative A.
Additional forage would be allocated in areas except wild horse herd areas as follows:					
o Cattle Allotments					
<ul style="list-style-type: none"><li>60% to reinstate suspended cattle AUMs and 40% for wildlife.</li><li>After restoring all suspended AUMs, allocate additional AUMs proportionately between livestock and wildlife.</li></ul>	<ul style="list-style-type: none"><li>60% to restore suspended cattle AUMs and 40% for wildlife.</li><li>After restoring all suspended AUMs, allocate any additional forage to livestock.</li></ul>	<ul style="list-style-type: none"><li>60% to reinstate suspended cattle AUMs and 40% for wildlife.</li><li>After restoring all suspended AUMs, allocate any additional forage to livestock.</li></ul>	<ul style="list-style-type: none"><li>60% to reinstate suspended cattle AUMs and 40% for wildlife.</li><li>After reinstating all suspended AUMs, allocate additional forage to wildlife.</li></ul>	<ul style="list-style-type: none"><li>Optimum wildlife levels where conflicts with livestock do not exist; specific to deer, habitat would be managed to support significantly increased levels.</li><li>Target livestock AUM figures are not final stocking levels.</li><li>All livestock use adjustments would be implemented through documented mutual agreement or by decision.</li><li>When livestock use adjustments would be implemented by decision, it would be based on operator</li></ul>	Same as Alternative C.

				consultation and monitoring of resource conditions. <ul style="list-style-type: none"><li>Any necessary adjustments in stocking levels or other management practices, including changes or additions to existing management facilities, would be based on allotment evaluations.</li></ul>	
o Sheep Allotments					
Forage increases would be divided proportionately between livestock and big game.	Same as the Proposed RMP.	Any additional forage would be allocated to sheep.	<ul style="list-style-type: none"><li>Forage increases would be allocated to big game.</li><li>If additional forage were not needed by big game, it would be given to livestock.</li><li>Big game numbers would be allowed to increase only to the point livestock permitted use would not be reduced.</li></ul>	<ul style="list-style-type: none"><li>Optimum wildlife levels would be provided for where conflicts with livestock do not exist; specific to deer, habitat would be managed to support significantly increased levels and increased levels of pronghorn on East Bench.</li><li>Target livestock AUM figures are not final stocking levels.</li><li>All livestock-use adjustments would be implemented through documented mutual agreement or by decision.</li><li>When livestock-use adjustments would be implemented by decision, it would be based on operator consultation and monitoring of resource conditions.</li><li>Any necessary adjustments in stocking levels or other management practices, including changes or additions to existing management facilities, would be based on allotment evaluations.</li></ul>	Same as Alternative C.
Additional forage would be allocated in the Winter Ridge HA and Hill Creek HMA as follows:					
<ul style="list-style-type: none"><li>This Herd Area and Herd Management Area will not be managed for wild horses.</li><li>Forage increases would be divided proportionately between livestock and big game.</li><li>If big game does not need additional forage, it would be given to livestock.</li></ul>	<ul style="list-style-type: none"><li>Forage increases would be divided proportionately between livestock, big game, and wild horses.</li><li>If wild horses or big game do not need additional forage, it would be given to livestock.</li></ul>	<ul style="list-style-type: none"><li>This Herd Area and Herd Management Area will not be managed for wild horses.</li><li>Additional forage would be allocated to livestock.</li></ul>	<ul style="list-style-type: none"><li>Forage increases would be divided proportionately between big game and wild horses.</li><li>If wild horses or big game do not need additional forage, it would be given to livestock.</li><li>Big game and wild horse numbers would be allowed to increase only to the point livestock permitted use would not be reduced.</li></ul>	<ul style="list-style-type: none"><li>Target livestock AUM figures are not final stocking levels. Rather, all livestock-use adjustments would be implemented through documented mutual agreement or by decision. When livestock-use adjustments would be implemented by decision, it would be based on operator consultation and monitoring of resource conditions.</li><li>Additionally, any necessary adjustments in stocking levels or other management practices, including changes or additions to existing management facilities, would be based on allotment evaluations.</li><li>Optimum wildlife levels would be</li></ul>	Same as Alternative C.

Table 2.1.6 Proposed RMP and Alternatives - Forage					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
				provided for where conflicts with livestock do not exist; specific to deer, habitat would be managed to support significantly increased levels.	
FORAGE — BLUE MOUNTAIN LOCALITY					
<ul style="list-style-type: none"><li>If monitoring indicates forage assignments cannot be met, livestock permitted use and wildlife use would be reduced proportionately.</li><li>The first year livestock reductions would be made with an initial 10% adjustment.</li><li>Five-year agreements would be developed and signed outlining the process for phased reductions to the desired level.</li></ul>	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>If monitoring indicates forage assignments cannot be met, wildlife use would be reduced to a level at which no livestock/wildlife forage conflict exists.</li><li>Any additional necessary reductions would be made to livestock.</li><li>Five-year agreements would be developed and signed outlining the process for phased reductions to the desired level.</li></ul>	<ul style="list-style-type: none"><li>If monitoring indicates forage assignments cannot be met, livestock permitted use would be reduced.</li><li>Adjustments would be attained by decision or agreement.</li><li>The first year reductions would be made with an initial 10% adjustment.</li><li>Five-year agreements would be developed and signed outlining the process for phased reductions to the desired level.</li></ul>	<ul style="list-style-type: none"><li>Target livestock AUM figures are not final stocking levels.</li><li>All livestock use adjustments would be implemented through documented mutual agreement or by decision.</li><li>When livestock use adjustments would be implemented by decision, it would be based on operator consultation and monitoring of resource conditions.</li><li>Any necessary adjustments in stocking levels or other management practices, including changes or additions to existing management facilities, would be based on allotment evaluations.</li><li>Decreases in livestock forage would be implemented over a five-year period.</li></ul>	Same as Alternative C.
Additional forage would be allocated in the Blue Mountain area as follows:					
Additional AUMs realized through management changes and/or livestock-oriented vegetation treatments would be divided proportionately between livestock and big game.	Same as the Proposed RMP.	Additional AUMs realized through management changes and/or livestock-oriented vegetation treatments would be assigned to livestock.	Additional AUMs realized through management and/or created from wildlife-oriented vegetation treatment would be provided to wildlife.	<ul style="list-style-type: none"><li>Habitat for deer would be managed to support current levels.</li><li>Target livestock AUM figures are not final stocking levels.</li><li>All livestock-use adjustments would be implemented through documented mutual agreement or by decision.</li><li>When livestock-use adjustments would be implemented by decision, it would be based on operator consultation and monitoring of resource conditions.</li><li>Any necessary adjustments in stocking levels or other management practices, including changes or additions to existing management facilities, would be based on allotment evaluations.</li></ul>	Same as Alternative C.
FORAGE — DIAMOND MOUNTAIN LOCALITY					
<ul style="list-style-type: none"><li>If monitoring indicates that forage assignments cannot be met, then livestock and wildlife use would be reduced proportionately.</li><li>The first year livestock reductions</li></ul>	Same as the Proposed RMP.	<ul style="list-style-type: none"><li>If monitoring indicates that forage assignments cannot be met, then wildlife use would be reduced to a level at which no livestock/wildlife forage conflict exists.</li></ul>	<ul style="list-style-type: none"><li>If monitoring indicates that forage assignments cannot be met, then livestock permitted use would be reduced.</li><li>Adjustments would be attained by</li></ul>	<p>If monitoring indicates that forage assignments cannot be met, then reductions would be made using the following criteria:</p> <ul style="list-style-type: none"><li>Temporary, nonrenewable livestock</li></ul>	Same as Alternative C.

Table 2.1.6 Proposed RMP and Alternatives - Forage					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
<p>would be made with an initial 10% adjustment.</p> <ul style="list-style-type: none"><li>Five-year agreements would be developed and signed outlining the process for phased reductions to the desired level.</li></ul>		<ul style="list-style-type: none"><li>Any additional necessary reductions would be made to livestock.</li></ul>	<p>decision or agreement.</p> <ul style="list-style-type: none"><li>The first year, reductions would be made with an initial 10% adjustment.</li><li>Five-year agreements would be developed and signed at the same time outlining the process for phased reductions to the desired level.</li></ul>	<p>AUMs above permitted use would be reduced first.</p> <ul style="list-style-type: none"><li>On wildlife crucial habitat, livestock permitted use would be reduced if there is a conflict between use by livestock and wildlife and if wildlife numbers are within the herd unit or population objective levels.</li><li>If there is no conflict and the reduction is necessary because of overuse by either livestock or wildlife, that animal's numbers would be reduced.</li><li>On non-crucial wildlife habitat, livestock permitted use and wildlife numbers would be reduced equally.</li><li>The first year, there would be an initial 10% adjustment in permitted use.</li><li>Five-year agreements would be developed and signed at the same time outlining the process for phased reductions to the desired level.</li><li>Temporary adjustments in use due to effects of drought would be made to livestock and/or wildlife as needed based on monitoring.</li></ul>	
Additional forage would be allocated in the Diamond Mountain area as follows:					
<p>Additional AUMs would be provided as follows:</p> <ul style="list-style-type: none"><li>In the northern half of the area (Diamond Mountain and Brown's Park), additional AUMs would be provided to livestock until wildlife demands require them.</li><li>In the southern half of the area (Ashley Valley and Myton Bench), forage increases would be divided proportionately between livestock and big game on non-crucial wildlife areas.</li></ul>	Same as the Proposed RMP.	Additional AUMs realized through management changes and/or vegetation treatments would be assigned to livestock.	Additional AUMs realized through management changes and/or vegetation treatment would be provided to wildlife or retained for watershed.	<ul style="list-style-type: none"><li>Additional AUMs (over permitted use) would be provided to livestock on a temporary, nonrenewable basis until identified for crucial wildlife needs.</li><li>Additional AUMs outside crucial wildlife areas could be assigned to livestock.</li></ul>	Same as Alternative C.

Table 2.1.7 Proposed RMP and Alternatives – Lands and Realty Management

Table 2.1.7 Proposed RMP and Alternatives – Lands and Realty Management					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
LANDS AND REALTY MANAGEMENT — MAP FIGURE 6					
<b>INTRODUCTION</b> Federal public land laws and implementing regulations enable the BLM to engage in and complete realty actions involving acquisition, use, disposal, and adjustment of land resources and maintenance of historic records for these transactions.					
<b>GOALS AND OBJECTIVES</b> <ul style="list-style-type: none"><li>Accommodate community growth and development when it is determined that it is in compliance with other goals and objectives of the plan.</li><li>Improve management opportunities for resource protection, resource development, or administration of public lands.</li><li>Process applications, permits, operating plans, mineral exchanges, leases, and other use authorizations for public lands in accordance with policy and guidance.</li><li>Manage public lands to support goals and objectives of other resources programs, respond to public requests for land use authorizations, and acquire administrative and public access where necessary.</li><li>Dispose of lands that are effectively unmanageable due to size, location, etc.</li><li>Acquire lands that would enhance management objectives of this RMP.</li><li>Give land exchanges with the State of Utah priority consideration to resolve inholdings issues.</li><li>As per the State of Utah v. Andrus, October 1, 1979 (Cotter Decision), the BLM would grant the State of Utah reasonable access to state lands for economic purposes, on a case-by-case basis.</li></ul>					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b> <ul style="list-style-type: none"><li>Consider new major communication sites on an as-needed basis.</li><li>Acquisitions, exchanges, easements, or disposals would be considered, using LTA criteria on a case-by-case basis, between willing buyers and sellers.</li><li>The BLM would retain lands within its administrative jurisdiction, except where necessary to accomplish one or more of the following objectives:<ul style="list-style-type: none"><li>Improve management of natural resources through consolidation of federal, state and private lands.</li><li>Secure key property necessary to protect special status species, including threatened and endangered species, promote biological diversity, increase recreational opportunities, and preserve archaeological, paleontological and historical resources.</li></ul></li><li>Implement specific acquisitions authorized by Acts of Congress by acquiring minimal non-federal lands or interest in lands.</li><li>When opportunities occur, acquire isolated tracts of non-federal land from willing sellers within special management areas to consolidate ownership and eliminate non-federal in-holdings.</li><li>The following criteria would be used when evaluating proposed land use authorizations:<ul style="list-style-type: none"><li>Land use authorizations would not be approved in any designated exclusion areas.</li><li>Land use authorizations in avoidance areas may be authorized provided they are considered consistent with the current management objectives; those that are not would either be rejected or would necessitate a plan amendment prior to approval.</li><li>Habitat for listed T&amp;E species would be retained in federal ownership. Exceptions may be considered in exchanges with the State of Utah and others with consultation and concurrence with the USFWS.</li></ul></li></ul>					
<b>DISPOSALS</b> <ul style="list-style-type: none"><li>Public lands within the VFO would be considered for disposal through methods such as sale, exchange, state indemnity selection Airport and Airway Improvement Act, Color-of-Title Act, State Selections under the Enabling Act, Recreation and Public Purpose Act patent, other lesser-used authorities, or as directed by special legislation.</li><li>All disposal actions would be coordinated with adjoining landowners, local governments, and current land users. Approximately 32,067 acres of public lands for disposal are identified in Map Figure 6.</li></ul>					
<b>EASEMENTS</b> Acquire public access to approximately 70,700 public acres for recreational purposes identified as follows: <ul style="list-style-type: none"><li><b>High Priority:</b> Ashley Creek drainages, White River, Jackson Draw, Warren Draw, Allen Draw, Red Mountain, Wild Mountain-South Pot Creek, Spring Creek, Nine Mile, Red Mountain East and West, and Moon Shine area.</li><li><b>Moderate Priority:</b> Horseshoe Bend, Argyle Ridge, Jensen Canyon, Little Sulfur Canyon, Ashley Creek Recreation Site, Hoy Mountain, Dead Horse Draw, and Blue Mountain.</li><li><b>Low Priority:</b> Sears Canyon, Marshall Draw, West Little Mountain, and East Nine Mile Canyon.</li></ul>					
<b>EXCHANGES/ACQUISITIONS</b> <ul style="list-style-type: none"><li>Public lands would be considered for disposal by exchange provided the exchange would result in more efficient federal management of the public lands. Land exchanges would be based on fair market value determined for the federal and non-federal lands as defined in Uniform Appraisal Standards for Federal Acquisitions and by current BLM policy.</li><li>Non-federal lands would be considered for acquisition through exchange of suitable public land, on a case-by-case basis, where acquisition of the non-federal lands would contain resource values equal to or greater than the public lands being exchanged.</li><li>Exchanges with the State of Utah would be given a priority consideration. There are a significant number of state land sections administered by the School and Institutional Trust Lands Administration (SITLA) scattered throughout the RMP area. Many of these state lands are in-holdings located within designated resource management areas identified in this RMP. SITLA has indicated their desire to exchange SITLA lands within these BLM management areas for BLM-administered lands elsewhere in the RMP area. The BLM recognizes the opportunity for mutually beneficial land tenure adjustments and would apply the RMP Land Tenure Adjustment Criteria.</li><li>Non-federal lands to be acquired through both Bureau- and public-initiated exchanges must be in the public interest and have at least one of the following characteristics:<ul style="list-style-type: none"><li>Acquisition would facilitate access to public lands and resources and/or contribute to a more efficient and manageable land ownership pattern.</li><li>Acquisition would facilitate implementation of the RMP management actions.</li><li>Acquisition of the non-federal lands would maintain or enhance public uses and values, with priority given to acquiring riparian/wetlands; lands with high recreation use and/or wildlife values; sensitive plant or animal habitat; and lands with significant cultural sites and/or paleontological localities or within other special designations.</li><li>Acquisitions that would meet other conditions pursuant to FLPMA Section 206 or 43 CFR 2200.</li></ul></li></ul>					

Table 2.1.7 Proposed RMP and Alternatives – Lands and Realty Management

Table 2.1.7 Proposed RMP and Alternatives – Lands and Realty Management					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
LANDS AND REALTY MANAGEMENT — MAP FIGURE 6					
<ul style="list-style-type: none"><li>Acquired lands would be managed in accordance with management objectives identified for adjacent lands unless resource considerations require a plan amendment.</li></ul>					
<b>FENCING REQUIREMENTS FOR PAVED HIGHWAYS</b> All applications to pave routes would be evaluated in site-specific NEPA analysis to determine the need for fencing.					
<b>LAND TENURE ADJUSTMENTS (LTAS)</b> <ul style="list-style-type: none"><li>Land ownership changes would be considered on lands not specifically identified in the RMP (Map Figure 6) for disposal or acquisition if the changes are in accordance with resource management objectives and other RMP decisions, determined to be in the public interest, and would accomplish one or more of the following criteria:<ul style="list-style-type: none"><li>The changes are determined to be in the public interest. The public would benefit from land resources coming into public ownership, while at the same time accommodating the needs of local and state governments, including the needs for public purposes, community growth and the economy.</li><li>The changes result in a gain of important manageable resources on public lands such as crucial wildlife habitat, significant cultural sites, mineral resources, water sources, listed species by habitat, or areas key to productive ecosystems.</li><li>The changes ensure public access to lands in areas where access is needed and cannot otherwise be obtained.</li><li>The changes would promote more effective management and meet essential resource objectives through land ownership consolidation.</li><li>The changes result in acquisition of lands that serve regional or national priorities identified in applicable policy directives or legislation.</li></ul></li><li>If one or more of the above criteria are not met, proposed land ownership changes outside of designated transfer areas would not be approved or would require a plan amendment unless it was determined to be in the best interests of the affected landowners and the public.</li><li>Non-federal lands located within sensitive areas would be acquired through donation, purchase, or land exchange. Land acquisitions would be negotiated from willing landowners.</li><li>Acquire fee title or interest in non-federal lands with priority placed on lands with critical resource values (e.g., water rights, scenic easements, Greater Sage-grouse leks).</li><li>No lands acquired through land tenure adjustments would be classified or opened for agricultural entry or leasing in the RMP planning area.</li></ul>					
<b>OTHER METHODS OF ACQUISITION</b> In addition to acquiring non-federal lands through land exchanges, VFO would acquire lands by direct purchase utilizing programs such as the Land and Water Conservation Fund (LWCF), when funding is available, donation, or legal settlement. Such land would be vested in the U.S. in perpetuity unless otherwise directed by Bureau or Congressional policy.					
<b>RECREATION AND PUBLIC PURPOSE ACT (R&amp;PP)</b> <ul style="list-style-type: none"><li>Lands conveyed to state or local governments or non-profit organizations under the Recreation and Public Purpose Act (R&amp;PP) Act may include those identified in LTAs. In addition, requests for lands other than those identified would be considered for disposal provided the proposed use would provide a greater public benefit than that which the current management provides, and that the action is otherwise consistent with this RMP. Examples may include, but are not limited to local government or non-profit recreational and public purpose facilities such as public shooting ranges, landfills, motor-cross, and racetracks, etc.</li><li>All Recreation &amp; Public Purposes (R&amp;PP) lease areas would be administratively unavailable for leasing or open to leasing subject to major constraints such as No Surface Occupancy (NSO) stipulations.</li></ul>					
<b>RIGHTS-OF-WAY (ROWS)/EASEMENTS</b> <ul style="list-style-type: none"><li>All future ROW applications involving projects that are less than the major project thresholds described above would be evaluated on a case-by-case basis. Future ROWs would be consolidated in corridors where reasonable and economically feasible.</li><li>Future ROWs that cross the Lower or Upper Green River would be placed in the Four Mile Bottom Area or at the Head of Little Swallow Canyon.</li><li>Generally, future ROWs would be located adjacent to existing routes and within existing R/W granted routes, when facilities are compatible, as much as possible.</li><li>Easements would be acquired from willing landowners to gain access to public lands.</li><li>Lands are also available for major water development ROWs on a case-by-case basis with special restrictions depending on the scope of the project and resource concerns identified during the processing of any project proposal in compliance with NEPA. Major ROW projects such as hydroelectric dam and wind farm ROWs may be permitted on a case-by-case basis if the project is consistent with the goals and objectives or other land management prescriptions. If it is not in compliance with the land management prescriptions, then it would require a plan amendment.</li><li>Authorization of any right-of-way for wind or solar energy would incorporate BMPs as applicable and provisions contained in the Final Wind Energy Programmatic Environmental Impact Statement (PEIS) (June 24, 2005) and the joint PEIS.</li></ul>					
<b>SALES</b> <ul style="list-style-type: none"><li>Any lands to be disposed of by sale that are not identified in this RMP would require a plan amendment. Land sales would reserve all minerals as required by FLPMA except where sale of the mineral interests would not be consistent with the requirements of Section 209 FLPMA.</li><li>If the public lands have no known mineral values, the mineral estate would be disposed of pursuant to the authority of Section 209(b) of FLPMA.</li><li>In instances where the surface estate is already in private ownership and the mineral estate is reserved to the U.S., the surface owner may purchase the reserved mineral estate, provided that the criteria under 43 CFR 2720 are met.</li><li>Lands identified for consideration for disposal would be used for a variety of other authorized activities, based on the need for future community growth and development.</li></ul>					
<b>TRANSPORTATION/UTILITY CORRIDORS</b> <ul style="list-style-type: none"><li>This RMP is consistent with existing right-of-way (ROW) corridors, including the Western Utility Group (WUG) updates to the Western Regional Corridor Study (Map Figure 6), and would designate additional corridors subject to physical barriers, and sensitive resource values. Sensitive resource values would include, but are not limited to, threatened and endangered species habitat, cultural and paleontological resources, sensitive soils, riparian areas, areas possessing high scenic quality, and ACECs.</li><li>These approved corridors are the preferred location for future major linear ROWs which meet the following criteria:<ul style="list-style-type: none"><li>Pipelines with a diameter greater than 20 inches.</li></ul></li></ul>					

Table 2.1.7 Proposed RMP and Alternatives – Lands and Realty Management

Table 2.1.7 Proposed RMP and Alternatives – Lands and Realty Management					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
LANDS AND REALTY MANAGEMENT — MAP FIGURE 6					
<ul style="list-style-type: none"><li>○ Transmission lines (not distribution) with a voltage capacity of 69 kV or greater.</li><li>○ Paved routes or routes consisting of more than two lanes.</li><li>○ Significant canals, ditches, or conduits requiring a permanent width greater than 50 feet.</li><li>● Major linear ROWs meeting the above thresholds that are proposed outside of the preferred, designated corridors may require a plan amendment.</li><li>● The Vernal LUP would be consistent with decisions identified in the West-wide Energy Corridor (WWEC) PEIS ROD.</li></ul>					
<b>TRESPASS RESOLUTION</b> <ul style="list-style-type: none"><li>● Intentional trespass resolution would be limited to removal and / or restoration as appropriate. Unintentional trespass resolution may include:<ul style="list-style-type: none"><li>○ Authorization under ROW grant, commercial/agricultural lease, or permit.</li><li>○ Disposal of the affected land through sale or exchange.</li><li>○ Removal, depending on the nature of the trespass.</li></ul></li><li>● In all such trespass cases, administrative costs incurred by the BLM for investigating and resolving trespasses will be collected. All trespass incidents resolved by issuance of ROW grants, leases, or permits would be subject to payment by the holder/lessee/permittee of rent based on market value. Trespass cases resolved by land sales would be based on fair market value, and land exchanges would be completed on an equal value basis.</li></ul>					
<b>WITHDRAWALS</b> <ul style="list-style-type: none"><li>● Review existing withdrawals and classifications on BLM-administered lands on a case-by-case basis to determine their need and consistency with the intent of the withdrawals in accordance with section 204(l) of FLPMA, and recommend continuing, modifying, or terminating as applicable (Figure 6).</li><li>● Any lands becoming unencumbered by withdrawals or classifications would be managed according to the decisions made in this RMP. If the RMP has not identified management prescriptions for these lands, they would be managed in a manner consistent with adjacent or comparable public lands within the VPA. If the unencumbered lands fall within two or more management scenarios where future-planning criteria may not be clear, a plan amendment may be required.</li></ul>					
<b>LAND ACCESS</b>					
Public access to the White River would be pursued at the mouth of Cowboy Canyon, Bonanza Bridge, and Wagon Hound Road.	Same as the Proposed RMP.	Public access to the White River would not be pursued at the mouth of Cowboy Canyon, Bonanza Bridge, and Wagon Hound Road.	Same as the Proposed RMP.	Unspecified in the current management plans.	Same as the Proposed RMP.
An easement for the old Uintah Railroad bed from the Utah / Colorado line to Watson in Evacuation Creek would not be pursued.	Same as the Proposed RMP.	Same as the Proposed RMP.	An easement for the old Uintah Railroad bed would be pursued from the Utah / Colorado line to Watson in Evacuation Creek.	Unspecified in the current management plans.	Same as Alternative C.
Acquisition of Indian trust lands in Bitter Creek and Willow Creek would be pursued.	Same as the Proposed RMP.	Administrative access only across the Indian trust lands in Bitter Creek would be pursued.	Same as the Proposed RMP.	Unspecified in the current management plans.	Same as the Proposed RMP.
Acquisition of Indian trust lands near the confluence of South and Sweetwater Canyon would be pursued.	Same as the Proposed RMP.	Administrative access only across Indian trust lands near the confluence of South and in Sweetwater Canyon would be pursued.	Same as Alternative A.	Unspecified in the current management plans.	Same as the Proposed RMP.
<b>OTHER LAND AND REALTY ACTIONS</b>					
Retain non-WSA lands with wilderness characteristics in federal ownership (106,178 acres).	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the current management plans.	Retain non-WSA lands with wilderness characteristics in federal ownership (277,596 acres).
Non-WSA lands with wilderness characteristics would be managed as rights-of-way avoidance areas.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the current management plans.	Non-WSA lands with wilderness characteristics would be managed as rights-of-way exclusion areas (277,596 acres).
<b>WITHDRAWALS</b>					
The following areas are recommended for locatable mineral withdrawal: <ul style="list-style-type: none"><li>● Book Cliffs Natural Area (401 acres)</li></ul>	Same as the Proposed RMP.	Same as the Proposed RMP.	The following areas are recommended for locatable mineral withdrawal:	Recommend protective withdrawals or other protective measures that will preclude mineral and agricultural entry	Same as Alternative C and all non-WSA lands with wilderness characteristics.

Table 2.1.7 Proposed RMP and Alternatives – Lands and Realty Management

<ul style="list-style-type: none"><li>• Green River Scenic Corridor in Brown's Park (8,208 acres)</li><li>• Lears Canyon relict vegetation areas (1,375 acres)</li><li>• White River non-WSA lands with wilderness characteristics (6,720 acres)</li><li>• White River SRMA (1,110 acres)</li><li>• Developed and potential recreation sites (5,000 acres)</li></ul>			<ul style="list-style-type: none"><li>• Book Cliffs Natural Area (401 acres)</li><li>• Green River Scenic Corridor in Brown's Park (8,208 acres)</li><li>• Lears Canyon relict vegetation areas (1,375 acres)</li><li>• Lower Green River Area of Critical Environmental Concern (ACEC) (17,063 acres)</li><li>• White River (9,218 acres)</li></ul>	on (in priority order): <ul style="list-style-type: none"><li>• The Green River Scenic Corridor in Brown's Park (19,400 acres)</li><li>• The relict vegetation areas (3,600 acres)</li><li>• The Lower Green River ACEC (7,900 acres)</li><li>• Developed and potential recreation sites (5,000 acres).</li></ul>	

Table 2.1.8 Proposed RMP and Alternatives – Livestock and Grazing Management

Table 2.1.8 Proposed RMP and Alternatives – Livestock and Grazing Management					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
LIVESTOCK AND GRAZING MANAGEMENT — MAP FIGURES 7–11					
<b>GOALS AND OBJECTIVES</b> Achieve appropriate utilization of the range by livestock and wildlife through management prescriptions and administrative adjustments.					
<b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b>					
<b>CRITERIA FOR CHANGING CLASS OF LIVESTOCK</b> Requests from permittees to convert class of livestock would be handled as follows: <ul style="list-style-type: none"><li>On crucial deer winter ranges, cattle are preferred.</li><li>In areas where fencing would be required, conversion would be contingent upon signed fence agreement and fences would be in place prior to issuance of permit to graze. The applicant(s) requesting the conversion would be responsible to fund the fencing and cattle guards/gates and to construct and maintain fences. (Consistent with Vernal District Grazing Advisory Board and Vernal BLM joint Rangeland Improvement (RI) Policy dated 12/08/1992).</li><li>In areas where grazing would be along paved routes, evaluate and determine the need for fencing. Applicants would be required to fence the road if it is determined necessary to protect human and livestock health and safety.</li><li>Areas with riverine/lotic systems may require additional management actions such as, but not limited to, fencing of streams.</li><li>Prior to the authorization of any livestock conversions in WSAs, the impacts from any necessary rangeland improvements projects would be assessed. Conversions in WSAs would be made in compliance with H-8550-1 Interim Management Plan (IMP) Chapter 3 Guidelines for Specific Activities -D. The IMP is to direct activities within the WSAs until such time as Congress acts on the WSA designations.</li></ul>					
<b>GRAZING IN RIVER CORRIDORS</b> <ul style="list-style-type: none"><li>As opportunities arise, such as voluntary relinquishment, consider changes to livestock use to assure management objectives are met.</li><li>Where livestock conflicts with other uses of the river, mitigate through management or other actions.</li><li>Identify criteria for acceptable levels of livestock grazing use along river bottoms. (See Riparian section.)</li><li>If grazing is causing resource degradation, to the extent that rangeland health standards are not being met and progress is not being made, monitoring data show that livestock grazing is the most significant factor, and all other options have been exhausted, close those riparian areas that do not satisfactorily respond to changes in management.</li></ul>					
<b>RELINQUISHMENT OF PREFERENCE</b> <ul style="list-style-type: none"><li>Voluntary relinquishments of grazing permits and preference, in whole or in part, by a permittee in writing to the BLM will be handled on a case-by-case basis. The BLM will not recognize as valid, relinquishments which are conditional on specific BLM actions and the BLM will not be bound by them. Relinquished permits and the associated preference will remain available for application by qualified applicants after the BLM considers if such action would meet rangeland health standards and is compatible with achieving LUP goals and objectives. Prior to re-issuance of the relinquished permit, the terms and conditions may be modified to meet LUP goals and objectives and/or site-specific resource objectives.</li><li>However, upon relinquishment, the BLM may determine through a site-specific evaluation and associated NEPA analysis, that the public lands involved are better used for other purposes. Grazing may then be discontinued on the allotment through an amendment to the existing LUP or a new LUP effort. Any decision issued concerning discontinuance of livestock grazing is not permanent and may be reconsidered and changed through future LUP amendments and updates.</li></ul>					
<b>SEASONS OF USE</b> <ul style="list-style-type: none"><li>Prior to approving changes in permitted seasons of use, the following would be mandatory:<ul style="list-style-type: none"><li>Compliance with the standards for range management (see Standards for Rangeland Health and Guidelines for Grazing Management for BLM Lands in Utah, May 1997).</li><li>Preparation, signature, and implementation of a monitoring plan.</li><li>Signature of permittee accepting the grazing management practices determined necessary by the Authorized Officer to approve the change.</li><li>Agreement by permittee to management practices that provide for the physiological requirements of desired plants.</li></ul></li><li>Requests from a permittee to change seasons of use would be a priority if all of the following criteria were met:<ul style="list-style-type: none"><li>Changes enhance or meet resource objectives contained in the Vernal RMP.</li><li>Allotment(s) are scheduled for assessment the same year a request is made.</li><li>Funding for the assessment is voluntarily provided by sources other than the BLM.</li></ul></li><li>Develop management plans and/or grazing agreements for livestock allotments to allow flexibility in grazing management, which may include consolidation of allotments, change in seasons of use, and reduction and/or consolidation of grazing allotments and pastures (Map Figures 7–11). Until all wild horses have been removed, livestock permittees with allotments within Herd Management Areas would be required to have a current health certificate, including documentation of annual vaccinations for infectious diseases for all horses, mules, or burros used in their grazing operation.</li></ul>					
Lands acquired by acquisition of properties in the Nine Mile Acquired Area would not be grazed to enhance riparian and watershed values.	Same as the Proposed RMP.	Livestock grazing would be allowed in the Nine Mile Acquired Area if such use is controlled, of short duration, and would not detract from recreation and/or riparian values along the river.	Same as the Proposed RMP.	Unspecified in the current management plans.	<ul style="list-style-type: none"><li>Lands acquired by acquisition of properties in the Nine Mile area would not be grazed to enhance riparian and watershed values.</li><li>Changes in class of livestock would not be allowed in non–WSA lands with wilderness characteristics if fencing or other structural</li></ul>

LIVESTOCK AND GRAZING MANAGEMENT — MAP FIGURES 7–11					
					improvements are necessary or if the conversion would result in significant resource conflicts or impacts.
SEASONS OF USE					
<b><u>PHENOLOGY</u></b> Livestock grazing would be allowed under the discretion of the VFO in Area 1.	Same as the Proposed RMP.	<b><u>BILLED USE</u></b> Livestock grazing would be allowed under the discretion of the VFO in Area 1.	<b><u>ADJUDICATED</u></b> Livestock grazing could be allowed under the discretion of the VFO in Area 1.	<b><u>PERMITTED</u></b> Livestock grazing would be allowed under the discretion of the VFO in Area 1.	<b><u>ADJUDICATED</u></b> Same as Alternative C.
<i>* Livestock grazing would be allowed from 6/1 through 10/31 in Area 2 or 5/1 with a deferment.</i>  <i>*This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.</i>	Same as the Proposed RMP.	Livestock grazing would be allowed from 5/19 through 10/7 in Area 2.	Livestock grazing would be allowed from 6/15 through 8/31 in Area 2.	Livestock grazing would be allowed from 5/19 through 10/7 in Area 2.	Same as Alternative C.
<i>* Livestock grazing would be allowed from 5/1 through 12/31 in Area 3.</i>  <i>*This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.</i>	Same as the Proposed RMP.	Livestock grazing would be allowed from 5/31 through 11/1 in Area 3.	Livestock grazing would be allowed from 6/15 through 8/31 in Area 3.	Livestock grazing would be allowed from 6/3 through 10/6 in Area 3.	Same as Alternative C.
<i>* Livestock grazing would be allowed from 5/1 through 6/1 in Area 4.</i>  <i>*This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.</i>	Same as the Proposed RMP.	Livestock grazing would be allowed from 4/25 through 5/26 and 11/1 through 12/31 in Area 4.	Livestock grazing would be allowed from 10/1 through 3/1 (fall/winter) in Area 4.	Livestock grazing would be allowed from 6/1 through 10/31 in Area 4.	Same as Alternative C.
<i>* Livestock grazing would be allowed from 5/1 through 6/1 and 10/1 through 2/28 in Area 5.</i>  <i>*This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.</i>	Same as the Proposed RMP.	Livestock grazing would be allowed from 4/10 through 5/26 and 10/1 through 1/30 in Area 5.	Livestock grazing would be allowed from 10/1 through 3/1 (fall/winter) in Area 5.	Livestock grazing would be allowed from 4/3 through 6/15 and 10/31 through 1/30 in Area 5.	Same as Alternative C.
<i>* Livestock grazing would be allowed from 10/1 through 4/1 or 5/1 with deferment in Area 6.</i>  <i>*This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.</i>	Same as the Proposed RMP.	Livestock grazing would be allowed from 10/26 through 5/8 in Area 6.	Livestock grazing would be allowed from 10/1 through 3/1 (fall/winter) in Area 6.	Livestock grazing would be allowed from 3/10 through 4/24 and 6/23 through 8/30 and 10/21 through 2/28 in Area 6.	Same as Alternative C.
<i>* Livestock grazing would be allowed from 4/1 through 5/31 and/or 9/1 through 10/31 in Area 7.</i>  <i>*This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.</i>	Same as the Proposed RMP.	Livestock grazing would be allowed from 5/20 through 12/1 in Area 7.	Livestock grazing would be allowed from 10/1 through 11/30 (fall) in Area 7.	Livestock grazing would be allowed from 5/26 through 10/20 in Area 7.	Same as Alternative C.

Table 2.1.9 Proposed RMP and Alternatives – Minerals and Energy Resources					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
MINERALS AND ENERGY RESOURCES — MAP FIGURES 18–23					
<p><b>GOALS AND OBJECTIVES</b></p> <ul style="list-style-type: none"><li>Continue to meet local and national non-renewable and renewable energy and other public mineral needs. Support a viable long-term mineral industry related to energy development while providing reasonable and necessary protections to other resources.</li><li>The following principles would be applied:<ul style="list-style-type: none"><li>Encourage and facilitate the development by private industry of public land mineral resources in a manner that satisfies national and local needs and provides for economical and environmentally sound exploration, extraction and reclamation practices.</li><li>Process applications, permits, operating plans, mineral exchanges, leases, and other use authorizations for public lands in accordance with policy and guidance.</li><li>Monitor salable and leasable mineral operations to ensure proper resource recovery and evaluation, production verification, diligence, and inspection and enforcement of contract sales, common use areas, community pits, free use permits, leases and prospecting permits.</li></ul></li><li>The plan would recognize and be consistent with the National Energy Policy by:<ul style="list-style-type: none"><li>Recognizing the need for diversity in obtaining energy supplies.</li><li>Conserving sensitive resource values.</li><li>Improving energy distribution opportunities.</li></ul></li></ul>					
<p><b>MANAGEMENT COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES</b></p> <ul style="list-style-type: none"><li>In accordance with an UDEQ-DAQ letter dated June 6, 2008, (see Appendix O requesting implementation of interim nitrogen oxide control measures for compressor engines) the BLM will require the following as a Lease Stipulation and a Condition of Approval for Applications for Permit to Drill:<ul style="list-style-type: none"><li>All new and replacement internal combustion gas field engines of less than or equal to 300 design-rated horsepower must not emit more than 2 gms of NO<sub>x</sub> per horsepower-hour. This requirement does not apply to gas field engines of less than or equal to 40 design-rated horsepower.</li><li>All new and replacement internal combustion gas field engines of greater than 300 design rated horsepower must not emit more than 1.0 gms of NO<sub>x</sub> per horsepower-hour.</li></ul></li><li>Mineral and energy resource exploration and development surface-disturbing activities would be allowed in the VPA unless precluded by other program prescriptions. The stipulations identified for surface-disturbing activities in Appendix K would generally apply to these activities.</li></ul> <p><b>ALTERNATIVE ENERGY</b></p> <ul style="list-style-type: none"><li>The plan would recognize the opportunity for alternative energy development such as wind, solar, and geothermal. BMPs would be developed from PEISs such as ones completed or initiated for wind and solar energy.</li><li>Individual proposals would be evaluated based on conformance with other program goals and objectives stated in the plan.</li></ul> <p><b>LIGHT AND SOUND</b></p> <p>The BLM would seek to minimize light and sound pollution within the VPA using best available technology such as installation of multi-cylinder pumps, hospital sound-reducing mufflers, and placement of exhaust systems to direct noise away from noise sensitive areas (e.g., sensitive habitat, campgrounds, river corridors, and Dinosaur National Monument). Light pollution would be mitigated by using methods such as limiting height of light poles, timing of lighting operations (meaning limiting lighting to times of darkness associated with drilling and work over or maintenance operations), limiting wattage intensity, and constructing light shields. If a determination is made that natural barriers or view sheds would meet these mitigation objectives, the above requirements may not apply.</p> <p><b>LOCATABLE</b></p> <p>Operations on lands open to mineral entry (as well as on claim locations that pre-date withdrawal) must be conducted in compliance with the 43 CFR 3809 and 3715 regulations. The three level of operations under these regulations include casual use, notice and, plan of operation. A plan would have to be filed for operations usually conducted under notice in:</p> <ul style="list-style-type: none"><li>Areas in the National Wild and Scenic Rivers System and areas designated for potential addition to the system.</li><li>Designated ACECs.</li><li>Areas designated as part of the National Wilderness Preservation System and administered by the BLM.</li><li>Areas designated as “closed” to OHV use as defined in 43 CFR 8340-5.</li><li>Any lands or waters known to contain federally proposed or listed threatened or endangered species or their proposed or designated crucial habitat.</li><li>National Monuments and National Conservation Areas administered by the BLM; see 43 CFR 3809.11(c).</li><li>A plan must be submitted for any bulk sampling of 1,000 tons or more of presumed ore for testing; see 43 CFR 3809.11(b)).</li></ul> <p><b>MINERAL MATERIALS</b></p> <ul style="list-style-type: none"><li>All existing material sites would be evaluated to determine continual need and ensure that they are accommodating user needs.</li><li>Common use areas, community pits, free-use permits, competitive and non-competitive contract sales, and testing and sampling of mineral materials may be authorized by the BLM in “open” areas.</li></ul> <p><b>OIL AND GAS</b></p> <ul style="list-style-type: none"><li>Approximately 53,111 acres within the Ouray National Wildlife Refuge would be closed to oil and gas leasing.</li><li>Mitigation of oil and gas impacts developed under the plan and applied to leases issued after the date of this RMP in the form of stipulations would adhere to the BLM’s standard format. Stipulations are necessary to protect the resource and would contain</li></ul>					

Table 2.1.9 Proposed RMP and Alternatives – Minerals and Energy Resources

Table 2.1.9 Proposed RMP and Alternatives – Minerals and Energy Resources					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
MINERALS AND ENERGY RESOURCES — MAP FIGURES 18–23					
<div>provisions/criteria to allow for waiver, exception, and modification if warranted.</div> <div><ul style="list-style-type: none"><li>The plan would provide for a variety of oil and gas operations and geophysical explorations. These activities would be allowed in the VPA unless precluded by other program prescriptions. The stipulations identified for surface-disturbing activities in Appendix K would generally apply to these activities.</li><li>Approximately 188,500 acres of split estate lands (federal minerals-Tribal surface) within the Hill Creek Extension of the Uintah and Ouray Indian Reservation are included in the acreage figures found in the Oil and Gas section.</li></ul></div>					
COMBINED HYDROCARBON AREAS / SPECIAL TAR SAND AREAS					
Management decisions regarding combined hydrocarbon area/special tar sand areas are deferred to the PEIS that is being prepared.	Approximately 51,829 acres would be administratively available for combined hydrocarbon leasing subject to standard lease terms.	Approximately 61,424 acres would be administratively available for combined hydrocarbon leasing subject to standard lease terms.	Approximately 43,530 acres would be administratively available for combined hydrocarbon leasing subject to standard lease terms.	Approximately 116,208 acres in areas identified for combined hydrocarbon leasing would be available for future tar sand development subject to standard lease terms.	Approximately 43,295 acres in areas identified for combined hydrocarbon leasing would be available for future tar sand development subject to standard lease terms.
Management decisions regarding combined hydrocarbon area / special tar sand areas are deferred to the PEIS that is being prepared.	Approximately 200,836 acres would be administratively available for combined hydrocarbon leasing with CSU.	Approximately 198,238 acres would be administratively available for combined hydrocarbon leasing with CSU.	Approximately 195,566 acres would be administratively available for combined hydrocarbon leasing with CSU.	Approximately 101,279 acres would be administratively available for combined hydrocarbon leasing with CSU.	Approximately 191,563 acres would be administratively available for combined hydrocarbon leasing with CSU.
Management decisions regarding combined hydrocarbon area / special tar sand areas are deferred to the PEIS which is being prepared.	Approximately 10,803 acres would be administratively available for combined hydrocarbon leasing with NSO.	Approximately 3,806 acres would be administratively available for combined hydrocarbon leasing with NSO.	Approximately 3,696 acres would be administratively available for combined hydrocarbon leasing with NSO.	Approximately 11,589 acres would be administratively available for combined hydrocarbon leasing with NSO.	Approximately 3,696 acres would be administratively available for combined hydrocarbon leasing with NSO.
Management decisions regarding combined hydrocarbon area / special tar sand areas are deferred to the PEIS that is being prepared.	Approximately 35,044 acres would be closed to leasing.	Approximately 35,044 acres would be closed to leasing.	Approximately 55,720 acres would be closed to leasing.	Approximately 35,045 acres would be closed to leasing.	Approximately 59,966 acres would be closed to leasing.
Management decisions regarding combined hydrocarbon area / special tar sand areas are deferred to the PEIS that is being prepared.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the current management plans.	Close non-WSA lands with wilderness characteristics to leasing.
GILSONITE AND PHOSPHATE (NON-ENERGY LEASABLES)					
172 miles or 36,846 acres would be available for prospecting, leasing, and development of Gilsonite (additional veins located through field study or prospecting not shown on Map Figure 18 would also be available if such are within "open" category lands).	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	<div><ul style="list-style-type: none"><li>168 miles or 36,009 acres would be open for prospecting, leasing, and development of Gilsonite (additional veins located through field study or prospecting not shown on Map Figure 22 would also be available if such are within "open" category lands).</li><li>Restrictions placed on the lease or subsequent conditions of approval would not apply to maintenance and production of existing facilities.</li><li>Restrictions from other resource decisions would be applied to new leases, or at the time of lease renewal, for existing leases.</li><li>Exploration and development of phosphate within crucial deer and elk winter range would be allowed year 'round, but would require management actions designed to mitigate both short- and long-term</li></ul></div>	<div><ul style="list-style-type: none"><li>163 miles or 34,967 acres would be available for prospecting, leasing, and development of Gilsonite (additional veins located through field study or prospecting not shown on Figure 23 would also be available if such are within "open" category lands).</li><li>Close non-WSA lands with wilderness characteristics to leasing.</li></ul></div>

Table 2.1.9 Proposed RMP and Alternatives – Minerals and Energy Resources

Table 2.1.9 Proposed RMP and Alternatives – Minerals and Energy Resources					
PROPOSED RMP	Alternative A (Draft RMP/EIS Preferred Alternative)	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
MINERALS AND ENERGY RESOURCES — MAP FIGURES 18–23					
				loss of habitat.	
76,208 acres would be open for prospecting, leasing, and development of phosphate with standard and special stipulations within the phosphate occurrence areas.	87,724 acres would be open for prospecting, leasing, and development of phosphate with standard and special stipulations within the phosphate occurrence areas.	Same as Alternative A.	63,571 acres would be open for prospecting, leasing, and development of phosphate with standard and special stipulations within the phosphate occurrence areas.	<ul style="list-style-type: none"><li>84,600 acres would be open for prospecting, leasing, and development of phosphate with standard and special stipulations within the phosphate occurrence areas</li></ul>	<ul style="list-style-type: none"><li>52,063 acres would be open for prospecting, leasing, and development of phosphate with standard and special stipulations within the phosphate occurrence areas.</li></ul>
MINERAL MATERIALS					
389,788 acres would be available for mineral material disposal with standard and special stipulations. <b>Note:</b> Acreage figures for the Proposed RMP may reflect different sum totals, as calculations were determined using different technology.	415,395 acres would be available for mineral material disposal with standard and special stipulations.	432,953 acres would be available for mineral material disposal with standard and special stipulations.	388,699 acres would be available for mineral material disposal with standard and special stipulations.	387,700 acres would be available for mineral material disposal with standard and special stipulations.	344,682 acres would be available for mineral material disposal with standard and special stipulations.
Close non-WSA lands with wilderness characteristics to disposal of mineral materials (106,178 acres).	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the current management plans.	Close non-WSA lands with wilderness characteristics to disposal of mineral materials (277,596 acres).
OIL AND GAS (INCLUDES COAL BED NATURAL GAS)					
<b>**Note:</b> Further consultation with the Ute Indian Tribe resulted in identification of stipulations for the Hill Creek Extension has occurred, which caused the increase in the Proposed RMP. The Hill Creek plan was identified in Chapter 2, but was not resolved into specific stipulation categories.					
**Approximately 860,651 acres would be open to leasing subject to the terms and conditions of the standard lease form.	Approximately 983,905 acres would be open to leasing subject to the terms and conditions of the standard lease form.	Approximately 1,113,116 acres would be open to leasing subject to the terms and conditions of the standard lease form.	Approximately 858,619 acres would be open to leasing subject to the terms and conditions of the standard lease form.	Approximately 918,315 acres would be open to leasing subject to the terms and conditions of the standard lease form.	Approximately 818,891 acres would be open to leasing subject to the terms and conditions of the standard lease form.
**Approximately 779,730 acres would be open to leasing subject to moderate constraints, such as TLs and CSU.	Approximately 796,955 acres would be open to leasing subject to moderate constraints, such as TLs and CSU.	Approximately 706,281 acres would be open to leasing subject to moderate constraints, such as TLs and CSU.	Approximately 768,466 acres would be open to leasing subject to moderate constraints, such as TLs and CSU.	Approximately 617,715 acres would be open to leasing subject to moderate constraints, such as TLs and CSU.	Approximately 680,570 acres would be open to leasing subject to moderate constraints, such as TLs and CSU.
**Approximately 86,789 acres would be open to leasing subject to major constraints such as No Surface Occupancy (NSO) stipulations.	Approximately 69,302 acres would be open to leasing subject to major constraints such as No Surface Occupancy (NSO) stipulations.	Approximately 42,053 acres would be open to leasing subject to major constraints such as No Surface Occupancy (NSO) stipulations.	Approximately 58,670 acres would be open to leasing subject to major constraints such as No Surface Occupancy (NSO) stipulations.	Surface occupancy would be precluded on approximately 136,930 acres to protect wildlife, watershed, and recreation.	Approximately 47,629 acres would open to leasing subject to major constraints such as No Surface Occupancy (NSO) stipulations.
**Approximately 186,917 acres would be administratively unavailable for leasing.	Approximately 63,839 acres would be administratively unavailable for leasing.	Approximately 52,550 acres would be administratively unavailable for leasing.	Approximately 228,246 acres would be administratively unavailable for leasing.	Approximately 52,540 acres would be administratively unavailable for leasing.	Approximately 367,037 acres would be administratively unavailable for leasing.
No geophysical exploration would be allowed in non-WSA lands with wilderness characteristics except that hand-carried geophone lines would be permitted.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the Draft EIS.	Unspecified in the current management plans.	Same as the Proposed RMP.

Table 2.2.1 Summary of Impacts – Air Quality					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
AIR QUALITY					
PM2.5, CO2, and ozone precursor (VOCs, NOx, CO) emissions would increase as a result of 156,425 acres/decade from prescribed fire treatments.	Same as Proposed RMP.	Same as Proposed RMP.	Same as Proposed RMP.	PM2.5, CO2, and ozone precursor (VOCs, NOx, CO) emissions would increase as a result of 50,900 acres/decade of prescribed fire treatments.	Same as Proposed RMP.
Beneficial reduction of PM10 and other windborne particulate from erosion of exposed soils as a result of increasing vegetation and lowering soil disturbance.	Same as Proposed RMP.	Due to less restrictive management in many areas, PM10 and other windblown particulate from erosion of exposed soils would be higher than under the Proposed RMP.	Due to more restrictive management in many areas, PM10 and other windblown particulate from erosion of exposed soils would be lower than under the Proposed RMP.	Same as Alternative B.	Due to more restrictive management in many areas, PM10 and other windblown particulate from surface disturbance and erosion of exposed soils would be lower than under the Proposed RMP.
Mineral resource decisions: projected concentrations of CO, PM10, PM2.5, SO2 and NOx would not have adverse impacts as they would be below the applicable NAAQS as modeled for 3-hour, 24-hour, and annual time frames. BLM sources add an incremental increase (1%)0 to background concentrations of benzene, formaldehyde, and xylenes that already exceed at least one AACL. No visibility criteria exceedances are projected.	Same as Proposed RMP.	Same as Proposed RMP.	Same as Proposed RMP.	Same as Proposed RMP.	Same as Proposed RMP.

Table 2.2.2 Summary of Impacts – Cultural Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
CULTURAL RESOURCES					
Restriction of OHV travel to designated routes in areas of high cultural resource site density would beneficially reduce potential impacts to cultural resources.	Same as Proposed RMP.	Same as Proposed RMP.	Restrictions on OHV travel and mineral development in the areas of high cultural resource site density would have the most beneficial impacts on high-density cultural sites.	Unrestricted OHV travel and mineral development in areas of high cultural resource density would have the highest potential for adverse impacts to sites.	Restrictions on OHV travel and mineral development in the areas of high cultural resource site density would have the most beneficial impacts on high-density cultural sites.
156,425 acres/decade of prescribed fire to reduce fuels and lessen wildfire severity would have beneficial impacts on cultural resources.	Same as Proposed RMP.	Same as Proposed RMP.	Same as Proposed RMP.	50,900 acres/decade of prescribed fire to reduce fuels and lessen wildfire severity would have beneficial impacts to cultural resources, but less than the other alternatives.	156,425 acres of prescribed fire per decade to reduce fuels and lessen wildfire severity would have beneficial impacts on cultural resources.
Potential acquisition of Indian trust lands, and other areas, as well as pursuing a locatable mineral withdrawal or other protective measures for certain areas would have beneficial impacts on potential cultural sites in these areas.	Same as Proposed RMP.	Potential acquisition of Indian trust lands only would have beneficial impacts on potential cultural sites in these areas. Impacts from locatable mineral withdrawals would be the same as Alternative A.	Similar to Alternative A, except that an easement for the Uintah Railroad bed, a known and documented historical cultural site, would be pursued, with potential beneficial impacts to cultural resources.	Unspecified lands and realty decisions would have unknown impacts on cultural resources. Pursuing locatable mineral and agricultural withdrawals would have beneficial impacts on cultural resources.	Potential acquisition of Indian Trust Lands, the Uintah Railroad bed, and other areas. Proposals for locatable mineral withdrawals in several areas, including non-WSA lands with wilderness characteristics. Other protective measures for certain areas would have beneficial impacts on potential cultural sites in these areas.
Moderate beneficial impacts to cultural resources from limitations and restrictions imposed on OHV travel.	Same as Proposed RMP.	Greater potential for impacts to cultural resources than Alternative A, with less beneficial impacts from limitations and restrictions on OHV travel.	The most limitations and restrictions on OHV travel would have the most beneficial impacts on cultural resources.	Unspecified travel management actions under this alternative, with the least restrictions on OHV travel would have the fewest beneficial and potentially the most adverse impacts on cultural resources.	Limitations and restrictions on OHV travel would have the most beneficial impacts on cultural resources.
Areas designated as VRM Class I and II would provide greater protection, and more beneficial impacts to cultural resources than Alternatives B and D.	Areas designated as VRM Class I and II would provide greater protection and more beneficial impacts to cultural resources than the Proposed RMP and Alternatives B and D.	Areas designated as VRM Class I and II would provide greater protection than Alternative D, but less than all other alternatives.	Areas designated as VRM Class I and II would provide the second most protection (with the second greatest beneficial impacts) to cultural resources behind Alternative E.	Alternative D would provide the least protection and fewest beneficial impacts to cultural resources from VRM Classes I and II.	Areas designated as VRM Class I and Class II would provide for the least landscape change and the most protection (with the greatest beneficial impacts) to cultural resource, greater than all other alternatives.

Table 2.2.3 Summary of Impacts – Environmental Justice					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
ENVIRONMENTAL JUSTICE					
Indian tribes would benefit from revenues derived from rights-of-way grants to oil and gas industry, but traditions and religious sites could be adversely impacted.	Same as Proposed RMP	Similar to Proposed RMP, however oil and gas-related revenues could be greater and religious sites and traditions could be most adversely impacted under this alternative given Alternative B proposed the greatest amount of wells.	Same as Proposed RMP.	Similar impacts to Proposed RMP, except that Hill Creek extension would not be developed. Adverse impacts to human health would be reduced under this alternative.	Similar to Proposed RMP, however Indian tribes would benefit least from revenues derived from rights-of-way grants to oil and gas industry. Protection of traditions and religious sites could be greatest under this alternative.
Minerals development could adversely reduce or replace tribal livestock grazing, decrease opportunities for hunting and gathering and ceremonial worship. The tribal community of Ouray could be adversely impacted with regard to health and safety with increases in oil and gas extraction-related activity	Same as Proposed RMP	Similar to Proposed RMP, potential for adverse health-related impacts to Ouray community would be greatest under this alternative.	Same as Proposed RMP.	Similar to Proposed RMP.	Similar to Proposed RMP except minerals development would be least likely to reduce or replace tribal livestock grazing and opportunities for hunting and gathering and ceremonial worship could be greatest under Alternative E.

Table 2.2.4 Summary of Impacts – Fire Management					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
FIRE MANAGEMENT					
156,425 acres/decade of prescribed fire would reduce fuel loading and the risk of a large-scale, catastrophic fire.	Same as Proposed RMP.	Same as Proposed RMP.	Same as Proposed RMP.	50,900 acres/decade of prescribed fire would reduce fuel loading and the risk of a large-scale, catastrophic fire.	Same as Proposed RMP.
Approximately 18,860 acres of surface disturbance would pose a greater risk for wildland fire due to minerals development (and surface disturbances) within the BLM administered areas of the VPA, in the short term and long term. Short-term surface disturbances within this area would increase the risk of wildland fire, particularly during clearing and blading of well pads and access roads, due to spark or heat ignition from vehicles, construction equipment, and construction personnel. Long-term adverse impacts on fire management would be due to limitations on prescribed fire. There may also be beneficial long-term benefits as access roads, well pads, and mines would provide access and create firebreaks that would be helpful in preventing and suppressing future wildfires.	Impacts similar to those described under Proposed RMP, with approximately 18,971 acres at risk from minerals-related wildland fire.	Impacts similar to those described under Proposed RMP, with approximately 19,033 acres at risk from minerals-related wildland fire.	Impacts similar to those described under Proposed RMP, with approximately 18,757 acres at risk from minerals-related wildland fire.	Impacts similar to those described under Proposed RMP, with approximately 18,212 acres at risk from minerals-related wildland fire.	Impacts similar to those described under Proposed RMP, with approximately 17,469 acres at risk from minerals-related wildland fire.
Rangeland improvement would occur on 34,640 acres, with beneficial impacts on fire management.	Same as Proposed RMP.	Rangeland improvement would occur on 50,900 acres, with beneficial impacts on fire management.	Rangeland improvement would occur on 45,860 acres, with beneficial impacts on fire management.	Rangeland improvement would occur on 40,390 acres, with beneficial impacts on fire management.	Same as Alternative C.
Seven SRMAs, 400 miles of non-motorized trails, and 800 miles of motorized trails would increase indirect fire risks from human- and vehicle-caused ignitions.	Same as Proposed RMP.	Fire risks similar to Alternative A, but with only four SRMAs, 800 miles of motorized trails, and no non-motorized trails.	Fire risks similar to Alternative A, with eight SRMAs and 400 miles of non-motorized trails, and no motorized trails.	Fire risks similar to but less than Alternative A, with 4 SRMAs and designation of 55 miles of non-motorized trails.	Eight SRMAs, 400 miles of non-motorized trails, and 800 miles of motorized trails would increase visitor use and indirect risks of human- and vehicle-caused fires.
546,152 acres of forest and woodland available for treatment would reduce wildfire risk.	552,152 acres of forest and woodland available for treatment would reduce wildfire risk	554,108 acres of forest and woodland available for treatment would reduce wildfire risk.	Same as Alternative A.	Impacts similar to but less than Alternative A, with 288,200 acres (88,200 acres of forest and 200,100 acres of woodland) available for treatment to reduce fire risks.	131,809 acres of forest and woodland treatments would reduce fuel loading and the risk of wildfires.

Table 2.2.5 Summary of Impacts – Hazardous Materials					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
HAZARDOUS MATERIALS					
Potentially increased long-term, indirect, adverse impacts from hazardous material use, generation, storage, transportation, and/or disposal associated with the development of 1,640,381 acres of mineral resources.	Impacts similar to Proposed RMP, but with 1,780,860 acres of mineral resource development.	Impacts similar to Proposed RMP, but with 1,819,397 acres of minerals resource development.	Impacts similar to Proposed RMP, but with 1,627,085 acres of minerals resource development.	Impacts similar to Proposed RMP, but with 1,536,030 acres of minerals resource development.	Decreased, long-term potential to generate hazardous materials from the lowest acreage available for mineral resources development (1,499,461 acres).  Recommended closure of non-WSA lands with wilderness characteristics to mining and closure of these areas to mineral leasing decreases lands available for mining and mineral leasing and the associated generation of hazardous materials.

Table 2.2.6 Summary of Impacts – Lands and Realty					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
LANDS AND REALTY					
Pursuing easements for Cowboy Canyon, Bonanza Bridge, and Wagon Hound Road would beneficially permit public access to the White River.	Same as Proposed RMP	No pursuit of easements to Cowboy Canyon, Bonanza Bridge, and Wagon Hound Road would restrict access to public lands.	Similar impacts as Proposed RMP, except would also pursue an easement for the old Uintah Railroad bed from the Utah/Colorado line to Watson in Evacuation Wash.	Unspecified actions on pursuit of easements.	Same as Alternative C.
Acquisition of Indian Trust lands in Bitter Creek and Sweetwater Canyon would beneficially allow public access and improved management of the area.	Same as Proposed RMP	Administration access only sought for Indian Trust lands in Bitter Creek and Sweetwater Canyon would have adverse impacts on cohesive management of the area.	Same as Proposed RMP	Unspecified actions on acquisition of Indian Trust lands.	Same as Alternative C.
22,814 acres would be pursued as a locatable mineral withdrawal, resulting in adverse impacts to Lands and Realty because more acres would be restricted and the range of allowable land uses would be less.	Same as Proposed RMP	Same as Proposed RMP	Similar impacts as the proposed RMP, except that 36,265 acres would be pursued as a locatable mineral withdrawal, resulting in adverse impacts to lands and realty	Land withdrawal decisions would preclude mineral and agricultural entry on 35,900 acres, resulting in adverse, long-term impacts on lands and realty because the range of land uses would be more limited and in general, more acres would be subject to restrictions.	Same as Alternative C.
Management of 106,178 acres non-WSA lands with wilderness characteristics as right-of-way avoidance areas to prevent surface disturbance and protect the wilderness characteristics of these areas would result in fewer lands and realty actions.	Unspecified in the DEIS.	Unspecified in the DEIS.	Unspecified in the DEIS.	Unspecified in the Current Management Plan.	Management of 277, 596 acres of non-WSA lands with wilderness characteristics as right-of-way exclusion areas to prevent surface disturbance and protect the wilderness characteristics of these areas would result in fewer lands and realty actions.
Retention of public lands in federal ownership would maintain and enhance BLM's ability to manage the resource values and uses of the non-WSA lands with wilderness characteristics.	Unspecified in the DEIS.	Unspecified in the DEIS.	Unspecified in the DEIS.	Unspecified in the Current Management Plan.	Retention of public lands in federal ownership would maintain and enhance BLM's ability to manage the resource values and uses of the non-WSA lands with wilderness characteristics.

Table 2.2.7 Summary of Impacts – Livestock and Grazing Management					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
156,425 acres/decade of prescribed fire would produce beneficial improvements in the health, biomass, age class, and diversity of forage.	Same as Proposed RMP	Same as Proposed RMP	Same as Proposed RMP	50,900 acres/decade of prescribed fire would produce beneficial improvements in the health, biomass, age class, and diversity of forage, though at a less degree than the other alternatives.	Same as Proposed RMP
LIVESTOCK AND GRAZING MANAGEMENT					
Phenology-based use system would have positive impacts on rangeland health. 138,402 AUMs allocated to livestock, a 5.3% AUM reduction compared to Alternative D.	Same as Proposed RMP, except 137,838 AUMs allocated to livestock, a 5.7% reduction form Alternative D.	Billed use based system. 139,163 AUMs allocated to livestock, a 4.8% AUM reduction from Alternative D.	Adjudicated use based system. Adverse impacts from 77,294 AUMs allocated to livestock, a 47.1% AUM reduction from Alternative D.	Permitted use based system. 146,161 AUMs allocated to livestock.	Same as Alternative C.
Oil and gas well construction would cause adverse short-term loss of 303 AUMs and long-term adverse loss of 829 AUMs from well pads, roads, and minerals infrastructure (a 4% reduction in AUMs compared to Alternative D).	Same as Proposed RMP, except short-term loss of 304 AUMs and long-term loss of 833 AUMs (a 4% reduction in AUMs compared to Alternative D).	Same as Proposed RMP, except adverse short-term loss of 305 AUMs and long-term adverse loss of 837 AUMs from minerals surface disturbances and construction (a 5% reduction in AUMs compared to Alternative D).	Same as Proposed RMP, except adverse short-term loss of 301 AUMs and long-term adverse loss of 824 AUMs from constructed minerals facilities and activities (a 3% reduction in AUMs compared to Alternative D).	Same as Proposed RMP from adverse short-term loss of 293 AUMs and long-term adverse loss of 800 AUMs.	Same as Proposed RMP from short-term adverse loss of 282 AUMs and long-term loss of 766 AUMs (a 4% increase in AUMs compared to Alternative D).
Short-term adverse impacts to livestock from displacement during rangeland improvement treatments on 34,640 acres, development of 812 guzzlers/reservoirs and 51 springs. Long-term benefits from improved rangeland for livestock.	Same as Proposed RMP.	Same as Proposed RMP, except treatments on 50,900 acres, 1,165 guzzlers/reservoirs, and 78 wells/springs.	Same as Proposed RMP, except treatments on 45,860 acres, 811 guzzlers/reservoirs, and 87 wells/springs.	Same as Proposed RMP, except treatments on 40,390 acres, 775 guzzlers/reservoirs, and 74 wells/springs.	Same as Alternative C.
Beneficial impacts from continued grazing allowed on 106,178 acres of non-WSA lands with wilderness characteristics.	No management for non-WSA wilderness characteristics values.	No management for non-WSA wilderness characteristics values.	No management for non-WSA wilderness characteristics values.	No management for non-WSA wilderness characteristics values.	Same as Proposed RMP, except grazing would be allowed on 277,596 acres of non-WSA lands with wilderness characteristics.

Table 2.2.8 Summary of Impacts – Minerals and Energy Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
MINERALS AND ENERGY RESOURCES					
1,640,381acres available for oil and gas under standard and controlled use leasing stipulations, a 7% increase over Alternative D, would have direct beneficial impacts on minerals development from increased revenues and royalties. Adverse impacts from reduction of finite minerals resources after extraction. Impacts to non-fluid mineral resources would be similar.	1,780,860 acres available for oil and gas under standard and controlled use leasing stipulations, a 16% increase over Alternative D, with impacts similar to the Proposed RMP for fluid and non-fluid minerals.	1,819,397 acres available for oil and gas under standard and controlled use leasing stipulations, an 18% increase over Alternative D, with impacts similar to the Proposed RMP for fluid and non-fluid minerals.	1,627,085 acres available for oil and gas under standard and controlled use leasing stipulations, a 6% increase over Alternative D, with minor adverse impacts from reduced availability of the resource for extraction and reduced royalties and revenues. Impacts to non-fluid mineral resources would be similar to the Proposed RMP.	1,536,030 acres available for oil and gas leasing under standard and controlled use stipulations, with adverse impacts similar to the Proposed RMP. Non-fluid minerals impacts similar to the Proposed RMP.	1,499,461 acres available for oil and gas leasing, a 2% decrease from Alternative D – No Action. Alternative E has the fewest acres open to oil and gas development; however, the open areas have more potential than Alternative D. A 4% increase in the number of wells is anticipated compared to Alternative D.
Cultural actions would have long-term indirect economically adverse impacts by increasing costs of development.	Same as the Proposed RMP.	Similar to Alternative A.	Cultural resource decisions would close 48,801 acres to oil and gas leasing in the Uinta Foothills, Little/Devil’s Hole, Upper Willow Creek, and Four Mile Wash.	Beneficial impacts to minerals development by opening areas to leasing and development.	Same as Alternative C.
106,178 acres of non-WSA lands with wilderness characteristics would be closed to oil and gas leasing (except White River, which would be NSO), solid mineral leasing, and mineral material disposal. These decisions would reduce opportunities for exploration and production of mineral and energy resources.	No acres of non-WSA lands with wilderness characteristics would be managed for protection of wilderness characteristics. There would be no effect on exploration or development of mineral and energy resources.	Same as Alternative A.	Same as Alternative A.	Unspecified in the Current Management Plan.	277,596 acres of non-WSA lands with wilderness characteristics would be closed to oil and gas leasing, solid mineral leasing, and mineral material disposal. These areas would be proposed for withdrawal from entry for locatable minerals. These decisions would reduce opportunities for exploration and production of mineral and energy resources.
<ul style="list-style-type: none"><li>Decision to minimize noise and light pollution adjacent to Dinosaur NM would increase costs of exploration and development, and reduce opportunities for development.</li><li>Closure of the Pelican Lake SRMA to mineral material disposal and NSO of oil and gas leasing would increase costs for fluid mineral development and limit production of mineral materials</li></ul>	Same as the Proposed RMP. Closures and NSO at Pelican Lake SRMA would be the same as the Proposed RMP. In addition, NSO around old growth pinyon in the Book Cliffs and within ½ mile each side of the White River would increase cost of oil and gas production.	Same as Alternative A. Same as Alternative A at the Pelican Lake SRMA.	Same as Alternative A. Same as Alternative A at the Pelican Lake SRMA.	No required mitigation for noise and light pollution adjacent to Dinosaur NM; thus no effect on oil and gas development. Management prescription for Pelican Lake SRMA would have the same effect on mineral and energy development as described under Alternative A.	Similar to Alternative C, except that 277,597 acres of non-WSA lands with wilderness characteristics closed to mineral and energy development to provide opportunities for primitive recreation; reducing opportunities for production of these resources.
Restrictions on surface disturbance and development on steep slopes would increase costs of mineral and energy exploration and development, potentially limit amount of ultimate development, and decrease royalties paid to the federal government and the State of Utah.	Same as the Proposed RMP.	Similar to the Proposed RMP and Alternative A.	Similar to the Proposed RMP and Alternative A.	Similar to the Proposed RMP and Alternative A.	Similar to the Proposed RMP and Alternative A.
Management prescriptions to protect 54,958 acres of ACEC, 52 miles of wild and scenic rivers, and 53,058 acres of WSA would close or limit surface disturbance in these special designation areas, limiting future exploration and	Management prescriptions to protect 101,181acres of ACEC, 86 miles of wild and scenic rivers, and 53,058 acres of WSA would close or limit surface disturbance in these special designation areas, limiting future exploration and	Management prescriptions to protect 53,411 acres of ACEC, 52 miles of wild and scenic rivers, and 53,058 acres of WSA would close or limit surface disturbance in these special designation areas, limiting future exploration and	Management prescriptions to protect 266,948 acres of ACEC, 216 miles of wild and scenic rivers, and 53,058 acres of WSA would close or limit surface disturbance in these special designation areas, limiting future exploration and	Management prescriptions to protect 86,604 acres of ACEC, 52 miles of wild and scenic rivers, and 53,058 acres of WSA would close or limit surface disturbance in these special designation areas, limiting future exploration and	Management prescriptions to protect 311,666 acres of ACEC, 192 miles of wild and scenic rivers, and 53,058 acres of WSA would close or limit surface disturbance in these special designation areas, limiting future exploration and

Table 2.2.8 Summary of Impacts – Minerals and Energy Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
MINERALS AND ENERGY RESOURCES					
development of mineral and energy resources.	development of mineral and energy resources.	development of mineral and energy resources.	development of mineral and energy resources.	development of mineral and energy resources.	development of mineral and energy resources.
Seasonal and spatial buffers and mitigation to maintain and enhance habitat for special status species and other wildlife would have minor adverse impacts on mineral and energy exploration and development by increasing economic costs.	Protections for special status species and other wildlife would be more restrictive to mineral and energy exploration and development than Alternative D – No Action.	Limitations for protecting special status species and other wildlife would be less restrictive than Alternative D, with minor adverse impacts similar to Alternative A.	Similar impacts as the Proposed RMP, but more restrictive, with more adverse economically related impacts to minerals development than Alternative D.	An adverse, but minor, increase in development costs for the protection of special status species and other wildlife species.	Same as Alternative C.
289,687 acres of VRM Class I and Class II areas would limit mineral and energy development and economic gain by increasing production costs and reducing areas of development.	357,909 acres of VRM Class I and Class II areas would have impacts similar to the Proposed RMP, but to more acres.	167,088 acres of VRM Class I and Class II areas would have impacts similar to the Proposed RMP, but to fewer acres.	508,441 acres of VRM Class I and Class II areas would have adverse impacts on minerals development similar to the Proposed RMP, but to a greater number of acres.	166,772 acres of current VRM Class I and Class II would have impacts similar to Alternative B.	594,210 acres of VRM Class I and Class II areas would have impacts similar to the Proposed RMP, but to the greatest number of acres.

Table 2.2.9 Summary of Impacts – Non-WSA Lands with Wilderness Characteristics

Table 2.2.9 Summary of Impacts – Non-WSA Lands with Wilderness Characteristics					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS					
Limiting OHV use to designated routes in Little Hole/Devils Hole, Upper Willow Creek, and Four Mile Wash (areas of high cultural site density) would prevent surface disturbance that would degrade the natural characteristics of Lower Flaming Gorge, Wolf Point, and Desolation Canyon non-WSA lands with wilderness characteristics. Motorized use, however, would reduce opportunities for solitude and primitive recreation.  Oil and gas leasing with an NSO stipulation in Four Mile Wash would prevent surface disturbance that would impact the natural characteristics of Desolation Canyon non-WSA land with wilderness characteristics.	Same as the Proposed RMP.	Same as the Proposed RMP, except oil and gas leasing would be permitted with standard stipulations, resulting in surface disturbance that degrades the natural characteristics of the Four Mile Wash area of Desolation Canyon non-WSA lands with wilderness characteristics.	OHV use and oil and gas leasing would be closed in Little Hole/Devils Hole and Four Mile Wash, protecting the wilderness characteristics of Lower Flaming Gorge and Desolation Canyon non-WSA lands with wilderness characteristics.  Limiting OHV use in Upper Willow Creek would have the same effects on Wolf Point as described in the Proposed RMP. Oil and gas leasing with timing and controlled surface use stipulations would permit surface disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics.	OHV use would not be limited in areas of high cultural site density, resulting in surface disturbance that would degrade the natural characteristics of Lower Flaming Gorge, Wolf Point, and Desolation Canyon.  The areas would be open to oil and gas leasing, resulting in surface disturbance that would degrade the wilderness characteristics of the three non-WSA lands with wilderness characteristics.	OHV use would have the same effects as described for Alternative C, except Upper Willow Creek would also be closed to OHV use and oil and gas leasing, protecting the wilderness characteristics of Wolf Point.
156,425 acres of prescribed fire treatments per decade would restore vegetation communities and the naturalness of non-WSA lands with wilderness characteristics. Fire operations would degrade opportunities for solitude and primitive recreation in the short term.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	50,900 acres of prescribed fire treatments with the same impacts as the Proposed RMP.	Same as the Proposed RMP.
Proposed locatable mineral withdrawal of 17,814 acres would protect the wilderness characteristics of portions of the Lower Flaming Gorge, Cold Spring Mountain, White River, and Cripple Cowboy non-WSA lands with wilderness characteristics.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP, but also includes mineral withdrawal in Desolation Canyon non-WSA lands with wilderness characteristics for a total of 26,386 acres.	Proposed locatable mineral withdrawal of 30,900 acres would protect the wilderness characteristics of portions of the Lower Flaming Gorge, Cold Spring Mountain, and Desolation Canyon non-WSA lands with wilderness characteristics.	Proposed locatable mineral withdrawal of 277,596 acres would protect the wilderness characteristics of all non-WSA lands with wilderness characteristics.
Land acquired in Nine Mile Canyon would not be grazed by livestock. Improvement of riparian and watershed condition would enhance the natural characteristics of a portion of the Desolation Canyon non-WSA lands with wilderness characteristics and the setting required to provide opportunities for solitude and primitive recreation.	Same as the Proposed RMP.	Land acquired in Nine Mile Canyon would be grazed by livestock, but there would be no noticeable impacts to the naturalness of the Desolation Canyon non-WSA lands with wilderness characteristics. The presence of livestock could degrade the desired experience of some visitors.	Same as the Proposed RMP.	Same as Alternative B.	Same as the Proposed RMP.
Between 54% and 100% of 11 non-WSA lands with wilderness characteristics,	Between 70% and 100% of 11 non-WSA lands with wilderness characteristics,	Same as Alternative A, except up to 171,412 of non-WSA lands with	Between 51% and 100% of 11 non-WSA lands with wilderness characteristics,	Same as Alternative C, except up to 145,711 acres of non-WSA lands with	Between 14% and 85% of 11 non-WSA lands with wilderness characteristics,

Table 2.2.9 Summary of Impacts – Non-WSA Lands with Wilderness Characteristics

Table 2.2.9 Summary of Impacts – Non-WSA Lands with Wilderness Characteristics					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS					
totaling up to 150,421 acres, would lose their wilderness characteristics due to oil and gas development.	totaling up to 153,768 acres, would lose their wilderness characteristics due to oil and gas development.	wilderness characteristics would lose their wilderness characteristics.	totaling up to 123,571 acres would lose their wilderness characteristics due to oil and gas development.	wilderness characteristics would lose their wilderness characteristics.	totaling up to 117,470 acres would lose their wilderness characteristics due to oil and gas development.
Managing White River, Blue Mountain, Browns Park, and Nine Mile Canyon SRMAs would provide for primitive recreation opportunities in portions of the SRMAs – preserving wilderness characteristics. Motorized recreation opportunities would be emphasized in other parts of the SRMA, conflicting with opportunities for solitude and primitive recreation.	Same as the Proposed RMP, but also include management of the Book Cliffs SRMA.	Managing Browns Park and Nine Mile Canyon as SRMAs would have the same impacts on non-WSA lands with wilderness characteristics as Proposed RMP.	Same as Alternative A.	Managing Browns Park and Nine Mile Canyon as SRMAs would have the same impacts on non-WSA lands with wilderness characteristics as described under the Proposed RMP.	Same as Alternative A, except that all non-WSA lands within the five SRMAs would be managed for primitive recreation, opportunities for solitude, and the setting required to support those opportunities.
Developing 400 miles of non-motorized trails would provide added opportunities for primitive recreation. Development of 800 miles of motorized trails would conflict with primitive recreation, and non-WSA lands with wilderness characteristics that provide those opportunities.	Same as the Proposed RMP.	Development of 800 miles of motorized trails would have the same impacts on non-WSA lands with wilderness characteristics as the Proposed RMP and Alternative A.	Same as the Proposed RMP and Alternative A, except 800 miles of motorized trails would not be developed.	Developing 57 miles of non-motorized trails would have the same impacts on non-WSA lands with wilderness characteristics as the Proposed RMP and Alternative A.	Same as the Proposed RMP and Alternative A, except 800 miles of motorized trails would not be developed.
75,845 acres closed to OHV use would enhance the wilderness characteristics of portions of the Lower Flaming Gorge and White River non-WSA lands with wilderness characteristics.	Same as the Proposed RMP.	60,187 acres closed to OHV use would enhance the wilderness characteristics of portions of the White River non-WSA lands with wilderness characteristics.	366,559 acres would be closed to OHV use, enhancing the wilderness characteristics of 18 non-WSA lands with wilderness characteristics.	50,388 acres would be closed to OHV use, enhancing the wilderness characteristics of parts of every non-WSA lands with wilderness characteristics, except Hideout Canyon.	392,818 acres would be closed to OHV use, enhancing the wilderness characteristics of all non-WSA lands with wilderness characteristics.
Prohibiting surface disturbance on slope greater than 40% would prevent surface disturbances that would degrade the naturalness of the non-WSA lands with wilderness characteristics.	Same as the Proposed RMP.	Erosion control plans required for surface disturbances on slopes greater that 20% would not prevent degradation of the natural characteristics of non-WSA lands with wilderness characteristics.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.
Designation of 4 ACECs would protect the wilderness characteristics of portions of 4 non-WSA lands with wilderness characteristics. Protection of 2 recommended wild and scenic rivers would protect the wilderness characteristics of portions of 3 non-WSA lands with wilderness characteristics.	Designation of 6 ACECs would protect the wilderness characteristics of portions of 7 non-WSA lands with wilderness characteristics. Protection of 3 recommended wild and scenic rivers would protect the wilderness characteristics of portions of 3 non-WSA lands with wilderness characteristics.	Designation of 4 ACECs would protect the wilderness characteristics of portions of 4 non-WSA lands with wilderness characteristics. Protection of 2 recommended wild and scenic rivers would protect the wilderness characteristics of portions of 3 non-WSA lands with wilderness characteristics.	Designation of 8 ACECs would protect the wilderness characteristics of portions of 11 non-WSA lands with wilderness characteristics. Protection of 5 recommended wild and scenic rivers would protect the wilderness characteristics of portions of 8 non-WSA lands with wilderness characteristics.	Designation of 4 ACECs would protect the wilderness characteristics of portions of 4 non-WSA lands with wilderness characteristics. Protection of 2 recommended wild and scenic rivers would protect the wilderness characteristics of portions of 3 non-WSA lands with wilderness characteristics.	Same as Alternative C, except White River would not be recommended suitable for wild and scenic river designation. White River would be managed as eligible, and protected, pending review of a dam construction permit.
139,502 acres would be managed by VRM Class I and Class II objectives, protecting the landscapes and the natural characteristics of portions of the non-WSA lands with wilderness characteristics.	148,364 acres would be managed by VRM Class I and Class II objectives, protecting the landscapes and the natural characteristics of portions of the non-WSA lands with wilderness characteristics.	52,777 acres would be managed by VRM Class I and Class II objectives, protecting the landscape and the natural characteristics of portions of the non-WSA lands with wilderness characteristics.	191,657 acres would be managed by VRM Class I and Class II objectives, protecting the landscape and the natural characteristics of portions of the non-WSA lands with wilderness characteristics.	52,626 acres would be managed by VRM Class I and Class II objectives, protecting the landscape and the natural characteristics of portions of the non-WSA lands with wilderness characteristics.	277,596 acres would be managed by VRM Class I objectives, protecting the landscape and the natural characteristics of the non-WSA lands with wilderness characteristics.
No horse herds would be maintained in the Bonanza, Hill Creek, or Winter Ridge	The presence of wild horses would supplement the wilderness characteristics	The presence of wild horses would supplement the wilderness characteristics	The presence of wild horses would supplement the wilderness characteristics	The presence of wild horses would supplement the wilderness characteristics	Same as Alternative C.

Table 2.2.9 Summary of Impacts – Non-WSA Lands with Wilderness Characteristics

Table 2.2.9 Summary of Impacts – Non-WSA Lands with Wilderness Characteristics					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS					
herd areas. There would be no supplemental wilderness characteristics or opportunity to view wild horses.	of the Wolf Point and Desolation Canyon non-WSA lands with wilderness characteristics. Construction of waters and fences to manage horses would degrade the naturalness of the non-WSA lands with wilderness characteristics to some degree.	of the Desolation Canyon non-WSA lands with wilderness characteristics. Construction of waters and fences to manage horses would degrade the naturalness of the non-WSA lands with wilderness characteristics to some degree.	of the White River, Wolf Point, and Desolation Canyon non-WSA lands with wilderness characteristics. Construction of waters and fences to manage horses would degrade the naturalness of the non-WSA lands with wilderness characteristics to some degree.	of the Desolation Canyon non-WSA lands with wilderness characteristics. Construction of waters and fences to manage horses would degrade the naturalness of the non-WSA lands with wilderness characteristics to some degree.	
546,152 acres of forests and woodlands would be treated or harvested. Treatments with prescribed fire could restore natural vegetation communities and enhance the natural characteristics of the non-WSA lands with wilderness characteristics. Treatments with chainsaws and bulldozers would degrade naturalness of the non-WSA lands with wilderness characteristics. Operation of the treatment would diminish opportunities for solitude and primitive recreation in the short term.	552,152 acres would be treated or harvested with the same impacts to non-WSA lands with wilderness characteristics as described for the Proposed RMP.	554,108 acres would be treated or harvested with the same impacts to non-WSA lands with wilderness characteristics as described for Alternative A.	Same as Alternative A, except treatment would not be permitted in 242,760 acres of ACECs.	Up to 88,200 acres of forests and 200,100 acres of woodlands would be treated or harvested with the same impacts to non-WSA lands with wilderness characteristics as Alternative A.	No mechanical forest or woodland treatment would be permitted in non-WSA lands with wilderness characteristics. Treatments could be performed with prescribed fire, with impacts the same as described for the Proposed RMP.
A management prescription would be implemented to protect the wilderness characteristics of 15 non-WSA lands with wilderness characteristics, totaling 106,178 acres.	No specific actions are prescribed to protect the wilderness characteristics of non-WSA lands with wilderness characteristics. There would be no impacts on non-WSA lands with wilderness characteristics.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	A management prescription would be implemented to protect the wilderness characteristics of all 25 non-WSA lands with wilderness characteristics, totaling 277,596 acres.

Table 2.2.10 Summary of Impacts - Paleontology					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
PALEONTOLOGY					
Long-term, direct, potentially adverse impacts from surface disturbance caused by, fire management, lands and realty decisions, livestock and grazing, minerals development, recreation, and woodland management. Beneficial impacts from development include increased access that would increase likelihood of site discoveries and long-term increase in knowledge of fossil resources.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	Beneficial impacts from development include site discoveries and long-term increase in knowledge of fossil resources.
Limits on surface disturbance in VRM Class I and Class II areas (289,687 acres) and non-WSA lands with wilderness characteristics (106,178 acres) would protect paleontological resources.	Limits on surface disturbance in designated VRM Class I and Class II areas (357.909 acres) would protect paleontological resources.	Same as Alternative A, except protection within 167,088 acres of designated VRM Class I and Class II areas.	Same as Alternative A, except protection within 508,441 acres of designated VRM Class I and Class II areas.	Same as Alternative A, except protection within 166,772 acres of designated VRM Class I and Class II areas.	Limits on surface disturbance in designated VRM Class I and Class II areas (594,210 acres) and non-WSA lands with wilderness characteristics (277,596 acres) would protect paleontological resources.
Beneficial long- and short-term direct-protection-related impacts from travel decisions by limiting open OHV areas to 6,202 acres.	Same as the Proposed RMP.	Same as the Proposed RMP, except open OHV use would be allowed on 5,434 acres.	Same as Alternative B.	Long-term adverse impacts from unrestricted OHV use on 787,859 acres.	Same as Alternative B.

Table 2.2.11 Summary of Impacts - Recreation					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RECREATION					
OHV restrictions in areas with high-density cultural sites would be adverse for motorized recreation, but beneficial to non-mechanized recreation. OHV restrictions would beneficially reduce resource use conflicts and improve visitor safety.	Same as the Proposed RMP	Similar impacts as the Proposed RMP	Same as the Proposed RMP	Beneficial impacts on motorized recreational use from open OHV areas at cultural sites. Lack of resource protection would have adverse impacts on sightseeing and interpretive sites.	Closing areas to OHV use would have long-term, adverse impacts on motorized recreational opportunities. Long-term, beneficial impacts on non-motorized recreation from OHV restrictions.
Prescribed burn fuel treatments on 156,425 acres per decade would limit recreation in treatment areas in the short term, but have long-term beneficial impacts on recreation from improved wildlife habitat, increased landscape diversity, and decreased risks of damage to developed recreation sites from wild land fire.	Same as the Proposed RMP	Same as the Proposed RMP	Same as the Proposed RMP	Same as the Proposed RMP except that the short-term and long-term impacts would be less (prescribed burns would be permitted on 50,900 acres).	Same as the Proposed RMP
Proposed minerals withdrawals and easements would beneficially increase recreational access and recreational opportunities for motorized and non-motorized users. Retention of 106,178 acres of non-WSA lands with wilderness characteristics in federal ownership and excluding ROWs would have beneficial impacts on non-mechanized recreational opportunities.	Proposed minerals withdrawals and easements would beneficially increase recreational access and recreational opportunities for motorized and non-motorized users.	Beneficial impacts to recreational opportunities from proposed mineral withdrawals.	Same as the Proposed RMP, except that non-WSA lands with wilderness characteristics would not be managed under this alternative.	Same as Alternative B.	Same as the Proposed RMP, except that 277,596 acres of non-WSA lands with wilderness characteristics would increase the beneficial recreational opportunities for non-mechanized users. The impacts to mechanized users would be more adverse because OHV use would be prohibited in these areas.
Potential leasing and minerals development and surface disturbances on approximately 2,143,223 acres would have direct and indirect adverse impacts on recreational opportunities and experiences, except for OHV use that would benefit from additional road construction. Managing 106,178 acres of non-WSA lands with wilderness characteristics as closed to mineral leasing would have long-term beneficial impacts on motorized and non-motorized recreational opportunities.	Same as the Proposed RMP, except that 2,320,825acres would be affected by minerals leasing and mining and no management of non-WSA lands with wilderness characteristics.	Same as Alternative A, except that 2,376,920 acres would be affected by minerals leasing and mining.	Same as Alternative A, except that 2,116,201 acres would be affected by minerals leasing and mining and no management of non-WSA lands with wilderness characteristics.	Same as Alternative A, except that approximately 2,044,339 acres would be available for minerals leasing and mining.	Same as the Proposed RMP, except that 1,931,353 acres would be affected by minerals leasing and mining and 277,596 acres in non-WSA lands with wilderness characteristics would beneficially impact opportunities for non-mechanized recreational opportunities. Adverse impacts on mechanized opportunities in non-WSA lands with wilderness characteristics from prohibitions on OHV travel.
Designation of 133,560 acres of SRMAs would have long-term, beneficial impacts on mechanized and non-mechanized recreational opportunities.	Same as the Proposed RMP, but to a greater degree, from designation of 499,588 acres of SRMAs.	Same as Alternative D from designation of 86,454acres of SRMAs.	Same as the Proposed RMP, but to a greater degree, from designation of 522,604 acres of SRMAs.	Same as Alternative B.	Same as Alternative C.
Development and/or improvement of 800 miles of motorized trails, development and/or maintenance of 400 miles of mechanized (non-motorized) trails, and increasing the number of cabins would	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP, except that 800 miles of motorized trails would not be developed (with adverse impacts from limited OHV recreational opportunities, but beneficial to other, non-mechanized	Development of 55 miles of hiking or horse trails and 2 miles of mountain-bike trails would have beneficial impacts on recreation.	Development of 400 miles of non-motorized trails would enhance recreation opportunities for non-motorized and non-mechanized opportunities, but would be adverse for motorized OHV users from

Table 2.2.11 Summary of Impacts - Recreation					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RECREATION					
have beneficial impacts on recreation.			recreational activities).		limited opportunities.
Designation of 131,697 acres of ACECs would be beneficial to mechanized and non-mechanized recreation opportunities.	Same as the Proposed RMP, but to a greater degree from designation of 345,850 acres as ACECs.	Same as the Proposed RMP from designation of 170,886 acres as ACECs.	Same as the Proposed RMP, but to a greater degree from designation of 681,310 acres as ACECs.	Same as the Proposed RMP from designation of 165,944 acres as ACECs.	Same as Alternative C.
Management of 106,178 acres of non-WSA lands with wilderness characteristics would provide opportunities for primitive forms of recreation.	Not managed under this alternative.	Not managed under this alternative.	Not managed under this alternative.	Not managed under this alternative.	Protection of wilderness characteristics on 277,596 acres of non-WSA lands with wilderness characteristics would provide opportunities for primitive forms of recreation.
6,202 acres would be designated as open to OHV travel, 1,643,475 acres would allow OHV travel on designated routes, 75,845 acres would be closed to OHV travel, and 4,860 miles of designated OHV routes would have long-term beneficial impacts on OHV recreation and long-term beneficial impacts on other forms of recreation by reducing recreation use conflicts.	Same as the Proposed RMP.	5,434 acres would be open to OHV use, 1,659,901 acres would be designated as limited, 60,187 acres would be closed to OHV use, and 4,860 miles of designated OHV routes would have impacts similar to the Proposed RMP.	5,434 acres would be open to OHV use, 1,353,529 acres would be designated as limited, 366,559 acres would be closed to OHV use, and 4,707 miles of designated routes would have impacts similar to the Proposed RMP.	787,859 acres would remain open to OHV travel, 887,275 acres would be designated as limiting OHV use to designated routes, and 50,388 acres as closed to OHV use. There would be beneficial impacts for OHV users from a substantial area open to unrestricted OHV travel. There would be adverse impacts to other (non-mechanized and non-motorized)recreational activities, and resource use conflicts would continue.	5,434 acres would be designated as open to OHV travel; 1,326,024 acres would be designated as limited; and 392,818 acres would be closed to OHV travel. 4,654 miles of designated OHV routes would have long-term beneficial impacts on OHV recreation and long-term beneficial impacts on other forms of recreation by reducing recreation use conflicts.

Table 2.2.12 Summary of Impacts – Riparian Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RIPARIAN RESOURCES					
Prescribed fire allowed on 156,425 acres/decade would result in fewer adverse impacts from wildland fire to riparian resources.	Same as Proposed RMP.	Same as Proposed RMP.	Same as Proposed RMP.	Prescribed fire allowed on 50,900 acres/decade would result in more adverse impacts from wildland fire to riparian resources compared with the other alternatives.	Prescribed fire on 156,425 acres per decade would result in fewer severe wildfires, promote healthy upland vegetation condition, and reduce erosion and sedimentation to riparian systems.
245,607 AUMs allotted with 50% riparian utilization would cause more adverse impacts to riparian resources than Alternative C.	245,649 AUMs allotted with 50% riparian utilization would cause more adverse impacts to riparian resources than Alternative C.	244,034 AUMs allotted with greater forage utilization (60%) in riparian areas would cause more adverse impacts to riparian resources than Alternative C.	187,450 AUMs allotted with 50% riparian utilization would have the least adverse impacts to riparian resources.	246,128 AUMs allotted with unspecified use of riparian areas would have the greatest adverse impacts to riparian resources.	187,450 AUMs allotted with 50% riparian utilization would maintain proper functioning condition of riparian zones in the VPA.
Increased public access via easements and acquisitions, and agricultural entry on withdrawn lands would expose riparian areas to adverse impacts from resource degradation.	Increased public access via easements and acquisitions, and agricultural entry on withdrawn lands would expose riparian areas to adverse impacts from resource degradation.	No easements or acquisitions sought. Agricultural entry on withdrawn lands would expose riparian areas to adverse impacts from resource degradation.	Similar to Alternative A, though somewhat greater adverse impacts could occur if more easements or acquisitions were sought than under Alternative A.	Unspecified amounts of land easements and acquisitions.	Increased public access via easements and land acquisitions would lead to increased visitation and increased human impacts on riparian systems. Proposal for mineral withdrawals would limit surface disturbances in riparian zones.
Rangeland improvements would treat 34,640 acres, with the least beneficial impacts to riparian resources from improving filtration (reducing sedimentation) and reducing livestock watering within riparian areas.	Rangeland improvements would treat 34,640 acres, with the least beneficial impacts to riparian resources from improving filtration (reducing sedimentation) and reducing livestock watering within riparian areas.	Rangeland improvements would treat 50,900 acres, with impacts similar to Alternative A, but would be the most beneficial of all the alternatives.	Rangeland improvements would treat 45,860 acres, with impacts similar to but less than Alternative B.	Rangeland improvements would treat 40,390 acres, with impacts similar to Alternative A.	Rangeland improvements would treat 45,860 acres, with impacts similar to but less than Alternative B.
Beneficial impacts from designating SRMAs, managing OHV use. Long-term adverse impacts from trail development.	Beneficial impacts from designating SRMAs, managing OHV use. Long-term adverse impacts from trail development.	Similar to Alternative D, but with less beneficial impacts caused by trail development, which would adversely impact riparian areas.	Similar to Alternative A, but would have the most beneficial impacts on riparian resources.	Beneficial impacts from continued management of SRMAs, management of OHV use, and limited trail development.	Managing portions of SRMAs for primitive opportunities and settings would limit surface disturbances that result in erosion and sedimentation in riparian systems. Limiting most OHV use to designated routes would also limit surface disturbance, with the same impacts on riparian systems.
Closing obsolete roads and limiting OHV use would have more long-term, direct, beneficial impacts on riparian resources than Alternative D, but less than Alternative C.	Closing obsolete roads and limiting OHV use would have more long-term, direct, beneficial impacts on riparian resources than Alternative D, but less than Alternative C.	Management of OHV use would have more beneficial impacts than Alternative D, but less than A and C.	Closing obsolete roads and placing the most limitations on OHV use would have the most beneficial impacts on riparian resources.	Unspecified road and trail closures, and the most Open-class OHV use would have long-term adverse impacts on riparian resources.	Closing obsolete roads and placing the most limitations on OHV use would have the most beneficial impacts on riparian resources.
Limiting surface disturbance on steep slopes would reduce erosion and sedimentation to riparian systems.	Limiting surface disturbance on steep slopes would reduce erosion and sedimentation to riparian systems.	Disturbance would not be limited on steep slopes.	Limiting surface disturbance on steep slopes would reduce erosion and sedimentation to riparian systems.	Disturbance would only be restricted on steep slopes for mineral production activities.	Limiting surface disturbance on steep slopes would reduce erosion and sedimentation to riparian systems.
Designation of additional special management areas (ACEC and recommended wild and scenic rivers) would limit surface disturbances that lead to erosion and sedimentation and deterioration of riparian zones.	Designation of additional special management areas (ACEC and recommended wild and scenic rivers) would limit surface disturbances that lead to erosion and sedimentation and deterioration of riparian zones.	Designation of limited special management areas (ACEC and recommended wild and scenic rivers) would slightly limit surface disturbances that lead to erosion and sedimentation and deterioration of riparian zones.	Designation of the greatest area of special management areas (ACEC and recommended wild and scenic rivers) would limit surface disturbances that lead to erosion and sedimentation and deterioration of riparian zones.	Unspecified in the Current Management Plan.	Designation of the greatest area of special management areas (ACEC and recommended wild and scenic rivers) would limit surface disturbances that lead to erosion and sedimentation and deterioration of riparian zones.
Protection of 106,178 acres of wilderness characteristics in non-WSA lands with wilderness characteristics would limit surface disturbances that lead to erosion	Unspecified in the DEIS.	Unspecified in the DEIS.	Unspecified in the DEIS.	Unspecified in the Current Management Plan.	Protection of 277,596 acres of wilderness characteristics in non-WSA lands with wilderness characteristics would limit surface disturbances that lead to erosion

Table 2.2.12 Summary of Impacts – Riparian Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
RIPARIAN RESOURCES					
and sedimentation in riparian zones.					and sedimentation in riparian zones.
552,152 acres of woodlands treated or harvested would have long-term adverse impacts caused by soil erosion.	552,152 acres of woodlands treated or harvested would have long-term adverse impacts caused by soil erosion.	554,108 acres of woodlands harvested or treated would have impacts similar to Alternative A.	Same as Proposed RMP.	288,300 acres of woodlands harvested or treated would have the least adverse impacts on riparian resources caused by soil erosion.	Treatment or harvest of 421,133 acres of forests and woodlands would result in increased soil erosion.

Table 2.2.13 Summary of Impacts – Social and Economic Considerations					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SOCIAL AND ECONOMICS CONSIDERATIONS					
<b>LIVESTOCK GRAZING:</b> Socioeconomic impacts would be identical to current conditions because the amount of AUMs available is identical to Alternative D.	<b>LIVESTOCK GRAZING:</b> Same as Proposed RMP.	<b>LIVESTOCK GRAZING:</b> 7,084 fewer AUMs (5% less) would not alter socioeconomic impacts compared to Alternative D.	<b>LIVESTOCK GRAZING:</b> 68,926 fewer AUMs (47% less) would have negligible impact on socioeconomics given the total average actual use of AUMs has been around 78,500 over the previous 10 years.	<b>LIVESTOCK GRAZING:</b> Socioeconomic impacts would remain similar to current conditions.	<b>LIVESTOCK GRAZING:</b> Same as Alternative C.
<b>MINERAL DEVELOPMENT:</b> 93,861 jobs over 20 years and 14.8 employees per well. \$12.9 billion in development costs \$520 million annually in federal royalty revenue. \$462.9 million annually in county royalty revenue. \$20.4 million estimated annual property tax benefit from oil and gas production	<b>MINERAL DEVELOPMENT:</b> Same as Proposed RMP	<b>MINERAL DEVELOPMENT:</b> 94,586 jobs over 20 years. \$13.0 billion in development costs. \$524.8 million annually in federal royalty revenue. \$466.5 million annually in county royalty revenue. \$20.5 million estimated annual property tax benefit from oil and gas production	<b>MINERAL DEVELOPMENT:</b> 92,085 jobs over 20 years. \$12.7 billion in development costs. \$511.2 million annually in federal royalty revenue. \$454.4 million annually in county royalty revenue. \$20.0 million estimated annual property tax benefit from oil and gas production	<b>MINERAL DEVELOPMENT:</b> 86,668 jobs over 20 years. \$11.9 billion in development costs. \$480.9 million annually in federal royalty revenue. \$427.4 million annually in county royalty revenue. \$18.8 million estimated annual property tax benefit from oil and gas production	<b>MINERAL DEVELOPMENT:</b> 90,532 jobs over 20 years. \$12.5 billion in development costs over 20 years. \$453,600,000 in state revenue. \$281,300,000 in local revenue. \$446,600,000 in royalties to counties. \$19.6 million estimated annual property tax benefit from oil and gas production
<b>RECREATION:</b> Long-term, indirect beneficial impacts on communities from development of recreational opportunities, increased tourist spending, and limits on other activities.	<b>RECREATION:</b> Similar impacts as Alternative A with regard to Backcountry Byways, trails and cabins. More potential for visitation and recreation opportunities (and related economic gains) within SRMAs compared to Proposed RMP and Alternative D.	<b>RECREATION:</b> Similar impacts as Alternative D. Less recreational opportunities than Alternative A, with fewer long-term indirect beneficial impacts from tourism.	<b>RECREATION:</b> Similar impacts as Alternative A. More potential for visitation and recreational opportunities than Alternative B, but less economic gain than Alternative A.	<b>RECREATION:</b> Current recreational opportunities support 2.5 total annual visitation. \$99.5 million in total annual traveler spending, \$2.08 million in tourism related taxes, with 2,580 in recreation related jobs.	<b>RECREATION:</b> Long-term, indirect benefits to communities from development of recreational opportunities, increased tourist spending, and limits on other activities.
<b>SPECIAL DESIGNATIONS:</b> Opportunities for adverse socioeconomic impacts resulting from the designation of ACECs is likely to be minor as 83,539 acres would be Closed or designated as NSO.  Beneficial impacts of tourism-related revenue as a result of WSA designation would be identical to Alternative D.	<b>SPECIAL DESIGNATIONS:</b> Same as Proposed RMP.	<b>SPECIAL DESIGNATIONS:</b> Opportunities for adverse socioeconomic impacts resulting from ACEC designation would be least under Alternative B, as 23,390 would have major restrictions on oil and gas development.  Beneficial impacts of tourism-related revenue as a result of WSA designation would be identical to Alternative D.	<b>SPECIAL DESIGNATIONS:</b> Opportunities for adverse impacts resulting from ACEC designation would be greatest under Alternative C, as 257,006 acres would have major restrictions on oil and gas development.  WSR designation of 216 river miles could have long-term beneficial impacts on tourism-related revenues.	<b>SPECIAL DESIGNATIONS:</b> Impacts to socioeconomics would be similar to current conditions, as 47,167 acres are designated as ACECs.  With 52 river miles designated as eligible for WSR status, socioeconomic impacts would be negligible.	<b>SPECIAL DESIGNATIONS:</b> Similar to Alternative C.
<b>TRAVEL MANAGEMENT:</b> Greatest potential for social and economic benefits to the extent that user conflicts are reduced, and that sufficient opportunities exist for both motorized and non-motorized recreation.	<b>TRAVEL MANAGEMENT:</b> Same as Proposed RMP	<b>TRAVEL MANAGEMENT:</b> Social and economic benefits to OHV users and associated businesses higher than under the Proposed Plan, but less than under current conditions. Social and economic benefits to non-motorized recreationists less than under the Proposed Plan, but greater than under current conditions.	<b>TRAVEL MANAGEMENT:</b> Potential decrease in OHV visitation with corresponding potential increase in non-motorized recreation. Adverse economic impacts to businesses focusing on OHV use, but positive economic benefits to businesses focusing on non-motorized recreation.	<b>TRAVEL MANAGEMENT:</b> Economic contributions from OHV users would be similar to current conditions. There could be a potential decrease in social well-being and contribution to the local economy from recreationists seeking non-motorized opportunities. There could be possible degradation of other resources that could adversely impact recreation opportunities and	<b>TRAVEL MANAGEMENT:</b> Greatest potential for a decrease in OHV visitation with a corresponding increase in non-motorized recreation. Adverse impacts to businesses focusing on OHV use would be greatest.

Table 2.2.13 Summary of Impacts – Social and Economic Considerations					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SOCIAL AND ECONOMICS CONSIDERATIONS					
				visitation in the long term.	
<b>NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS:</b> Negligible adverse economic impacts from reduction of oil and gas development on 106,178 acres of non-WSA lands with wilderness characteristics. Possible increases in revenues from primitive recreation	<b>NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS:</b> No impacts, as no non-WSA lands would be managed for wilderness characteristics	<b>NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS:</b> No impacts, as no non-WSA lands would be managed for wilderness characteristics	<b>NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS:</b> No impacts, as no non-WSA lands would be managed for wilderness characteristics	<b>NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS:</b> No impacts, as no non-WSA lands would be managed for wilderness characteristics	<b>NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS:</b> Adverse economic impacts from reduction in oil and gas development on 277,596 acres of non-WSA lands with wilderness characteristics. Possible increases in revenues from primitive recreation.

Table 2.2.14 Summary of Impacts – Soil and Water Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SOIL AND WATER RESOURCES					
Prescribed burning on 156,425 acres/decade would cause short-term erosion on: 20,335 acres of water-erodible soils 123,575 acres of wind-erodible soils, and reclamation difficulty on: 14,078 acres of sodic soils 31,285 acres of saline soils 10,949 acres of gypsic soils	Same as Proposed RMP.	Same as Proposed RMP.	Same as Proposed RMP.	Management for prescribed burning on 50,900 acres/decade would have 3 times less short-term adverse impacts on soils.	Same as Proposed RMP.
50% forage utilization and 245,607 AUMs allocated would moderate adverse impacts on soil and water resources through loss of cover and trampling.	50% forage utilization and 245,649 AUMs allocated would moderate adverse impacts on soil and water resources through loss of cover and trampling.	60% forage utilization and 244,034 AUMs allocated would have impacts similar to Alternative A.	60% forage utilization and 187,450 AUMs allocated would have the least adverse impacts on soil and water resources through loss of cover and trampling.	245,108 AUMs allocated and unspecified forage utilization would potentially have the greatest adverse impacts on soil and water resources through loss of cover and trampling.	50% forage utilization and 187,450 AUMs allocated would have less adverse impacts on soil and water resources through loss of cover and trampling, than Alternative D – No Action.
Increased public access via easements and acquisitions, and agricultural entry on proposed land withdrawals would expose soil and water resources to potential degradation.	Same as Proposed Plan.	No easements or acquisitions would be sought. Agricultural entry on withdrawn lands would expose soil and water resources to potential degradation.	Same as Proposed Plan.	Land withdrawals that would preclude agricultural entry would have the least adverse impacts on soil and water resources compared with other alternatives. Unspecified land easements and acquisitions.	Same as Proposed Plan.
1,640,381 acres available for oil and gas development under standard and controlled use leasing stipulations, adversely impacting 18,860 acres of soils in the long-term on approximately 3,665 wells.	1,780,860 acres available for oil and gas development under standard and controlled use leasing stipulations, adversely impacting 18,945 acres of soils in the long-term on approximately 3,688 wells.	1,819,397 acres available for oil and gas development under standard and controlled use leasing stipulations, adversely impacting 18,757 acres of soils in the long term on approximately 3,712 wells.	1,627,085 acres available for oil and gas development under standard and controlled use leasing stipulations, adversely impacting 18,757 acres of soils in the long term on approximately 3,637 wells.	1,536,030 acres available for oil and gas development under standard and controlled use leasing stipulations, adversely impacting 18,212 acres of soils in the long term on approximately 3,488 wells.	1,499,461 acres available for oil and gas development, adversely impacting 17,468 acres of soils in the long term from development of about 3,285 wells.

Table 2.2.14 Summary of Impacts – Soil and Water Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SOIL AND WATER RESOURCES					
Managing 106,178 acres of non-WSA lands with special protections to maintain their wilderness characteristics would result in long-term benefits to water quality and soil productivity in the form of reduced soil erosion, sedimentation, and salinity in streams.	Varying levels of development and surface disturbance within non-WSA lands would have indirect, long-term, adverse impacts to water quality and soil productivity.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Managing 277,596 acres of non-WSA lands with special protections to maintain their wilderness characteristics would result in long-term benefits to water quality and soil productivity in the form of reduced soil erosion, sedimentation, and salinity in streams.
34,640 acres of rangeland treatments would beneficially impact vegetation cover, reducing erosion and sedimentation by the least amount.	Same as Proposed RMP.	50,900 acres of rangeland treatments would beneficially impact vegetation cover, reducing erosion and sedimentation by the greatest amount.	45,860 acres of rangeland treatments would beneficially impact vegetation cover, reducing erosion and sedimentation.	40,390 acres of rangeland treatments would beneficially improve vegetative cover, thereby reducing erosion and sedimentation.	45,860 acres of rangeland treatments would maintain and restore vegetation condition, reducing erosion and sedimentation.
Designating 3 backcountry byways, 7 SRMAs, 400 miles of non-motorized trails, and 800 miles of motorized trails would likely have adverse impacts from erosion, sedimentation, and soil degradation. Limiting OHV use to trails for game retrieval would beneficially impact soils.	Designating 3 backcountry byways, 7 SRMAs, 400 miles of non-motorized trails, and 800 miles of motorized trails would likely have adverse impacts from erosion, sedimentation, and soil degradation. Limiting OHV use to trails for game retrieval would beneficially impact soils.	Designating 3 backcountry byways, 4 SRMAs, and 800 miles of motorized trails would likely have adverse impacts from erosion, sedimentation, and soil degradation. Allowing OHV off trails to retrieve game would be adverse to soils.	Designating 8 SRMAs, and 400 miles of non-motorized would have adverse impacts caused by erosion, sedimentation, and soil degradation. Limiting OHV use to trails for game retrieval would beneficially impact soils.	Designating 3 backcountry byways, 4 SRMAs, and 57+ miles of motorized trails (and unlimited access) would likely have adverse impacts caused by erosion, sedimentation, and soil degradation.	Establishing 8 SRMAs and 400 miles of non-motorized would result in increased visitation and adverse impacts from erosion, sedimentation, and soil degradation. Elements of recreation management that limit surface disturbance, however, would protect soil and water resources. Limiting OHV use to trails for game retrieval would beneficially impact soils.

Table 2.2.14 Summary of Impacts – Soil and Water Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SOIL AND WATER RESOURCES					
Restrictions on surface-disturbing activities for slopes 21-40% and greater than 40% would reduce erosion and sedimentation.	Same as Proposed Plan.	Restrictions on surface-disturbing activities for slopes greater than 20% would reduce erosion and sedimentation, but less than Alternatives A, C, and the Proposed Plan.	Restrictions on surface-disturbing activities for slopes 21-40% and greater than 40% would reduce erosion and sedimentation.	Restrictions on surface-disturbing for mineral activities only for slopes greater than 40% would reduce erosion and sedimentation, but less than any other alternative.	Same as Alternative C.
<p>The designation of 131,700 acres as ACECs would result in less surface disturbance but would have the least indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.</p> <p>The designation of 39 BLM shoreline miles as WSRs may increase visitation, but would also prevent surface disturbance in the immediate vicinity and have direct and indirect, long-term benefits to water quality and soil productivity.</p>	<p>The designation of 345,400 acres as ACECs would result in less surface disturbance and would have the second greatest indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.</p> <p>The designation of 57 BLM shoreline miles as WSRs may increase visitation, but would also prevent surface disturbance in the immediate vicinity and have direct and indirect, long-term benefits to water quality and soil productivity.</p>	<p>The designation of 179,356 acres as ACECs would result in less surface disturbance and would have indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.</p> <p>The designation of 39 BLM shoreline miles as WSRs may increase visitation, but would also prevent surface disturbance in the immediate vicinity and have direct and indirect, long-term benefits to water quality and soil productivity</p>	<p>The designation of 681,310 acres as ACECs would result in less surface disturbance and would have the greatest indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.</p> <p>The designation of 112 BLM shoreline miles as WSRs may increase visitation, but would also prevent surface disturbance in the immediate vicinity and have the greatest direct and indirect, long-term benefits to water quality and soil productivity.</p>	<p>The designation of 165,944 acres as ACECs would result in less surface disturbance and would have indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.</p> <p>The designation of 39 BLM shoreline miles as WSRs may increase visitation, but would also prevent surface disturbance in the immediate vicinity and have direct and indirect, long-term benefits to water quality and soil productivity.</p>	<p>The designation of 681,310 acres as ACECs would result in less surface disturbance and would have the greatest indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.</p> <p>The designation of 104 BLM shoreline miles as WSRs may increase visitation, but would also prevent surface disturbance in the immediate vicinity and have the greatest direct and indirect, long-term benefits to water quality and soil productivity</p>
<b>OHV USE:</b> 6,202 acres open 1,643,475 acres limited 75,845 acres closed 4,860 miles of designated routes would limit adverse impacts caused by erosion and sedimentation.	<b>OHV USE:</b> Same as Proposed RMP.	<b>OHV USE:</b> 5,434 acres open 1,659,901 acres limited 60,187 acres closed 4,861 miles of designated routes would allow more adverse OHV-caused erosion and sedimentation.	<b>OHV USE:</b> 5,434 acres open 1,353,529 acres limited 366,559 acres closed 4,707 miles of routes designate would allow the least OHV-caused erosion and sedimentation.	<b>OHV USE:</b> 787,859 acres open 887,275 acres limited 50,388 acres closed undesigned routes would have long-term adverse impacts from OHV-caused soil erosion and sedimentation.	<b>OHV USE:</b> 5,434 acres open 1,326,024 acres limited 392,818 acres closed 4,654 miles of designated routes would result in the least OHV-caused erosion and sedimentation.
Management of 546,152 acres of forest and woodlands harvested would result in short-term adverse impacts from erosion and sedimentation, but long-term beneficial impacts by reducing wildland fire risks.	Management of 552,152 acres of forest and woodlands harvested would result in short-term adverse impacts from erosion and sedimentation, but long-term beneficial impacts by reducing wildland fire risks.	Management of 554,108 acres of forest and woodlands harvested would result in short-term adverse impacts from erosion and sedimentation, but long-term beneficial impacts by reducing wildland fire risks.	Same as Alternative A.	Management of 288,300 acres of forest and woodlands harvested would result in the highest amount of adverse short-term erosion and sedimentation from disturbance during management, but long-term beneficial impacts from reducing wildland fire.	Harvest of 421,133 acres of forest and woodlands would result in short-term adverse impacts from erosion and sedimentation, but long-term beneficial impacts by reducing wildfire risks.
289,687 acres as VRM Class I and II would result in less development and surface disturbance and, thus, in fewer indirect, long-term adverse impacts to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.	357,909 acres as VRM Class I and II would result in less development and surface disturbance and, thus, in fewer indirect, long-term adverse impacts to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.	166,794 acres as VRM Class I and II would result in the lowest limitations of development and surface disturbance and, thus, would result in fewer indirect, long-term benefits to water quality and soil productivity	508,441 acres as VRM Class I and II would result in the second least amount of development and surface disturbance and, thus, in fewer indirect, long-term adverse impacts to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.	166,772 acres as VRM Class I and II would result in the lowest limitations of development and surface disturbance and, thus, would result in fewer indirect, long-term benefits to water quality and soil productivity.	594,210 acres as VRM Class I and II would result in the least amount of development and surface disturbance and, thus, in fewer indirect, long-term adverse impacts to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams

Table 2.2.15 Summary of Impacts – Special Designations					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SPECIAL DESIGNATIONS					
Management of 131,700 acres of ACECs, 53,058 acres of WSAs, and 52 miles of wild and scenic rivers would result in the least benefit to special area values including rangeland, fire, soil, watershed, vegetation, riparian, woodland, and wildlife resources, and recreation uses.	Management of 345,850 acres of ACECs, 53,058 acres of WSAs, and 86 miles of wild and scenic rivers would result in the third highest benefit to special area values including rangeland, fire, soil, watershed, vegetation, riparian, woodland, and wildlife resources, and recreation uses.	Management of 179,356 acres of ACECs, 53,058 acres of WSAs, and 52 miles of wild and scenic rivers would result in the fourth highest benefit to special area values including rangeland, fire, soil, watershed, vegetation, riparian, woodland, and wildlife resources and recreation uses.	Management of 681,310 acres of ACECs, 53,058 acres of WSAs, and 216 miles of wild and scenic rivers would result in the highest benefit to special area values including rangeland, fire, soil, watershed, vegetation, riparian, woodland, and wildlife resources, and recreation uses.	Management of 165,944 acres of ACECs, 53,058 acres of WSAs, and 52 miles of wild and scenic rivers would result in the fifth highest benefit to special area values including rangeland, fire, soil, watershed, vegetation, riparian, woodland, and wildlife resources, and recreation uses.	Management of 681,310 acres of ACECs, 53,058 acres of WSAs, and 192 miles of wild and scenic rivers would result in the second highest benefit to special area values including rangeland, fire, soil, watershed, vegetation, riparian, woodland, and wildlife resources, and recreation uses.

Table 2.2.16 Summary of Impacts – Special Status Species					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SPECIAL STATUS SPECIES					
156,425 acres/decade of prescribed fire would help beneficially restore habitat health over the long term, though individual displacement and loss of habitat would be adverse in the short term.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	50,900 acres/decade of prescribed fire would have similar impacts as Alternative A, but on a smaller scale.	Same as the Proposed RMP.
22,814 acres of mineral withdrawals would preclude mineral entry, providing beneficial protection of special status species.	Same as the Proposed RMP	Same as the Proposed RMP.	36,265 acres of mineral withdrawals would preclude mineral entry, providing beneficial protection of special status species.	35,900 acres of mineral withdrawals would preclude agricultural and mineral entry and provide beneficial protection of special status species.	Same as Alternative C. Land and easement acquisition would lead to increased visitation and surface disturbance that would impact special status species habitat. Proposed mineral withdrawals and ROW exclusion areas, on the other hand, would reduce surface disturbance that would impact vegetation communities.
1,640,381 acres associated with mineral development under standard and controlled use leasing stipulations would have impacts similar to Alternative D, but to a greater degree.	1,780,860 acres associated with mineral development under standard and controlled use leasing stipulations would have impacts similar to Alternative D, but to a greater degree.	1,819,397 acres associated with mineral development under standard and controlled use leasing stipulations would have impacts similar to Alternative D, but to the highest degree of all the alternatives.	1,627,085 acres associated with mineral development under standard and controlled use leasing stipulations would have impacts similar to Alternative D, but to a slightly higher degree.	1,536,030 acres associated with mineral development under standard and controlled use leasing stipulations would cause moderate reductions in the AUMs available to wildlife, adversely increase habitat fragmentation, cause adverse deterioration of fisheries and wildlife habitats, and disruption and alteration of seasonal migration routes.  <b>Note:</b> This alternative does not include the acreage for the Hill Creek Extension as it was not leased in the Book Cliffs RMP.	1,499,461 acres associated with mineral development under standard and controlled use leasing stipulations would have impacts similar to Alternative D, but to a slightly lesser degree.
34,640 acres of rangeland improvements (vegetation treatments) would benefit special status species where additional water sources were established and habitat were restored, though improvements could have adverse impacts if livestock move into areas that have received little grazing in the past.	Same as the Proposed RMP	50,900 acres of rangeland improvements would have impacts similar to the Proposed RMP but to a greater extent.	45,860 acres of rangeland improvements would have impacts similar to the Proposed RMP but to a greater extent.	40,390 acres of rangeland improvements would have impacts similar to the Proposed RMP but to a greater extent.	Same as Alternative C
Establishment of 3 backcountry byways, 7 SRMAs (133,560 total acres), 400 miles of non-motorized and 800 miles of motorized trails would expose areas that may have special status species, causing displacement, disturbance, and/or harm.	Establishment of 3 backcountry byways, 7 SRMAs (499,588 total acres), 400 miles of non-motorized and 800 miles of motorized trails would expose areas that may have special status species, causing displacement, disturbance, and/or harm.	Establishment of 3 backcountry byways, 4 SRMAs (86,454 total acres), and 800 miles of motorized trails would expose areas that may have special status species, causing displacement, disturbance, and/or harm.	Establishment of 8 SRMAs (522,604 total acres), and 400 miles of non-motorized trails would expose areas that may have special status species, causing displacement, disturbance, and/or harm.	Establishment of 4 SRMAs (86,454 total acres), and 57+ miles of motorized trails (and unlimited access) would expose areas that may have special status species, causing displacement, disturbance, and/or harm.	Establishment of 8 SRMAs (522,604 total acres) and 400 miles of non-motorized trails would expose areas that may have special status species, causing displacement, disturbance, and/or harm.
OHV travel limited to designated routes or closed except for managed open areas. 6,202 acres open to OHV travel; 1,643,475 acres limited to OHV travel;	Same as the Proposed RMP	OHV travel limited to designated routes or closed except for managed open areas. 5,434 acres open to OHV travel; 1,659,901 acres limited to OHV travel;	OHV travel limited to designated routes or closed except for managed open areas. 5,434 acres open to OHV travel; 1,353,529 acres limited to OHV travel;	Minimal recreational management oversight and unrestricted OHV use on 787,859 acres would expose areas that may have special status species, causing	OHV travel limited to designated routes or closed except for managed open areas. 5,434 acres open to OHV travel; 1,326,024 acres limited to OHV travel;

Table 2.2.16 Summary of Impacts – Special Status Species					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SPECIAL STATUS SPECIES					
75,845 acres closed to OHV travel. The increase in recreation management and decrease in acres open to OHV travel would result in fewer impacts to special status species than Alternative D.		60,187 acres closed to OHV travel. The increase in recreation management and decrease in acres open to OHV travel would result in fewer impacts to special status species than Alternative D.	366,559 acres closed to OHV travel. The increase in recreation management and decrease in acres open to OHV travel would result in fewer impacts to special status species than Alternative D.	displacement, disturbance, and/or harm.	392,818 acres closed to OHV travel. The increase in recreation management and decrease in acres open to OHV travel would result in fewer impacts to special status species than Alternative D.
Riparian habitat would be utilized to 30% of vegetation, which would indirectly reduce erosion of stream banks and sedimentation of stream habitat.	Same as the Proposed RMP.	Riparian habitat would be utilized to 50% during the growing season and 60% during the dormant season to maintain vegetation, which would indirectly reduce erosion of stream banks and sedimentation of stream habitat, but less than the Proposed RMP and Alternatives A, C, and E.	Same as the Proposed RMP.	Unspecified riparian use would not beneficially impact special status species.	Same as the Proposed RMP.
131,700 acres of ACEC designation, 53,058 acres of WSAs, and 65 miles of W&SR recommended designations would help maintain habitat for special status species.	345,850 acres of ACEC designation, 53,058 acres of WSAs, and 96 miles of W&SR recommended designations would help maintain habitat for special status species.	179,356 acres of ACEC designation, 53,058 acres of WSAs, and 52 miles of W&SR recommended designations would help maintain habitat for special status species.	681,310 acres of ACEC designation, 53,058 acres of WSAs, and 216 miles of W&SR recommended designations would help maintain habitat for special status species.	165,944 acres of ACEC designation, 53,058 acres of WSAs, and 52 miles of W&SR recommended designations would help maintain habitat for special status species.	681,310 acres of ACEC designation, 53,058 acres of WSAs, and 216 miles of W&SR recommended designations would help maintain habitat for special status species.
Beneficial seasonal and spatial buffers would be created for raptor species under guidance of Best Management Practices as described in “Best Management Practices for Raptors and Their Associated Habitats in Utah” (Utah BLM, 2006, Appendix A). Implementation of Sage-grouse protection measures—no surface-disturbing activities within 0.25 miles of active leks year round, no surface-disturbing activities within 2 miles of active leks March 1 through June 15—would have beneficial impacts on this species.	Raptors would be managed using Best Management Practices including implementation of spatial and seasonal buffers comparable to the USFWS’s Guidelines for Raptor Protection From Human and Land Use Disturbances, with modifications allowed as long as protection of nests is ensured.  Implementation of Sage-grouse protection measures—avoid human disturbance within 0.6 miles of leks from March 1 through May 31 from 1 hour before sunrise to 3 hours after sunrise and construction of routes, fences, poles, and utility lines would be avoided within 1,300 feet of a lek.	Raptors managed at less restrictive levels than the Proposed RMP and Alternative A. Sage-grouse management similar to Alternative A, but less protective due to allowances for certain developments within 1,300 feet of a lek.	USFWS seasonal and spatial buffers would be implemented for raptor species. Sage-grouse protection measures would be the same as the Proposed RMP.	Seasonal and spatial buffers would be created for raptor species under the Diamond Mountain area for the twenty special status or sensitive raptor species listed in the Diamond Mountain RMP. Raptor buffers in the Book Cliffs area would remain unspecified. For Sage-grouse in the Book Cliffs RMP area surface disturbance, exploration, drilling, and other development activity would only be allowed from June 15 through March 15 and no drilling or storage facilities would be allowed within 300 feet of a Sage-grouse lek. For Sage-grouse in the Diamond Mountain RMP area surface-disturbing activities would not be allowed within Sage-grouse nesting areas from March 1 through June 30 or within 1,000 feet of Sage-grouse strutting grounds.	Same as Alternative C.
Colorado River cutthroat trout would be beneficially reintroduced into 9 streams and their tributaries.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	Suitable habitat would be provided and maintained to reintroduce Colorado River cutthroat trout into 8 streams as found applicable.	Same as the Proposed RMP.
Management of 546,152 acres of forest and woodlands would have treatments or be harvested resulting in short-term adverse impacts related to the removal of vegetation and other surface disturbance but with beneficial impacts in the long-term as habitat for special status species	Impacts similar to the Proposed RMP for management of 552,152 acres of forest and woodlands.	Impacts similar to the Proposed RMP for management of 554,108 acres of forest and woodlands.	Same as Alternative A.	Impacts similar to the Proposed RMP for management of 288,300 acres of forest and woodlands.	Impacts similar to the Proposed RMP for management of 421,133 acres of forest and woodlands.  Approximately 330,573 acres within WSAs and Non-WSAs with wilderness characteristics would not have vegetation removal resulting in reduced surface

Table 2.2.16 Summary of Impacts – Special Status Species					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
SPECIAL STATUS SPECIES					
is restored.					disturbance but no treatments that could restore habitats.
Management of 106,178 acres of non-WSA lands with wilderness characteristics to protect their wilderness characteristics would limit surface disturbances, providing protection of special status species and their habitat.	No specific actions are specifically prescribed to protect the wilderness characteristics of non-WSA lands with wilderness characteristics.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Management of 277,596 acres of non-WSA lands with wilderness characteristics to protect their wilderness characteristics would limit surface disturbances, providing protection of special status species and their habitat.

Table 2.2.17 Summary of Impacts - Vegetation					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
VEGETATION					
156,425 acres of fire treatments/decade would produce beneficial improvements in the long-term in the health, biomass, age class, and diversity of forage.	Same as the Proposed RMP	Same as the Proposed RMP.	Same as the Proposed RMP.	50,900 acres/decade of prescribed fire would produce beneficial improvements in the health, biomass, age class, and diversity of forage, though at a lesser degree than the Proposed RMP and other alternatives.	Same as the Proposed RMP.
245,607 AUMs allotted could result in short-term impacts that include loss of vegetative cover and biomass, and trampling, with long-term impacts such as reductions in plant productivity and regenerative ability, and increases in weeds; though 50% upland vegetation utilization by livestock, and 30% riparian vegetation utilization would set limits on grazing impacts.	Same as the Proposed RMP except that 245,649 AUMs would be allotted for livestock, wildlife, and wild horses.	244,034 AUMs allotted could result in impacts similar to the Proposed RMP; though 60% upland vegetation utilization by livestock and 50% riparian vegetation utilization would set limits on grazing impacts.	Same as the Proposed RMP except that 187,450 AUMs would be allotted for livestock, wildlife, and wild horses.	246,128 AUMs allotted could result in impacts similar to the Proposed RMP; unspecified upland vegetation utilization by livestock and no utilization specified for riparian areas could have indirect, adverse impacts on vegetation.	Same as the Proposed RMP except that 187,450 AUMs would be allotted for livestock, wildlife, and wild horses.
Increased public access via easements and acquisitions, and agricultural entry on withdrawn lands would expose vegetation resources to potential degradation. 22,814 acres of locatable mineral withdrawals would result in protection from surface disturbance due to locatable minerals activities on these lands.	Same as the Proposed RMP	No easements or acquisitions sought except across Indian trust lands in Bitter Creek. Agricultural entry on withdrawn lands would expose vegetation resources to potential degradation. 22,814 acres of locatable mineral withdrawals would result in protection from surface disturbance due to locatable minerals activities on these lands.	Similar to the Proposed RMP, though somewhat greater impacts may occur if more easements/acquisitions are sought than those under the Proposed RMP. 36,265 acres of locatable mineral withdrawals would result in protection from surface disturbance due to locatable minerals activities on these lands.	5,000 acres would preclude agricultural entry that would lessen exposure of vegetation resources to potential degradation compared with other alternatives. Unspecified amounts of land easements and acquisitions would occur. 35,900 acres of locatable mineral withdrawals would result in protection from surface disturbance due to locatable minerals activities on these lands.	Same as Alternative C.
18,860 acres of surface disturbance associated with mineral development would have adverse impacts to vegetation resources including direct loss of vegetation and increased risk of noxious weed invasion.	Same as the Proposed RMP except on 18,971 acres.	Same as the Proposed RMP except on 19,033 acres.	Same as the Proposed RMP except on 18,757 acres.	Same as the Proposed RMP except on 18,212 acres.	Same as the Proposed RMP except on 17,469 acres.
34,640 acres of vegetation treatments would disrupt vegetation communities in the short-term but, in the long-term, would help restore natural vegetation communities, eliminate weeds, and control livestock movement (through fencing). Guzzlers/ reservoirs (812) would result in the direct removal of vegetation in the locations where these rangeland improvements are installed.	Same as the Proposed RMP.	Same as the Proposed RMP except that 50,900 acres would receive vegetation treatments and 1,165 guzzlers/reservoirs would be installed.	Same as the Proposed RMP except that 45,860 acres would receive vegetation treatments and 811 guzzlers/reservoirs would be installed.	Same as the Proposed RMP except that 40,390 acres would receive vegetation treatments and 775 guzzlers/reservoirs would be installed.	Same as Alternative C.
Establishment of 3 backcountry byways, 7 SRMAs (133,560 total acres), 400 miles of non-motorized and 800 miles of motorized trails would adversely expose areas to trampling and weed introduction.	Establishment of 3 backcountry byways, 7SRMAs (499,588 total acres), 400 miles of non-motorized and 800 miles of motorized trails would adversely expose areas to trampling and weed introduction.	Establishment of 3 backcountry byways, 4 SRMAs (86,454 total acres), and 800 miles of motorized trails would adversely expose areas to trampling and weed introduction.	Establishment of 8 SRMAs (522,604 total acres), and 400 miles of non-motorized trails would adversely expose areas to trampling and weed introduction.	Establishment of 4 SRMAs (86,454 total acres), and 57+ miles of motorized trails (and unlimited access) would adversely expose areas to trampling and weed introduction.	Establishment of 8 SRMAs (522,604 total acres) and 400 miles of non-motorized trails would expose areas to trampling and weed introduction.
Erosion control on slopes greater than	Same as the Proposed RMP.	Erosion control on slopes greater than	Erosion control on slopes greater than	Restrictions on surface-disturbing for	Same as Alternative C.

Table 2.2.17 Summary of Impacts - Vegetation					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
VEGETATION					
20% and surface disturbance restrictions on slopes greater than 40% would have beneficial impacts that ensure adequate substrate exists for continued plant growth.		20% would have beneficial impacts that ensure adequate substrate exists for continued plant growth, but less beneficial than the Proposed RMP and Alternatives C and E.	20% and no surface disturbance on slopes greater than 40% would have beneficial impacts that ensure adequate substrate exists for continued plant growth.	mineral activities for slopes greater than 40% would ensure adequate substrate exists for continued plant growth. Erosion control on slopes less than 40% are unspecified.	
131,700 acres of ACEC designation, 53,058 acres of WSAs, and 72 miles of W&SR recommended designations would benefit vegetation resources by reducing surface disturbance in these areas.	Same as the Proposed RMP except that there would be 345,850 acres of ACEC designation and 96 miles of W&SR recommended designation.	Same as the Proposed RMP except that there would be 179,356 acres of ACEC designation, and 65 miles of W&SR recommended designations.	Same as the Proposed RMP except that there would be 681,310 acres of ACEC designation, and 216 miles of W&SR recommended designations.	Same as the Proposed RMP except that there would be 165,944 acres of ACEC designation, and 52 miles of W&SR recommended designations.	Same as the Proposed RMP except that there would be 681,310 acres of ACEC designation, and 216 miles of W&SR recommended designations.
75,845 acres would be closed to OHV travel, which would reduce damage to and loss of vegetation, and the spread of weeds.	Same as the Proposed RMP.	Same as the Proposed RMP except that 60,187 acres would be closed to OHV travel.	Same as the Proposed RMP except that 366,559 acres would be closed to OHV travel.	Same as the Proposed RMP except that 50,388 acres would be closed to OHV travel.	Same as the Proposed RMP except that 366,559 acres would be closed to OHV travel.
Management of 106,178 acres of non-WSA lands with wilderness characteristics to protect their wilderness characteristics would limit surface disturbances, providing protection of vegetation communities in these areas.	No specific actions are specifically prescribed to protect the wilderness characteristics of non-WSA lands with wilderness characteristics.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Management of 277,596 acres of non-WSA lands with wilderness characteristics to protect their wilderness characteristics would limit surface disturbances and protect vegetation communities in these areas.

Table 2.2.18 Summary of Impacts – Visual Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
VISUAL RESOURCES					
156,425 acres of fire treatments/decade would have short-term impacts that affect color, line, form, and texture of the treated area; long-term benefits to visual resources would include lower frequency, size, and smoke generation of unmanaged wildland fires, and enhance scenic quality through greater variety of vegetation.	Same impacts as the Proposed RMP.	Same impacts as the Proposed RMP.	Same impacts as the Proposed RMP.	Same types of impacts as the Proposed RMP, except that 50,900 acres/decade would be treated, with reduced levels of short-term and long-term adverse and beneficial impacts.	Same impacts as the Proposed RMP.
22,814 acres of locatable mineral withdrawals, and ROW exclusion and prohibitions on oil and gas leasing within the 106,178 acres of non-WSA lands with wilderness characteristics would have protection-related, beneficial impacts on scenic quality.	22,814 acres of locatable mineral withdrawals would have beneficial, long-term, protection-related impacts on scenic quality.	Same as Alternative A.	Same impacts as the Proposed RMP, except 36,265 acres would be protected under mineral withdrawals.	Pursuing 35,900 acres of minerals withdrawals would have long term, beneficial impacts on visual resources.	Same impacts as the Proposed RMP, except that 36,265 acres of proposed minerals withdrawals and 277,596 acres of non-WSA lands with wilderness characteristics managed as ROW exclusion areas and prohibitions on oil and gas leasing would have long-term, beneficial impacts on visual resources.
2,143,223 acres available for minerals surface disturbances would have adverse impacts to visual resources.	2,320,825 acres available for minerals leasing surface disturbances would have similar impacts as the Proposed RMP.	2,376,920 acres available for minerals leasing surface disturbances would have similar impacts as the Proposed RMP.	Same impacts as the Proposed RMP, but on 2,116,201 acres available for minerals surface disturbances.	2,044,339 acres available for minerals leasing surface disturbances would have adverse impacts to visual resources.	1,931,353 acres available for minerals leasing surface disturbances would have adverse impacts to visual resources.
Designation of 133,560 acres as SRMAs would have short-term and long-term beneficial impacts on visual resources by limiting surface-disturbing activities to ensure recreational opportunities. The mitigation of light pollution adjacent to Dinosaur NM would also be beneficial in the long term.	Same impacts as the Proposed RMP, but to a greater degree, from designation of 499,620 acres as SRMAs and from light pollution mitigation.	Same impacts as the Proposed RMP, but to a lesser degree, from designation of 86,454 acres as SRMAs and from light pollution mitigation.	Same impacts as the Proposed RMP, but to a greater degree, from designation of 522,604 acres as SRMAs and from light pollution mitigation.	Impacts the same as Alternative B because the same acreage would be designated as SRMAs. Some adverse impacts from lack of light mitigation adjacent to Dinosaur NM.	Same impacts as Alternative C.
Development/improvement of 800 miles of motorized trails would produce fugitive dust, erosional impacts, and surface-disturbing contrasts that would be directly adverse to visual quality. Closing or limiting OHV travel on 1,719,320 acres would benefit scenic quality by limiting surface disturbances.	Same impacts as Proposed RMP.	Same impacts as Proposed RMP on 1,720,088 closed or with limits on OHV travel.	No motorized trails would be established. Closing or limiting OHV travel on 1,720,088 acres would benefit visual quality.	Establishment of 55 miles of motorized trails would produce fugitive dust, erosional impacts, and surface-disturbing contrasts that would be directly adverse to visual quality. Closing or limiting OHV travel on 937,663 acres would benefit scenic quality.	No motorized trails would be established. Closing or limiting OHV travel on 1,720,088 acres would reduce surface disturbance and benefit visual quality.
Designating 131,700 acres as ACECs would benefit visual resources through VRM management implementation and restricting surface disturbances.	Same impacts as Proposed RMP, but to a greater degree from designation of 345,850 acres as ACECs.	Same impacts as Proposed RMP from designation of 179,356 acres as ACECs.	Same impacts as Proposed RMP, but to a greater degree, from designation of 681,310 acres as ACECs.	Same impacts as Proposed RMP from designation of 165,944 acres as ACECs.	Same impacts as Alternative C.
Management of 133,560 acres of SMRAs would have beneficial, short-term and long-term impacts on scenic quality by protecting these areas from surface disturbances.	Same impacts as Proposed RMP, but to a greater degree from designation of 499,588 acres as SRMAs.	Same impacts as Proposed RMP from designation of 86,454 acres as SRMAs.	Same impacts as Proposed RMP, but to a greater degree from designation of 522,604 acres as SRMAs.	Same as Alternative B.	Same as Alternative C.
Managing 289,687 acres under VRM Class I and Class II objectives would	Same impacts as Proposed RMP, except to a greater degree by managing 357,909	Same impacts as Proposed RMP, but to a lesser degree, by managing 167,088	Same impacts as Proposed RMP, except to a substantially greater degree, by	Same as Alternative B.	Impacts similar to Alternative C by managing 594,210 acres under VRM

Table 2.2.18 Summary of Impacts – Visual Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
VISUAL RESOURCES					
benefit scenic resources in the long term.	acres under VRM Class I and II objectives.	acres under VRM Class I and II objectives.	managing 508,441 acres under VRM Class I and II objectives.		Class I and Class II objectives.
546,152 acres of woodlands and forests would have treatments or be harvested; short-term impacts would be degradation of line, color, and texture contrasts created from woodland treatments, harvesting and salvage, and OHV surface disturbances in areas visible to the public; long-term impacts would include reducing the potential for wildland fires and creation of scenic variety through a mosaic of vegetation types.	Same impacts as the Proposed RMP, but on 552,152 acres.	Same impacts as the Proposed RMP, but on 544,108 acres.	Same as Alternative A.	Same impacts as the Proposed RMP, but to a lesser degree, on 88,200 acres.	Same impacts as the Proposed RMP, but on 421,133 acres.
Management of 106,178 acres under VRM Class II objectives within non-WSA lands with wilderness characteristics would have long-term, beneficial impacts on scenic quality.	No management of non-WSA lands with wilderness characteristics	No management of non-WSA lands with wilderness characteristics	No management of non-WSA lands with wilderness characteristics	No management of non-WSA lands with wilderness characteristics	Management of 277,596 acres of non-WSA land with wilderness characteristics to protect their wilderness characteristics would limit changes to the landscape and scenery.

Table 2.2.19 Summary of Impacts – Wild Horses					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WILD HORSES					
No impacts to wild horses from fire treatments, as all horses would be removed from the VPA.	Prescribed burning on 156,425 acres/decade would have short term, adverse impacts on forage and on access of horses to burned areas. Long term, beneficial impacts from improved forage resulting from vegetation treatments.	Same as the Proposed RMP.	Same as Alternative A.	50,900 acres/decade of prescribed fire would produce beneficial improvements of wild horse habitat in the health, biomass, age class, and diversity of forage, though to a lesser degree than the other alternatives.	Same as Alternative A.
All horses would be removed from VPA in the long term. Short-term, beneficial impacts from allocation of 2,340 AUMs allocated to wild horses because forage would be available until final gathering and removal.	Long-term, beneficial impacts from allocation of 2,940 AUMs in Winter Ridge HA and Hill Creek HMA to ensure sustainability and health of these herds.	0 AUMs allocated to wild horses (horses would be removed from the VPA), with short-term, adverse impacts from lack of forage allocation until gathering and removal of wild horses.	A total of 3,960 AUMs allocated to wild horses in Bonanza HMA, Winter Ridge HA, and Hill Creek HMA would have short-term and long-term, beneficial impacts on horses by providing for health and sustainability of these herds. Long-term adverse impacts from reduction of forage allocation if conflicts are identified between horse and wildlife.	3,360 AUMs allocated to wild horses, with 2,340 AUMs allocated to Hill Creek HMA and Winter Ridge HA would have impacts the same as Alternative C.	Same as Alternative C.
No impacts to wild horses from minerals decisions since they would be removed.	Surface-disturbing mineral leasing within 89% of HMAs and HA (240,247 acres) would have adverse impacts to horse habitat by directly reducing forage productivity. Indirect, adverse impacts would be likely from human-caused harassment (noise, motion, lights, and human presence).	Same as the Proposed RMP.	Same impacts as Alternative A, except that 79% of HMA and HA (213,908 acres) would be available for surface-disturbing mineral leasing	Short-term and long-term direct and indirect impacts to wild horses (same as discussed under Alternative A) from allowing mineral leasing within 88% (234,010 acres) of HMAs and HA.	Same as Alternative C, except 78% (209,838 acres) of HMA and HA would be affected.
Long-term, adverse impacts to wild horses from removal of all horses from the VPA	Long-term, beneficial impacts from re-establishment of Winter Ridge herd and maintenance of Hill Creek herd.	Same as Proposed RMP.	Long-term, beneficial impacts to wild horses from re-establishment of a herd in the Bonanza HMA, with a minimum herd size of 40 horses; 50 horses minimum in the Winter Ridge HMA, and a Hill Creek HMA herd with a minimum herd size of 70 individuals.	Long-term, beneficial impacts on wild horses from maintaining the Hill Creek HMA herd. Long-term, adverse impacts to horses from lack of specific management decisions to address equine disease concerns, herd gathering to maintain population size, or resolution of Ute and private property boundaries concerns.	Same as Alternative C.

Table 2.2.20 Summary of Impacts – Wildlife and Fisheries Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WILDLIFE AND FISHERIES RESOURCES					
Restrictions on OHV travel to designated routes and on oil and gas development (open subject to timing and controlled surface use or no surface occupancy) in areas with high cultural resource site density would beneficially preserve habitat for wildlife.	Same as the Proposed RMP except in the Little/Devils Hole areas where only OHV travel limited to designated routes would be in place.	Same as the Proposed RMP except in the Little/Devils Hole areas (same as Alternative A) and in the Four Mile Wash area which would include the OHV restrictions but allow oil and gas development subject to standard stipulations.	High cultural site density areas would be closed to OHV travel and oil and gas development except in the Upper Willow Creek area of the Book Cliffs, which would be the same as the Proposed RMP.	High cultural site density areas would remain open to OHV use and oil and gas development and therefore not protect wildlife habitat near cultural sites, with potentially adverse impacts to wildlife.	Same as Alternative C.
154,900 acres of fire treatments/decade would produce beneficial improvements in the health, biomass, age class, and diversity of forage for wildlife resources.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	50,900 acres/decade of prescribed fire treatments would have similar impacts as Alternative A, though on a smaller scale than the other alternatives.	Same as the Proposed RMP.
104,865 AUMs allocated to wildlife and 2,340 AUMs (temporarily) allocated to wild horses would have more beneficial impacts for wildlife than Alternative D by providing more forage for wildlife.	104,871 AUMs allocated to wildlife and 2,940 AUMs allocated to wild horses would have more beneficial impacts for wildlife than Alternative D by providing more forage for wildlife.	104,871 AUMs allocated to wildlife would have impacts similar to the Proposed RMP by providing forage for wildlife.	106,196 AUMs allocated to wildlife and 3,960 AMUs allocated to wild horses would have impacts similar to the Proposed RMP by providing forage for wildlife.	96,607 AUMs allocated to wildlife and 3,360 AMUs allocated to wild horses would have impacts similar to but less than the Proposed RMP and action alternatives.	Same as Alternative C.
Limiting upland vegetation utilization by livestock to 50%, and 30% riparian vegetation utilization would beneficially improve habitat for wildlife resources.	Same as the Proposed RMP	Limiting upland vegetation utilization by livestock to 60%, and 50% riparian vegetation utilization would benefit wildlife habitat, but less than The Proposed RMP and Alternatives A, C, and E.	Same as the Proposed RMP.	Unspecified vegetation utilization by livestock, and unspecified riparian vegetation utilization would provide less protection to wildlife and fisheries habitat than the Proposed RMP and action alternatives.	Same as the Proposed RMP.
Precluding mineral entry on withdrawn lands (22,814 acres) would have long-term beneficial impacts on habitat by protecting them from minerals surface disturbances.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP except that 36,265 acres would be withdrawn from mineral entry.	Same as the Proposed RMP except that 35,900 acres would be withdrawn from mineral entry.	Same as Alternative C.
Construction activities associated with mineral development would cause reduction in the AUMs available to wildlife, loss of wildlife and fisheries habitats, and disruption and/or alteration of seasonal migration routes due to the additional construction facilities; indirect impacts include habitat fragmentation and changes in behavior, distribution, activity, and energy expenditure that are caused by human disturbance. Total area open to oil and gas development, mineral material disposal, and phosphate and gilsonite development would be 1,640,381 acres, 389,788 acres, 76,208 acres, and 172 miles, respectively.	Same as the Proposed RMP except that total area open to oil and gas development, mineral material disposal, and phosphate and gilsonite development would be 1,780,860 acres, 415,395 acres, 87,724 acres, and 172 miles, respectively.	Same as the Proposed RMP except that total area open to oil and gas development, mineral material disposal, and phosphate and gilsonite development would be 1,819,397 acres, 432,953 acres, 87,724 acres, and 172 miles, respectively.	Same as the Proposed RMP except that total area open to oil and gas development, mineral material disposal, and phosphate and gilsonite development would be 1,627,085 acres, 388,699 acres, 63,571 acres, and 172 miles, respectively.	Same as the Proposed RMP except that total area open to oil and gas development, mineral material disposal, and phosphate and gilsonite development would be 1,536,030 acres, 387,700 acres, 84,600 acres, and 168 miles, respectively.	Same as the Proposed RMP except that total area open to oil and gas development, mineral material disposal, and phosphate and gilsonite development would be 1,499,461 acres, 344,682 acres, 52,063 acres, and 163 miles, respectively.
Rangeland improvements—34,640 acres of vegetation treatments, 69 miles of fencing, 812 guzzlers/reservoirs, 38 miles of pipeline, and 51 wells/springs—would have long-term beneficial impacts to	Same as the Proposed RMP.	Same as the Proposed RMP except that rangeland improvements would consist of 50,900 acres of vegetation treatments, 369 miles of fencing, 1,165 guzzlers/reservoirs, 51 miles of pipeline,	Same as the Proposed RMP except that rangeland improvements would consist of 45,860 acres of vegetation treatments, 129 miles of fencing, 811 guzzlers/reservoirs, 30 miles of pipeline,	Same as the Proposed RMP except that rangeland improvements would consist of 40,390 acres of vegetation treatments, 65 miles of fencing, 775 guzzlers/reservoirs, 35 miles of pipeline, and 74 wells/springs.	Same as Alternative C.

Table 2.2.20 Summary of Impacts – Wildlife and Fisheries Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WILDLIFE AND FISHERIES RESOURCES					
wildlife habitat by improving existing habitat and providing water during high-stress drought periods.		and 78 wells/springs.	and 87 wells/springs.		
Establishment of 3 backcountry byways and 7 SRMAs (133,560 total acres),would have long-term beneficial impacts on wildlife and fisheries by limiting surface-disturbing activities; adverse impacts would be produced by increased visitor use and recreational activities.	Establishment of 3 backcountry byways and 7 SRMAs (499,588 total acres) would have similar impacts to the Proposed RMP.	Establishment of 3 backcountry byways and 4 SRMAs (86,454 total acres), would have similar impacts to the Proposed RMP.	Establishment of 8 SRMAs (522,604 total acres) would have similar impacts to the Proposed RMP.	Establishment of 4 SRMAs (86,454 total acres) would have similar impacts to the Proposed RMP. Establishment of 57+ miles of motorized trails (and unlimited access) and minimal recreational management would adversely impact wildlife and fisheries from recreational activities without protective measures.	Establishment of 8 SRMAs (522,604 total acres) would have similar impacts to the Proposed RMP.
Stream habitat improvements, enhancements, and/or maintenance for Colorado River cutthroat trout on 9 streams would help reduce erosion and sedimentation, which would have direct beneficial impacts on wildlife and fisheries resources. Other measures to protect, enhance, or provide habitat for special status species would also have direct beneficial impacts on wildlife and fisheries resources.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP except that there would be fewer protection and improvement measures than the Proposed RMP and the action alternatives.	Same as the Proposed RMP.
Wildlife management actions would have beneficial impacts by providing habitat and forage for wildlife, expanding wildlife reintroduction efforts, and protecting crucial winter ranges.	Same as the Proposed RMP except that there would be more protective measures provided for crucial winter ranges and BLM would provide habitat and forage for the emigration and/or reintroduction of bison in the Southern Book Cliffs.	Same as the Proposed RMP, but with fewer beneficial impacts related to offering less protection for crucial winter ranges. Also, reintroductions of moose and bison would not be supported.	Same as the Proposed RMP except that there would be more protective measures provided for crucial winter ranges and BLM would provide for the emigration and/or reintroduction of bison in the Southern Book Cliffs. This alternative would be more beneficial to wildlife and fisheries than the Proposed RMP and all the other alternatives.	Amount of allowed disturbances in crucial winter ranges would be unspecified; species reintroduction would be unspecified.	Same as Alternative C.
75,845 acres would be closed to OHV travel, which would have beneficial impacts by providing additional wildlife habitat protection from surface disturbances, noise, and human harassment.	Same as the Proposed RMP.	Same as the Proposed RMP except that 60,187 acres would be closed to OHV travel.	Same as the Proposed RMP except that 366,559 acres would be closed to OHV travel.	Same as the Proposed RMP except that 50,388 acres would be closed to OHV travel.	Same as the Proposed RMP except that 366,559 acres would be closed to OHV travel.
546,152 acres of forest and woodlands harvested or treated would have long-term beneficial impacts to wildlife and fisheries by reducing fuel loading and the risks of wildland fire, and improving big-game habitat. Short-term impacts would include temporary loss of forage and cover.	Same as the Proposed RMP except that 552,152 acres of forest and woodland would have treatments or be harvested.	Same as the Proposed RMP except that 554,108 acres of forest and woodland would have treatments or be harvested.	Same as Alternative A.	Same as the Proposed RMP except that 288,300 acres of forest and woodland would have treatments or be harvested.	Same as the Proposed RMP except that 421,133 acres of forest and woodland would have treatments or be harvested and 330,573 acres within non-WSA lands with wilderness characteristics would not have vegetation removal.
131,700 acres of ACEC designation, 53,058 acres of WSAs, and 72 miles of W&SR recommended designations would	Same as the Proposed RMP except that there would be 345,850 acres of ACEC designation and 96 miles of W&SR	Same as the Proposed RMP except that there would be 179,356 acres of ACEC designation, and 65 miles of W&SR	Same as the Proposed RMP except that there would be 681,310acres of ACEC designation, and 216 miles of W&SR	Same as the Proposed RMP except that there would be 165,944 acres of ACEC designation, and 52 miles of W&SR	Same as Alternative C.

Table 2.2.20 Summary of Impacts – Wildlife and Fisheries Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WILDLIFE AND FISHERIES RESOURCES					
benefit wildlife resources by reducing surface disturbance in these areas.	recommended designation.	recommended designations.	recommended designations.	recommended designations.	
Management of 106,178 acres of non-WSA lands with wilderness characteristics to protect their wilderness characteristics would limit surface disturbances, providing protection of wildlife habitat in these areas.	No specific actions are specifically prescribed to protect the wilderness characteristics of non-WSA lands with wilderness characteristics.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Management of 277,596 acres of non-WSA lands with wilderness characteristics to protect their wilderness characteristics would limit surface disturbances and protect wildlife habitat in these areas.

Table 2.2.21 Summary of Impacts – Woodlands and Forest Resources

Table 2.2.21 Summary of Impacts – Woodlands and Forest Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WOODLANDS AND FOREST RESOURCES					
156,425 acres of fire treatments/decade would produce long-term, beneficial improvements in the health, biomass, age class, and diversity of woodlands and forest. Treatments would also reduce the long-term risks of stand-altering wildland fire. Short-term, adverse impacts would result from increased potential for soil erosion and soil loss on steep slopes.	Same as Proposed RMP	Same as Proposed RMP	Same as Proposed RMP	50,900 acres/decade of prescribed fire treatments would have the same types of impacts as the Proposed RMP, though to a lesser degree.	Same as Proposed RMP
Impacts to 18,860 acres from mineral leasing surface disturbances would have potentially long-term, adverse impacts on woodlands and forest from loss of productivity and harvesting opportunities in disturbed areas.	Same as Proposed RMP, but impacts would be on 18,971 acres.	Same as Proposed RMP, but impacts would be on 19,033 acres.	Same as Proposed RMP, but impacts would be on 18,757 acres.	Same as Proposed RMP, but impacts would be on 18,212 acres.	Same as Proposed RMP, but impacts would be on 17,469 acres <sup>22</sup> .
133,560 acres of area designated as SRMAs would have long-term beneficial impacts to woodlands and forest by restricting OHV use to designated routes and managing woodland harvesting.	Same types of impacts as the Proposed RMP, but more beneficial through designation of 499,5880 acres as SRMAs	Designation of 86,454 acres of SRMAs would result in the same types of impacts as the Proposed RMP, but to the lowest degree of long-term beneficial impacts to woodlands and forest of the action alternatives.	Designation of 522,604 acres as SRMAs would have the same types of impacts as the Proposed RMP, but the most long-term beneficial impacts to woodlands and forest of the action alternatives.	Same as Alternative B.	Same as Alternative C.
Managing browse in riparian areas would protect riparian woodland species in the short term and long term. Soils/water resource decisions to protect slopes would have short-term and long term, beneficial impacts on woodlands.	Same as the Proposed RMP.	Same as the Proposed RMP.	Same as the Proposed RMP.	Long-term, adverse impacts to riparian woodland species from allowed grazing within riparian areas; long-term, adverse impacts to woodlands from protection of steep slopes >40% only	Same as the Proposed RMP.
Designating 131,700 acres as ACECs would have long-term, beneficial, indirect impacts to woodlands and forest resources by protecting scenery, habitat, and cultural values in these areas. Protection of Upper and Lower Green River segments would benefit riparian woodland species.	Designation of 345,850 acres as ACECs would have same impacts as the Proposed RMP, but increased in scope. The impacts would be the same as the Proposed RMP along designated river segments.	Designation of 179,356 acres as ACECs would have same impacts as the Proposed RMP.	Designation of 681,310 acres as ACECs and protection of upper and lower Green River segments, segments along the White River, and tributaries would have long-term, beneficial impacts on upland and riparian woodland species.	Beneficial impacts on woodlands from continued protection of the resource within 165,944 acres of designated ACECs and along the upper and lower Green River segments.	Same impacts as Alternative C.

Table 2.2.21 Summary of Impacts – Woodlands and Forest Resources

Table 2.2.21 Summary of Impacts – Woodlands and Forest Resources					
Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D Current Management (No Action)	Alternative E
WOODLANDS AND FOREST RESOURCES					
Travel decisions to develop and manage up to 800 miles of motorized trails and 400 miles of non-motorized trails would have adverse impacts from surface disturbance, but would be beneficial by increasing opportunities for woodland harvesting opportunities. Developing 400 miles of trails along the Green River would jeopardize relict stands of riparian woodlands.	Same impacts as the Proposed RMP.	Same impacts as the Proposed RMP.	400 miles of non-motorized trails would have adverse impacts on riparian and relict woodlands.	55 miles of new trails development along riparian areas would have impacts similar to the Proposed RMP, but to a lesser degree.	Same impacts as the Alternative C.
546,152 acres managed through treatment or be available for woodland harvest would have beneficial impacts to woodlands by either reducing fuel loading and/or providing opportunities for harvesting.	552,152 acres managed for treatments and/or harvesting, with the same impacts as the Proposed RMP.	554,108 acres managed for treatment and/or harvesting, with same impacts as the Proposed RMP.	Same impacts as the Proposed RMP.	Same impacts as the Proposed RMP, but to a lesser degree as 288,300 acres managed for treatment and/or harvesting.	Same impacts as the Proposed RMP, but 421,133 acres would be managed for treatments and/or woodland harvesting.

## **3.0 AFFECTED ENVIRONMENT**

---

### **3.1 INTRODUCTION**

The Affected Environment chapter describes the present condition of the physical, biological, social, and economic environment within the U.S. Bureau of Land Management's (BLM) Vernal Planning Area (VPA) prior to the initiation of the Proposed RMP or any alternative. This chapter is organized by existing natural resources and describes the present uses of these resources, fire management, special land designations, and the present socioeconomic conditions. This information provides the basis for evaluating potential changes in the environment due to implementation of the Proposed RMP or any alternative.

#### **3.1.1 GEOGRAPHIC SETTING**

The vast area of the VPA covered by this Resource Management Plan (RMP) revision is located in northeastern Utah and includes the Uinta Basin, the East and West Tavaputs Plateaus, the Eastern Uinta Mountains, the Book Cliffs, Diamond Mountain, Nine Mile Canyon, and Browns Park. The area is bounded on the west by the Wasatch Mountains and on the east by the Douglas Creek Arch in Colorado. The Wyoming/Utah state line forms the northern boundary of the VPA, and the Tavaputs Plateau and the Book Cliffs form the southern boundary.

#### **3.1.2 RESOURCE SETTING**

Within the VPA, public lands administered by the BLM encompass 1,725,512 acres (approximately 30%) of the land area. Most of the land that the BLM manages is in the eastern and southern portions of the VPA and is generally characterized by habitats associated with the Colorado Plateau. Other government agencies that manage land in the area include the U.S. Forest Service (USFS), U.S. National Park Service (NPS), U.S. Fish and Wildlife Service (USFWS), Utah Division of Wildlife Resources (UDWR), and Utah School and Institutional Trust Lands Administration (SITLA). Additional lands are held in private ownership or are located within the boundaries of the Uintah and Ouray Indian Reservation.

The lands of the VPA are characterized by a variety of valuable natural resources, including oil, natural gas, minerals, livestock forage, and unique vistas and land formations that draw both developers and visitors to the area. These user groups place demands on the resources under the jurisdiction of the BLM that either directly or indirectly affect the management of associated resources.

### **3.2 AIR QUALITY**

Air quality within the VPA and its surrounding airshed has the potential to be affected by such activities as emissions from the construction and operation of oil and gas facilities, access roads, and other elements of management activities. This section describes the existing air quality resource of the VPA and the applicable air regulations that would apply to the alternatives.

### 3.2.1 REGIONAL OVERVIEW

The climate in the VPA is characterized as arid, with cold winters and hot summers. Annual precipitation (rainfall and snowfall) in the VPA ranges from 8 to 35 inches and is dependent largely on elevation and aspect. Temperature inversions, where air temperatures near the ground are colder than the temperatures above, are common in the basins and other lower elevational areas of the VPA. Inversions commonly occur in winter when snow accumulation on the ground combines with short daylight hours. In summer, inversions dissipate rapidly when early morning sunlight warms the air near the ground surface. Inversions can hinder air pollutant dispersion by preventing emissions from mixing with the ambient air in the vertical direction. On average, mean morning mixing heights in the area are approximately 1,000 feet; mean afternoon mixing heights are more than 7,800 feet (Holzworth 1972). Mean morning mixing heights tend to be lowest in summer and fall, and highest in winter.

Air pollutant dispersion in the VPA is also dependent on wind direction and speed. Wind information available from the Western Regional Climatic Center (WRCC) and the BLM as part of their remote automated weather stations (RAWS) project (<http://raws.dri.edu/>) for 1996 show that although wind direction is highly influenced by the local terrain, the wind direction in the northern portion of the VPA tends to be northwesterly, i.e. blowing from the northwest to the southeast (Kings Point – Dutch John RAWS station). The wind direction in the western and southern portions of the VPA tends to be southwesterly, i.e., blowing from the southwest to the northeast (Five Mile - Duchesne and Winter Ridge RAWS stations, respectively). Figure 3.2.1 presents representative windroses for these locations in the VPA.

Figure 3.2.1. Representative windroses for the VPA (RAWS data, 1996).

### 3.2.2 BASELINE AIR QUALITY

The VPA is located in a region designated as unclassifiable for  $PM_{10}$  and unclassifiable/attainment for all other airborne pollutants [See 40 CFR Part 81] (L. Svoboda, EPA Region VIII, 2005).

### 3.2.3 REGULATORY SETTING

The U.S. Environmental Protection Agency (EPA) delegates the authority to manage air resources to the state when a State Implementation Plan (SIP) is approved and implemented. The UDEQ currently has approved SIPs for air quality programs under its jurisdiction, and the EPA has delegated authority for all air quality issues in the State of Utah, excluding Uintah and Ouray Indian Reservation lands. The air quality in Utah is currently regulated by the Utah Division of Air Quality (UDAQ). All stationary sources of air pollution are subject to the air quality regulations and standards under the UDEQ administration.

A portion of the VPA is located within the Uintah and Ouray Indian Reservation. The UDEQ does not have authority to administer air quality programs on Uintah and Ouray Indian Reservation lands. Sources located within Native American Indian Territory are not regulated by any SIP approved programs; and they are subject only to the federal air quality programs under the authority of EPA Region 8.

The Federal Clean Air Act (FCAA) amendments of the 1990s require all states to control air pollution emission sources so that national ambient air quality standards (NAAQS) are met and maintained.

In addition to these requirements, the National Park Service (NPS) Organic Act requires the NPS to protect the natural resources of the lands it manages from the adverse effects of air pollution. In 1978, the US Forest Service (USFS) Air Monitoring Program was established to protect all USFS managed lands from the adverse effects of air pollution. In 1988, the USFS became a primary participant in the national visibility monitoring program titled Interagency Monitoring of Protected Visual Environments (IMPROVE). Starting with the enactment of the Regional Haze Rule, the USFS has provided regional haze monitoring representing all visibility-protected federal VRM Class I areas where practical.

Air quality in a given location is defined by pollutant concentrations in the atmosphere and is generally expressed in units of parts per million (ppm) or micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ). One measure of a pollutant is its concentration in comparison to a national and/or state ambient air quality standard. The National Ambient Air Quality Standards (NAAQS) and Utah Air Quality Standards are health-based criteria for the maximum acceptable concentrations of air pollutants (with a margin of safety) at all locations to which the public has access. The NAAQS are established by the EPA and are outlined in the Code of Federal Regulations (40 CFR 50). An area that does not meet the NAAQS is designated as a nonattainment area on a pollutant-by-pollutant basis. The State of Utah has adopted the NAAQS as state air quality standards. In 2004, the EPA passed a suite of actions called the Clean Air Rules of 2004 aimed at improving America's air quality. Two of the rules, the Nonroad Diesel Rule and the Ozone Rules, will potentially improve the future air quality of the VPA.

### 3.2.4 REGIONAL AIR EMISSIONS

The VPA covers Daggett, Duchesne, and Uintah Counties and part of Grand County. Currently, emission sources within the VPA consist of mostly oil and gas development facilities and mining

sites. There are also fugitive dust sources associated with these sites, construction activities and roadways. A detailed listing of emission sources in and around the VPA, along with information on how specific sources were addressed in the air quality modeling, is available the TSD (Trinity and Nicholls, 2006, tabular source information is found in Appendix C).

### 3.2.4.1 NATIONAL AMBIENT AIR QUALITY STANDARDS (NAAQS) AND CRITERIA

The significant criteria for potential air quality impacts include NAAQS requirements for CO, PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, O<sub>3</sub>, and NO<sub>2</sub>/NO<sub>x</sub>. Applicable federal and state criteria are presented in Table 3.2.1.

**Table 3.2.1. Applicable Ambient Air Quality Standards**

Pollutant	Averaging Period	National Ambient Air Quality Standards (µg/m <sup>3</sup> )	State Ambient Air Quality Standards (µg/m <sup>3</sup> )
CO	1-Hour <sup>a</sup>	40,000 µg/m <sup>3</sup>	
	8-Hour <sup>a</sup>	10,000 µg/m <sup>3</sup>	
PM <sub>10</sub>	24-Hour <sup>a</sup>	150 µg/m <sup>3</sup>	
PM <sub>2.5</sub>	24-Hour <sup>c</sup>	35 µg/m <sup>3</sup>	
	Annual <sup>b</sup>	15 µg/m <sup>3</sup>	
SO <sub>2</sub>	3-Hour <sup>a</sup>	1,300 µg/m <sup>3</sup>	700 µg/m <sup>3</sup> <sup>d</sup>
	24-Hour <sup>a</sup>	365 µg/m <sup>3</sup>	260 µg/m <sup>3</sup> <sup>e</sup>
	Annual <sup>b</sup>	80 µg/m <sup>3</sup>	60 µg/m <sup>3</sup> <sup>e</sup>
O <sub>3</sub>	8-Hour	0.075 ppm	
NO <sub>2</sub>	Annual <sup>b</sup>	100 µg/m <sup>3</sup>	

<sup>a</sup> Not to be exceeded more than once per year on average over 3 years.

<sup>b</sup> The 3-year average of the weighted annual mean. PM<sub>2.5</sub> concentrations from single or multiple community-oriented monitors must not exceed 15.0 µg/m<sup>3</sup>.

<sup>c</sup> The 3-year average of the 98th percentile of 24-hour concentrations must not exceed 35 µg/m<sup>3</sup>

<sup>d</sup> Colorado standard, more stringent than the NAAQS.

<sup>e</sup> Wyoming standard, more stringent than the NAAQS.

### 3.2.4.2 CRITERIA FOR PREVENTION OF SIGNIFICANT DETERIORATION (PSD)

The applicable air quality criteria also include the PSD increments, which limit the incremental increase of PM<sub>10</sub>, SO<sub>2</sub> and NO<sub>2</sub> above the legally defined baseline levels. A PSD Increment is the maximum increase in ambient concentrations that is allowed to occur above a baseline concentration for a pollutant. The increments are evaluated for both the Class I and Class II areas. PSD Increments have not yet been established for PM<sub>2.5</sub> and are not addressed in increments analysis.

The National Ambient Air Quality Standards (NAAQS) and Utah Air Quality Standards are health-based criteria for the maximum acceptable concentrations of air pollutants at tall locations to which the public has access. All NEPA analysis comparisons to the PSD Class I and II

increments are intended to evaluate a threshold of concern for potential impacts, and do not represent a regulatory PSD Increment Consumption Analysis. The determination of PSD increment consumption is a regulatory agency responsibility conducted as part of the New Source Review process, which also includes a Federal Land Management Agency's evaluation of potential impacts to Air Quality Related Values (AQRV) such as visibility, aquatic ecosystems, flora, fauna, etc.

Although the EPA has revised the PM<sub>2.5</sub> (particulate matter less than 2.5 microns in effective diameter) Ambient Air Quality Standard, this revised limit will not be enforceable until formally approved. However, due to public concern and possible impacts on human health and visibility, PM<sub>2.5</sub> is being considered in this analysis. Current NAAQS and Utah Air Quality Standards, and PSD Class I and II increments are discussed below. The increment standards addressed in this study are listed in Table 3.2.2.

**Table 3.2.2. Increment Standards for Class I and Class II Areas**

Pollutant	Averaging Period	Class I Increment ( $\mu\text{g}/\text{m}^3$ )	Class II Increment ( $\mu\text{g}/\text{m}^3$ )
PM <sub>10</sub>	24-Hour	8	30
	Annual	4	17
SO <sub>2</sub>	3-Hour	25	512
	24-Hour	5	91
	Annual	2	20
NO <sub>2</sub>	Annual	2.5	25

The PSD Class I Areas included in the analysis are listed in Table 3.2.3. Limitations on the additional amount of air pollution allowed in these areas from major emitting facilities are strict. The remainder of the project area is classified a PSD Class II, where similar but less stringent incremental pollution limits apply. These increments are shown in Table 3.2.2.

Potential air quality impacts from the Proposed RMP and Alternatives are analyzed and reported in Chapter 4. However, the analysis is prepared solely under the requirements of NEPA, in order to assess and disclose "reasonably foreseeable" impacts to both the public and the Bureau decision maker before a Record of Decision is issued. Due to the preliminary nature of the NEPA air quality assessment, it should be considered a reasonable upper estimate of potential impacts. Actual impacts at the time of development may be lower.

UDEQ is the air quality regulatory agency responsible for determining potential impacts once detailed development plans have been made, subject to applicable air quality laws, regulations, standards, control measures and management practices. Therefore, the State of Utah has the ultimate responsibility for reviewing and permitting air pollutant emission sources before they become operational. EPA has this responsibility on tribal lands. Representative background concentrations recommended by UDEQ and other appropriate sources were added to the modeled results for comparison to the appropriate ambient air quality standards as outline in Table 3.2.4.

**Table 3.2.3. Sensitive Areas to Be Considered in the Analysis**

<b>Mandatory Federal Class I Area (unless otherwise specified) <sup>a</sup></b>	<b>Managing Agency <sup>b</sup></b>	<b>Class Category</b>	<b>State</b>
Arches NP	NPS	Class I	UT
Browns Park NWR	USFWS	Class II	UT
Canyonlands NP	NPS	Class I	UT
Capitol Reef NP	NPS	Class I	UT
Dinosaur NM	NPS	Class II <sup>c, d</sup>	UT/CO
Flaming Gorge NRA	FS	Class II <sup>e</sup>	UT/WY
High Uintas WA	FS	Class II <sup>c</sup>	UT
Ouray NWR	USFWS	Class II	UT
USFS Request (Areas near Mount Olympus, Twin Peaks, Lone Peak, Mount Timpanogos, and Mount Nebo)	FS	Class II	UT

<sup>a</sup> NP= National Park, WA=Wilderness Area, NWR=National Wildlife Refuge, NM=National Monument, NRA=National Recreation Area.

<sup>b</sup> NPS= USDI - National Park Service. USFWS = US Fish & Wildlife Service, FS= USDA - Forest Service.

<sup>c</sup> Sensitive Class II areas included in the analysis. (Archer, 2001a and Archer, 2002a)

<sup>d</sup> SO<sub>2</sub> increments in these Class II areas in Colorado have the same protection as Class I areas.

<sup>e</sup> Sensitive Class II areas included in the analysis per CDPHE. (Machovec, 2002)

Sensitive areas of the Ute Indian Tribe were also considered.

**Table 3.2.4. Background Concentrations for Vernal RMP Area**

<b>Pollutant</b>	<b>Annual (<math>\mu\text{g}/\text{m}^3</math>)</b>	<b>24-Hour (<math>\mu\text{g}/\text{m}^3</math>)</b>	<b>8-Hour (<math>\mu\text{g}/\text{m}^3</math>)</b>	<b>3-Hour (<math>\mu\text{g}/\text{m}^3</math>)</b>	<b>1-Hour (<math>\mu\text{g}/\text{m}^3</math>)</b>	<b>Monitoring Station Location Description</b>
NO <sub>2</sub>	10	-	-	-	-	Recommended by the Utah Dept. of Environmental Quality. <sup>a</sup>
SO <sub>2</sub> <sup>b</sup>	5	10	-	20	-	Estimates based on the 1993 PSD application for Bonanza Power Plant, Deseret Generation and Transmission.
PM <sub>10</sub>	10	28	-	-	-	Recommended by the Utah Department of Environmental Quality. <sup>a</sup>
CO <sup>c</sup>	-	-	4,236	-	6,984	Grand Junction, Mesa County, Colorado. (Highest monitored concentration in 2001.) <sup>d</sup>

<sup>a</sup> Background concentrations recommended by the Utah Department of Environmental Quality in memorandum No. DAQP-003-03, dated on January 17, 2003 from Richard W. Sprott to Yu Shan Huang.

<sup>b</sup> The SO<sub>2</sub> background concentrations are provided by Tom Orth, UDEQ. (Orth 2002)

<sup>c</sup> The CO concentrations are reported in ppm: 8-hr, 3.7 ppm; 1-hr, 6.1 ppm.

<sup>d</sup> Monitoring station was nearest to the Vernal RMP area. This background concentration is a conservatively high estimate for the Vernal RMP area since it was measured in an urban area.

### 3.2.4.3 VISIBILITY CRITERIA

Federal Class I areas, which include certain national wilderness areas, national memorial parks, and national parks, are afforded the highest level of protection. Ambient air increments that apply within Class I areas are more stringent than those that apply to other areas (i.e., Class II areas). In addition to more stringent ambient air increments, Class I areas are also protected by the regulation of AQRVs within their borders. Federal Land Managers (FLMs) are responsible for the management of Class I areas. Mandatory Federal Class I areas (sensitive areas) considered in the Air Quality modeling methodology for the Vernal and Roan Plateau air analysis were Dinosaur National Monument, Canyonlands National Park, Flaming Gorge NRA, Arches National Park, and Capitol Reef National Park.

### 3.2.5 CONSISTENCY WITH NON-BUREAU PLANS

The Vernal Field Office manages its resources consistent with other plans not administered by the BLM. EPA Region 8 regulates all air quality related issues in the Uintah and Ouray Indian Reservation; while the UDEQ regulates the air quality related issues in the state of Utah, except on Indian lands.

In addition to the federal and state air quality programs mentioned in the previous section, the BLM is also committed to manage the VPA consistent with the Utah Smoke Management Plan (SMP). The BLM, U.S. Forest Service, National Park Service, Utah Department of Natural Resources, U.S. Fish and Wildlife Service, and the UDEQ currently have a signed Memorandum of Understanding (MOU) in place to regulate the prescribed burning activities in Utah (UDAQ 1999). The MOU requires the BLM to report all prescribed fire activities to the SMP program coordinator. UDEQ has incorporated the SMP into UAC R307-204 in 2001. Each prescribed fire must first be approved by the SMP through issuance of a burn permit in order to assure that the burning activity will not cause dangerous air quality conditions.

### 3.2.6 GLOBAL CLIMATE CHANGE

On-going scientific research has identified the potential impacts of climate changing pollutants on global climate. These pollutants are commonly called "greenhouse gases" and include carbon dioxide, CO<sub>2</sub>; methane; nitrous oxide; water vapor; and several trace gas emissions. Through complex interactions on a regional and global scale, these emissions cause a net warming effect of the atmosphere, primarily by decreasing the amount of heat energy radiated by the Earth back into space. Although climate changing pollutant levels have varied for millennia (along with corresponding variations in climatic conditions), recent industrialization and burning of fossil carbon sources have caused CO<sub>2</sub> concentrations to increase dramatically, and are likely to contribute to overall climatic changes, typically referred to as global warming. Increasing CO<sub>2</sub> concentrations also lead to preferential fertilization and growth of specific plant species.

Global mean surface temperatures have increased nearly 1.0°C (1.8°F) from 1890 to 2006 (Goddard Institute for Space Studies, 2007). However, observations and predictive models indicate that average temperature changes are likely to be greater in the Northern Hemisphere. Figure 3.2.2 demonstrates that northern latitudes (above 24° N ) have exhibited temperature

increases of nearly 1.2°C (2.1°F) since 1900, with nearly a 1.0°C (1.8°F) increase since 1970. Without additional meteorological monitoring systems, it is difficult to determine the spatial and temporal variability and change of climatic conditions, but increasing concentrations of these "greenhouse gases" are likely to accelerate the rate of climate change.

The Intergovernmental Panel on Climate Change (IPCC) has recently completed a comprehensive report assessing the current state of knowledge on climate change, its potential impacts, and options for adaptation and mitigation. At printing of this PRMP/FEIS, this assessment is available on the IPCC web site at <http://www.ipcc.ch/>. According to this report, global climate change may ultimately contribute to a rise in sea level, destruction of estuaries and coastal wetlands, and changes in regional temperature and rainfall patterns, with major implications to agricultural and coastal communities. The IPCC has suggested that the average global surface temperature could rise 1 to 4.5 degrees Fahrenheit (°F) in the next 50 years, with significant regional variation. The National Academy of Sciences (2006) has confirmed these findings, but also indicated that there are uncertainties regarding how climate change may affect different regions. Computer models indicate that such increases in temperature will not be equally distributed globally, but are likely to be accentuated at higher latitudes, such as in the Arctic, where the temperature increase may be more than double the global average (BLM 2007). Also, warming during the winter months is expected to be greater than during the summer, and increases in daily minimum temperatures is more likely than increases in daily maximum temperatures. Vulnerabilities to climate change depend considerably on specific geographic and social contexts.

The BLM recognizes the importance of climate change and the potential effects it may have on the natural environment. Several activities occur within the planning area that may generate emissions of climate changing pollutants. For example, oil and gas development, large fires, and recreation using combustion engines, can potentially generate CO<sub>2</sub> and methane. Wind erosion from disturbed areas and fugitive dust from roads along with entrained atmospheric dust has the potential to darken glacial surfaces and snow packs resulting in faster snowmelt. Other activities may help sequester carbon, such as managing vegetation to favor perennial grasses and increase vegetative cover, which may help build organic carbon in soils and function as "carbon sinks".

Figure 3.2.2. Annual mean temperature change for northern latitudes (24–90° N). Source: Goddard Institute for Space Studies (2007).

### 3.3 CULTURAL RESOURCES

The VPA has a wide array of environmental settings and resources long used by humans. Consequently, the VPA encompasses a large and diverse assemblage of prehistoric archaeological sites, historical archaeological sites and localities, and locations of traditional cultural value. For the purpose of this chapter, *cultural resources* are defined as both prehistoric and historical archaeological sites and structures, as well as non-archaeological and non-structural sites (i.e., waterways, view sheds, and resource areas) that have been identified as important for traditional and/or ideological reasons by the various Native American groups with ancestral and/or present ties to the area. Many of these cultural resources have multiple associations and use values. These non-renewable resources provide a record of prehistoric and historical cultures and events and have use value for many contemporary groups including local residents, scientists, and Native Americans.

#### 3.3.1 PREVIOUS PROJECTS AND KNOWN CULTURAL RESOURCE TYPES WITHIN THE VPA

Various explorers, scholars, government institutions, academic institutions, and private cultural resource consulting firms have carried out anthropological and archaeological research within the VPA. The quality and quantity of research carried out by these different entities has, to date,

proven highly variable. Previous research projects range from small surveys of a limited geographic area to large, linear projects spanning the entire VPA.

Beginning as early as 1892 and extending to 1926, approximately seventeen significant archaeological projects were completed in the Uinta Basin. These projects recorded numerous sites and recovered many artifacts and data. As most of these projects were undertaken in a period when rigorous scientific standards were not the norm, much of the data is poorly recorded, reports are descriptive or speculative in nature, or data has been lost. Nonetheless, these early reports remain valuable as descriptive or comparative sources of data (Spangler 1995:81).

By the mid-1930s, the application of more rigorous and systematic archaeological standards was becoming more common. Beginning in this period, researchers focused on areas where high site frequencies were anticipated (i.e., in canyons, along drainages, near permanent water, etc.). As expected, research in these areas yielded high frequencies of sites with evidence of permanent settlement and horticulture. Areas that have been studied in this manner include the Dinosaur National Monument area, Nine Mile Canyon, and various areas along the Tavaputs Plateau and Uinta Basin foothills (Spangler 1995:181). Prior to the 1970s, archaeologists associated with universities or research institutions carried out archaeological research in these areas. The passage of several environmental protection laws during the 1960s and 1970s (the foremost being the National Historic Preservation Act of 1966) spurred cultural resource management archaeology across the country. In the Uinta Basin, the first significant cultural resource management projects were carried out in the 1950s and 1960s, with a quantitative jump noted in the early 1970s (Spangler 1995:190). Since the 1930s, more than 62 significant archaeological projects have been completed in the Uinta Basin (Spangler 1995). Numerous archaeological sites were recorded during these projects, with large numbers recommended eligible to and many actually nominated to the NRHP (Appendix D).

### **3.3.2 PREHISTORIC AND ETHNOGRAPHIC SITE TYPES**

The following section provides a basic description of the primary known prehistoric site types within the VPA. Some site types, such as artifact scatters, are included because they are common throughout the area and are a major component of the Section 106 compliance workload for BLM archaeologists. Others, such as burials, rock art, and ceremonial sites, may not occur in as large numbers as do artifact scatters but are included because they represent significant management challenges to the BLM due to their importance to Native American tribal groups.

**Rock Art** – A large number of rock art sites have been identified in the Uinta Basin and more are likely to exist. Rock art sites identified in the Uinta Basin are highly variable and may range from one depiction to a panel or series of panels with numerous depictions. Some sites contain large, multiple, and interconnected rock art panels. In addition to variations in size, numerous different rock art styles have been recorded in the Uinta Basin. In some instances rock art is located near other types of sites; in other instances, rock art is isolated. As rock art is frequently located in difficult terrain, a comprehensive survey of existing rock art and its relationships to other sites has been difficult to complete. Finally, rock art sites have routinely been subjected to acts of vandalism and are susceptible to deterioration (Spangler 1995:140-145). Currently, there

remains much to be learned regarding known rock art sites with a high probability for further significant rock art discoveries.

**Well-preserved Open Camp and Village Sites** – Open camp and village sites are similar large prehistoric occupations, distinguished primarily on the basis of the presence or absence of residential structures. Campsites located on plateaus, outcrops, and valley floors characterize open campsites. These sites typically have evidence of lithic scatters, ceramic scatters, and projectile points, and are often defined on the presence of remnants of hearths and other features. Many of the sites have been characterized as hunting and butchering activity areas.

**Platform Sites** – Platform sites, or sites located on top of flattened knolls, are rare within the Uinta Basin. One site overlooking the Green River is an unusual site on a knoll that appears to have been leveled off, whether manually or by environmental processes is unknown. The leveled surface of the knoll has a circular structure made of flat sandstone slabs approximately 1.5 feet high with the interior filled with a light-colored clay material. This structure is unknown in function and, to date, it is the only known feature of its type within the Uinta Basin. Others could be present with the Uinta Basin, but have yet to be discovered.

**Rock Shelters and Caves** – As their name implies, rock shelter sites contain evidence of human occupation located within existing rock overhangs or caves. The range of rock shelter sites includes relatively long-term single occupations, multiple reuse occupations through time, and ephemeral single-use episodes. Rock shelters and caves are generally located within canyons, near permanent water sources, such as rivers or streams. Most of these sites also tend to be located on the southern side of canyons (Spangler 1995:162), although they can be found within any portion of geologically suitable areas.

**Prehistoric Architectural Sites** – A relatively wide range of site types is included in this category. Architectural sites have been recorded in open-air and sheltered settings, at nearly all elevations, and in virtually every environment within the Uinta Basin. However, some types of architecture are restricted to only certain regions or settings. To date, the range of architectural sites includes stone or masonry structures, pit structures, temporary brush structures, tipi rings, sweat lodges, storage structures or granaries, stone alignments or walls, cairns, and rubble mounds. Structures such as tipi rings, temporary brush structures, and perhaps sweat lodges are located in more open environments, on knolls, cliff edges, or terraces. Stone or masonry structures, granaries, and often walls are found in cliffside rock shelters, in canyons or on ledges. Other stone or masonry structures can also be found in open areas, stream and river terraces, upland ridges, small cliff openings, and butte or mesa faces. Typically, such structures are found within reasonable proximity of sandstone formations and outcrops, which provide much of the source material for building them.

**Prehistoric Artifact Scatters** – Prehistoric artifact scatters may be encountered in open-air or sheltered settings and in nearly all environment types and elevations. These types of sites are located throughout the Uinta Basin and number from the hundreds to the thousands. Artifact scatters typically consist of lithic artifacts such as chipped stone debitage, tools, cores, and tool and core fragments. However, many artifact scatters may also contain ceramic artifacts, groundstone artifacts, or a combination of lithic, ceramic, and groundstone artifacts. Previously

recorded artifact scatters in the Uinta Basin range from only a few to hundreds (or even thousands) of artifacts. Artifact scatters do not typically contain evidence of architecture, although smaller features, such as hearths, may be present either on the surface or below the surface. The function of artifact scatters is highly variable and can be subject to differing interpretations. Minimally, artifact scatters are likely to have been involved in short-term land-use settlement systems.

**Prehistoric Resource Procurement Sites** – Locations where prehistoric populations procured a specific resource are common within the Uinta Basin. A wide range of resources appear to have been exploited in a manner that left archaeological evidence, including game animals (hunting sites), chipped stone materials (lithic procurement sites), and floral materials (botanical processing sites). Several different hunting site types have been identified to date, including hunting blinds, game drives, game traps, and butchery sites. Hunting sites can be designed to either funnel game toward a desired goal or to hide the hunter in ambush-style hunting. In general, hunting sites are identifiable due to the strategic placement of rock or brush structures along game trails, water sources, near topographic features that restricted game movement, or in locales that provide an advantage in elevation. Butchery sites are typically identified by the presence of high numbers of animal bones that bear evidence of processing - such as cut marks or diagnostic breakage patterns. In many instances, the kill location and butchery location are the same.

**Prehistoric Ceremonial Sites** – Ceremonial sites are usually located in areas with panoramic views, and are recognized by the presence of a stone circle or alignment that contains little or no artifacts. Ceremonial sites are interpreted as vision quest locations (Reed and Metcalf 1999:52). The vision quest interpretation has largely been inferred from ethnographic work among modern Native American groups. However, the actual nature of prehistoric ceremonial sites is currently not well understood.

**Prehistoric Isolated Features** – Sites recorded as prehistoric isolated features typically consist of one isolated cultural feature that has few or no associated artifacts. In many instances the isolated feature is unidentified, while in other cases the feature is identified as a simple cultural feature (i.e., a cairn, etc.).

**Prehistoric Landscapes** – Prehistoric landscapes are a type of cultural resource that encompasses a range of cultural resource sites within a given environment. The study of prehistoric landscapes is a relatively new endeavor in the New World. This approach has become more common in the Old World, namely Great Britain and Europe. The interaction of human sociopolitical and economic systems and the landscapes in which humans live and create environments is one main focus of research into landscape archaeology. In short, prehistoric landscape can be defined as including humans and their anthropogenic ecosystem.

The types of landscapes that could be characterized within the Uinta Basin include canyons and plateaus. These encompassing landscapes are large in scale, but contain hundreds of smaller, more distinct units of residential dwellings, storage areas, resources scatters, etc., that make up the landscape. Individually, the sites within a given landscape may not be particularly noteworthy or significant. However, when each site is taken into consideration with other,

geographically close sites, a landscape emerges that encompasses multiple types of past human uses of the landscape. These individual sites cluster together in a setting that sets it apart from the region as a whole. These landscapes could also have importance for extant Native American tribes as sacred or important places with cultural importance.

**Prehistoric Trails** – Travel routes along river corridors and open drainages were common ways for prehistoric peoples to get from area to area. The White River was a traditional Ute travel route within the eastern Uinta Basin to western Colorado (Spangler 1995:872). Other trail areas have been formally identified to the east of the region (Reed and Metcalf 1999:51) as well as in the Book Cliffs (Blaine Phillips personal communication 2002), and additional unidentified prehistoric and protohistoric trails are likely to exist within the region. Prehistoric trails could potentially be identified through remote sensing and ground-truthing.

### 3.3.3 HISTORICAL SITE TYPES

The following section provides a basic description of the primary known historical site types within the VPA. Undoubtedly, other site types do exist within the area, but those listed here comprise the bulk of historical sites currently managed by the BLM.

**Historical Architectural Sites** – Historical architecture sites range from simple one-room cabins to multi-story and multi-room structures. Historical structure sites may contain abandoned structures or evidence of structures, while other sites might consist of a structure or structures that are still in use. To date, historical architecture sites include structures such as cabins/homesteads, forts or military posts, trading posts, private residences, line shacks, civic structures, stone or masonry walls, fences, corrals or pens (both Anglo and Ute), sheds, barns, or outhouses. Although typically located in desirable areas or near reliable water sources, historical architecture can be found in nearly every setting or environment. Among the more common structural sites with the VPA are those towns, such as Dragon, Watson, and Rainbow mines, and rail sidings associated with gilsonite mining in the region.

**Artifact Scatters/Middens** – Historical artifact scatters and middens may consist of one or more of the following: glass, ceramics, cans, building materials, barbed wire, cartridge cases, faunal material, personal items, or miscellaneous artifacts. Artifact densities may range from relatively sparse to relatively dense scatters. Historical artifact scatters can represent light or intense land use, and can be encountered in nearly any environment or elevation. Artifact scatters may be associated with isolated residences, larger settlements, campsites, or, they may be the result of random dumping episodes.

**Aspen Art and Historical Inscriptions** – Aspen art (i.e., dendroglyphs) and historical inscriptions are present on BLM lands within the VPA. These inscriptions have been found both on trees (primarily aspen) and on rock faces. Aspen art is considered to be any historical carving or engraving made on trees. Aspen art includes carvings related to activities such as settlement (e.g. as property markers) as well as random works found near roads or near historical campsites. The frequencies of aspen art range from a single mark, multiple markings on one tree, or a series of markings on multiple trees. Aspen art is often associated with particular ethnic groups, such as the Basque (primarily in Nevada), or with particular labor groups, such as sheepherders, timber

men, and others who spend time within aspen groves. Elsewhere in Utah, particular groves of trees became favorites for carvers, and dozens of inscriptions can be found which span long periods of time. These groves essentially became historical "message boards" for users of the area.

**Historical Burials/Cemeteries** – Early historic period burials may consist of isolated burials of a few or one individual, while early cemeteries will contain numerous individuals. Currently, several cemeteries exist within the Uinta Basin. In addition, several isolated burials, located both on public and private land, have been recorded. Other isolated burials might yet be encountered.

**Irrigation Systems/Canals** – The development of agriculture and ranching in the Uinta Basin often required the building of waterworks to bring water into relatively dry regions. In general, irrigation works are considered as improvements, which have been made on natural drainages, or as the construction of new waterways. Irrigation works can include ponds, dams, concrete, stone-lined or earthen ditches or canals, headgates, culverts, diversion gates, or wells.

**Mining Sites** – In many parts of the Uinta Basin, the mining industry has played an important economic role. Mining related sites are variable. Recorded examples include small-scale mining efforts at one locale, small-scale operations at multiple sites, and complex mining works at one or more locations carried out by large mining firms. The goals of Uinta Basin mining efforts are also varied, with several different kinds of precious metals (i.e., gold, silver, copper, and uranium), minerals, and hydrocarbons sought. Besides the actual mine or quarry, mining sites can have related architecture, temporary camps, ore piles, middens, artifact scatters, burials, or aspen art located nearby. Additionally, railroads constructed specifically to serve the mining industry may also be associated with mine sites.

**Oil and Gas Industry Sites** – Oil and gas industry historical sites can consist of pipelines, wells, processing and transport facilities, and "prospects." The first well in the Uinta Basin was drilled on the East Tavaputs Plateau in 1900 (Spangler 1995:822). Although unsuccessful, the sinking of this first well foreshadowed the fervent activity that would occur in the area 40 years later. While more than 40 wells were drilled in the Uinta Basin between 1908 and 1913, most historical archaeological and structural sites associated with the industry date to the post-World War II era, when oil and gas exploration began in earnest.

**Privies/Outhouses** – Prior to the installation of buried sewer lines, sanitation facilities often consisted of excavated pits designed to collect and contain waste. Although originally intended to serve as sanitation facilities, privies often served as secondary refuse dumping locales. Also during use, personal items were often accidentally dropped into privies. Through secondary dumping and accidental loss, many privies contain high frequencies of artifacts. As privies routinely contain high numbers of artifacts, in an often-undisturbed subsurface deposit, privies may serve as valuable sources of data. Privies are routinely found in association with campsites, private residences, public structures, military posts, and commercial buildings. Privy sites have been found on mining sites and other industrial sites as well. No clear indication of the frequency and/or distribution of such sites could be gleaned from Spangler (1995), thus it is unclear how many historical privies and outhouses are present on BLM lands within the VPA. However,

given their general association with permanent and/or long-term occupation sites, few privies are likely to be found on BLM lands.

**Historical Transportation Sites** – Establishing efficient transportation routes was one of the main goals of explorers and settlers during the settlement of the west. The Uinta Basin was no different. As Euroamericans settled the Uinta Basin, establishing efficient travel avenues was of vital importance in aiding the growth of settlements, the mining industry, and the agriculture and ranching businesses. To date, identified transportation related sites include trails, paths, paved or unpaved roads, bridges, railroads, wagon or stagecoach routes, stagecoach or railroad stops, railroad section stations, ferry sites, and airstrips or runways. Furthermore, as trappers and fur traders routinely used waterways for travel, the shores of various sections of waterways might contain evidence of early travel. Several East-West and North-South transportation routes used and developed by the Northern Ute bands in the 19th and early 20th centuries are known within the VPA. These include "Pony Trails" and "Wagon Trails". These routes gave access into and out of western Colorado and into and out of the San Rafael area of Utah. Burials, rockart and other site types are associated with these routes.

### 3.3.4 NON-ARCHAEOLOGICAL SITE TYPES

Non-archaeological site types are distinguished from archaeological site types in order to discuss places that are not necessarily associated with prehistoric or historical artifacts assemblages and collections. Tribal representatives typically identify these sites during the government-to-government consultation process that is required of federal agencies. However, Traditional Cultural Properties can also be identified by representatives of other culture groups, such as historical culture groups associated with the Euro-American migration to the western United States. Some common site types are lakes and springs, land features, and traditional gathering or collection areas.

**Lakes and Springs** – Several tribes, including the Shoshone and Ute, claim places of water as places of traditional importance and have traditional stories about mythical beings, or water spirits that live in lakes, rivers, and springs (Spangler 1995). No specific places of this type have been identified in lands managed by the VFO. However, an ethnographic overview for the Flaming Gorge Dam Environmental Impact Statement prepared by SWCA for the USBR recorded several stories about "water babies" and other mythical beings seen in the Green River in historic times (Rhodenbaugh and Newton 2000). None of these areas were identified as Traditional Cultural Properties.

**Traditional Gathering or Collection Areas** – Traditional plant or other resource gathering areas may be places of traditional importance to Native American groups. These areas are generally places where Native Americans go to collect resources such as medicinal plants used and minerals to be used in ceremonies and are often in current use when identified. Recently, Native Americans have also identified hunting areas as Traditional Cultural Properties (Newton and Hancock 2000). No specific places of this type have been recorded on lands managed by the VFO.

**Land Features** – Large geographic regions, such as deserts, mountain ranges, and valleys are often identified as Traditional Cultural Places but few have been formally documented as such. According to Deloria and Stoffle (1998), the Oquirrh Mountains and Granite Mountain near Salt Lake contains various places that are considered to be traditionally important or sacred to the Goshute Indians. Deloria and Stoffle did not specify what these places were or precisely where they were located. Bull Lake, which is located on the Wind River reservation, is considered to be a place of traditional importance to the Eastern Shoshone (Shimkin 1986). It is said that Bull Lake is where monsters live and if eaten, the monsters will change into water buffalo and disappear. No specific places of this type have been recorded on lands managed by the VFO.

### **3.3.5 GENERAL SITE LOCATIONS AND HIGH SITE DENSITY AREAS**

Cultural resources are scattered throughout the VPA. Present knowledge of their locations is largely constrained by the nature of cultural resource investigations, most of which have been driven by the Section 106 compliance needs of development projects. As such, existing data on site types, locations, and significance (use values) consists of snapshots across the VPA rather than a comprehensive picture. Nevertheless, based on these data, as well as on a number of overview surveys, it is possible to define the types of environmental settings where prehistoric and historical sites are more or less likely to occur. Overview surveys and existing data provide a general picture of site location tendencies that can be used to describe the places where prehistoric and historical sites are likely to exist.

During the late 1970s and early 1980s a number of surveys called "Class II" surveys were undertaken in order to attempt to determine if environmental variables could predict prehistoric archaeological site location in a way that would preclude the need to conduct formal surface inventories in particular environmental settings (Spangler 1995:226). Because the surveys found that prehistoric archaeological sites could be found across nearly all environmental zones, these surveys failed to meet their original goals. Furthermore, the surveys were unable to accurately predict specific site locations. However, the surveys were able to demonstrate good associations of prehistoric archaeological sites with general environmental zones. In other words, while specific site locations could not be predicted, and it appeared that there was potential for the presence of at least one or a few cultural resource sites in nearly all environmental zones of a given area, the Class II surveys were able to identify zones that had higher and lower frequencies of prehistoric archaeological sites.

The association of prehistoric archaeological sites with particular environmental zones can serve as a useful management tool for identifying areas where anticipated activities would have greater or lesser potential for impacts on prehistoric cultural resources. The Class II surveys, summarized in Spangler (1995:226-242), identified that proximity to water and certain vegetation types tended to influence site density. Areas within approximately 1 km of permanent water or within immediate proximity of a semi permanent water source appear to have high probabilities for cultural resource site occurrence. Furthermore, vegetation zones dominated by juniper were also identified as areas with high potential for cultural resource site locations. Finally, areas of intermittent sand dunes also tended to have high densities of prehistoric archaeological sites. Areas lacking water, juniper trees, or sand dunes, and areas of relatively steep slope tended to have low site densities. Areas of high site density tended to have between 1

and 7 sites per square mile with an average of 4.87 sites/square mile while areas of low density had less than 1 site per square mile (Spangler 1995:226-242).

The locations of historical cultural resource sites are more difficult to predict. Because historical populations have greater ease of transportation and different economic interests, historical site locations are not as constrained by availability of water and particular vegetative resources as were the locations of prehistoric occupations. Furthermore, linear historical sites such as roads, railroads, and canals, are likely to crosscut a wide variety of topographic settings and environmental zones. Nonetheless, two factors are likely to have conditioned the location of most historical cultural resource sites—proximity to watered/arable land for agriculture and proximity to mineral resources for extractive industries.

For the purposes of analysis, these factors were utilized to develop zones of high and low probability for cultural resource site locations. All areas within approximately 1 km of permanent water, or within juniper vegetation zones, sand dunes, or general area of historical mining districts were considered high site probability zones. Areas with greater than 30% slope, or not having any of the high site probability factors were considered low site probability zones.

In addition, four areas of high site density have been identified within the VPA through previous investigations. These areas, and the acreages they encompass, are identified in Table 3.3.1. To be certain, other areas of high site density exist within the planning area but have not yet been identified and verified through field studies. Areas of high site density, such as those listed in Table 3.3.1, have many significant use values. In particular, they have high scientific and conservation values, and in some cases, high traditional values as well. Such areas also tend to have high public use values, but these are outweighed by other use values that necessitate the restriction of activity within the areas.

**Table 3.3.1. Known High Site Density Areas within the VPA**

Site Name/Number	Acreage
Little/Devil's Hole	10,878 acres
Uinta Foothills	33,059 acres
Upper Willow Creek	4,304 acres
Site 42Un1388 (Four Mile Wash)	560 acres

### 3.3.6 KNOWN NATIONAL REGISTER LISTED SITES

Existing data do, however, identify several cultural sites of determined local, regional, or national significance and four areas of high site density. The sites of determined significance are listed on the National Register of Historic Places (NRHP) (Table 3.3.2). Although these sites have been listed on the NRHP, it should be remembered that sites which have been determined eligible for listing on the NRHP but are not currently listed are afforded the same level of protection and consideration in planning and land-use decisions as those that are listed. However, since the locations of every single eligible site within the planning area are not known, largely because of the dearth of investigative surveys that have been conducted, it is not possible to

provide a comprehensive list or map of all such sites. Therefore, only those NRHP-listed sites are provided herein.

**Table 3.3.2. Known National Register Listed Sites within the VPA**

Site Name/Number	Area
Cockleburr Wash Petroglyphs	Jensen
Dr. John Parson Cabin Complex	Browns Park
John Jarvie Historic Ranch District	Browns Park
Little Brush Creek Petroglyph Panel	Vernal
McConkie Ranch Petroglyphs	Dry Fork
Nine Mile Canyon	Nine Mile Canyon (East Portion)

### 3.3.7 SUMMARY OF CULTURAL RESOURCES

Cultural resources within the Vernal area are numerous, diverse, and widely dispersed. The resources range from small, ancient artifact scatters associated with prehistoric populations to historical resources like cabins, homesteads, mines, and railroads. Although these resources have been documented over years of study, a comprehensive picture of the exact distribution of the resources is not possible due to the large area encompassed and the lack of region-wide systematic study.

Nonetheless, previous data and investigations do provide a general picture of the types of sites present and their locations. Although it is not possible to provide exact data on the location of all types of cultural resources and to therefore gauge with precision the effects of particular management decisions on those resources, it is possible to derive general tendencies for site locations that can be used to gauge the relative probability and relative severity of the impacts of various management decisions on cultural resources in the overall area. For the purposes of subsequent analyses, areas within the VPA would be divided into zones with "High" and "Low" probabilities for cultural resources, based on the relationships between site location and environmental variables that have been established by previous research (Spangler 1995:226–242). High probability zones would be considered those that are within 1 km of permanent water, a juniper zone, sand dune areas, and historical mining districts. Low probability zones would be all areas with greater than 20% slope and areas not meeting the criteria for definition as a high probability zone. These criteria provide replicable proxy data for site location, and can be used to gauge whether a management decision is more or less likely to impact cultural resources.

## 3.4 ENVIRONMENTAL JUSTICE

The Executive Order on Federal actions to address environmental justice in minority populations and low-income populations (Executive Order 12898, with explanatory memorandum) directs federal agencies to assess whether their actions have disproportionately high and adverse human health or environmental effects on minority communities and low-income communities. The Ute Tribe constitutes both a minority community and a low-income community.

Federal minerals are located on 188,500 acres of the Hill Creek Extension, Uintah and Ouray Indian Reservation in Uintah County 113,684 acres within the Hill Creek Extension are Indian minerals. The Hill Creek Extension has important cultural and economic values for the Northern Ute Tribe. This area, as with other areas on the reservation, is economically important because of oil and gas royalties, rights-of-way fees and employment opportunities.

The Uintah and Ouray Indian Reservation has 3,725 Tribal members living on the reservation. The total potential labor force is approximately 1,600, of which about 42% are considered unemployed. Approximately 80% of those who are employed work for the Tribe. Eighty-three percent of those that are employed earn less than \$14,000 annually. Mineral resources, particularly oil, gas, and oil shale, are the greatest economic assets of the Tribe. Other minerals on the reservation include tar sands, coal, gilsonite, bentonite, wurtzilite, phosphate, and sand and gravel. Raising cattle and the growing of livestock feed are other important economic activities that occur on the reservation (BLM 1999).

The southern portion of the Hill Creek Extension, along the Book Cliffs divide, has important traditional life ways and religious values for the Tribe. This area has been distinguished as "wilderness" by the Tribe because of its relatively pristine condition. Big game hunting is an important traditional lifestyle for Tribal members. Some religious ceremonies of the Ute people require plants and other materials that are located here. Additionally, the Hill Creek Extension contains numerous archaeological sites, including rock art, camps and burials that have sacred meaning (Duncan 1992).

## **3.5 FIRE MANAGEMENT**

### **3.5.1 RESOURCE OVERVIEW**

Fire management planning policy requires that a Fire Management Plan, including fire prevention, preparedness, suppression, and use as well as subsequent restoration and rehabilitation, be conducted on an interagency basis. The Fire Management Plan conforms to the National Fire Plan and Federal Wildland Fire Management Policy (USDI 1995). The Vernal Field Office is a major partner in the Uinta Basin Interagency Fire Center (Center). The Center conducts all initial and extended-attack dispatching for the BLM, Ashley National Forest, the Uintah-Ouray Indian Agency, the USFWS - Ouray and Browns Park National Wildlife Refuges, the Utah Division of State Lands and Forestry, and the Utah component of Dinosaur National Monument. An annual operating plan (AOP) has been developed by the Center to establish operating procedures for coordinated responses and cooperative sharing of resources throughout the VPA. Consolidation of dispatch services in the Center has improved coordination of interagency fire planning among the land management agencies in the area.

Wildland fires are integral natural forces affecting public lands within the VPA. In the 10-year period from 1989 to 1998, 497 wildland fires burned a total of 8,540 acres in the VPA. Of these wildland fires, 445 were caused by lightning, and 52 were human-caused ignitions. During the period from 1999 through 2001, 24,294 acres were treated by prescribed burning in a total of

nine treatment areas. Plans for the following five years included prescribed burns on approximately 11,000 acres annually (see Fire Management Plan for specific sites and acreage).

Historically, a lack of funding from resources programs limited the fuels program to a few prescribed fires. The fire suppression program was funded at limited levels until the new Fire Management Plans (FMPs) were completed, and suppression of wildland fire was the only fire management tool used. The fire suppression policy did not take into account the long-term effects on the ecosystems of the area or the long-term costs associated with it. By restricting the natural role of fire in the ecosystem, fuel loads have increased over the years. Pinyon-juniper, sagebrush, and other shrub-type species have become the dominant vegetation communities. Other large conifer species (e.g., Douglas fir, Ponderosa pine) have become decadent, and the health of these stands has declined (see Woodlands and Forest section).

More than one million acres have been designated as needing fire treatments within the VPA. Treatment goals are to reduce the potential for catastrophic stand-destroying wildland fire, enhance wildlife habitat, and increase vegetation diversity. These VPA fire treatment areas also include forage areas for livestock and wildlife, mineral resources including oil and gas fields, and popular hunting and fishing areas. The area is mainly rural, but has an increasing number of residences and population centers within four identified Wildland Urban Interface (WUI) areas.

### 3.5.2 FIRE MANAGEMENT CATEGORIES

The VPA is divided into fire management categories, and the appropriate fire treatment response for the VPA would be managed using the Fire Management Polygons (A, B, C, and D) as described in BLM Handbook 1601 - land-use Planning, and as summarized below:

**Category A.** Areas where unplanned fire is not desired at all.

**Category B.** Areas where unplanned fire is not desired because of current conditions. Prescribed fire use is allowed to obtain resource management objectives. Mechanical/chemical treatments would be used where social and/or resource constraints preclude the use of prescribed fire.

**Category C.** Areas where wildland fire is desired. Prescribed fire is allowed and may be extensive to obtain resource management objectives. Mechanical/chemical treatments would be used where social and/or resource constraints preclude the use of prescribed fire.

**Category D.** Areas where wildland fire is desired, and there are few or no constraints for its use.

Fire suppression activities and the appropriate management response (AMR) would be implemented through the guidance developed in the fire management categories and developed for the Vernal Field Office. The criteria used in developing the categories were determined by an interdisciplinary team of resource specialists. Criteria for each category are described below:

**Category A.** This category includes the salt desert shrub type where the risk of cheatgrass (a noxious weed) invasion is high after an area has been burned or treated. Also included are the major river corridors in the VPA where fire would destroy Fremont cottonwood, which is a keystone species that is presently declining. Constraints to fire management activities include cultural resource sites, high recreational use, highly developed oil and gas fields, high invasive weed potential, and threatened and endangered (T&E) species habitat. Wildland fire for resource use is not appropriate.

**Category B.** This category includes identified crucial deer winter range and crucial sage grouse habitat. Within this habitat, Wyoming sagebrush is identified as a keystone species, which has been in a continual state of decline because of widespread drought and invasive species encroachment. Also included within this polygon are the four identified WUI areas, including cultural resource sites, adjacent urban interfaces, sage grouse and deer winter range habitat, moderate potential for invasive weeds, and T&E species habitat. Wildland fire for resource use is not appropriate.

**Category C.** This category contains the pinyon-juniper type, along with the aspen/Douglas fir, mountain browse, and non-crucial areas of the sagebrush type. Fire is desired to achieve resource objectives. Constraints to fire management activities include a limited amount of oil and gas development, non-critical sage grouse habitat, a limited amount of T&E species habitat, and a limited amount of cultural resources. Wildland fire use for resource objectives is appropriate.

**Category D.** This category contains all of the existing Wilderness Study Areas (WSAs) within the VPA. The role of fire would be widely incorporated, as there are few resource constraints within these polygons. Constraints to fire management activities would include WSA-designated areas, non-critical sage grouse habitat, a limited amount of T&E species habitat, and a limited amount of cultural resources. Wildland fire use for resource objectives is appropriate.

## 3.6 HAZARDOUS MATERIALS

### 3.6.1 BLM HAZARDOUS MATERIALS MANAGEMENT PROGRAM GOALS

Hazardous materials are defined as any material that, because of its quantity, concentration, or physical or chemical characteristics, may pose a real hazard to human health or the environment. Hazardous materials include flammable or combustible material, toxic material, corrosive material, oxidizers, aerosols, and compressed gases.

The Hazardous Materials Management Program, a program that provides guidance supplemental to the National Contingency Plan (EPA 1994), typically supports and guides other programs or agencies to ensure that they adhere to all federal and state environmental laws and regulations regarding hazardous materials. The Hazardous Materials Management Program would review this document, the VPA RMP EIS and would also review all National Environmental Policy Act

(NEPA) compliance documents produced for actions within the VPA for hazardous materials management environmental compliance. If the Hazardous Materials Management Program found within the VPA sites that contained hazardous substances, all surface and/or subsurface activities would be suspended until the VPA obtained direction from the appropriate federal and/or state regulatory agency. Monitoring would be carried out in response to assessment, cleanup, and restoration of a contaminated site. Monitoring would be coordinated with other programs to ensure that those program objectives were met.

The owners and operators of oil, gas, and coal bed natural gas (CBNG) wells within the VPA are required to have emergency plans that cover potential emergencies including fires, employee injuries, chemical releases, and other potential hazards related to hazardous materials. Emergency plans typically contain phone numbers for all medical and emergency services and a list of responsible personnel to contact in the case of emergency. The plans would be posted at all emergency facilities, and employees would be trained in emergency response upon being hired by minerals exploration and development, and maintenance companies.

There are no approved hazardous waste disposal facilities on public lands within the VPA. All hazardous wastes are transported out of the VPA to approved disposal facilities that are constructed and operated in accordance with state and federal regulations. Oil and gas operators are required to comply with a Hazardous Substance Management Plan, as directed by the regulations of the Resource Conservation and Recovery Act (RCRA), which regulates transportation and disposal of hazardous wastes. All private business and organizations that handle hazardous materials would be required to comply with EPA regulations pertaining to the storage, use, transportation, and disposal of these materials. The transportation of hazardous materials is subject to guidelines under the Utah Department of Transportation as well as the United States Department of Transportation.

The current BLM, Vernal Field Office declaration statement regarding hazardous materials management within the VPA is as follows:

Less than 10,000 pounds of any chemical(s) from EPA's Consolidated list of Chemicals Subject to Reporting Under Title III of the Superfund Amendments and Reauthorization Act [SARA] of 1986, and less than the Threshold Planning Quantity [TPQ] of any extremely hazardous substance(s), as defined in 40 CFR 355, would be used, produced, transported, stored, disposed, or associated with the proposed operation annually. Vehicle and equipment fuel, lubricants, antifreeze and battery acid would be the only hazardous material used or associated with the proposed action. Risk of a release would be very low, and the adverse environmental affect of a release would be minimal because it would be cleaned up immediately and disposed of in an approved waste disposal facility (BLM 2001).

### **3.6.2 HAZARDOUS MATERIALS RISKS WITHIN THE VPA**

There are two types of hazardous materials risks: those risks associated with unauthorized releases, and other hazardous materials risks from controlled uses of materials listed under SARA and 40 CFR 355.

The remote nature of VPA lands creates an opportunity for illegal dumping of hazardous materials. These unauthorized releases could include materials from illegal drug laboratories or the illegal dumping of hazardous materials by private companies or individuals. When these types of dumps are encountered, the dumpsite is secured to ensure public safety, appropriate agencies are contacted, and clean up is conducted in accordance with established BLM plans and procedures. If the source responsible for the dumping is identified, that information would be released to the appropriate authorities for prosecution.

Controlled releases of hazardous materials could be the result of programs conducted by the Vernal Field Office, state or local governments, or operations of local businesses and industries. Authorized sources of hazardous materials could include oil and gas development, mineral extraction and processing operations, landfills and hazardous material disposal sites, aboveground and underground storage tanks, abandoned mine lands (AML), and small businesses.

#### **3.6.2.1 LANDFILLS AND HAZARDOUS WASTE DISPOSAL FACILITIES**

There are no approved hazardous materials waste facilities on public lands in the VPA. However, a hazardous materials disposal site is located on private land near Altamont, Utah. BLM policy has been to either close or transfer ownership of all landfills that were historically on Vernal Field Office-administered lands. The Vernal Field Office is currently in compliance with this policy. In order to meet compliance, Red Wash and Jensen landfills were closed; ownership of the Vernal City/County landfill was transferred from BLM ownership; and dumps at the White River oil shale facility were covered and revegetated.

#### **3.6.2.2 STORAGE TANKS**

The use of aboveground storage tank (AST) and underground storage tank (UST) operations is regulated by the EPA and administered by the state of Utah. Operators are responsible for understanding and complying with the EPA regulations. Underground storage tanks within the VPA are concentrated primarily within the towns of Vernal and Naples, and along the Highway 40 and 191 travel corridors (UDERR 2004).

#### **3.6.2.3 SMALL BUSINESSES**

The types of small businesses and organizations that generate or use hazardous materials include (but are not limited to) automotive shops, dry cleaning businesses, print shops, and hospitals. These operations are regulated by the EPA and administered by the state of Utah. It is the responsibility of the business/organization owner to understand and comply with EPA

regulations pertaining to hazardous materials used or hazardous wastes that are generated by that business or organization.

### 3.6.2.4 OIL AND GAS

An increased risk of hazardous materials is an indirect effect of oil, gas, and mineral development. As oil and gas development increases so does the use, generation, and transportation of hazardous materials (Table 3.6.1). For descriptions of areas that may be affected by particular kinds of development, see Section 3.9, Mineral Resources.

### 3.6.2.5 TAR SAND

In the early 1980s, certain tar sand deposits in the Uinta Basin were divided into seven Special Tar Sand Areas (STSAs), as designated by the USGS under direction from Congress pursuant to the Combined Hydrocarbon Leasing Act of 1981. These STSAs are: (1) Pariette, (2) Sunnyside, (3) Argyle Canyon - Willow Creek, (4) Asphalt Ridge - Whiterocks, (5) Hill Creek, (6) P.R. Spring, and (7) Raven Ridge - Rim Rock (BLM 2002).

Tar sands may be extracted via in-situ methods or via surface mining, depending on the depth. In-situ extraction and processing may involve chemicals similar to those for conventional oil and gas (see Table 3.6.1). Hazardous materials associated with surface mining are those primarily used in vehicle and equipment operation, such as battery acid, fuels, lubricants, and antifreeze.

### 3.6.2.6 GILSONITE

Gilsonite mining operations within the VPA do not conduct mineral processing on the mine site. Therefore, the only hazardous materials used for Gilsonite mining are those associated with vehicle and equipment operation.

### 3.6.2.7 OIL SHALE

Currently one RD&D lease has been issued to OSEC to prove development potential of oil shale processes. In addition, on SITLA lands, northeast of Bonanza (Sections 10 and 15 of T9S, R25E), is an oil shale project owned by Oiltech. This project is a pilot plant running processing tests of White River Oil Shale.

**Table 3.6.1. Hazardous Constituents Potentially Used or Produced During Construction, Drilling, Production, and Reclamation Operations Associated with Oil and Gas Production**

Use	Material	Hazardous Constituents
Drilling Materials	Barite	Barium compounds, fine mineral fibers
	Bentonite	Fine mineral fibers
	Caustic Soda	Sodium hydroxide
	Glutaraldehyde	Isopropyl alcohol
	Lime	Calcium hydroxide

**Table 3.6.1. Hazardous Constituents Potentially Used or Produced During Construction, Drilling, Production, and Reclamation Operations Associated with Oil and Gas Production**

Use	Material	Hazardous Constituents
	Mica	Fine material fibers
	Phosphate Esters	Methanol
	Polyacrylamides	Acrylamide, Polycyclic aromatic hydrocarbons (PAHs), Petroleum distillates, Polycyclic organic matter (POM), "Fine mineral fibers
	Retarders	Fine mineral fibers
	Anionic Polyacrylamide	Acrylamide
	Polyanionic Cellulose	Fine mineral fibers
Cement/Plug	Anti-foamer	Glycol ethers
	Bentonite	Fine mineral fibers
	Calcium Chloride Flake	Fine mineral fibers
	Cellophane Flake	Fine mineral fibers
	Cements	Aluminum oxide, Fine mineral fibers
	Chemical Wash	Ammonium oxide, Glycol ethers
	Diatomaceous Earth	Fine mineral fibers
	Extenders	Aluminum oxide, Fine mineral fibers
	Fluid Loss Additive	Acrylamide, Fine mineral fibers, Naphthalene
	Friction Reducer	Fine mineral fibers, Naphthalene, PAHs, POM
	Mud Flash	Fine mineral fibers
	Retarder	Fine mineral fibers
	Salt	Fine mineral fibers
	Silica Flour	Fine mineral fibers
Fracturing Material	Biocides	Fine mineral fibers, PAHs, POM
	Breakers	Ammonium persulphate, Ammonium sulphate, Copper compounds, Ethylene glycol, Fine mineral fibers, Glycol ethers
	Clay stabilizer	Fine mineral fibers, Glycol ethers, Isopropyl alcohol, Methanol, PAHs, POM
	Crosslinkers	Ammonium chloride, Methanol, Potassium hydroxide, Zirconium nitrate, Zirconium sulfate
	Foaming Agent	Glycol ethers
	Gelling Agent	Benzene, Ethylbenzene, Methyl tert-butyl ether (MTBE), Naphthalene, PAHs, POM, Sodium hydroxide, m-Xylene, o-Xylene, p-Xylene
	PH buffers	Acetic acid, Benzoic acid, Fumaric acid, Hydrochloric acid, Sodium hydroxide
	Sands	Fine mineral fibers

**Table 3.6.1. Hazardous Constituents Potentially Used or Produced During Construction, Drilling, Production, and Reclamation Operations Associated with Oil and Gas Production**

Use	Material	Hazardous Constituents
Production Product/Fuel	Solvents	Glycol ethers
	Surfactants	Glycol ethers, Isopropyl alcohol, Methanol, PAHs, POM
	Natural Gas	n-Hexane, PAHs, POM
	Produced water/drill cuttings	Barium, Cadmium, Chromium, Lead, Manganese, Radium 226, Uranium, Other radionuclides
Fuel	Liquid hydrocarbons	Benzene, Ethyl benzene, n-Hexane, PAHs, POM, Toluene, m-Xylene, o-Xylene, p-Xylene
	Diesel fuel	Benzene, Cumene, Ethylbenzene, MTBE, Naphthalene, PAHs, POM, Toluene, m-Xylene, o-Xylene, p-Xylene
	Gasoline	Benzene, Cumene, Cyclohexane, Ethylbenzene, n-Hexane, MTBE, Naphthalene, PAHs, POM, Tetraethyl lead, Toluene, m-Xylene, o-Xylene, p-Xylene
	Jet A	Benzene, Cumene, Cyclohexane, Ethylbenzene, n-Hexane, MTBE, Naphthalene, PAHs, POM, Toluene, m-Xylene, o-Xylene, p-Xylene
Geophysical Survey Materials	Propane	Propylene
	Explosives, fuses, detonators, boosters, fuels	Aluminum, Ammonium nitrate, Benzene, Cumene, Ethylbenzene, Ethylene glycol, Lead compounds, MTBE, Naphthalene, Nitric acid, Nitroglycerine, PAHs, POM, Toluene, m-Xylene, o-Xylene, p-Xylene
	Coating	Aluminum oxide
	Cupric sulfate solution	Cupric sulfate, Sulfuric acid
Pipeline Material	Diethanolamine	Diethanolamine
	LP Gas	Benzene, n-Hexane, Propylene
	Molecular sieves	Aluminum oxide
	Pipeline primer	Naphthalene, toluene
	Potassium hydroxide solution	Potassium hydroxide
	Rubber resin coatings	Acetone, Coal tar pitch, Ethyl acetate, Methyl ethyl ketone (MEK), Toluene, Xylene
	Gases	Formaldehyde, Nitrogen dioxide, Ozone, Sulfur dioxide, sulfur trioxide
Emissions	Hydrocarbons	Benzene, Ethylbenzene, n-Hexane, PAHs, Toluene, m-Xylene, o-Xylene, p-Xylene
	Particulate Matter	Barium, Cadmium, Copper, Fine mineral fibers, Lead, Manganese, Nickel, POM, Zinc
Miscellaneous	Acids	Acetic anhydride, Formic acid, sodium chromate, Sulfuric acid

**Table 3.6.1. Hazardous Constituents Potentially Used or Produced During Construction, Drilling, Production, and Reclamation Operations Associated with Oil and Gas Production**

Use	Material	Hazardous Constituents
	Antifreeze, Heat Control, and Dehydration Agents	Acrolein, Cupric sulfate, Ethylene glycol, Freon, Phosphoric acid, Potassium hydroxide, sodium hydroxide, Triethylene glycol
	Batteries	Cadmium, Cadmium oxide, Lead, Nickel hydroxide, Potassium hydroxide, Sulfuric acid
	Biocides	Formaldehyde, Isopropyl alcohol, Methanol
	Cleaners	Hydrochloric acid
	Corrosion Inhibitors	4-4' Methylene dianiline, Acetic acid, Ammonium bisulfite, Basic zinc carbonate, Diethylamine, Dodecylbenzenesulfonic acid, Ethylene glycol, Isobutyl alcohol, Isopropyl alcohol, Methanol, Naphthalene, Sodium nitrite, Toluene, Xylene
	Emulsion Breakers	Acetic acid, Acetone, Ammonium chloride, Benzoic acid, Isopropyl Alcohol, Methanol, Naphthalene, Toluene, Xylene, Zinc chloride
	Fertilizers	Unknown
	Herbicides	Active and inert ingredients (including proprietary ingredients) of herbicides are addressed and described in the Final PEIS and ROD Vegetation Treatments Using Herbicides on Bureau of Land Management Lands in 17 Western States, June 2007.
	Lead-free thread compound	Copper, zinc
	Lubricants	1,2,4-Trimethylbenzene, Barium, Cadmium, Copper, n-Hexane, Lead, Manganese, Nickel, PAHs, POM, Zinc
	Methanol	Methanol
	Motor Oil	Zinc compounds
	Paints	Aluminum, Barium, n-Butyl alcohol, Cobalt, Lead, Manganese, PAHs, POM, Sulfuric acid, Toluene, Triethylamine, Xylene
	Paraffin Control	Carbon disulfide, Ethylbenzene, Methanol, Toluene, Xylene
	Photoreceptors	Selenium
	Scale inhibitors	Acetic acid, Ethylene diamine tetra, Ethylene glycol, Formaldehyde, Hydrochloric acid, Isopropyl alcohol, Methanol, Nitrilotriacetic acid
	Sealants	1,1,1-Trichloroethane, n-Hexane, PAHs, POM
	Solvents	1,1,1-Trichloroethane, Acetone, t-Butyl alcohol, Carbontetrachloride, Isopropyl alcohol, MEK, Methanol, PAHs, POM, Toluene, Xylene
	Starting Fluid	Ethyl ether
	Surfactants	Ethylene diamine, Isopropyl alcohol, Petroleum naphtha

### 3.6.2.8 PHOSPHATE

Phosphate deposits exist in the Uinta Basin within the Meade Peak Member of the Permian Park City Formation. Simplot Phosphate (formerly known as SF Phosphate) owns and mines a phosphate deposit that is located on private land within the VPA.

The Utah Division of Water Quality regulates Simplot Phosphate's phosphate mining operation, including the large tailings pond disposal area. Samples of tailings water taken indicate concentrations of phosphate, fluoride, total dissolved solids (TDS), and chromium to have been higher than the Utah Water Quality Standards (UDDW 2003). These standards are the most stringent of the applicable numeric criteria for Big Brush Creek, the nearby creek.

In 1996 Simplot (then SF Phosphate) performed a full-spectrum chemical analysis on a grab sample of the mine's tailings water. With the available data, it is not possible to know if the standards for cyanide, chromium, or zinc exceeded limits because the testing methods did not meet the accuracy levels for those determinations; however, the results indicate that TDS and phosphorus exceeded the limits. Although analyses of tailings solids show that the 1996 tailings solids are non-toxic, non-acid-forming, and non-saline, data showed higher levels of sulfates, hardness, calcium, and TDS in tailings water than those found in Big Brush Creek. This indicates that should tailings water migrate past the seepage collection system into Big Brush Creek, the creek's water would be degraded.

Open plan of operation UTU76097 involves a planned phosphate mill tailings disposal from Simplot Phosphate's milling of phosphate from patented mining claims onto mill sites.

### 3.6.2.9 MINERAL MATERIALS

Mineral materials include sand, gravel, and building stone. There is currently one open notice under the CFR 3809 BLM Surface Management regulations on public lands within the VPA. This notice, UTU66378, regulates a stone quarry that employs motorized vehicles to extract and haul the stone. Materials used for vehicle and equipment operation, such as battery acid, fuels, lubricants and antifreeze are the hazardous materials associated with surface mining.

## 3.7 LANDS AND REALTY

As provided by FLPMA, the BLM has the responsibility of planning for and managing public lands. Public lands, as defined by FLPMA, are lands and/or any interest in lands (e.g., mineral estate, reservations, etc.) that are owned by the United States and administered by the Secretary of the Interior, through the BLM. The land surface and mineral ownerships within the VPA are varied and intermingled; consequently, so are the administrative jurisdictions for land use and minerals.

Land and realty program objectives are the following:

- Manage the public lands to support goals and objectives of other resource programs,
- Respond to public requests or applications for land-use authorizations, and

- Acquire administrative and public access where necessary to enhance resource management objectives of the BLM.

### **3.7.1 LAND OWNERSHIP ADJUSTMENT**

As mandated by Sec. 106 (a)(1) of FLPMA (43 USC 1701), public lands are retained in federal ownership except for those public lands that have future potential for disposal (i.e., sale and exchange).

### **3.7.2 DISPOSAL AND ACQUISITION**

As described under Sec. 203 (a) and Sec. 206 of FLPMA (43 USC 1713; 1716), public lands have potential for disposal when they are isolated and/or difficult to manage. Lands in the VPA identified for disposal must meet public objectives (as outlined in Sec. 203 (a) and Sec. 206 of FLPMA), such as community expansion and economic development. Exchanges are initiated in direct response to public requests or by the BLM to improve management of the public lands. The BLM will use both sales and exchange to accomplish disposals to meet plan goals.

Public sales are managed under the disposal criteria set forth in Sec. 203 of FLPMA. Federal law requires lands to be sold at not less than fair market value. Public lands classified, withdrawn, reserved, or otherwise designated as not available or subject to sale are not available for sale.

Public land cannot be effectively administered without legal and physical access. Methods used to acquire legal rights that meet resource management needs include negotiated purchase, donation, exchange, and condemnation. Acquisition alternatives include purchase of fee or less-than-fee interest above, on, and below the surface; perpetual exclusive easements; and permanent or temporary nonexclusive easements. Acquisition of access rights supports one or more of these resources: lands, minerals, forestry, range, wildlife, recreation, and watershed. Acquisitions of road or trail easements are probably the most frequently encountered access needs. Such easements include:

- road easements
- scenic or conservation easements
- sign locations
- stream clearance projects
- utility easements
- hunting and fishing easements
- range improvements

In the case of a split-estate acquisition, courts have historically ruled that use of the mineral estate has precedence over use of the surface estate, regardless of consistency with long-term land-use planning decisions.

### 3.7.3 WITHDRAWALS

Withdrawals are formal actions that set aside, withhold, or reserve federal land by statute or administrative order for public purposes. A withdrawal may remove areas from the public lands to be managed under the authority of another federal agency or department, although the land does not leave federal ownership. Withdrawals accomplish one or more of the following:

- Transfer total or partial jurisdiction of federal land between federal agencies
- Close (segregate) federal land to operation of all or some of the public land laws and/or mineral laws
- Dedicate federal land to a specific purpose

Withdrawals are often used to preserve sensitive environmental values, protect major federal investments in facilities or other improvements, support national security, and provide for public health and safety. Withdrawals segregate a particular portion of public lands, suspend operation of the public land laws (withdrawn from settlement, sale, location, or entry), and prevent any disposal of public lands or resources involved in certain types of land-use application. Withdrawals remain in effect until specifically revoked.

Withdrawals that no longer serve the purpose for which they were established or that lack sufficient justification of need would be revoked. Withdrawal review is mandated by FLPMA, which requires the BLM to eliminate all unnecessary withdrawals and classifications. Before recommending a withdrawal continuation, alternatives such as rights-of-way (ROWs) and interagency agreements must be explored. Appendix E describes the existing withdrawals within the VPA.

### 3.7.4 RIGHTS-OF-WAY (ROWs)

All public lands in the VPA are made available for ROW designation, permits, and leases, with the exception of defined exclusion and avoidance areas. Short segments of corridor, or windows, are designated when a full-length ROW corridor cannot be justified. Existing utility windows, ROW concentration areas, and communication sites are the preferred locations for future grants. Designated corridors are the preferred locations for placement of two or more linear or aerial ROWs that are similar, identical, or compatible. Corridors may be designated as Active or Contingency.

### 3.7.5 UTILITY/TRANSPORTATION SYSTEMS

ROWs are granted on a case-by-case basis. The majority of ROWs granted in the last 20 years have been for oil and gas gathering systems or roads. The majority of these ROWs did not follow designated corridors. Instead, routes were recommended that were the least environmentally damaging and followed de facto utility and transportation systems. Historically, pipeline ROWs granted within the VPA have been small surface pipelines, because they were determined to be the least environmentally damaging. Most of the larger diameter (10+ inches) pipelines (e.g., MAPCO, Northwest and Questar oil/gas transportation pipelines) were buried. The Western Regional Corridor Study Committee recommended that utility corridors cross the VPA.

Exclusion areas prohibit ROWs and corridor/window designation. All WSAs are exclusion areas where new rights-of-ways are prohibited. Avoidance areas are areas where special environmental and/or management considerations exist. ROWs are either not granted in these areas, or, if granted, are subject to stringent terms and conditions. The following avoidance areas were described in the Diamond Mountain and Book Cliffs RMPs:

- Red Mountain
- Six Mile Draw roadless area
- Red Fleet recreation area
- Pariette Wetlands
- Green River corridor
- Development of inventoried recreation sites
- Sage grouse strutting areas
- Scenic corridors
- Archaeological sites
- Fragile watersheds
- Threatened and endangered plant and wildlife habitat areas
- Crucial winter range
- ACECs (Diamond Mountain RMP)

### **3.7.6 ACCESS**

Access to public lands is provided throughout the VPA. Access should be closed or restricted, where necessary, to protect public health and safety and to protect significant resource values. Easements can be acquired to provide access to public lands for recreational, wildlife, range, cultural/historical, mineral, ACEC, special management areas, and other resource needs. Note that all valid existing leases and rights are acknowledged by the BLM, and management actions implemented through approval of the Final RMP and Record of Decision do not apply retroactively to these leases and rights.

Throughout much of Utah, the state owns and manages four isolated sections in each 36-section township. These are generally sections 2, 16, 32, and 36, and are ordinarily one mile square (640 acres). They are primarily administered by the Utah School and Institutional Trust Lands Administration (SITLA) for the purpose of economic support of the state's public schools and institutional trust funds. Activities on state land generally are not substantially different from those on the surrounding land administered by the BLM. Many of the SITLA lands generate funds through grazing permits, right-of-way easements and permits, and hydrocarbon or other mineral leases.

Many BLM lands with management restrictions, such as WSAs, have state lands that are adjacent to or within their boundaries. State lands that are completely or almost entirely surrounded by BLM lands with management restrictions, or are in conjunction with administratively endorsed National Park Service lands, are termed state inholdings.

Existing access to inheld state lands varies. Some of the parcels have direct access through cherry-stemmed or boundary roads of WSAs. Inheld parcels may or may not currently have access, depending upon whether or not existing vehicle routes lead to them. BLM policy, as required by the Cotter decision, is that "the state must be allowed access to the state school trust lands so that those lands can be developed in a manner that will provide funds for the common school...." This decision confined the issue of access to situations directly involving economic revenues generated for the school trust. For example, if a holder of a state oil and gas lease on a parcel of state land that is completely surrounded by a WSA requires access to develop that lease, the BLM must grant the leaseholder reasonable access with consideration given to minimize impacts to wilderness character

### **3.7.7 PERMITS AND LEASES**

Sec. 302 of FLPMA states that public lands may be offered for permit or lease to state, local, or private citizens for use, occupation, or development. For example, the BLM may permit agricultural development, residential use (only under certain very limited conditions), commercial use, advertising, or National Guard use of public lands. Permits are usually short-term authorizations not to exceed 3 years. Leases are long-term authorizations that usually require a significant economic investment in the land. Permits and leases generally require the permittee or lessee to pay rent to the U.S. for the use of federal property.

### **3.7.8 TRESPASS**

Trespass occurrences are known to exist but many have not been documented and pursued because of lack of personnel and higher priority work. Common trespass locations in the VPA are along drainages, oil fields, and other areas bordering public lands. The BLM is responsible for realty trespass abatement, which consists of trespass prevention, trespass detection, and trespass resolution. The method of trespass resolution depends on whether a trespass was intentional or not, the extent and duration of use, and the existence and extent of resource impacts. In the past, trespass resolution has involved the BLM collecting administrative costs from the trespassing party and then either issuing temporary land-use authorizations (such as ROW grants, leases, or permits to resolve unauthorized agricultural use or location of canals, fences, pipelines or other facilities) or requiring that the unauthorized use be discontinued or that the personal property be removed.

## **3.8 LIVESTOCK AND GRAZING MANAGEMENT**

The Vernal Field Office currently administers grazing on 167 allotments throughout the VPA. Of these, five grazing allotments (Dry Creek, Hoy Flat, Offield Mountain, South Pot Creek, and Wild Mountain–Colorado) are located entirely outside the VPA boundary and two allotments (Max Canyon and Blind Canyon) are located entirely on private land inholdings within the VPA. The 160 allotments within the VPA designated for livestock grazing encompass approximately 1,691,116 acres of BLM land. An additional 545,887 acres of other lands (private, state, tribal, etc.) are included within these allotments.

Livestock are regularly permitted to graze on 153 of the 160 allotments as follows: cattle (113), sheep (27), sheep and cattle (12), and horses (1). A few of the cattle and/or sheep allotments also permit some horses. Forty-five of the 153 allotments are currently grazed under a deferment rotation system, which involves delaying grazing in an allotment until the seed maturity of the key forage species.

On the remaining 7 allotments (Red Creek Flat, Rye Grass, Marshall Draw, Taylor Flat, Warren Draw South, Watson-Diamond Mountain and Sears Canyon), cattle are permitted on a temporary, non-renewable basis; however, such use is discretionary.

Within the VPA, 146,161 animal unit months (AUMs) are allocated for livestock, but active permitted use for the 160 allotments is currently 137,897 AUMs. However, the demand for forage resources by livestock (the total average actual use) for the past 10 years was only 78,500 AUMs.<sup>1</sup> Suspended use for the 160 allotments is currently 26,364 AUMs. Comprehensive grazing allotment information is summarized in Appendix L.

### **3.8.1 PAST GRAZING MANAGEMENT CATEGORIES AND CURRENT RANGE CONDITIONS, CARRYING CAPACITY, MANAGEMENT, AND FACILITIES**

Ecological conditions of the two former RMAs (Diamond Mountain and Book Cliffs) were assessed and identified using two different evaluation methods. In the 1994 Diamond Mountain RMP, allotments were evaluated according to seral stages, (Early, Mid or Late). In the 1985 Book Cliffs RMP, allotments were evaluated as being in Excellent, Good, Fair, or Poor ecological condition.

In 1997, the BLM in Utah developed Standards for Rangeland Health and Guidelines for Grazing Management (see Appendix F). These standards are descriptions of the desired condition of the biological and physical components and characteristics of rangelands. Guidelines are management approaches, methods, and practices that are intended to achieve a standard.

The BLM has defined four Fundamentals of Rangeland Health, which are the basic ecological principles underlying sustainable production of rangeland resources. These four fundamentals are embodied in the BLM's new Grazing Regulations (43 CFR Part 4100) and serve as the basis for standards and guidelines for grazing management on BLM-administered public lands in Utah. The Standards and guidelines developed by the Utah Resource Advisory Council provide for conformance with these fundamentals (43 CFR Part 4180.2(b)). The fundamentals are as follows:

- Watersheds are in or making significant progress toward properly functioning physical condition. This condition includes their upland, riparian/wetland, and aquatic components. Soil and plant conditions support infiltration, soil moisture storage, and the release of water that are in balance with climate and landform, and maintain or improve water quality, and timing and duration of flow.

<sup>1</sup> This information was compiled from the Actual Use records of each livestock operator. When actual use was not available, licensed-use figures were used.

- Ecological processes, including the hydrologic cycle, nutrient cycle, and energy flow, are maintained, or there is significant progress toward their attainment, in order to support healthy biotic populations and communities.
- Water quality complies with State water quality standards and achieves, or is making significant progress towards achieving, established BLM management objectives such as meeting wildlife needs.
- Habitats are, or are making significant progress toward being, restored or maintained for Federal Threatened and Endangered species, Federal proposed, Category 1 and 2, Federal candidate, and other special status species.

### **3.8.2 CURRENT GRAZING MANAGEMENT CATEGORIES**

Following the four fundamentals, the Vernal BLM has since re-evaluated each grazing allotment and designated each as being in one of three management categories: Maintain (M), Improve (I), or Custodial (C). The criteria used for categorizing the allotments were based on resource potential, resource use conflicts, opportunity for positive economic return on public investments, and the present management situation. Sixty allotments are in the I category, 47 are in the M category, and 53 are in the C category.

#### **3.8.2.1 CATEGORY M – MAINTAIN EXISTING RESOURCE CONDITIONS**

- The present ecological condition and management are satisfactory.
- Either:
  1. Late to climax seral stage condition will be maintained under present management, if desired; or
  2. Conditions are mid seral stage or improving, with improvement expected to continue under present management, if desired; or
  3. Opportunities for BLM management are limited, either because the percentage of public land is low or the acreage of public lands is small.
- There are no major, land-use resource conflicts with livestock grazing.
- Land ownership status may or may not limit grazing management opportunities.
- Opportunities for positive economic return from public investment may exist.

#### **3.8.2.2 CATEGORY I – IMPROVE EXISTING RESOURCE CONDITIONS**

- Present ecological condition is unsatisfactory.
- Ecological condition is in early to mid seral stage.
- Ecological condition is in mid to late seral stage.
- Ecological succession is expected to regress further.

- Allotment has a potential for medium to high vegetation production, but production is low to moderate.
- Resource conflicts/controversy with livestock grazing are evident.
- There is potential for positive economic return on public investment.

### 3.8.2.3 CATEGORY C – CUSTODIAL MANAGEMENT

- Present ecological condition is not in a declining trend.
- Allotment has a low vegetation production potential and is producing near this level.
- There may be limited conflicts between livestock grazing and other resources.
- Present management is satisfactory or is the only logical management under existing conditions.
- Opportunities for positive economic return on public investments do not exist.

## 3.9 MINERALS AND ENERGY RESOURCES

### 3.9.1 OIL AND GAS

Oil and gas development are major resource development activities within the Uinta Basin, and intense oil and gas exploration and development are expected on BLM-administered lands within the VPA over the planning period of the Proposed RMP. These resources are located in an EPCA focus area. At present, approximately 2,800 oil and gas wells are active within the VPA. The Geologic and Engineering Team in the BLM Vernal Field Office has estimated the relative potential for oil and gas resources, including CBNG, in six exploration and development areas within the VPA. These areas, from north to south, are: Manila-Clay Basin, Tabiona-Ashley Valley, Altamont-Bluebell, Monument Butte-Red Wash, West Tavaputs Plateau, and East Tavaputs Plateau (See Figure 19 in the Maps section).

The number of current leases (wells, developments, and explorations) existing within the VPA changes rapidly and frequently. As such, presenting such information would be without merit, since said information would be outdated immediately upon issuance of the document.

Seismic surveys, both three-dimensional (3D) and two-dimensional (2D), are expected to increase during the planning period, particularly in the East Tavaputs Plateau exploration and development area. Forty-five (45) to 75 Notices of Intent (NOIs) to perform surveys are anticipated, and the Geologic and Engineering Team has estimated that approximately 2,055 new oil wells, 4,345 new gas wells, and 130 new CBNG wells would be drilled during the planning period. The majority of the oil and gas development activity is anticipated to occur in the Monument Butte-Red Wash exploration and development area. Most CBNG activity is expected to occur in the East and West Tavaputs Plateau areas.

#### 3.9.1.1 OIL AND GAS LEASING, AND LOCATABLE AND SALEABLE MINERALS CATEGORIES

The exploration and development of oil and gas resources is accomplished in several stages of activity. The first stage (land categorization) involves determining which public domain lands

should be leased and under what conditions. The second stage is leasing. The third stage includes exploration, development, and production operations.

The BLM has designated four categories that describe the conditions placed upon public domain lands in regard to their availability for fluid hydrocarbon leasing, and the entire VPA has been assigned one of the following leasing categories for oil and gas development:

- Standard Stipulations
- Timing and Controlled Surface Use
- No Surface Occupancy
- Closed to Leasing

**Standard Stipulations** – This lease category identifies areas, which are open to exploration and development, subject to the terms and conditions of the standard lease form.

**Timing and Controlled Surface Use** – This category identifies areas that are open to exploration and development, subject to relatively minor constraints such as seasonal restrictions. These areas possess other land uses and/or resource values such as critical big game wildlife range or special status plant and wildlife species, which might conflict with fluid hydrocarbon exploration and development and, therefore, moderately restrictive lease stipulations may be required to mitigate these impacts. The stipulations are utilized where there are resource values, which may require specific protection, but the conflicts with fluid hydrocarbon exploration and development would not be of sufficient magnitude so as to preclude surface occupancy.

**No Surface Occupancy** – This minerals lease category identifies areas that are open to exploration and development subject to highly restrictive lease stipulations, which includes no surface occupancy (NSO). These areas possess special resource values or land uses such as camping or picnic areas, scenic areas, Recreation and Public Purpose (R&PP) patents and leases, important historical and/or archaeological areas, and buffer zones along the boundaries of special use areas such as wild and scenic river corridors. This category is used for those areas where a number of seasonal or other minor constraints would severely restrict exploration and development.

**Closed to Leasing** – This lease category identifies areas that are closed to leasing either by discretionary or non-discretionary decisions. These areas have other land uses or resource values, which cannot be adequately protected, even with the most restrictive lease stipulations. Closing these areas to leasing is the only way to ensure their appropriate protection. Discretionary closures involve lands where the BLM has determined that energy and/or mineral leasing, entry, or disposal, even with the most restrictive stipulations or conditions, would not be in the public interest. Non-discretionary closures involve lands that are specifically closed to energy and/or mineral leasing, entry, or disposal by law, regulation, Secretarial decision, or Executive Order. All WSAs are closed to leasing by law.

Locatable and salable minerals areas are generally classified as either Open or Closed. Locatable minerals are usually the base and precious metal ores, ferrous metal ores, and certain classes of

industrial minerals where acquisition is by staking a mining claim (location) over the deposit and then acquiring the necessary permits to explore or mine. Salable minerals are defined as mineral commodities sold by sales contract from the federal government. Salable minerals are generally common varieties of construction materials and aggregates, such as sand, gravel, cinders, roadbed, and ballast material.

#### **3.9.1.1.1 EPCA**

The Vernal Field Office Planning Area is located within the western portion of the Uinta/Piceance Basin area which covers a large amount of northeast Utah and northwest Colorado (approximately 18,945,000) acres and is known to have significant occurrences of oil and gas resources which have been depicted in a variety of studies. Based on the known quantities of oil and natural gas resources within the VPA, the Uinta Basin has been designated as an EPCA focus area for oil and gas exploration and development. Most recently, in 2003, a multi-agency effort produced a "Scientific Inventory of Onshore Federal Lands' Oil and Gas Resources and Reserves and the Extent and Nature of Restrictions or Impediments to their Development." It is BLM policy to consider this information in its planning process. The information, commonly referred to as the EPCA data, portrays two kinds of basic energy related information relevant to the Uinta/Piceance Basin, volumetric data and accessibility data (EPCA 2003).

The volumetric data on oil reserve estimates for the entire basin is predicted between 61–296 million barrels of oil with a mean estimate of 149 million barrels of oil (EPCA 2003).

Volumetric data on gas reserve estimates for the entire basin is predicted between 12-35 trillion cubic feet with a mean estimate of 22 trillion cubic feet. Most of the undiscovered natural gas is found widely dispersed in continuous deposits rather than distinct structural traps (EPCA 2003).

Among the five study areas that were subject to the EPCA study, the Uinta/Piceance Basin has the highest percentage of oil (85%) available under standard lease terms (EPCA 2003).

Another kind of data illustrated by EPCA is that of accessibility by industry to the estimated reserves. Accessibility by industry was based on the actual depiction of existing land-use plan stipulations that presently occur in the Vernal Field Office Planning Area. Careful review of this information shows many major inaccuracies of oil and gas stipulations as they presently occur within the planning area. A more accurate portrayal of existing oil and gas stipulations which affect industry accessibility to oil and gas resources is shown in Chapter 2, Proposed RMP and Alternatives and is located in the Alternative Matrix under Alternative D (No Action) which depicts current leasing stipulations.

In addition to the EPCA data, which is a very large-scale portrayal of energy information, the BLM prepared more site-specific data based on 14 conventional and unconventional oil and gas play areas within the Vernal Field Office. Numerous data sources including USGS, UGS, academic research, UDOGM, industry and government sources, were queried in order to depict specific information that was relevant to the potential for occurrence of oil and gas resources within Duchesne, Uintah and Daggett Counties. This information was then used to compile the

Mineral Potential Report for the Vernal Field Office. The mineral report also depicts the potential for reasonable foreseeable development for six different zones within the VPA. A brief summation of the six oil and gas producing zones is portrayed below.

#### **3.9.1.2 MANILA-CLAY BASIN EXPLORATION AND DEVELOPMENT AREA**

Historically, exploration activity for and production of oil and gas in this region have been relatively low, particularly over the last 15 years. All producing wells in the area were drilled prior to 1980. Historic gas well data indicate that only three gas wells have been drilled since 1980, none of which are currently producing wells. New geologic data or an increase in the price of natural gas could create increased interest in this area. It is projected that a maximum of 45 additional gas wells would be drilled in this area in the 5 years following the approval of the ROD for this plan.

#### **3.9.1.3 TABIONA-ASHLEY VALLEY EXPLORATION AND DEVELOPMENT AREA**

Past exploration for oil and gas resources in this region has been unproductive. Data indicate that there have been no gas wells and only one oil well drilled in this region since 1980, and that the lone well is not producing. It is projected that no more than 30 oil wells would be drilled within this area in the 5 years following the approval of the ROD for this plan.

#### **3.9.1.4 ALTAMONT-BLUEBELL EXPLORATION AND DEVELOPMENT AREA**

This area has had major oil exploration and production in the past, but due to a combination of low oil prices and the depletion of the oil reservoir the number of oil wells drilled annually in this area has decreased since the early 1990s. It is projected that no more than 175 oil wells would be drilled within this area in the 5 years following the approval of the ROD for this plan. Past exploration does not indicate a high potential for gas development, but the presence of deep gas reserves in the southern portion of this area could be explored over the next 15 years.

#### **3.9.1.5 MONUMENT BUTTE-RED WASH EXPLORATION AND DEVELOPMENT AREA**

The Monument Butte-Red Wash exploration and development area has been an area of extensive oil and gas development and production in the past. It is projected that the oil and gas development within Monument Butte-Red Wash will continue to be extensive in the 5 years following the approval of the ROD for this plan with 1,700 oil wells and 3,100 gas wells projected to be drilled in this area.

#### **3.9.1.6 WEST TAVAPUTS PLATEAU EXPLORATION AND DEVELOPMENT AREA**

This is not to be confused with the West Tavaputs EIS analysis for full field oil and gas development currently being conducted out of the Price Field Office. The area in the VPA has not been extensively developed for oil and gas resources in the past 15 years. However, based on BLM discussions with oil and gas producers, there is major interest in this area for oil and gas exploration and development. The greatest interest is in gas development on the eastern side of

this area. As many as 75 oil wells, 350 gas wells, and 50 CBNG wells could be drilled in the area in the 5 years following the approval of the ROD for this plan.

### 3.9.1.7 EAST TAVAPUTS PLATEAU EXPLORATION AND DEVELOPMENT AREA

This area has had slightly more oil and gas exploration and development than the West Tavaputs Plateau area that falls in the VPA, and it is anticipated that major development, particularly within natural gas fields, will occur in the 5 years following the approval of the ROD for this plan. Increased seismic exploration is expected in the area, and a potential land exchange with the State of Utah (subject to congressional approval) is expected to lead to increasing additional drilling in the first five years. It is projected that 75 new oil wells, 600 new gas wells, and 80 new CBNG wells could be drilled in this area in the 5 years following the approval of the ROD for this plan.

### 3.9.2 TAR SAND

Tar sand contains heavy hydrocarbon residues such as bitumen, tar, or degraded oils that have lost their volatile components. Hydrocarbons can be liberated from tar sands by heating and other processes. Tar sand deposits in the VPA are generally located along the margins of the Uinta Basin.

The bituminous substance in the sandstones of the Basin's geologic formations is tarry residuum of petroleum that fills the pore space in coarse sandstones or forms cement in loose unconsolidated sands (Pruitt 1961). The ore retrieved from tar sands is bitumen. Bitumen is a general name for various solid and semi-solid hydrocarbons that are fusible and are soluble in carbon bisulfide. Petroleum, asphalt, natural mineral wax, and asphaltite are all considered bitumen.

In the early 1980s, certain tar sand deposits in the Uinta Basin were divided into seven Special Tar Sand Areas (STSAs) designated by the U.S. Geological Survey (USGS) under direction from Congress pursuant to the Combined Hydrocarbon Leasing Act of 1981. These STSAs are Pariette, Sunnyside, Argyle Canyon - Willow Creek, Asphalt Ridge - Whiterocks, Hill Creek, P.R. Spring, and Raven Ridge - Rim Rock (BLM 2002). Table 3.9.1 quantifies the estimated amount of bitumen that could potentially be recovered from each of the STSAs in the VPA.

**Table 3.9.1. Estimated Number of Barrels of Bitumen Contained within Each STSA**

STSA	Geologic Formations	Barrels of Bitumen
Argyle Canyon-Willow Creek	Green River Formation	60–90 million
Asphalt Ridge-Whiterocks	Duchesne River/Uinta, Navajo Sandstone, and Mesa Verde Formations	1.2–1.3 billion
Hill Creek	Green River Formation	1.6 billion
Pariette	Uinta Formation	12–15 million
P.R. Spring	Green River Formation	4–4.5 billion
Raven Ridge-Rim Rock	Green River Formation	100–130 million
Sunnyside	Wasatch Formation	3.5–4 billion

**Table 3.9.1. Estimated Number of Barrels of Bitumen Contained within Each STSA**

STSA	Geologic Formations	Barrels of Bitumen
------	---------------------	--------------------

Source: Blackett 1996

Other minor tar sand deposits have also been delineated within the VPA. These deposits include Chapita Wells (7.5 to 8 million barrels of bitumen), Cow Wash (1 to 1.2 million barrels of bitumen), Upper Kane Hollow (unestimated), Spring Branch (1.5 to 2 million barrels of bitumen), Tabiona (1.3 million barrels of bitumen), Lake Fork (6.5 to 10 million barrels of bitumen), Split Mountain (unestimated), Nine Mile Canyon (unestimated), Minnie Maude Creek (10 to 15 million barrels of bitumen), Little Water Hills (10 to 12 million barrels of bitumen), and Spring Hollow (unestimated; Blackett 1996).

Because tar sand development associated with a combined hydrocarbon lease could be more disruptive to environmental resources than oil and gas development, all combined hydrocarbon leases issued in STSAs are regulated by an amended leasing category system.

- Open to leasing, with standard stipulations
- Open to leasing, with standard and special stipulations
- Open to leasing, with no right of surface occupancy
- Closed to leasing

As of October 2001, there were four permitted tar sand surface mining operations in the VPA, all located in Uintah County. The potential for development of this resource, other than for asphalt paving, is anticipated to remain low over the next 15 years.

### 3.9.3 GILSONITE

Gilsonite is the purest solid bitumen found in nature. Gilsonite is the trade name for Uintaite, which is a black, pitch-like substance that occurs in pure form in vein-type deposits in the Tertiary sediments of the Uinta Basin of northeastern Utah. It is a petroleum substance of uniform composition and texture with a distinctive conchoidal fracture. In gilsonite, the surfaces exposed along fractures typically have a bright sheen and reflect bright light, in notable contrast to the jet-black color. A number of important uses for gilsonite have been found since its discovery in the late nineteenth century. These uses include high-grade varnishes, lacquers, paints, acid proofing, insulating plastics, inks, and mastic (Crawford 1960). For commercial purposes, it is graded and marketed by producers into "Selects" and "Standard." There is also a very high-grade variety with high luster and deep black color known as "Jet Black" (Stern 1960).

Gilsonite is allocated by non-competitive and competitive leasing only. Leasing actions may be initiated by public interest or by the BLM. Allocation methods vary to suit different situations.

There is high to moderate potential for gilsonite occurrence within the VPA. It is likely that there will be continued exploration and development of this resource within the next 15 years.

### 3.9.4 OIL SHALE

Oil shale is a popular term for sedimentary rock (e.g., marlstone) from the Tertiary Green River Formation that contains kerogen. Kerogen is a fossilized organic material that can be converted to conventional oil via retorting or destructive distillation processes (Cashion 1967) characterizes oil shale as a marlstone that, when distilled, will yield 15 gallons or more of oil per ton of rock.

Oil shale occurs within the lower part of the Parachute Creek Member of the Green River Formation. The Mahogany Oil Shale Zone of the Parachute Creek Member is the most notable kerogen-bearing unit of the Green River Formation (Trudell et al. 1983). It outcrops in the southern part of the VPA and dips north towards the synclinal axis of the Uinta Basin. The Mahogany Zone varies in thickness throughout the Uinta Basin, generally thickening and becoming less defined from east to west (Cashion 1967).

There is a high to moderate potential for occurrence of oil shale within the VPA. It is expected that a total of one or two small-scale projects may be active over the next 15 years.

### 3.9.5 PHOSPHATE

Phosphate deposits exist in the Uinta Basin within the Meade Peak Member of the Permian Park City Formation. Phosphate ore is present in the form of  $P_2O_5$  (Schillie 2002). Extensive, relatively high-grade deposits occur at or near the surface in the VPA, making phosphate mining in the VPA economical because the ore can be cheaply strip-mined. Deposits in the Flaming Gorge/Manila Field area are less economically attractive because of the area's more complex geologic setting.

There is high to moderate potential for the occurrence of phosphate deposits within the VPA. Phosphate mining on private land is expected to continue over the next 15 years. There is some potential for exploration on BLM lands over the next 15 years.

### 3.9.6 MINERAL MATERIALS

Other mineral materials include fine sand, gravel, and building stone. Fine sand deposits can be found on the northern edge of Ashley Valley, the portion of the Uinta Basin lying between Asphalt Ridge and the Utah-Colorado state line, Moon Lake Reservoir, and Yellowstone Reservoir. Moon Lake Reservoir and Yellowstone Reservoir are both on U.S. Forest Service (USFS) land in the Uinta Mountains.

Coarse sand and gravel deposits are found along the northern margin of the Uinta Basin, where it abuts the southern flank of the Uinta Mountains. More specifically, these deposits occur in the upper sandstone units of the Tertiary Duchesne River Formation, in the Uinta Piedmont, and in Quaternary terrace/alluvial deposits in streams draining the Uinta Mountains. Green River terrace deposits are a source of sand and gravel, and the Mississippian Madison Limestone that crops out along the south flank of the Uinta Mountains can be crushed and used as an aggregate.

Building stone resources exist in the Parachute Creek Member of the Tertiary Green River Formation. More specifically, the resource occurs as loose rock that has been eroded from outcrops along the south side of Duchesne County through southern Uintah County.

There is a high to moderate potential for the occurrence of mineral materials, including sand, gravel, and building stone in the VPA. It is likely that exploration and development of these resources will continue to occur over the next 15 years.

### **3.9.7 LOCATABLE MATERIALS**

Minor deposits of locatable materials that are associated with hydrothermal alteration and secondary mineral precipitation (e.g., base metals, gold, gypsum, and uranium) are known to exist within the VPA (Johnson 1973). The Precambrian Red Creek Quartzite has yielded some lead, gold, copper, silver, iron, and barium between Mountain Home and the Owyukuts Plateau. The Mississippian carbonate rocks along the south flank of the Uinta Mountains contain some small iron deposits (Pruitt 1961). The terrace deposits of the Green River also contain some fine-grained placer gold (Pruitt 1961). Uranium is known to exist in some sections of the carboniferous units of the Mesa Verde and Uinta Formations (Chenoweth 1992). Gypsum is known to occur as an evaporative salt in the Jurassic Carmel and Triassic Moenkopi Formations. When mined for chemical-use purposes (e.g., for carbonate scrubber material), the Mississippian Madison Limestone that outcrops along the flanks of the Uinta Mountains may be subject to mining claim locatable mineral regulations, and may be removed pursuant to the Forest Service 36 CFR 228 (A) or the BLM 43 CFR 3715, 3802, and 3809 mining regulations, as appropriate.

There is moderate potential for the occurrence of locatable minerals within the VPA. Very little development activity for locatable minerals is anticipated over the next 15 years.

### **3.9.8 COAL**

Coal mining has not occurred on public lands in the VPA due to lack of demand and the poor quality of the deposits. However, coal of commercial value exists in the coal unit of the Cretaceous Frontier Sandstone and the Mesa Verde Group Formations (Pruitt 1961). The Frontier Sandstone is the most important coal-bearing unit in the VPA. The quality of these coal beds improves in an easterly direction (Doelling and Graham 1972).

There is a moderate potential for the occurrence of economically valuable coal deposits within the VPA, but it is unlikely that coal exploration or development will occur over the next 15 years because of the generally low-grade quality of the coal.

## **3.10 NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

### **3.10.1 OVERVIEW**

Since wilderness study areas (WSAs) were established in the 1980s, designation of wilderness in Utah has become a prominent national issue. For more than 20 years, the public has debated which lands have wilderness characteristics and should be considered by Congress for wilderness

designation. As a result of the debate (and a significant passage of time since the BLM's original inventories), in 1996 the Secretary of the Interior directed the BLM to take another look at some of the lands in question. In response to the direction of the Secretary, the BLM inventoried these lands, and approximately 2.6 million acres of public land statewide (outside of existing WSAs) were found to have wilderness characteristics (1999 Utah Wilderness Inventory).

Non-WSA lands with wilderness characteristics are areas having 5,000 acres, or areas less than 5,000 acres that are contiguous to designated wilderness, WSAs, or other lands administratively endorsed for wilderness; or in accordance with the Wilderness Act's language, areas "of sufficient size as to make practicable its preservation and use in an unimpaired condition". These are areas in a natural or undisturbed condition and provide outstanding opportunities for solitude or primitive forms of recreation (non-motorized and non-mechanized activities in undeveloped settings). The BLM used the same criteria for determining wilderness characteristics as in the 1979 wilderness inventory. The 5,000 acre value was helpful to the BLM in making preliminary judgments, but it was not considered a limiting factor. Refer to the definition of *Wilderness Characteristics* in the glossary in the Draft RMP/Draft EIS.

In April 2003 the BLM and the State of Utah, the Utah School and Institutional Trust Land Administration (SITLA), and the Utah Association of Counties (collectively "Utah") reached an agreement negotiated to settle a lawsuit originally brought in 1996 by Utah, challenging the BLM's authority to conduct new wilderness inventories. The settlement stipulated that the BLM's authority to designate new WSAs expired no later than October 21, 1993. The BLM, however, does have the authority to conduct inventories for characteristics associated with the concept of wilderness (FLPMA Section 201; 43 U.S.C. §1711) and to consider management of these values in its land-use planning process (FLPMA Section 202; 43 U.S.C. §1712). The BLM's land-use Planning Handbook (H-1601-1) states that decisions on whether or not to protect areas with wilderness characteristics are to be considered during planning.

### **3.10.2 PLANNING AREA PROFILE**

There are nine areas in the VPA (approximately 102,938 acres) outside of existing WSAs that were determined by the BLM in the 1999 inventory to have the wilderness characteristics of size, naturalness, and outstanding opportunities for solitude or primitive recreation. In addition to the lands found to have wilderness characteristics in the 1999 inventory, other lands in the VPA have been proposed for wilderness as a part of legislation before Congress (America's Red Rocks Wilderness Act). A BLM interdisciplinary team evaluated a variety of sources of information, including information provided by the public about these areas, their on-the-ground knowledge of these areas, information in case files and field notes/files, master title plats, aerial photos, GIS data layers, and field inspections, and the team determined that all or parts of these areas have wilderness characteristics. Of the 34 areas evaluated, a total of 25 areas outside of existing WSAs totaling about 277,596 acres were found to have wilderness characteristics. These areas are identified in the table below (Table 3.10.1; See Figure 26 in the Maps section). These non-WSA lands with wilderness characteristics have been carried through the land-use planning process to assess the impacts of management options on these lands and to determine how their wilderness characteristics will be managed. Many of the inventoried lands were found to lack

wilderness characteristics, and these are also identified in the table below (Table 3.10.1; see Figure 26 in the Maps section).

Detailed information about non-WSA lands with wilderness characteristics is part of the administrative record for the Draft RMP/Draft EIS. The following records are available for public review at the Vernal Field Office: (1) 1999 Utah Wilderness Inventory; (2) 1999 Utah Wilderness Inventory Revision Document for the Vernal Field Office; (3) 1999 Utah Wilderness Inventory case files for the Vernal Field Office; (4) Reasonable Probability Determinations for the Vernal Field Office; and (5) Documentation of Wilderness Characteristics Review for the Vernal Field Office.

**Table 3.10.1 Non-WSA Lands with Wilderness Characteristics in the VPA**

<b>Name</b>	<b>Acres with Wilderness Characteristics (WC)</b>	<b>Acres with No Wilderness Characteristics (NWC)</b>	<b>Contiguous Lands with Wilderness Characteristics</b>
Beach Draw	898	9	Beach Draw is contiguous to Dinosaur National Monument lands recommended by the Park Service for wilderness designation.
Bitter Creek	33,488	8,816	No contiguous lands with wilderness characteristics.
Bourdette Draw	13,335	2,174	No contiguous lands with wilderness characteristics.
Bull Canyon	2,483	32	Bull Canyon is contiguous to the BLM's Bull Canyon WSA, located in Utah and Colorado.
Cliff Dweller Canyon	0	14,604	No contiguous lands with wilderness characteristics.
Cold Spring Mountain	8,764	4,412	Cold Spring Mountain is contiguous to the BLM's West Cold Spring WSA, located in Utah and Colorado.
Cripple Cowboy	13,603	0	Cripple Cowboy is contiguous to the BLM's 400-acre Book Cliffs Mountain Browse ISA.
Daniels Canyon	3,045	0	Daniels Canyon is contiguous to the BLM's Daniels Canyon WSA and Dinosaur National Monument lands recommended by the Park Service for wilderness designation.
Dead Horse Pass	6,994	1,124	No contiguous lands with wilderness characteristics.

**Table 3.10.1 Non-WSA Lands with Wilderness Characteristics in the VPA**

<b>Name</b>	<b>Acres with Wilderness Characteristics (WC)</b>	<b>Acres with No Wilderness Characteristics (NWC)</b>	<b>Contiguous Lands with Wilderness Characteristics</b>
Desolation Canyon	63,118	6,993	Desolation Canyon is contiguous to the BLM's Desolation Canyon WSA. The non-WSA lands with wilderness characteristics are located in the BLM's Vernal, Price, and Moab Field Offices. This is the acreage with wilderness characteristics in the Vernal Field Office portion of the area. Total acreage of the non-WSA lands with wilderness characteristics covering all three field offices is 154,767.
Diamond Breaks	4,539	186	Diamond Breaks is contiguous to the BLM's Diamond Breaks WSA, located in Utah and Colorado.
Diamond Mountain	27,238	25	Diamond Mountain is contiguous to Dinosaur National Monument lands recommended by the Park Service for wilderness designation.
Dragon Canyon	0	19,899	No contiguous lands with wilderness characteristics.
Goslin Mountain	0	6,084	No contiguous lands with wilderness characteristics.
Hells Hole Canyon	2,709	0	Hells Hole Canyon includes 7,000 acres in Colorado.
Hideout Canyon	1,113	0	Hideout Canyon includes 11,607 acres of lands with wilderness characteristics in the Moab Field Office.
Lower Bitter Creek	11,417	2,682	No contiguous lands with wilderness characteristics.
Lower Flaming Gorge	17,810	3,360	No contiguous lands with wilderness characteristics.
Mexico Point	1,277	79	Mexico Point includes 12,837 acres of lands with wilderness characteristics in the Moab Field Office.
Moonshine Draw	4,513	0	Moonshine Draw is contiguous to Dinosaur National Monument lands recommended by the Park Service for wilderness designation.
Mountain Home	7,083	2,201	No contiguous lands with wilderness characteristics.

**Table 3.10.1 Non-WSA Lands with Wilderness Characteristics in the VPA**

<b>Name</b>	<b>Acres with Wilderness Characteristics (WC)</b>	<b>Acres with No Wilderness Characteristics (NWC)</b>	<b>Contiguous Lands with Wilderness Characteristics</b>
Rat Hole Ridge	11,367	0	Rat Hole Ridge includes 1,200 acres of lands with wilderness characteristics in Colorado.
Red Creek Badlands	0	4,656	No contiguous lands with wilderness characteristics.
Seep Canyon	0	20,802	No contiguous lands with wilderness characteristics.
Split Mountain Benches	0	2,164	No contiguous lands with wilderness characteristics.
Split Mountain Benches South	0	355	No contiguous lands with wilderness characteristics.
Stone Bridge Draw	0	3,638	No contiguous lands with wilderness characteristics.
Stuntz Draw	1,992	0	Stuntz Draw is contiguous to Dinosaur National Monument lands recommended by the Park Service for wilderness designation.
Sunday School Canyon	0	18,069	No contiguous lands with wilderness characteristics.
Sweetwater Canyon	6,994	0	No contiguous lands with wilderness characteristics.
Vivas Cake Hill	277	0	Vivas Cake Hill is contiguous to Dinosaur National Monument lands recommended by the Park Service for wilderness designation.
White River	21,210	8,564	No contiguous lands with wilderness characteristics.
Wild Mountain	527	31	Wild Mountain is contiguous to Dinosaur National Monument lands recommended by the Park Service for wilderness designation.
Wolf Point	11,802	2,764	No contiguous lands with wilderness characteristics.
<b>Total (34 areas)</b>	<b>277,596</b>	<b>133,723</b>	No contiguous lands with wilderness characteristics.

Non-WSA lands with wilderness characteristics analyzed in this document include 277,596 acres of BLM-administered public land. In addition to the acreage currently being managed to protect and preserve their wilderness characteristics, the BLM Utah is considering management options for 2,759,400 (5.3% of lands in Utah) additional acres of non-WSA lands with wilderness characteristics in six ongoing land-use planning efforts. This includes the 277,596 acres in the VPA. There are other federal lands with wilderness characteristics in Utah not administered by

the BLM that are currently being managed to protect those values. These are identified in Table 3.10.2.

**Table 3.10.2. Federal Lands with Wilderness Characteristics in Utah that are Currently Being Managed to Protect Those Values**

Land Administrator	Administrative Unit	Acres	Percent of Land in Utah*
BLM	Designated Wilderness	127,700	0.24
BLM	Wilderness Study Areas	3,214,740	6.10
National Park Service	Recommended Wilderness	1,467,082	2.79
U.S. Forest Service	Designated Wilderness	773,124	1.47
U.S. Forest Service	Recommended Wilderness	83,390	0.16
<b>Total</b>		<b>5,666,036</b>	<b>10.76</b>

\*The percentage figures shown in this table are based on a total land area of 52,541,440 acres in Utah.

## 3.11 PALEONTOLOGY

Fossils are the remains, traces, or imprints of ancient organisms preserved in or on the earth's crust that provide information about the history of life on earth. Paleontological resources do not include any materials associated with an archeological resource, which consist of material remains of past human life or activities that are over 100 years old (as defined in section 3(1) of the Archeological Resources Protection Act of 1979, as amended (16 U.S.C. 470bb[1])).

### 3.11.1 REGIONAL OVERVIEW

At approximately 125 miles in length, the Uinta Mountains are the largest east-west-trending mountain range in the western hemisphere (Hansen 1969). The Uinta Basin is an asymmetrical elongate basin. The Uinta Mountains flank the northern length of the basin and the Book Cliffs/Tavaputs Plateau flank the southern margin. The Uinta Basin, Uinta Mountains, and Book Cliffs/Tavaputs Plateau are the dominant physiographic provinces of northeastern Utah. The Uinta Mountains rise to elevations greater than 13,000 ft (nearly 4000 m). This mountain range includes many of the highest peaks in Utah.

The Uinta Basin is situated in the central portion of the VPA. It has a geologic history of several orogenies (mountain building events) and a series sea level changes evidenced in the various rock formations and in the fossil record. The rock outcrops in the VPA are primarily sedimentary and span more than 2.8 billion years (Ga) of geologic history. These sedimentary deposits include Precambrian marine clastics, Paleozoic shelf deposits, Mesozoic terrestrial deposits, Tertiary basin fill and lake deposits, and Late Tertiary and Quaternary basin fill, glacial deposits, and alluvium (Diamond Mountain RMP 1990). In other words, the sedimentary rocks within the VPA formed and deposited in a variety of ancient environments more than 65 million years ago.

**3.11.2 EVALUATION OF PALEONTOLOGICAL RESOURCE AND CONDITIONS**

The BLM has identified four objectives for the management of fossil resources on lands it administers. They are: 1) locating, evaluating, managing, and protecting fossil resources; 2) facilitating appropriate scientific, educational and recreational uses of fossils; 3) ensuring that proposed land uses do not inadvertently damage or destroy important fossil resources; and 4) fostering public awareness of the Nation's rich paleontological heritage (BLM 1998:01). The BLM considers vertebrate fossils, as a group, to be scientifically significant; invertebrate and plant fossils may be determined to be significant on a case-by-case basis. Petrified wood is treated as a mineral material and may be collected or purchased under the Material Sales Act of 1947 (as amended), but cannot be obtained under the General Mining Law of 1872.

In 1998, the BLM released H-8270-1, General Procedural Guidance for Paleontological Resource Management. This handbook established a simple tri-level classification system (Condition I, II, and III) for the "ranking of [geographic] areas according to their potential to contain vertebrate fossils, or noteworthy occurrences of invertebrate or plant fossils" (BLM 1998:II-3).

On October 15, 2007, the BLM Washington Office (WO) IM 2008-009 (BLM 2007) replaced the tri-level classification system with the Potential Fossil Yield Classification (PFYC) System for Paleontological Resources on Public Lands, and H-8270-1 was revised to include this new classification system. The new classification system is meant to provide baseline guidance for predicting, assessing, and mitigating paleontological resources. Table 3.11.1 below (from Attachment 2-2 of the IM) provides a correlation for the old and new classification systems.

**Table 3.11.1. Correlation between Condition and PFYC Classification Systems for Paleontological Resources**

<b>Condition Classes</b>	<b>PFYC Classes</b>
Condition 1 – Areas known to contain vertebrate fossils or noteworthy occurrences of invertebrate or plant fossils. (Note: this refers to known localities or groups of localities)	PFYC Class 4 (High) or Class 5 (Very High), based on geologic unit.
Condition 2 – Areas with exposures of geologic units or settings that have high potential to contain vertebrate fossils or noteworthy occurrences of invertebrate or plant fossils.	PFYC Class 3 (Moderate), Class 4 (High), or Class 5 (Very High), based on geologic unit.
Condition 3 – Areas are very unlikely to produce vertebrate fossils or noteworthy occurrences of invertebrate or plant fossils.	PFYC Class 1 (Very Low) or Class 2 (Low)

The descriptions for the classes below are written to serve as guidelines rather than as strict definitions:

**Class 1 – Very Low.** Geologic units that are not likely to contain recognizable fossil remains.

- Units that are igneous or metamorphic, excluding reworked volcanic ash units.

- Units that are Precambrian in age or older.

The probability for impacting any fossils is negligible.

**Class 2 – Low.** Sedimentary geologic units that are not likely to contain vertebrate fossils or scientifically significant non-vertebrate fossils.

- Vertebrate or significant invertebrate or plant fossils not present or very rare.
- Units that are generally younger than 10,000 years before present.
- Recent aeolian (wind-blown) deposits.
- Sediments that exhibit significant physical and chemical changes (i.e., diagenetic alteration).

**Class 3 – Moderate or Unknown.** Fossiliferous sedimentary geologic units where the fossil content varies in significance, abundance, and predictable occurrence; or sedimentary units of unknown fossil potential.

- Often marine in origin with sporadic known occurrences of vertebrate fossils.
- Vertebrate fossils and scientifically significant invertebrate or plant fossils known to occur intermittently; predictability known to be low.
- Poorly studied and/or poorly documented. Potential yield cannot be assigned without ground reconnaissance.

**Class 3a – Moderate Potential.** Units are known to contain vertebrate fossils or scientifically significant non-vertebrate fossils, but these occurrences are widely scattered. Common invertebrate or plant fossils may be found in the area, and opportunities may exist for hobby collecting. The potential for a project to be sited on or impact a significant fossil locality is low, but is somewhat higher for common fossils.

**Class 3b – Unknown Potential.** Units exhibit geologic features and preservational conditions that suggest significant fossils could be present, but little information about the paleontological resources of the unit or the area is known. This may indicate the unit or area is poorly studied, and field surveys may uncover significant finds. The units in this Class may eventually be placed in another Class when sufficient survey and research is performed. The unknown potential of the units in this Class should be carefully considered when developing any mitigation or management actions.

**Class 4 – High.** Geologic units containing a high occurrence of significant fossils. Vertebrate fossils or scientifically significant invertebrate or plant fossils are known to occur and have been documented, but may vary in occurrence and predictability. Surface-disturbing activities may adversely affect paleontological resources in many cases.

**Class 4a** – Unit is exposed with little or no soil or vegetative cover. Outcrop areas are extensive with exposed bedrock areas often larger than two acres. Paleontological resources may be susceptible to adverse impacts from surface-disturbing actions. Illegal collecting activities may impact some areas.

**Class 4b** – These are areas underlain by geologic units with high potential but have lowered risks of human-caused adverse impacts and/or lowered risk of natural degradation due to moderating circumstances. The bedrock unit has high potential, but a protective layer of soil, thin alluvial material, or other conditions may lessen or prevent potential impacts to the bedrock resulting from the activity.

- Extensive soil or vegetative cover; bedrock exposures are limited or not expected to be impacted.
- Areas of exposed outcrop are smaller than two contiguous acres.
- Outcrops form cliffs of sufficient height and slope so that impacts are minimized by topographic conditions.
- Other characteristics are present that lower the vulnerability of both known and unidentified paleontological resources.

Class 4 and Class 5 units may be combined as Class 5 for broad applications, such as planning efforts or preliminary assessments, when geologic mapping at an appropriate scale is not available.

**Class 5 – Very High.** Highly fossiliferous geologic units that consistently and predictably produce vertebrate fossils or scientifically significant invertebrate or plant fossils, and that are at risk of human-caused adverse impacts or natural degradation.

**Class 5a** – Unit is exposed with little or no soil or vegetative cover. Outcrop areas are extensive with exposed bedrock areas often larger than two contiguous acres. Paleontological resources are highly susceptible to adverse impacts from surface-disturbing actions. Unit is frequently the focus of illegal collecting activities.

**Class 5b** – These are areas underlain by geologic units with very high potential but have lowered risks of human-caused adverse impacts and/or lowered risk of natural degradation due to moderating circumstances. The bedrock unit has very high potential, but a protective layer of soil, thin alluvial material, or other conditions may lessen or prevent potential impacts to the bedrock resulting from the activity.

- Extensive soil or vegetative cover; bedrock exposures are limited or not expected to be impacted.
- Areas of exposed outcrop are smaller than two contiguous acres.
- Outcrops form cliffs of sufficient height and slope so that impacts are minimized by topographic conditions.
- Other characteristics are present that lower the vulnerability of both known and unidentified paleontological resources.

Using data gathered from the Utah Geological Survey, this section identifies areas according to their potential to contain vertebrate fossils or noteworthy occurrences of invertebrate or plant fossils.

### 3.11.2.1 CLASS 4 AND 5 AREAS

For the purpose of this management plan, all vertebrate fossil localities were identified as to section, township, and range. Any section that contained one or more (maximum of 36) vertebrate fossil localities was identified as a Class 4 and 5 area. The total area (the sum of all sections containing one or more vertebrate or trace fossil locality) for Class 4 and 5 areas is approximately 147,062 acres. Fossil localities that lack specific geographic information were not considered.

### 3.11.2.2 CLASS 3 AREAS

Areas where geological units that yield vertebrate fossils or significant invertebrate or plant fossils elsewhere are identified as Class 3 areas for the purposes of this management plan. Outcrops of units such as the Morrison, Mesa Verde, Mancos, Moenkopi, Green River, Uintah, Wasatch, Chinle, and Navajo/Nugget Formations should be considered as Class 3 areas in the VPA. All of these units contain vertebrate fossils in other locations and may require further assessment where they are exposed in the VPA. Areas where these units are covered or obscured are not Class 3 areas. The total acreage included in sections in which vertebrate or other scientifically significant fossils may be expected to occur is approximately 1,173,741 acres. Although significant fossils have not yet been found in these areas, there is a high potential for their discovery. Fossil localities that lack specific geographic information were not considered.

### 3.11.2.3 CLASS 1 AND 2 AREAS

Class 1 and Class 2 areas are not known to contain any paleontological localities and do not appear (at this time) to have geological units likely to produce vertebrate fossils or noteworthy occurrences of invertebrate or plant fossils. Classes 1 and 2 areas make up approximately 446,946 acres of the VPA.<sup>2</sup>

## 3.12 RECREATION

### 3.12.1 REGIONAL OVERVIEW

The vast and varied landforms within the VPA accommodate many recreational uses. With two major rivers and several small mountain ranges, this area attracts recreational users from the Uinta Basin, as well as from western Colorado, Wyoming, Idaho, and Utah's heavily populated Wasatch Front. The VPA is valued for its wide range of outdoor activities including hunting and fishing, rafting and canoeing, hiking and camping, OHV use, horseback riding and mountain biking, and general recreation. The rise in recreation's popularity has presented challenges to managing outdoor recreation to accommodate demand, while ensuring the health of the resources that are essential to its existence.

The basic units of recreation management are the Special Recreation Management Area (SRMA) and the Extensive Recreation Management Area (ERMA). An SRMA is a designated area where

---

<sup>2</sup> Calculations for condition areas acreages do not include State, Tribal, or Private lands.

recreation is emphasized. Extensive Recreation Management Areas are areas where recreation is unstructured and dispersed, where minimal recreation-related investments are required, and have minimal regulatory constraints.

### **3.12.1.1 SPECIAL RECREATION MANAGEMENT AREAS (SRMAs)**

#### **3.12.1.1.1 BROWNS PARK SRMA**

The Browns Park SRMA encompasses the Green River below Flaming Gorge Dam (from the Ashley National Forest boundary to the Utah-Colorado state line) and is approximately 23 miles in length and one mile wide, with line-of-sight up to one-quarter mile of the river centerline. River recreation, camping, fishing, and sightseeing are the primary recreational opportunities in Browns Park. There is an increasing interest in OHV, hiking, cycling, and equestrian use. The John Jarvie Historic Ranch is located within the Browns Park SRMA and provides a historic recreation resource for the area. The ranch accommodates approximately 15,000 visitors each year and is considered a major attraction within the Diamond Mountain ERMA.

#### **3.12.1.1.2 PELICAN LAKE SRMA**

Unlike many of the more remote recreation resources in the Diamond Mountain ERMA, Pelican Lake is in close proximity to Vernal and is heavily used by the semi-urban population of the Uinta Basin. The most popular activities on Pelican Lake are boating and fishing. Management of the SRMA has become more challenging as the population in Vernal continues to increase, bringing with it greater numbers of users and more conflicts between different recreational activities.

#### **3.12.1.1.3 RED MOUNTAIN-DRY FORK**

The Red Mountain-Dry Fork SRMA lies approximately 12 miles northwest of Vernal and is open year-round. Access to the area is by paved road. The area is primarily used by OHV recreationists, hunters, campers, mountain bikers, and for general day use. Rock art is also present in the area.

#### **3.12.1.1.4 NINE MILE CANYON**

The Nine Mile Canyon SRMA is located at the southwest boundary of the VPA, and is a popular tourist destination. Noted as having the highest concentration of rock art sites in the U.S., services are available, but limited, within the canyon and camping is not allowed. Travel through the canyon is along a narrow, unpaved road suitable for most passenger and small recreational vehicles. Nine Mile Canyon is protected by the Antiquities Act, which prohibits excavations or acts that may injure or destroy any historic or prehistoric ruins, dwellings, or other structures.

### **3.12.1.2 EXTENSIVE RECREATION MANAGEMENT (ERMAs)**

The ERMAs are areas where dispersed recreation is encouraged and where visitors have recreational freedom-of-choice with minimal regulatory constraint. They are usually areas that

receive very little recreation use. These areas could include developed and primitive recreation sites with minimal facilities. Public recreation issues or management concerns are limited, and minimal management suffices in these areas. Detailed planning is not usually required for these areas. All areas within the VPA that are not part of a SRMA are included within the ERMA.

### **3.12.2 RECREATION TYPES**

#### **3.12.2.1 TRAILS**

In November 2001, the Institute of Outdoor Recreation and Tourism at Utah State University (USU) prepared an analysis of public sentiment towards trails with a statewide telephone survey. Results were compiled for the Uinta Basin sub-area. Results of the survey indicated the following:

- Hiking was the most mentioned activity.
- OHV riding was mentioned second.
- Horseback riding was mentioned third.
- Only 47% of trail users indicated they would support the use of additional public funds for motorized trails.
- Over 79% of trail users support the use of additional public funds for non-motorized trails.
- A clear majority of the general population believes that trails provide economic benefit for local communities.

Using the data collected through USU, the Governor's Initiative on Trails established a goal to increase trail facilities throughout Utah. A working group to help establish priority areas for trail development focused on three major trails in the Uinta Basin:

- Dry Fork Flume, a non-motorized trail approximately 19 miles long.
- Outlaw Adventure OHV Trail, a motorized trail approximately 47 miles long.
- Vernal Canals – several non-motorized trails constituting 47 miles of total trail length.

#### **3.12.2.2 OFF-HIGHWAY VEHICLES (OHVs)**

The number of OHVs used in the VPA has grown in the last 10 years. According to Utah State Parks and Recreation, the number of statewide permits issued between 1988 and 1998 has grown from 20,000 to 70,000. There has been a 294% increase in registration since 1997, and annually, 30% have been first-time buyers. As identified by the National Management Strategy for Motorized Off-Highway Vehicle Use on Public Lands, the growth of OHV use can be attributed to the following:

- Greater public interest in unconfined outdoor recreation opportunities.
- Rising disposable income, fostered by a healthy domestic economy, for use on recreational pursuits.

- Advances in vehicle technology that enabled motorized OHV users to reach previously inaccessible areas.
- The rapid growth of the West's cities and suburbs, whose expansion and population growth has brought Westerners closer to once-remote public lands.
- A population with an increasing median age with changing outdoor recreational interests.

Extensive research has been conducted over the last several years to attempt to designate certain areas as appropriate for OHV use. This process is a long-term, ongoing effort to ensure resource protection while allowing a variety of recreation opportunities.

Areas that receive the most OHV use within the VPA are day-use areas accessible by the Vernal population. Presently, the areas of highest OHV use are: 1) Buckskin Hills, north of the town of Vernal; 2) Jensen Hills; 3) the Raven Ridge area, which is south of the east Highway 40 and east of the old Bonanza Highway; and 4) the Glen Bench ATV area north of Fantasy Canyon (an unofficial designated site, where people are directed to go to minimize intensive use of other more sensitive areas). Major visual, soils/watershed, and vegetation degradation is occurring in some areas.

### **3.12.2.3 HUNTING AND WILDLIFE VIEWING**

Hunting and wildlife viewing are widespread throughout the VPA. Concentrated areas occur in the Book Cliffs ERMA and Pariette Wetlands. Big game hunting in the Book Cliffs and on Diamond Mountain is generally an extended recreational activity (5-12 days) because of the limited number of tags and the excellent hunting opportunities that the area provides. Public access to the Diamond Mountain public lands is limited because of private ownership.

### **3.12.2.4 SCENIC DRIVES**

Four popular scenic drives, including Scenic Byways and Backways and one Federal Highway Administration National Scenic Byway, are within the VPA, typically promoted by the Dinosaurland Travel Board. The four routes are Nine Mile, Jones Hole, and Browns Park Backways and the Flaming Gorge Drive through the Ages National Scenic Byway. Other scenic routes would include the Dinosaur National Monument Park Highway, the state park roads into both Red Fleet and Steinaker Reservoirs, the Book Cliff Divide Road, and the day-use area accessing the Ashley National Forest up Dry Fork Canyon.

### **3.12.2.5 RIVER RECREATION**

Two major rivers provide the resource for river recreation- the Green River, and the White River. Since the last BLM planning efforts (in 1985 for the Book Cliffs, and 1994 for Diamond Mountain), commercial river recreation clients and river user days have remained relatively constant, while casual use has been increasing by approximately 5% annually.

**3.12.2.5.1 THE GREEN RIVER**

Along the Green River, the BLM administers and collects fees for all of the commercial river permits in three major river sections: the Flaming Gorge Dam to Little Hole (Section A), Little Hole to Indian Crossing (Section B), and Indian Crossing to the Utah/Colorado state line (Section C). Permits are required for commercial boating, while boating for personal use from the Flaming Gorge Dam to the Dinosaur National Monument at Lodore Canyon does not require a permit. The bulk of commercial use, approximately 75 boats per day, occurs between the Flaming Gorge Dam and Little Hole (all of which is administered by the Ashley National Forest).

The most apparent conflict on the Green is between different recreational activities. It is not uncommon to have commercial and private rafts, single kayaks, and drift boats on the same stretch of river simultaneously floating past shore fisherman. The noise from larger groups on the rafts can interfere with the peace and solitude sought by the fishermen. Use along the shore is primarily by fishermen.

**3.12.2.5.2 THE WHITE RIVER**

The White River is also a major resource for commercial and non-commercial boating. Approximately 2,000 people visit this stretch of the White River each year. The most popular section of the White River is from the Bonanza Bridge to the Enron take-out, a distance of 32 river miles.

Several visual resources exist in this section of the White River, providing additional recreation opportunities. One of the recreational and visual resources along the river is the Goblin City Overlook, a lookout point approximately 800 feet above the White River. The view is primarily eastward through a series of high ridges, which have features resembling towers, spires, and turrets.

The confluence of the Green River and White River occurs within the boundary of the Uintah and Ouray Indian Reservation. The Reservation requires a permit for river use and for take-out through any of their property.

**3.12.2.6 BOATING/SWIMMING**

Although most reservoir recreation occurs on the state park facilities of Steinaker and Red Fleet Reservoirs, Pelican Lake also receives heavy use from boaters. Activities on Pelican Lake include motorized and non-motorized boating and picnicking. There is intense fishing for bluegill and bass, especially on spring weekends, and up to 70 boats may use the BLM boat ramp daily. Swimming in Pelican Lake is strongly discouraged due to the threat of bacterial and parasitic skin infections.

### **3.12.3 MANAGEMENT STRATEGIES**

Within the VPA, and nationally, OHV areas are designated as open, limited, or closed. An open designation allows intensive OHV use where there are no compelling resource protection needs, user conflicts, or public safety issues. An area designated as limited restricts OHV use to meet specific resource management objectives. Limitations may occur on number or type of vehicles, time and season of use, or specific roads. An area is designated as closed to protect resources, ensure visitor safety, or reduce user conflicts. Within the VPA there are 787,859 acres open to OHV use, 887,275 acres that are limited, and 50,388 acres that are closed (see Figure 37 in the Maps section).

## **3.13 RIPARIAN AND WETLAND RESOURCES**

Riparian areas and wetlands are considered some of the most diverse and productive portions of the VPA, but on the landscape level riparian areas and wetlands typically compose less than 1% of the total land area. Benefits from these areas are essential to both human and wildlife values. The lifecycles of most mammals, birds, amphibians, and fishes rely partially or wholly on riparian and wetland areas. Sensitive species such as the Ute ladies'-tresses, Bald Eagles, and Western Yellow-billed Cuckoos have their primary habitat in riparian areas. Additionally, these areas provide recreational, scenic, livestock production, and hunting areas for humans. Often, riparian and wetland resources are among the first landscape features to show impacts from management activities and often reflect overall watershed condition.

### **3.13.1 REGIONAL OVERVIEW**

Approximately 16,000 acres of riparian zones are found along the Green and White Rivers and Bitter, Evacuation, Sweetwater, and Willow Creeks in the Book Cliffs portion of the VPA. As of 1982, 470 acres of riparian zones in the Book Cliffs portion of the VPA were identified as being in poor ecological condition (BLM 1984). However, current riparian conditions within the Book Cliffs are being assessed, and riparian conditions could have changed since the 1984 riparian/wetland assessment (see 3.11.2 below). The Diamond Mountain portion of the VPA contains 60,300 acres of riparian lands (2% of the inventoried lands), with 15,650 acres of the 60,300 acres in public lands. There are 540 miles of perennial and intermittent streams in the VPA (BLM 1993b). The BLM manages its riparian zones for multiple uses, including recreation, grazing, wildlife habitat, and other uses.

Wetlands in the study area are primarily adjacent to riparian zones and reservoirs. Additionally, several constructed water impoundments, the Pariette Wetlands, Bitter Creek Marsh, and springs are found in the VPA. The Pariette Wetlands have the largest contiguous area of wetlands in the VPA, and they are the largest waterfowl management area managed by the BLM in Utah. Specifically, the Pariette Wetlands area encompasses approximately 9,033 acres, 2,529 acres of which have riparian-wetland characteristics. The Pariette Wetlands riparian areas are situated along 7 miles of Pariette Draw, approximately 24 miles southwest of Vernal. Wetlands are divided between 20 ponds and impoundments that are regulated for waterfowl and migratory bird habitat. Bitter Creek contains vital riparian zones with box elders, aspens, willows, and sedges which support a variety of life including reptiles, amphibians, and waterfowl. The streams

and adjacent cliffs provide habitat for birds including Peregrine Falcons and Golden Eagles and provide prime calving grounds for elk and habitat for deer.

### **3.13.2 RIPARIAN AND WETLAND INVENTORY**

The Vernal Field Office has prepared a preliminary inventory of riparian and wetland resources within the VPA, although, as of October 2003, a comprehensive assessment of riparian condition has yet to be conducted by a full ID Team. As identified in the preliminary riparian inventory there are 295 miles and 3,674 acres of riparian areas currently in proper functioning condition, 133 miles and 1,452 acres functioning at risk, and 79 miles and 1,213 acres that are not in properly functioning condition. These are preliminary numbers and they may change as the inventory is completed. Figure 5 Forage (see Maps section) displays the coverage of riparian and wetland inventory data within the VPA. Functioning condition is divided into three classes: properly functioning condition (PFC), functioning at risk (FAR), and non-functioning (NF). (See Glossary for definitions).

## **3.14 SOCIOECONOMICS**

### **3.14.1 REGIONAL OVERVIEW**

This section describes the current social and economic setting, trends, conditions, and characteristics for Uintah, Duchesne, and Daggett Counties in northeastern Utah (Table 3.14.1). It will serve as a baseline for future resource management by the Vernal Field Office.

Along with much of the rest of Utah, Daggett, Duchesne, and Uintah Counties have grown in population and economic vitality over the years. These counties are populated by citizens who place a high value on living in rural and small-town environments and want to keep that identity. However, they also want to be prosperous and to live in prosperous communities. As prosperity is a common desire among members of each community, it is predicted that the economies and populations of these three counties will continue to grow indefinitely.

There are a number of similarities between Daggett, Duchesne, and Uintah Counties. The driving time from each of the three county seats to the political and economic capital of the state, Salt Lake City, is approximately 2-3 hours. Each of the counties has a distinctly rural culture and strong attitudes regarding the importance of farming and ranching in their culture. Each of the counties has an abundance of topographic scenic beauty that draws large numbers of visitors. All three counties have vast expanses of BLM and USFS land within them.

State and federal land (including the Uintah and Ouray Indian Reservation) in the three counties, managed by state and federal officials and Reservation authorities, ranges from 72% in Duchesne to 81% in Uintah to 89% in Daggett. The leadership of all three counties regards most of this land as part of their economic base.

Although the political leadership in each of the three counties knows and trusts the others, they are each highly independent. "One size" responses to the three counties from any government or

private entity seeking to engage in a region-wide project will not necessarily "fit all." There is only one all-weather road (SR 44 and US 191) from the Daggett County seat, Manila, to anywhere in Uintah and Duchesne Counties. (It is a 1.5-hour drive to Vernal and a 2.5-hour drive to the City of Duchesne.) In the winter, because that road goes over the Uinta Mountains, travel time and hazard can be increased considerably. Because of the road's location on the north slope of the Uinta Mountains and its limited access, in some ways, Daggett County residents feel more socially and economically connected to the Rock Springs, Wyoming area than they do to any area of Utah.

Uintah and Duchesne Counties have large portions of the Uintah and Ouray Indian Reservation within their boundaries, and they both work collaboratively with Reservation authorities on matters of mutual interest. Oil and natural gas is a significant portion of the economy in these two counties, particularly in Uintah County. Although Daggett County has no Native American lands and produces less oil and gas, it is the site for transportation and pipeline corridors that deliver gas and electricity to markets. Thus, the energy sector plays a different but equally important role. Daggett County also has the single largest tourist/recreation attraction of the three counties: Flaming Gorge National Recreation Area, which draws more than a million visitors a year. Uintah County is much larger in population (25,224) and economy (\$229.5 million total non-farm wages annually) than either Duchesne County (population 14,371; \$113.3 million total non-farm wages annually) or Daggett County (population 921; \$10.8 million total non-farm wages). Daggett County's tax base is so small that it has difficulty meeting all the responsibilities and expectations of a contemporary county.

**Table 3.14.1. County Comparisons**

County	Population 2000	Land Area	Percent BLM Land	Largest Industry
Daggett	921	459,553 acres	80.6	Government Services/Tourism
Duchesne	14,371	2.1 million acres	46.6	Government Services/Retail Trade
Uintah	25,224	2.9 million acres	46.1	Oil Gas and Mining/Government Services

To best understand the relationship between socioeconomics and planning for the Vernal Field Office, the social, economic, and governmental settings are discussed for each county. From these specific discussions, region-wide conclusions about the socioeconomic factors in the VPA can be drawn.

A statewide social survey was conducted by Utah State University (USU) in 2007 to assess the ways in which Utah residents use and value public land resources and their views about public lands management. A complete analysis of the results had not been finished as of February, 2008. "Public lands," as described in the study, consist of all federal and state managed lands, and not only BLM lands. Surveys were mailed to a random sample of residents of all 29 Utah counties. According to the authors, the study and sample sizes are designed to produce results generalizable at the state-wide level, with generalization increasingly risky as the sample area diminishes. The areas sampled do not necessarily coincide with field office planning area boundaries, as that was not the focus of the study. Nonetheless, the study provides current and

interesting results not available elsewhere, and shows the dependence of local communities on public lands for a variety of economic and recreational pursuits. Appendix XX (USU Public Lands Study) contains initial summary results for Uintah, Duchesne and Daggett Counties lying within the Vernal Field office. Where appropriate, study results are incorporated within the discussion of individual resources in Chapter 4. There is nothing in the preliminary USU results that affect the formulation of alternatives in Chapter 2 or the analysis of impacts in Chapter 4.

### 3.14.2 UINTAH COUNTY

#### 3.14.2.1 SOCIAL CHARACTERISTICS

Uintah County has experienced continuous population growth since the early 1900s (Table 3.14.2). Moderate growth is anticipated to continue into the next decade, as shown in the table below. The major communities include the county seat Vernal, Naples, and Ballard. Approximately 7,700 (or 31%) of Uintah County residents live in Vernal and 1,300 (or 5%) live in Naples. The largest number 15,644 (or 62%) live in unincorporated areas of the county. Most Uintah County residents live on farms, ranches, and unincorporated communities, many of which are tribal communities.

**Table 3.14.2. Population Growth by Area, Past, Present, and Projected**

Area	1990	2000	2020
Ballard Town	644	566	1,017
Naples City	1,334	1,300	1,718
Uintah County	22,211	25,224	29,058
Unincorporated Uintah County	13,589	15,644	18,495
Vernal City	6,644	7,714	8,341

Source: Utah Governor's Office of Planning and Budget (GOPB), 2000 Census, U.S. Census Bureau

Uintah County covers a land area of 4,477 square miles and, at 5.6 residents per square mile, is one of the least densely populated counties in the state. Approximately 10.3% of Uintah County residents are American Indian. Eighty percent of the households in Uintah County are family households, and 44.5% have children less than 18 years of age. Average household size in Uintah County, at 3.05 persons per household, is slightly smaller than the state average, at 3.13 persons per household. Approximately 65% of Uintah County residents are 18 years of age or older and 10% are 65 years plus (U.S. Census 2000).

Schools are an important component of the social setting in a community, indicating trends of the youthful population. Approximately 5,940 children are in the Uintah School District, and enrollment in Uintah schools has been steadily declining. Between 1997 and 2002, student population dropped from 6,445 to 5,938. The Vernal campus of Utah State University and the Uintah Basin Applied Technology College provide higher education opportunities to Vernal and Uintah County.

The residents of Uintah County value the rural character and quiet lifestyle that comprises their communities. The historical land-use practices including farming, ranching, and natural resource development that shaped the culture of the area serve as the foundation for today's rural community. While the initial Uinta Basin settlements were founded primarily upon agricultural practices, mining also helped establish communities in the basin. By the mid-1850s farmers and ranchers were growing wheat, vegetables, and fruit and grazing cattle in the basin and miners were extracting gold, copper, and gilsonite (Burton 1996). The agricultural and mining industries assisted in the formation of the local communities within the Uinta Basin and the historical practices still occur on the land today.

Many local residents are intimately connected to the traditional land-use practices that shaped the culture of the Uinta Basin. Today, citizens identify with the rural, small town sense-of-place that has been present in their communities for over a century. While residents of the County support growth and development, it must complement the current quality of life and values held by the citizens. According to the Uintah County General Plan Update, residents value the County's progressive, diverse, friendly, safe, rural and comfortable atmosphere.

### **3.14.2.2 ECONOMIC CHARACTERISTICS**

#### **3.14.2.2.1 EMPLOYMENT**

Uintah County has experienced significant changes in its employment base in the past 50 years (Table 3.14.3). Initially, agriculture-related activities such as ranching and farming dominated the economy. Then, during the second half of the twentieth century, the development of oil and gas reserves provided a major contribution to growth. Now, retail trade, private services, and government services together provide a significant contribution to the county's economy. This evolution in employment base demonstrates Uintah County's shift from an agrarian economy to that of oil and gas, services to support oil and gas, and the boom in public land industries.

Service-based employment contributes to the job base in the area. Almost two-thirds of Uintah County employees work in retail trade, private services, or government services. While the table below shows a high number of retail, service and government jobs, it should be noted that many of these jobs are in support of the oil, gas, and mining industry. A recent University of Utah Study commissioned by the Governor's Office concluded that 49.5% of all employment in the Uinta Basin (Uintah and Duchesne Counties) was directly or indirectly attributable to the oil and gas industry (page 21). This effect is presumably greater in Uintah than in Duchesne or Daggett Counties (State of Utah 2007).

The average annual non-farm wage in Uintah County was \$28,392 in 2003. Out of the top 35 employers in Uintah County, 13 are related to oil, gas and mining, 10 are government service employers, and 7 are retail employers. Unemployment in Uintah County was 6.1% in 2003, slightly higher than the state rate (approximately 5.6%).

**Table 3.14.3. Uintah County Labor Force Statistics**

	2000	2001	2002	2003
Construction	414	414	503	551
Ed/Health/Soc Svs	654	678	763	821
Financial Activities	283	274	309	323
Government	2,526	2,531	2,587	2,590
Information	104	115	120	133
Labor Force	11,029	11,707	12,563	13,013

Other Services	240	269	258	282
Profess/Business Svcs	504	508	483	466
Trade/Trans/Utilities	2,010	2,182	2,172	2,190

Source: Utah Department of Workforce Services

Per capita annual income in Uintah County was \$ 19,396 in 2003, lower than the state average of \$24,639. The median household income in Uintah County was \$42,422 in 2003. The national threshold for poverty in 2000 was an annual household income of \$14,269. Nationally, 11.3% of the population fell below the poverty line in 2000 (U.S. Census Bureau 2001). Approximately 14.5% of all residents of Uintah County fall below the federal poverty line; only San Juan County (26.4%) and Duchesne County (15%) have a higher percentage of the population below the poverty line. The average for the state of Utah is 8% (Utah Department of Workforce Services - Workforce Information, May 2001).

### 3.14.2.2.2 AGRICULTURE

Agriculture has historically been a big part of the identity of the people of Uintah County. The Utah Department of Agriculture reports 908 farms in Uintah County in 2002. Livestock is the county's largest source of cash receipts, with \$26.2 million in 2002 for livestock and livestock products. Crops produced \$3.3 million in cash receipts. The total amount of land used for agriculture includes 33,136 acres of harvested cropland and 60,838 acres of irrigated land (Utah Agricultural Statistics 2002). Uintah County officials indicate that although agriculture is a major part of the economy, to survive, many farmers and ranchers have full-time jobs and use agriculture only to supplement their livelihood and to maintain a close family tradition. Agriculture is very dependant upon BLM land access for grazing rights and other use. Grazing is discussed in detail in the VPA Analysis of Management Situation and in numerous sections of the VPA RMP.

**3.14.2.2.3 MINERAL RESOURCES**

The Department of the Interior's Mineral Management Service identifies fluid and non-fluid mineral resources in Uintah County. The non-fluid mineral resources explored in Uintah County include phosphate, gilsonite, oil shale, and other minerals. Fluid mineral resource activities include oil production, natural gas exploration and related mineral exploration. Among the resources, the highest revenue generator in the county is natural gas; the industry in Uintah County generated over \$30 million in federal Royalties in 2001. The most significant fluid mineral resource relative to contribution to state totals is oil production. Oil and gas production in 2001 represented 21% and 32% of the state totals, respectively. Table 3.14.4 shows the federal royalty values generated in 1998 and 2001 by Uintah County, and the following figure shows the amount of oil and gas production in Uintah County from 1991 to 2001. Note that number in parenthesis may reflect adjustments from the prior fiscal year.

It is also important to note that the amount of revenue generated in Uintah and Duchesne Counties does not remain in the counties. The total revenue is allocated to the federal government (Minerals Management Service). Of the total 10% pays administrative fees, 45% is allocated to the federal government (into Reclamation and General Funds), 45% is paid to the state, and the state then redistributes 40% of the royalty back to the county of origin (BLM 2005). The majority of the balance is used to fund other local projects, such as water projects of recreation facilities. Based on this formula, approximately \$16 million of the total amount of royalties in 2001 was redistributed to the Uintah County (BLM 2005).

**Table 3.14.4. Federal Royalty Values Generated, 1998 and 2001**

	<b>1998</b>	<b>2001</b>
Bonus	\$741,035.25	\$132,170.00
Gas	10,904,135.48	30,314,562.60
Gas Plant Products	(13,007.10)	15,561.81
Gilsonite	179,696.71	254,742.99
Oil	2,451,527.92	2,847,820.40
Other Revenues	561,542.36	1,178,669.68
Rent	722,936.93	854,674.40
Total	15,547,867.55	35,598,183.88

Source: Minerals Management Revenue Service, 2001

Oil and gas production in the state of Utah is impacted by the U.S. and world prices of oil and gas. As those prices rise and fall, oil and gas production in Utah also rises and falls. According to the Energy Information Administration, the average wellhead price for gas in Utah was approximately \$7.28 per MCF (thousand cubic feet). The average wellhead price for oil was \$60.78 per barrel (Energy Information Administration 2006).

In 2003 Uintah County Collected approximately \$19.5 million in total, local, centrally assessed and fee in lieu property taxes and approximately \$4.3 million or 22% of the total was oil and gas extraction property taxes (BLM 2005)

Population growth rates in Uintah County have fluctuated with the boom and bust cycle of fluid and non-fluid mineral resources. For example, the population of the county grew by 64% between 1970 and 1980, following a boom in the industry. The growth rate fell to approximately 9% between 1980 and 1990, as the industry declined. The boom and bust cycle is also evident in other sectors of the local economy. Typically during a boom cycle, retail trade and service industries are strong. These industries suffer when production is low.

**Figure 3.14.1. Uintah County Oil and Gas Production, 1999–2004.** Source: Utah State Division of Oil, Gas and Mining, Department of Natural Resources 2004.

**3.14.2.2.4 TOURISM AND RECREATION**

Recreation is an important component in the quality of life for Uinta Basin residents. In addition to providing recreation opportunity in close proximity to their homes, these residents enjoy a healthy tax base drawn from tourism. Visitors to the Uinta Basin participate in a variety of recreational opportunities including sightseeing, camping, hiking, hunting, mountain biking, fishing, boating, and OHV use. While some of these activities can be engaged in year-round, the busiest months for recreation in the Uinta Basin are the summer months.

Several indicators help detect and explain the impact of the tourism and recreation industries on the local area: job base provided by the tourism industry, traveler spending, and regional visitation. According to the Utah Division of Travel Development, travel and tourism related jobs in Uintah County decreased 2.0% in 2003, down from 1,661 in 2002 to 1,628. Traveler spending in Uintah County was estimated to be \$72.6 million per in 2003; a 40.7% increase from 2002 (Table 3.14.5). Traveler spending grew steadily from the early 1990s to 2002 and then surged to over \$72 million in 2003. The significant jump in travel-related spending is anticipated to be the result of increased oil and gas development in the Uinta Basin (Johnson 2006). This inference could be drawn from the fact that regional visitation counts to popular tourist destinations in the area did not show comparable increases. For example, visitation to Dinosaur National Monument, for which Vernal serves as a gateway has declined from over 360,000 visits in 2005 to approximately 230,000 visits in 2007. The 36% drop in visitation over a two year period could be partially attributed to the closing of the quarry within the Monument. In addition, visitation trends to the Flaming Gorge Area have also decreased in recent years (1999 - 2003) by 29%. This data supports that the recent increases in "traveler spending" are less likely attributed to recreation and tourism and more likely to be from services related to the oil and gas industry.

Estimated local tax revenues from traveler spending also increased significantly in 2003. Uintah County experienced a 40.7% increase in local tax revenues from traveler spending in comparison to 2002, up from \$1.08 million to \$1.5 million. In 2003, Uintah County also ranked eighth in the state from local tax revenues from traveler spending. The State of Utah saw a 19.4% increase in state and local tax revenues from traveler spending at \$444 million up from \$372 million in 2002. However, local tax revenues decreased 1.0% in 2003. Spending by travelers for the State of Utah was \$4.6 billion, down 1.3% from 2002 (Utah Division of Travel Development 2004).

**Table 3.14.5. Uintah County Travel-related Spending in 2003**

	<b>Traveler Spending</b>	<b>% Change from 2002</b>	<b>Tax Revenue in Traveler Spending</b>	<b>% Change from 2002</b>
State of Utah	\$4,631,000,000	-1.3	\$444,000,000*	19.4
Uintah County	\$72,600,000	40.7	\$1,519,500	40.7

\*Represents state and local tax revenues from the entire state

Source: Utah Division of Travel Development 2004

Traveler spending and tax revenue includes all visits to the area, whether for recreation, business, or other purposes. While it is a valuable measure for visitation to Uintah County, it does not only

reflect tourism visits. It should be noted that a portion of the tourism related tax dollars, such as transient room tax and restaurant tax, comes from oil and gas development related services (lodging, food, and other services for mining sector employees). While it is nearly impossible to extract whether a tourist dollar was generated from a tourist or a temporary mining employee, both are beneficial to the retail and service sectors of the local economy. A decrease in temporary oil and gas-related jobs may lead to a decrease in "tourism-related" revenue for the county. On the other hand, a decrease in oil and gas-related jobs could lead to an increase in actual tourism-related revenue.

While travel related employment, spending, and local tax revenue do bring increased revenue to Uintah County, the county has indicated additional stress on infrastructure because of growing travelers. Visitors to the area may recreate on BLM property but also depend on the cities and counties for the provision of basic services, such as law enforcement and emergency fire and health services. The county has stated that the burden of infrastructure improvements should be shared with the BLM.

### **3.14.2.3 GOVERNMENT SETTING**

A community's ability to support and pay for necessary public services is based on both the tax base within the community and the portion of that tax base that may be subject to economic change. This analysis of county finance is intended to be used to evaluate public policy decisions as well as the county's future ability to support and pay for necessary public services. Public services are the single largest expense of the county (35%), with public welfare the second large expense (18%; Uintah County 2000).

Uintah County draws its revenues from a wide range of sources, which would seem to protect it against a downturn in any one or a few areas. Because by law mineral lease payments cannot be reflected as county revenue, it is important to note the structure of these lease payments. These funds are not paid to the County directly and therefore do not show up in the general fund. Instead, a special service district administers these funds for use for transportation, roads, recreation and parks, and other items in Uintah County. This income is vital to the local economy.

Local governments such as Uintah County are normally supported by taxes. However, when a local government (such as Uintah County) contains vast expanses of federally owned land, taxes are not collected on that land. The Payments in Lieu of Taxes Act (PILT) provides for payments to local units of government containing certain federally owned lands (such as Uintah County) to assist in financing operations of that local government. Payments may be used by the counties for any governmental purpose. The total PILT payment to Uintah County in 2000 was \$685,850. In 2003, this value rose to a high of just under \$1.2 million. ([www.blm.gov/PILT](http://www.blm.gov/PILT)).

**3.14.3 DUCHESNE COUNTY****3.14.3.1 SOCIAL CHARACTERISTICS**

From 1995 to the present, the population of Duchesne County has grown steadily, along with the growth of Utah, to peak at 14,371. Moderate growth is anticipated to continue into the next decade. The Census Bureau predicts approximately 2,383 new residents by 2020 (U.S. Census 2000).

Approximately 4,300 (or 30%) of Duchesne County residents live in Roosevelt; 1,408 (or 10%) live in Duchesne; 539 live in Myton; 178 live in Altamont; and 149 live in Tabiona. The balance (54%) live in the unincorporated areas of the county (U.S. Census 2000). The majority of residents of Duchesne County live on farms and ranches and in unincorporated communities, many of which are Tribal communities on the Uintah and Ouray Reservation.

**Table 3.14.6. Duchesne County Population, Past, Present, and Projected**

	1990	2000	2020
Altamont	178	197	247
Duchesne	1,408	1,497	1,878
Myton	539	525	659
Roosevelt	4,299	4,325	5,427
Tabiona	149	138	174
Unincorporated Duchesne County	6,027	7,831	9,832
<b>Total</b>	<b>12,600</b>	<b>14,518</b>	<b>18,216</b>

Source: 2000 Census, U.S. Census Bureau

Average household size, at 3.11 persons per household, is virtually the same as the average for the state, at 3.13 persons per household. Only 7.3% of households have individuals aged 65 years and over, suggesting that the population of Duchesne County is young in comparison to the rest of Utah (U.S. Census 2000).

Of the 6,988 housing units, 4,559, or 65.2%, are occupied. Over one quarter (26.4%) of the housing stock in Duchesne County is for seasonal, recreational, or occasional use, which is defined by the owners having a primary residence elsewhere. Most (81%) of occupied housing is owner occupied (U.S. 2000).

The Duchesne County School District is a small rural school district with 4,100 students in thirteen schools, which are in six rural communities of the county. There are six elementary schools, three high schools, one junior high school, one K-12 school, and two special schools.

The residents of Duchesne County value the rural character and quiet lifestyle that comprises their communities. The historical land-use practices including farming, ranching, and natural resource development that shaped the culture of the area serve as the foundation for today's rural

community. The practices still occur on the land today and many residents are intimately connected to the traditional agricultural lifestyle. County citizens identify with the rural, small town sense-of-place that has been ever-present throughout the area. While residents of the County support growth and development, it must complement the current quality of life and values held by the citizens. According to the Duchesne County General Plan, residents value the County's "small town" qualities, exiting moral climate, low crime rates, and "neighborly" atmosphere.

### 3.14.3.1.1 UINTAH AND OURAY RESERVATION

The Uintah and Ouray Reservation is located within the Uinta Basin, covering a large portion of western Uintah and eastern Duchesne Counties. Ownership is a mixture of federal lands, fee lands, Indian Trust lands, and state of Utah lands. The Ute tribe has ownership of almost 1/4 of the total land area of the Uinta Basin. Oil and gas production from this land represents 1/4 of the oil and gas produced in Uintah County.

According to the Tribe's Department of Vital Statistics, the enrolled membership in the Ute Tribe is 3,120 members, up from 2,500 members in 1980. The population is projected to reach approximately 4,600 by 2010. Approximately 85% of the members of the Ute Tribe live within the boundaries of the Reservation (Bureau of Indian Affairs 2002). The median household income within the Reservation is significantly lower than in the national, state, or county median household income.

**Table 3.14.7. Median Household Income**

Region	Median Income
Duchesne County	26,491
State of Utah	31,417
United States	35,989
Ute Indian Tribe	14,500

Source: U.S. Bureau of Indian Affairs, 2002

Over 30% of the Ute population falls into the very low-income category. The Housing Authority indicates that many families are awaiting affordable housing (Bureau of Indian Affairs 2002).

### 3.14.3.2 ECONOMIC CHARACTERISTICS

#### 3.14.3.2.1 EMPLOYMENT

Duchesne County has experienced significant changes in its employment base in the past 50 years. Instead of the dominance of the traditional agrarian economy, trade, public employment, and private services together represent 55% of the jobs. The average annual non-farm wage in Duchesne County is \$23,769. The average annual non-farm wage in Duchesne County is \$28,392 in 2003. The table below shows the distribution of jobs in the county.

**Table 3.14.8. Duchesne County Labor Force Statistics**

	2000	2001	2002	2003
Construction	311	383	367	374
Ed/Health/Soc. Services	304	421	423	460
Finance/Ins./Real Estate	120	132	129	138
Government	1,538	1,533	1,585	1,658
Information	111	141	166	170
Labor Force	5,881	6,280	6,381	6,381
Leisure /Hospitality	322	293	330	310
Manufacturing	130	128	124	116
Mining – Includes oil and gas employment	517	633	616	451
Non Farm Jobs	4,764	5,126	5,192	5,049
Other Services	120	134	159	150
Prof./ Business Services	138	146	134	142
Trade/Trans./Utilities	1,159	1,182	1,159	1,080

Source: Department of Workforce Services

Unemployment in Duchesne County is consistently higher than the state's, at 6.8% in 2003. Almost one third of Duchesne County employees receive unemployment compensation. This can be attributed to the high Native American population and the very low median income of this population. Although per capita annual income in Duchesne County has grown from \$8,197 to \$12,326 in the past ten years, it is still considerably less than that of the state (\$18,185). The median household income for Duchesne County in 2000 was \$21,298 (U.S. Census 2000).

Poverty is determined as households below an annual income of \$14,269 (U.S. Census 2000). Duchesne County has the second highest percentage of persons below the poverty line (the highest being San Juan County). Of the total Duchesne County population in 1999 (14,381), 2,178 households (or 15%) reported an income below the poverty line. Nationally, only 11.3% of the population falls below the poverty line.

### **3.14.3.2.2 AGRICULTURE**

The Utah Department of Agriculture reports 932 farms in Duchesne County, with 1,304,716 acres of land being farmed. Livestock is the county's largest source of cash receipts, with a contribution of \$32.5 million for livestock and livestock products and \$7.7 million for crops. Duchesne County has 50,093 acres of harvested cropland and 94,723 acres of irrigated land (Utah Agricultural Statistics 2001).

**3.14.3.2.3 MINERAL RESOURCES**

The Department of the Interior's Mineral Management Service identifies gas and oil as mineral resources in Duchesne County. Fluid mineral resource activities include oil production, natural gas exploration, and related mineral exploration. The highest revenue-generator in the county of the resources is oil, generating over 2.8 million in federal royalties in 2001. Both oil and natural gas combined for 90% of the federal Royalty Values generated by Duchesne County in 2001. The following table shows the federal royalty values generated for 1998 and 2001 in Duchesne County. Note that numbers in parenthesis may represent prior fiscal year adjustments, or deductions from net receipts sharing. See Figure 3.14.2 for production amounts of oil and gas development in Duchesne County. The amount of royalty revenue redistributed to Duchesne County in 2001 was approximately \$2 million (BLM, 2005).

**Table 3.14.9. Federal Royalty Values Generated, 1998 and 2001**

	<b>1998</b>	<b>2001</b>
Bonus	\$196,264.25	\$51,899.50
Gas	890,672.63	1,290,578.68
Oil	2,040,988.31	2,863,660.72
Other Revenues	(34,556.54)	46,386.40
Rent	193,291.90	323,018.46
Total	3,288,834.46	4,575,543.76

Source: Minerals Management Revenue Service, 2001

Figure 3.14.2 Duchesne County Oil and Gas Production 1994-2004. Source: Utah State Division of Oil, Gas and Mining, Department of Natural Resources 2004.

Oil and gas production in the state of Utah is impacted by the U.S. and world prices of oil and gas. As those prices rise and fall, oil and gas production in Utah also rises and falls. According to the Energy Information Administration, the average wellhead price for gas in Utah was approximately \$7.28 per MCF (thousand cubic feet). The average wellhead price for oil was \$60.78 per barrel (Energy Information Administration 2006). In 2001, wells in Duchesne County produced approximately 5 million barrels of oil and approximately 14 million MCF (cubic thousand feet) of gas. These numbers were lower than in 1990, when approximately 7 million barrels of oil and 20 million MCF of gas were produced. Oil and gas production in 2001 represented 32.65% and 4.60% of the state totals, respectively.

#### **3.14.3.2.4 TOURISM AND RECREATION**

Recreation is an important component in the quality of life for Uinta Basin residents. In addition to providing recreation opportunity in close proximity to their homes, these residents enjoy a healthy tax base drawn from tourism. Visitors to the Uinta Basin participate in a variety of recreational opportunities including sightseeing, camping, hiking, hunting, mountain biking, fishing, boating, and OHV use. While some of these activities can be engaged in year-round, the busiest months for recreation in the Uinta Basin are the summer months.

Several indicators help detect and explain the impact of the tourism and recreation industries on the local area: job base provided by the tourism industry, traveler spending, and regional visitation. According to the Utah Division of Travel Development, travel and tourism related jobs in Duchesne County decreased 3.1% in 2003 down from 717 in 2002 to 695. Traveler spending in Duchesne County was estimated to be \$21.8 million per in 2003; a 0.9% decrease from 2002 (Table 3.14.10). Traveler spending has grown steadily since the early 1990s to 2000 where it peaked at \$26.3. Dollars spent by travelers in the County has since decreased to \$21.8 in 2003. In 2003, Duchesne County ranked 19th in the state for travel related spending and contributed 0.5% to statewide tourism spending.

Estimated local tax revenues from traveler spending decreased slightly in 2003. Duchesne County experienced a 1.1% decrease in local tax revenues from traveler spending in comparison to 2002, down from \$461,400 to \$456,200. In 2003, Duchesne County also ranked 19th in the state from local tax revenues from traveler spending. The State of Utah saw a 19.4% increase in state and local tax revenues from traveler spending at \$444 million up from \$372 million in 2002. However, local tax revenues decreased 1.0% in 2003. Spending by travelers for the State of Utah was \$4.6 billion, down 1.3% from 2002 (Utah Division of Travel Development 2004).

Although not traditionally an indicator of overall traveler spending, data on restaurant sales have been gathered for purposes of understanding cumulative effects of tourism spending. Restaurant sales are estimated at \$6.0 million per year in Duchesne County.

**Table 3.14.10. Duchesne County Travel-related Spending in 2003**

	<b>Traveler Spending</b>	<b>% Change from 2002</b>	<b>Tax Revenue in Traveler Spending</b>	<b>% Change from 2002</b>
Duchesne County	\$21,800,000	-0.9	\$456,200	-1.1
State of Utah	\$4,631,000,000	-1.3	\$444,000,000*	19.4

\*Represents state and local tax revenues from the entire state

Source: Utah Division of Travel Development 2004

Traveler spending includes all visits to the area, whether for recreation, business, or other purposes. While it is a valuable measure for visitation to Daggett County, it does not only reflect tourism visits. It should be noted that a portion of the tourism related tax dollars, such as transient room tax and restaurant tax, could come from oil and gas development related services (lodging, food, and other services for mining sector employees). While it is nearly impossible to extract whether a tourist dollar was generated from a tourist or a temporary mining employee, both are beneficial to the retail and service sectors of the local economy. A decrease in temporary oil and gas-related jobs may lead to a decrease in "tourism-related" revenue for the county. On the other hand, a decrease in oil and gas-related jobs could lead to an increase in actual tourism-related revenue.

While travel related employment, spending, and local tax revenue do bring increased revenue to Duchesne County, the county has indicated additional stress on infrastructure because of growing travelers. Visitors to the area may recreate on BLM property but also depend on the cities and counties for the provision of basic services, such as law enforcement and emergency fire and health services. The county has stated that the burden of infrastructure improvements should be shared with the BLM.

### **3.14.3.3 GOVERNMENT SETTING**

The majority of revenue for Duchesne County comes from charges for services (26%), property taxes (21%) and intergovernmental agreements (18%). The remainder comes from federal and state grants (11%), general sales (9%), fee in lieu (7%), and interest (5%). Duchesne County spends the majority of its income on public safety (35%), streets and highways (22%), and general government (15%). Other expenses include land purchases (9%), community development (6%), and parks, recreation, and culture (3%). The total PILT payment to Duchesne County in 2000 was \$425,557. This number rose to approximately \$750,000 in 2003 ([www.blm.gov/PILT](http://www.blm.gov/PILT)).

## **3.14.4 DAGGETT COUNTY**

### **3.14.4.1 SOCIAL CHARACTERISTICS**

Daggett County is the third smallest county in the state of Utah, with a land area of 698 square miles, or 459,553 acres. Of this land area, 88.8% is owned and managed by the federal and state governments.

Daggett County is one of the least densely populated counties in the state, at 1.32 people per square mile. The Daggett County population in 2000 was 921. This is an increase of 231 persons over the 1990 population of 690 (or a 33.5% increase). Daggett County's population has fluctuated over the years but has shown overall growth from the time it was organized in a split from Uintah County in 1918. Its population varied from 400 in 1920 to a peak of 1,164 in 1960 (related to dam construction). From 1970 to 1990 it was stable, at 600-700 persons. Although population spiked by 33% in 2000 due to construction, moderate growth is anticipated to continue into the next decade, as Daggett County adds approximately 170 new residents by 2020. Births have generally equaled deaths in the county, and all historic growth has come from net in-migration (U.S. Census 2000).

Manila, the county seat and the only incorporated community in the county, has a residential population of 308 persons (or 33% of the county's population). The balance, well over half of all the residents of Daggett County, live on farms and ranches or in unincorporated communities. The 2000 Decennial Census divided Daggett County into two census districts, east and west. The East Census District had a residential population of 149 persons, including the recreational areas around Flaming Gorge and the newly privatized community of Dutch John (U.S. Census 2000). The West Census District, which includes Manila and its surrounds, had a residential population of 722.

Seventy% of the households in Daggett County are family households, but only 27% have children younger than 18 years of age. Average household size in Daggett County, at 2.48 persons per household (less than the state of Utah average of 3.13 persons and less than Wyoming and Colorado) is small and getting smaller. This means that fewer families are having children in Daggett County that will need to be educated and will be seeking jobs. It may also mean that more secondary wage earners will be or are entering the labor market.

An unusually high number of Daggett County residents (60%) are in one- or two-person households. In the state of Utah, only 46.7% of households have two or fewer persons. In this respect, Daggett County households are more similar to Colorado and Wyoming households, at 60.4% and 62.1%, respectively (U.S. Census 2000).

The 2000 Census provides the following information about housing in Daggett County. Unlike Uintah and Duchesne Counties, in which 70-80% of housing units are occupied, only 31.4% of Daggett County's housing units are occupied. One explanation for this difference is that almost two-thirds (63.8%) of the housing stock in Daggett County is for seasonal, recreational, or occasional use, which means that the property owner's primary residence is elsewhere. Approximately 71% of the occupied housing units in Daggett County are owner-occupied (U.S. Census 2000).

With a total of 150 students, the Daggett County School District is the smallest in the state. Enrollment is declining, which is consistent with the declining population and small average household size. The county's three schools include Manila Elementary, Flaming Gorge Elementary and Manila Junior-Senior High School. These schools also serve students from McKinnon and Washam, Wyoming, areas north of the state line.

The residents of Daggett County value the rural character and quiet lifestyle that comprises their communities. The historical land-use practices including farming, ranching, and timber harvesting that shaped the culture of the area serve as the foundation for today's rural community. Today, County citizens identify with the rural, small town sense-of-place that has been ever-present throughout the area. While residents of the County support growth and development, it must complement the current quality of life and values held by the citizens.

#### 3.14.4.2 ECONOMIC CHARACTERISTICS

Daggett County has experienced significant changes in its employment base in the past 50 years (Table 3.14.11). Initially, agriculture-related activities, such as ranching and farming, dominated the economy. The construction of the huge, hydroelectric, Flaming Gorge Dam and Reservoir in the 1960s, as well as the construction of an all-weather highway through the county, changed the local economy forever. Now, the Daggett County economy is dominated by government services associated with the operation of the dam and management of the National Recreation Area and Ashley National Forest. Service-based employment also has become a major contributor to economic vitality, as a result of the growth of tourism and recreational activities. Government services, primarily associated with the operation of Flaming Gorge and Ashley National Forest, provide 47% of Daggett County jobs (UDWS 2001).

**Table 3.14.11. Daggett County Labor Force Statistics**

	2000	2001	2002	2003
Construction	46	17	14	16
Government	213	223	244	253
Labor Force	474	439	467	470
Leisure Hospitality	164	148	151	136
Mining	0	0	0	0
Non-farm Jobs	467	427	461	445
Trade/Trans/Utilities	30	25	22	25

In 1995, the unemployment rate in Daggett County was significantly higher than the state's, but since then, the county's rates have closely mirrored those of the state. The 2003 unemployment rate in Daggett County was 5.0%, one of the lowest rates in the state. Almost 50% of Daggett County employees receive government subsidy (U.S. Census 2000). From 2000 to 2003, the per capita annual income in Daggett County has grown from \$15,201 to \$18,161 (UDWFS 2003). Median household income in 2000 was \$30,833 (U.S. Census 2000).

Approximately 11.7% of the population of Daggett County is below the poverty level (annual household income being less than \$14,269), which compares to the national rate of 11.3% (U.S. Census 2000). Daggett County's poverty rate is the sixth highest in the state, and among the counties without significant tribal populations, Daggett County's rate is the second highest in the state (second to Carbon County).

**3.14.4.2.1 AGRICULTURE**

The Utah Department of Agriculture reports 28 farms in Daggett County in 2003. Livestock and the related ranch operations are the county's largest source of cash receipts, with a contribution of \$1.6 million for livestock and livestock products and \$500,000 for crops. Daggett County has 3,979 acres of harvested cropland and 8,182 acres of irrigated land, which produce 12,000 tons of hay and alfalfa (Utah Agricultural Statistics 2001).

**3.14.4.2.2 MINERAL RESOURCES**

Oil and gas production in Daggett County is not a significant contributor to the local economy. Oil and gas production in 2001 represented 0.01% and 0.4% of the state totals, respectively (Utah Division of Oil, Gas and Mining 2002).

**3.14.4.2.3 TOURISM AND RECREATION**

Recreation is an important component in the quality of life for Uinta Basin residents. In addition to providing recreation opportunity in close proximity to their homes, these residents enjoy a healthy tax base drawn from tourism. Visitors to the Uinta Basin participate in a variety of recreational opportunities including sightseeing, camping, hiking, hunting, mountain biking, fishing, boating, and OHV use. While some of these activities can be engaged in year-round, the busiest months for recreation in the Uinta Basin are the summer months.

Several indicators help detect and explain the impact of the tourism and recreation industries on the local area: job base provided by the tourism industry, traveler spending, and regional visitation. According to the Utah Division of Travel Development, travel and tourism related jobs in Daggett County decreased 0.4% in 2003 down from 258 in 2002 to 257. Daggett County ranks number one in the state for percent of total employment dependant on tourism related jobs. With a total of 443 non-agricultural related jobs reported in 2003, 257 jobs or 58% of total jobs are related to recreation and tourism. Traveler spending in Daggett County was estimated to be \$5.1 million per in 2003; a 23.9% decrease from \$6.7 million in 2002 (Table 3.14.12). Traveler spending remained fairly steady throughout the 1990s and peaked at \$11.7 million in 2000. Traveler spending decreased continuously since 2000.

The Flaming Gorge National Recreational Area (NRA) is the sixth most popular Utah tourist attraction, generating over one million visitors each year. Flaming Gorge NRA was the only one of Utah's national monuments or recreation areas not to report visitor declines during 2000. Despite these visitation rates and the significance of the recreation economy to Daggett County, the county's tourism represents only 0.1% of traveler spending in the state of Utah and ranks twenty-eighth among counties in Utah. Tourism spending in Daggett County has been growing at less than one half the rate of the state.

Estimated local tax revenues from traveler spending also decreased in 2003. Daggett County experienced a 23.6% decrease in local tax revenues from traveler spending in comparison to 2002, down from \$136,600 to \$106,700. In 2003, Daggett County also ranked 28th in the state from local tax revenues from traveler spending. The State of Utah saw a 19.4% increase in state

and local tax revenues from traveler spending at \$444 million up from \$372 million in 2002. However, local tax revenues decreased 1.0% in 2003. Spending by travelers for the State of Utah was \$4.6 billion, down 1.3% from 2002.

In contrast to Uintah and Duchesne County where some of the "traveler spending" can be attributed to oil and gas development, it is unlikely that this is the case in Daggett County since less than 0.05% of the State's mineral development occurs here. In Daggett County it is safer to assume that "traveler spending" actually comes from tourists to the area.

**Table 3.14.12. Daggett County Travel-related Spending in 2003**

	Traveler Spending	% Change from 2002	Tax Revenue from Traveler Spending	% Change from 2002
Daggett County	\$5,100,000	-23.9	\$106,700	-23.6
State of Utah	\$4,631,000,000	-1.3	\$444,000,000	19.4

\*Represents state and local tax revenues from the entire state

### 3.14.4.3 GOVERNMENT SETTING

The government setting in Daggett County is different than in Uintah or Duchesne Counties. Parts of the county, specifically Dutch John and the surrounding area, were formerly federal lands associated with Flaming Gorge NRA. Some of those lands have recently been incorporated into the town of Dutch John, and others have been designated as county land.

Charges for public services are an unusually large revenue item in Daggett County, partially due to the large public safety facility in Manila and the county's contracts to house state, federal, and county inmates there. The majority of Daggett County revenues come from charges for services (43%) and sale of property (25%). Federal and state grants, intergovernmental arrangements, transient room taxes, general sales and use, and fee in lieu generate the remainder of the income for the county. The total PILT payment to Daggett County in 2000 was \$38,074.

The same public services that generate revenue for the county are also apparently a high expenditure in Daggett County (53%). Other expenditures include general government (12%), streets and highways (10%), and community development (9%).

Another unique characteristic of Daggett County government is the special service districts of the county. The Daggett County Road and Transportation Special Services District is a primary recipient of mineral lease monies administered through the Permanent Community Impact Fund. During 1999, it received \$425,000 in mineral lease monies and an additional \$166,349 from other state sources, for a total of \$591,349. Approximately \$373,240 of this was spent for construction, \$8,316 was spent on salaries, and \$12,750 was spent on debt reduction and interest on that debt. The Daggett County Mosquito Abatement District (MAD) received \$18,217 in property taxes or in-lieu fees. Of this, \$14,489 was spent on salaries, and \$1,126 was spent on an

intergovernmental transfer. Finally, the district called Daggett County Service Area #1 had \$1,720 in revenues, \$1,000 from property taxes. The only expenses were \$136 for salaries.

### 3.14.5 REGION-WIDE CONCLUSIONS

This study has discussed the social, economic, and governmental settings of the three counties that compose the VPA. In addition to the statistics that help describe each county, conclusions can be drawn about the region's history, geography, and economics.

The first conclusion drawn is that, due to the history and geography of the Uinta Basin, much of the population has a common lifestyle and identity. The fact that each of these counties is at least two hours from any major city sustains a rural/small town lifestyle.

The second regional commonality among the counties is their economic dependency on physical resources within the VPA. From municipality to municipality in the region, lower-than-average wages and higher-than-average poverty rates are common. The economy of the region is based on agriculture, oil and gas exploration, and tourism. Major changes in the management of the land in any one of these sectors of the economy will have an effect on the socioeconomics of the individual counties and the region overall.

## 3.15 SOIL AND WATER RESOURCES

### 3.15.1 REGIONAL OVERVIEW

The VPA lies within portions of nine catalogued USGS 8-Digit Hydrologic Unit Code (HUC) watersheds located within the Upper Colorado hydrologic region (Region 14). The majority of the VPA is contained within seven watersheds in the Lower Green River drainage, although portions also are associated with the Upper Green River and the Lower White River drainage. Watershed acreages are described in Table 3.15.1.

**Table 3.15.1. Watersheds Associated with the VPA**

8-Digit HUC	Watershed Name	Acres within VPA
14040106	Upper Green-Flaming Gorge Reservoir	543,564
14060001	Lower Green-Diamond	566,835
14060002	Lower Green-Ashley-Brush	420,697
14060003	Lower Green-Duchesne	1,649,897
14060004	Lower Green-Strawberry	394,405
14060005	Lower Green-Desolation Canyon	645,365
14060007	Lower Green-Price	22,542
14060006	Lower Green-Willow	461,197
14050007	Lower White	797,137

Two municipal watersheds, Ashley Creek and Red Fleet, are also located within the VPA. The Ashley Creek municipal watershed occurs almost entirely upon lands administered by the USFS - Ashley National Forest; however, the BLM administers 670 acres, including Ashley Spring, the access point for the municipal supply. The Red Fleet municipal watershed contains 18,660 acres administered by the BLM, including lands surrounding Red Fleet Reservoir, which is the access point for the municipal supply.

### **3.15.2 TOPOGRAPHY**

The topography of the VPA is primarily defined along its northern portion by the Uinta Mountains. The Uinta Mountains are broad and massive and extend approximately 150 miles east to west. The Uinta Mountains consist of extensively glaciated, sedimentary and metamorphic rocks. Glacial deposition features have created numerous natural dams and small lakes on the slopes of the range. A portion of the VPA lies north of the Uinta Mountains and drains to the Green River below Flaming Gorge Reservoir. The Green River exits the VPA approximately 30 miles downstream of Flaming Gorge at the Utah/Colorado state boundary and reenters the VPA near Diamond Mountain, again along the Utah/Colorado state boundary. Portions of the south side of the Uinta Mountains drain to the Green River below Diamond Mountain through major tributaries such as Ashley Creek, Big Brush Creek, and the Whiterocks River.

The western side of the VPA is drained by the Duchesne River and its major tributary, the Strawberry River. The Duchesne River drains a topographic basin composed of Mesozoic and Tertiary sedimentary rocks characterized by a gently rolling, dissected plateau with deeply cut ravines and alluvial valleys. The Duchesne River enters the Green River near Ouray, in the central part of the VPA.

The eastern and southern part of the VPA, primarily consisting of the Book Cliffs portion of the VPA, is drained by Hill Creek, Bitter Creek, Evacuation Creek, Willow Creek, and the White River; these drainages also enter the Green River near Ouray. This area is part of the Tavaputs Plateau, composed of Tertiary sedimentary rocks and characterized by rugged terrain and deeply incised canyons (UDWaR 1999).

### **3.15.3 SOIL RESOURCES**

Soils in the VPA have developed from bedrock, from rocks/minerals deposited by rivers and glacial activity, and from windblown silt and sand. They were derived primarily from the sedimentary, metamorphic quartzite and volcanic rocks of the Uinta Mountains, Diamond Mountain Plateau, Avintaquin Mountains, East Tavaputs Plateau, West Tavaputs Plateau, Roan Cliffs, and Book Cliffs, which form the boundaries of the Uinta Basin and Browns Park.

Soils in the VPA are composed of a wide variety of soil types and characteristics. Certain soil types have chemical features that limit restoration and make reclamation difficult; these include sodium, soluble salts, carbonates, and gypsum. Physical soil characteristics that may limit reclamation include sandy soils, clayey soils, large coarse fragments (e.g., stones and boulders), shallow depth to parent material, and low organic matter content. A shallow depth to

groundwater limits reclamation in hydric soils. Soils in the VPA are composed of a wide variety of soil types and characteristics. Certain soil types have chemical features that limit restoration and make reclamation difficult; these include sodium, soluble salts, carbonates, and gypsum. Physical soil characteristics that may limit activities or reclamation include: low available water holding capacity, excessive drainage, hardpans, high amounts of rock fragments or large stones and boulders, shallow depth to parent material, high water table, and low organic matter content. Soils with these features are referred to as “limiting soils” in this document.

### **3.15.3.1 NATURAL RESOURCE CONSERVATION SERVICE (NRCS) SOIL SURVEYS**

The Natural Resource Conservation Service (NRCS) has conducted three soil surveys throughout the VPA, with second and third order delineation. The Uintah Area, Utah soil survey includes parts of Daggett, Grand, and Uintah Counties. Portions of Daggett County are also included in the Henrys Fork Area, Utah-Wyoming soil survey. The Duchesne County part of the VPA is covered by the Duchesne Area, Utah soil survey.

#### **3.15.3.1.1 HENRYS FORK AREA, UTAH-WYOMING SOIL SURVEY (USDA 1990)**

This soil survey covers the northern parts of Daggett County, as well as parts of Summit County, Utah and parts of Uinta and Sweetwater Counties in Wyoming. The survey, correlated in October 1990, is complete and available in digital and hardcopy formats. Information on soil features and use ratings can be obtained by using either the NRCS Soil Data Viewer or Microsoft Access software. Soil spatial data is available for use with standard GIS software.

#### **3.15.3.1.2 UINTAH AREA, UTAH SOIL SURVEY (USDA 1999)**

This soil survey covers Uintah County, part of northern Grand County, and the southern part of Daggett County. The survey, correlated in June 1999, is complete and available in digital format. Information on soil features and use ratings can be obtained by using either the NRCS Soil Data Viewer or Microsoft Access software. Soil spatial data is available for use with standard GIS software.

This soil survey covers the largest portion of the VPA, with 2,477,734 acres of soils surveyed. It ranges from the Diamond Mountain area in the north to the Book Cliffs in the south and from the Duchesne County line in the west to the Colorado state line in the east.

Taxonomic classifications of VPA soils within the boundaries of this survey include a wide variety of soil types. Diagnostic soil features include cryic soils, argillic horizons, mollic epipedons, calcic horizons, petrocalcics, gypsic horizons, psamments, and fluvents. Thirty taxonomic great groups and 151 soil series have been identified in the Uintah Area soil survey.

#### **3.15.3.1.3 DUCHESNE AREA, UTAH SOIL SURVEY**

This soil survey includes VPA lands in southeastern Duchesne County, Utah. Most of the fieldwork has been completed for this survey, but final correlation has not been completed. Correlation and final publication of the soil survey data by the NRCS began in late 2005 and

expected to be complete by 2010. Draft spatial soil data has been digitized and can be accessed with standard GIS software. Available information on soil features and use ratings can be obtained from official soil series descriptions and interpretation tables or local NRCS offices. Until final correlation and publication, this data is considered draft and is less accessible to the public than the published survey data from either the Henrys Fork or the Uintah Area soil surveys. Draft data is available by contacting the local NRCS office or BLM office.

This soil survey includes VPA lands in southeastern Duchesne County, Utah. Most of the fieldwork has been completed for this survey, but final correlation has not been completed. Correlation and final publication of the soil survey data by the NRCS is began in late 2005 and expected to be complete by 2010. Draft spatial soil data has been digitized and can be accessed with standard GIS software. Until final correlation and publication, this data is considered draft and is less accessible to the public than the published survey data from either the Henrys Fork or the Uintah Area soil surveys. Draft data is available by contacting the local NRCS office or BLM office.

### **3.15.3.2 SOIL CHARACTERISTICS OF GREATEST MANAGEMENT CONCERN**

#### **3.15.3.2.1 PRESENCE OF BIOLOGICAL CRUSTS**

The presence of biological crusts in arid and semi-arid lands have a very significant influence on reducing soil erosion by both wind and water, fixing atmospheric nitrogen, retaining soil moisture, and providing a living organic surface mulch. "These crusts are a complex mosaic of cyanobacteria, green algae, lichens, mosses, microfungi, and other bacteria" (BLM 2001:1). They can be used as an indicator of rangelands' ecological health. Development of biological crusts is strongly influenced by soil texture, soil chemistry, and successional colonization by crustal organisms. The type and abundance of biological crust can be used by a land manager to determine the ecological history and condition of a site. Biological crusts are generally found where there are openings in the vascular plant cover and protect open areas from wind and water erosion.

Limited data exists for biological crusts specific to the VPA. However there is some baseline information for parts of the VPA from the early 1970's and more recent information being collected as part of a National Science Foundation-funded project by Brigham Young University (personal communication, Diana Whittington, FWS – or better yet put in the correct and full citations.) There is also a growing body of literature and data, much of it based on the Colorado Plateau region that would be applicable to the soils and ecosystems of the VPA.

#### **3.15.3.2.2 SALINITY**

Soil salinity can have significant impacts on soil erosion and reclamation potential. Erosion of saline soils can also have significant impacts on the water quality of downstream watersheds. Soils with electrical conductivity levels of 8 dS/m (deciSeimens/meter) or greater were considered saline in all soil surveys. Saline soils occur in more than 365,851 acres, or

approximately 20% of the BLM-administered lands in the VPA. Add soils data for salinity and other soils features are taken from the SSURGO database.

Saline sediments that originate in the VPA eventually flow into the Colorado River. Salinity levels in the Colorado River are a regional, national, and international issue. Control of sediment discharged from public lands is mandated by the Colorado River Basin Salinity Control Act of 1974. Proper land use is the BLM's preferred method of achieving salinity control, with the planning process being the principal mechanism for implementation. Impacts are to be minimized in areas with saline soils, and revegetation of previously disturbed saline soils is to be promoted to the extent possible.

#### **3.15.3.2.3 SODIUM ABSORPTION RATIOS**

Soils with sodium absorption ratios (ratio of sodium salts to other soluble salts) of 13 or greater are considered sodic. Infiltration of precipitation into these soils is reduced by the dispersion of soil particles caused by the higher levels of sodium. Reduced infiltration rates result in greater surface runoff rates and increased soil erosion and sediment yields. Many sodic soils have a thin layer of suitable soil above the sodic horizon, but when this layer is disturbed or removed, the resulting impact can be irreversible. Sodic soils occur in approximately 161,344 acres, or approximately 9% of the BLM-administered lands within the VPA. Management of sodic soils should include minimizing the impacts of grazing and other surface disturbances, such as road construction.

#### **3.15.3.2.4 GYPSUM LEVELS**

Soils with gypsum levels equal to or greater than 10% are highly susceptible to water erosion and are difficult to reclaim. Gypsum is very soluble in water, which results in piping and other severe erosion features. Gypsic soils occur in approximately 132,706 acres, or 7% of the BLM administered lands within the VPA. The number of soil map units in the VPA with gypsic soils is relatively small, but nonetheless, these units require careful management to minimize impacts that may cause irreversible damage. Construction of roads and other facilities is difficult in these soils.

#### **3.15.3.2.5 RESPONSE TO DISTURBANCE**

Decisions regarding management of a particular soil resource is dependent on the particular soil type's ability to recover from specific disturbances. Gypsum content, salinity level, and sodium content are soil characteristics that can severely limit recovery from a disturbance. Road construction and operation of OHVs commonly impact the soils in the VPA. Additionally, the presence of surface water or groundwater has an influence on the severity of a disturbance and on when the activity may be allowed. Surface disturbances can cause compaction and increased soil erosion by either wind or water.

Use ratings and soil characteristics listed in the soil surveys are intended to be used as general guidelines for land-use planning, but site-specific investigations should be done to determine the suitability of soils at specific locations.

### **3.15.3.2.6 EROSION**

#### ***Water Erosion***

There is significant potential for severe soil erosion by water at several locations within the VPA. Erosion potential ratings were not available in the NRCS soil surveys at the time this analysis was conducted. The VPA area has determined the approximate locations of soils with potential for severe erosion by evaluating the k-factor, T factor, percent slope, and hydrologic group rating for each soil map unit. These are designations given to soils by the NRCS, which show the relative erodibility of each soil unit. Site specific and map unit specific determinations for erosion hazard ratings will continue to be developed and utilized within the VPA. Additionally, soil surface texture and the presence of surface or ground water have an influence on the severity of a disturbance and on when the activity may be allowed. Surface disturbances can cause compaction and increased soil erosion by either wind or water.

In the interim, for preliminary delineation of water erodible soils, soil mapping units with a k-factor of 0.32 or greater and slopes greater than 10% were considered susceptible to water erosion. Using these factors, water erodible soils were determined to cover 232,042 acres, or approximately 13% of the VPA. Current management activities are designed to minimize impacts so that erosion and sediment yield are not accelerated. Additional mitigation measures are to be taken, as necessary, to minimize impacts on soils determined to have severe erosion hazard potential.

#### ***Wind Erosion***

Many of the soils in the VPA are coarse-textured and very susceptible to wind erosion when the vegetative community is disturbed. The NRCS soil surveys classify each soil series into wind erodibility groups (1, 2, 3, 4L, 4, 5, 6, 7, and 8). Soils that are in wind erodibility groups 1, 2, 3, or 4L have erosion potentials ranging from extremely erodible to erodible, respectively. Wind erosion increases when the vegetative community is disturbed by intense grazing, fire, road construction, and other events that reduce the amount of vegetative cover. Disturbance of biological crusts on coarse-textured soils will also increase the potential for wind erosion. Wind-erodible soils cover 1,361,645 acres, or 79% of the VPA. To preserve soil resources in these areas, disturbance of the vegetative community and biological crusts are managed and minimized.

#### ***Reclamation of Drastically Disturbed Areas***

Many of the soils within the VPA have limiting features that make reclamation and revegetation very difficult. These limiting features include salinity, sodium content, clayey and sandy textures, drought conditions, alkalinity, low organic matter content, shallow depth to bedrock, stones and cobbles, and wind erosion. Sometimes the soil limitations are so severe that areas cannot be reclaimed from disturbance. Preventing disturbance to such limited soil resources is the most effective way to reduce impacts of road construction, grazing, fire, and other activities that drastically disturb the soil surface. Whenever impacts are deemed necessary in an area,

salvaging and stockpiling soil materials to replace the disturbed, limited soils is the most effective management decision regarding soils.

### **Road Construction and Maintenance**

Construction and maintenance of roads within the VPA will continue to be a prominent aspect of management. Soil properties that are limiting to construction of roads within the VPA include soils with high sodium content, high gypsum content, high soluble salts, low strength, shrink-swell potential, and frost action. A soil's large-stone content, its depth to hard bedrock, and its slope are also important physical features that must be considered when determining a soil's suitability for road construction.

Suitability ratings for construction of local roads assume that the roads will have an all-weather surface (commonly of asphalt or concrete) and are expected to carry automobile traffic year-round. Since the majority of roads constructed and maintained within the VPA do not have an all-weather surface, it should be assumed that site-specific evaluations would need to be conducted prior to construction of any new roads. Roads are graded to shed water, and conventional drainage measures are installed properly. With the exception of hard surface all-weather roads, most of roads in the VPA are constructed from the local soils, which may or may not be suitable for road construction.

## **3.15.4 WATER RESOURCES**

### **3.15.4.1 SURFACE WATER SUPPLY AND USE**

Surface water in the VPA is used for agricultural, municipal, industrial, power generation, and recreational purposes. Surface water is stored in several large and small reservoirs, both natural and human-made. The largest use of surface water is for agricultural irrigation, with almost 800,000 acre-feet of water per year being diverted to irrigate more than 200,000 acres of land (UDWaR 1999). Water diversions for municipal and industrial purposes (including residential water use, industrial water use, power production, and irrigation of parks, golf courses, and other outdoor areas) average approximately 14,000 acre-feet per year (UDWaR 1999). The Diamond Mountain portion of the VPA also has 15 hydropower site withdrawals covering approximately 93,900 acres along the Green River (BLM 1993).

The hydrology of the VPA is primarily dominated by spring runoff and from brief, intense storms that generally occur in late summer. The several large reservoirs that have been constructed on the Green and Strawberry Rivers have altered the natural hydrology of these major rivers by reducing the annual spring peak and providing higher minimum flows during the summer and winter months. Water diversions for agricultural, municipal, and industrial uses have also altered the natural hydrology of the VPA by reducing instream flows below diversion points.

Surface water flow supports riparian vegetation along the floodplains of the rivers and streams in the VPA. Approximately 92,226 acres of the VPA occur within the 100-year floodplains of the major drainages in the VPA. While the preliminary status of the functioning condition of riparian

vegetation along major waterways has been documented in preparation for this RMP, the condition of the floodplain and the stability of stream banks have not yet been determined for all areas (Strong 2002b). Surface water flow also supports riparian vegetation associated with other water features such as Stewart Lake, Pelican Lake, and the Pariette Wetlands.

### 3.15.4.2 GROUNDWATER SUPPLY AND USE

The primary use of groundwater in the VPA is for municipal and industrial purposes. Unconsolidated or alluvial aquifers are relatively limited within the VPA, with major use only in the Duchesne-Myton-Pleasant Valley area and east of Neola. Consolidated or bedrock aquifers form a major component of the groundwater system in the VPA. Major consolidated aquifers include sandstone beds within the Uinta Formation and the Bird's Nest and Douglass Creek aquifers within the Green River Formation. Total water withdrawal from all aquifers for municipal and industrial use is approximately 21,000 acre-feet, which is relatively minor compared to the estimated 350,000 acre-feet naturally discharged to streams and springs and the nearly 250,000 acre-feet lost to evapotranspiration (UDWaR 1999).

### 3.15.4.3 WATER QUALITY

Surface water quality problems are detailed in Utah's 303(d) list of impaired waters, required under the Clean Water Act (Table 3.15.2). Lower Ashley Creek was listed due to total dissolved solids (TDS) and selenium concentrations, likely the result of irrigation return flows. Portions of the Duchesne River and tributaries were listed primarily due to TDS concentrations, also attributable to irrigation return flows. Several reservoirs within the VPA were also listed, mostly for phosphorous levels, dissolved oxygen (DO) levels, and high temperatures.

Water bodies on Utah's 303(d) List of Impaired Waters are listed below in Table 3.15.2.

**Table 3.15.2. Water Bodies on Utah's 303(d) List of Impaired Waters, 2000**

HUC Code	Name	Stressor
	Calder Reservoir	DO, Total Phosphorous
14060001	Brough Reservoir	DO, Temperature
14060002	Lower Ashley Creek	TDS, Selenium
	Red Fleet Reservoir	DO, Temperature
	Steinaker Reservoir	Temperature
14060003	Antelope Creek	TDS
	Deep Creek	TDS
	Duchesne River from confluence with Green River to Randlett	TDS
	Duchesne River from Randlett to Myton	TDS
14060005	Pariette Draw	TDS, Boron
	Willow Creek from confluence with Green River to confluence with Meadow Creek	TDS

Source: UDEQ 2002

Excess salinity, the major surface water quality problem in the VPA, is of regional significance under the Colorado River Basin Salinity Control Act of 1974. Salinity contributions come from naturally occurring groundwater during low flow periods and from erosion of saline soils. A large part of the saline soil contribution is attributable to poor road construction practices and management (Strong 2002a). Other factors in water quality are salt-loading from irrigated agriculture, water and land contamination due to oil/gas well drilling, and elevated levels of total phosphorous and TDS in several basin streams (UDEQ 2003). Watersheds of particular concern include the Pariette, Red Creek, and Buckskin Hills watersheds.

The groundwater hydrology in the VPA is primarily dependent on rock structure. Concentrations of dissolved solids range from 19 to 112,000 mg/L and depend on changes in rock type and physical environments.

Locally, the groundwater salinity in the VPA is caused by natural geologic sources. The Tertiary Green River, Wasatch, and Uinta Formations and the Mesozoic Mancos Shale range from very saline to briny at depth (>500 ft.) and generally less saline at shallow depths (<500 ft.). High selenium and boron concentrations are of particular concern and have been studied at Stewart Lake, Lower Ashley Creek, and the Pariette Wetlands. The salinity of water produced in oil, gas, and CBNG development may change significantly within a few months or years particularly if vertical movement of water in faults and fractures is induced by the production of hydrocarbons and water from oil and gas wells (USGS 1987).

## **3.16 SPECIAL DESIGNATIONS**

### **3.16.1 AREAS OF CRITICAL ENVIRONMENTAL CONCERN (ACEC)**

#### **3.16.1.1 CURRENTLY DESIGNATED ACECs**

The VFO manages seven ACECs (165,944 total acres) that were designated in 1994 in the record of decision (ROD) for the Diamond Mountain RMP (BLM 1994a). They are, in order of decreasing size, Browns Park, Nine Mile Canyon, Red Mountain-Dry Fork, Red Creek Watershed, Pariette Wetlands, Lower Green River Corridor, and Lears Canyon. Existing ACECs are subject to reconsideration when RMPs are revised. Based on a current analysis of the areas, the present designations have been effective in protecting the relevant values they exhibit, and these will, again, be considered as ACECs in the Vernal RMP.

Table 3.16.1 provides a summary of the relevance and importance criteria for each currently designated ACEC. The management prescriptions for these areas are detailed in Chapter 3 of Diamond Mountain RMP and ROD (BLM 1994a).

**Table 3.16.1. Relevance and Importance Criteria of Currently Designated ACECs**

Relevance	Importance
<b>Browns Park</b> (52,721 acres) Significant diversity and density of cultural and historical sites, a nationally recognized Class I fishery; has special status plant and animal species habitat, cultural values, crucial deer winter habitat, high quality scenic values.	Has qualities that make it fragile, sensitive, rare, irreplaceable, unique, endangered, and threatened.
<b>Lears Canyon</b> (1,375 acres) Contains a natural system, specifically relict plant and plant communities, serves as a scientific reference area.	Has qualities that make it fragile, sensitive, rare, irreplaceable, unique, endangered, and threatened. Has been recognized as warranting protection in order to carry out the mandates of the Federal Land Policy and Management Act.
<b>Lower Green River Corridor</b> (8,470 acres – lower) Riparian habitat, special status animal species habitat, and high-quality scenic values.	Has more than locally significant qualities, which give it special worth, and distinctiveness.
<b>Nine Mile Canyon</b> (44,181 acres) Nationally significant Fremont, Ute, and Archaic rock art and structures; regionally significant populations of special status plant species, and high quality scenery.	Has more than locally significant qualities, which give it special worth, and distinctiveness.
<b>Pariette Wetlands</b> (10,437 acres) Special status bird and plant species habitat, a wetlands ecosystem, significant population of the federally threatened plant species <i>Sclerocactus glaucus</i> .	Has qualities that make it fragile, sensitive, rare, irreplaceable, unique, endangered, and threatened.
<b>Red Creek Watershed</b> (24,475 acres) Regionally significant critical watershed; part of Green River drainage system and its Class I fishery values.	Has more than locally significant qualities, which give it special worth, and distinctiveness.
<b>Red Mountain-Dry Fork</b> (24,285 acres) Significant diversity and density of cultural sites, quality paleontological finds, and two relic vegetation communities.	Has qualities that make it fragile, sensitive, rare, irreplaceable, unique and distinctive.

### 3.16.1.2 POTENTIAL ACECs

The eight potential ACECs and the expansion of two existing ACECs being considered for possible ACEC designation through this planning process are discussed below. Only those nominated areas determined to meet specific relevance and importance criteria are identified as potential ACECs. The following descriptions generally define the maximum acreage proposed in the alternatives although in some instances variations in the size and location of the proposed ACECs are described for clarification. See Table 4.16.1 in Chapter 4 for a description of the various acreage proposals, Figures 29–32 (in the Maps section) for geographic locations, and Appendix G for more information on ACEC evaluations.

**Table 3.16.2. Relevance and Importance Criteria of Potential ACECs**

Relevance	Importance
<b>Bitter Creek</b> (68,384 acres) Existence of an old growth forest, significant cultural and historic resources, important watershed, and critical ecosystem for wildlife and migratory birds.	Has significance due to qualities that make it fragile, sensitive, rare, irreplaceable, exemplary, and unique. Ancient (over 1,200 years) pinyon forest; irreplaceable. Ancestral home of the Northern Ute Tribe after relocation in the late 1800s. Many features, including graves, but specific locations are not known. The most extensive wetland in the multi-state Book Cliffs due to uniquely perched water table; a critical ecosystem for migratory birds and a wide variety of wildlife.
<b>Bitter Creek-P.R. Springs</b> (147,425 acres) Same as Bitter Creek.	Same as Bitter Creek.
<b>Coyote Basin ACEC</b> (87,743 acres) Important white-tailed prairie dog complex. Essential habitat for maintaining species diversity and includes one of the largest populations of white-tailed prairie dogs. The white-tailed prairie dog is essential to the survival of the endangered black-footed ferret in this area.	A critical ecosystem for the white-tailed prairie dog, one of 25 complexes nominated for ACEC status in the western states. Has significance due to qualities that make it fragile, sensitive, rare, irreplaceable, exemplary, and unique. This species occupies only an estimated 8% of the area it once occupied, and most of this is on public lands. The white-tailed prairie dog is particularly vulnerable to adverse change from a variety of current causes. The U.S. Fish and Wildlife Service has been petitioned to list species.
<b>Coyote Basin Complex</b> (124,161 acres) Same as Coyote Basin.	Same as Coyote Basin.
<b>Four Mile Wash</b> (50,280 acres) Existence of high value scenery, important riparian ecosystem, and special status fish.	Has significance due to qualities that make it fragile, sensitive, rare, irreplaceable, exemplary, and unique. Spectacular scenery viewed by increasing numbers of visitors from many states and countries. Lush riparian vegetation is rare in this desert ecosystem.  Critical habitat for four endangered fish - Colorado pikeminnow ( <i>Ptychocheilus lucius</i> ), Bonytail ( <i>Gila elegans</i> ), Humpbacked chub ( <i>Gila cypha</i> ), and the Razorback sucker ( <i>Xyrauchen texanus</i> ).
<b>Lower Green River Expansion</b> (1,700 acres) Existence of significant riparian habitat and outstanding scenic values.	Has significance due to qualities that make it fragile, sensitive, rare, irreplaceable, exemplary, and unique. An extension of the Lower Green River Corridor ACEC, where the significance of these important resources has been recognized. See Table 3.16.1 above.

**Table 3.16.2. Relevance and Importance Criteria of Potential ACECs**

Relevance	Importance
<b>Main Canyon</b> (100,915 acres) Existence of important cultural and historic resources, and natural systems.	Has significance due to qualities that make it fragile, sensitive, rare, irreplaceable, exemplary, and unique. Numerous sites associated with the historic Northern Ute migration route along Main Canyon. Historic inscription from early French fur trade era. Focus of past proposals to manage for exemplary natural systems. Part of the cooperative BLM/Utah Division of Wildlife Resources Book Cliffs Conservation Initiative. Most of ACEC within the Winter Ridge WSA.
<b>Middle Green</b> (6,768 acres) Existence of an important riparian ecosystem and high value scenery.	Has significance due to qualities that make it fragile, sensitive, rare, irreplaceable, exemplary, and unique. River and adjacent landscape provide spectacular scenery, viewed by increasing numbers of visitors from many states and countries. Lush riparian vegetation rare in this desert ecosystem.
<b>Nine Mile Canyon Expansion</b> (36,987 acres) Existence of significant cultural resources, special status plant species, and high quality scenery.	Has significance due to qualities that make it fragile, sensitive, rare, irreplaceable, exemplary, and unique. An extension of the existing Nine Mile Canyon ACEC, where the significance of these important resources has been recognized. See Table 3.16.1 above.
<b>White River</b> (47,130 acres) Existence of unique geological formations, high value scenery, significant historical events, and riparian ecosystem.	Has significance due to qualities that make it fragile, sensitive, rare, irreplaceable, exemplary, and unique. Unique, spectacular rock spires, named "Goblin City" by the John Wesley Powell 1869 expedition. A popular cottonwood grove campsite; place where the Powell Expedition camped and explored the nearby geological formations. Spectacular scenery viewed by increasing numbers of visitors from several states. Lush riparian vegetation is rare in this desert ecosystem.

### 3.16.2 WILD AND SCENIC RIVERS

#### 3.16.2.1 REGIONAL OVERVIEW

The Wild and Scenic Rivers Act established a National Wild and Scenic Rivers System (NWSRS) to protect and preserve designated rivers throughout the nation in their free-flowing condition, as well as their immediate environments. It contains policy for managing designated rivers and created processes for designating additional rivers into the NWSRS. Section 5(d) of the Act directs federal agencies to consider the potential for national wild, scenic, and

recreational river areas in all planning, for the use and development of water and related land resources. Wild and scenic river considerations are being made in the Vernal RMP revision.

To determine eligibility, the VFO inventoried all potentially eligible rivers. All rivers nominated during scoping or that appeared on national river lists were automatically considered. In addition, all rivers within the VPA were mapped and reviewed by agency and non-agency subject matter specialists and members of the interested public to identify any additional rivers that could be potentially eligible.

All rivers determined to be eligible for congressional designation into the NWSRS are considered further for suitability in the planning process. Those determined suitable for congressional designation into the NWSRS are recommended to Congress for such designation.

The Upper Green and Lower Green segments of the Green River were found suitable for congressional designation in the ROD for the Diamond Mountain RMP, and are currently managed to protect their free-flowing nature, outstandingly remarkable values, and tentative classifications.

### 3.16.2.2 RIVER SEGMENTS DETERMINED ELIGIBLE FOR WILD AND SCENIC RIVER DESIGNATION

Of the 89 streams segments identified by the VFO as potentially eligible and inventoried, 11 segments involving approximately 112 BLM shoreline miles and 216 total river miles were determined to be eligible for Congressional designation into the NWSRS (Table 3.16.3). Appendix C provides additional information regarding the eligibility review. It is BLM policy (8351 Manual, Section .32C) to manage eligible segments to protect their free-flowing nature, outstandingly remarkable values, and tentative classifications to the extent that the BLM has the authority to do so through FLPMA, the Wild and Scenic Rivers Act, and BLM policy. It should be noted that the BLM does not manage all lands through which the proposed wild and scenic river stretches pass, and thus cannot impose restrictions on other land owners and land managers in these areas. Until the ROD for the Vernal RMP is signed, such protection involves case-by-case review and mitigation of any actions proposed that might affect the eligible river. Protective management will continue for any segments determined suitable in the ROD for the Vernal RMP. For each suitable river, the ROD will identify specific management conditions that are in keeping with a suitability decision. Management that would apply, should any rivers be designated by Congress, is identified in the BLM's 8351 Manual, Section .51.

**Table 3.16.3. Summary Information for Eligible Rivers in the VPA**

Segment Name	Segment Description	Outstandingly Remarkable Values	Tentative Classification	BLM Shoreline Miles	Total Miles
Argyle Creek	Headwaters to Carbon County line	Scenic	Recreational	4.0	22.0

**Table 3.16.3. Summary Information for Eligible Rivers in the VPA**

<b>Segment Name</b>	<b>Segment Description</b>	<b>Outstandingly Remarkable Values</b>	<b>Tentative Classification</b>	<b>BLM Shoreline Miles</b>	<b>Total Miles</b>
Bitter Creek	Utah state line to where it enters private property	Fish, Wildlife/habitat, Cultural, Historic, Recreational	Scenic	7.0	22.0
Evacuation Creek	Utah state line to confluence with White River	Historic	Recreational	7.0	21.0
Lower Green River	Between public land boundary south of Ouray and the Carbon County line	Recreational, Fish	Scenic	27.0	30.0
Middle Green River	Between Dinosaur National Monument and the public land boundary north of Ouray	Fish	Recreational	20.0	36.0
Nine Mile Creek (A)	Within Duchesne County between the Carbon County line and the confluence with Gate Canyon	Scenic, Cultural	Recreational	7.0	13.0
Nine Mile Creek (B)	Within Duchesne County between Gate Canyon and the Green River	Scenic, Cultural	Scenic	0.0	6.0
Upper Green River	Between Little Hole and Utah state line	Scenic, Recreational, Fish, Wildlife/habitat, Cultural	Scenic	12.0	22.0
White River (A)	Between the Colorado state line and its confluence with Asphalt Wash	Scenic, Fish, Wildlife/habitat Recreational, Historic	Scenic	8.0	24.0
White River (B)	Between Asphalt Wash to where the river leaves Section 18, T10S. R23 E., SLBM	Scenic, Fish, Wildlife/habitat Recreational, Historic	Wild	10.0	10.0

**Table 3.16.3. Summary Information for Eligible Rivers in the VPA**

Segment Name	Segment Description	Outstandingly Remarkable Values	Tentative Classification	BLM Shoreline Miles	Total Miles
White River (C)	From where the river leaves Section 18, T10S. R23 E., SLBM to the Indian Trust Land boundary	Scenic, Fish, Wildlife/habitat Recreational, Historic	Scenic	10.0	10.0

Note: River mileage is approximate.

### 3.16.3 WILDERNESS STUDY AREAS

#### 3.16.3.1 OVERVIEW

In 1964, Congress passed the Wilderness Act, establishing a national system of lands for the purpose of preserving a representative sample of ecosystems in their natural condition for benefit of future generations. The Forest Service, National Park Service, and Fish and Wildlife Service managed most of the land designated as wilderness prior to 1976. With the passage of the Federal Land Policy and Management Act (FLPMA) in 1976, Congress directed the BLM to inventory, study, and recommend which public lands under its administration should be designated wilderness.

In 1979, the BLM began a wilderness inventory of 22 million acres of public land in Utah. By 1985, the BLM established 95 wilderness study areas (WSAs), totaling about 3.3 million acres, which have wilderness character. For the next several years, these areas were studied to determine which would be recommended to Congress for designation as wilderness. In October 1991, the Secretary of the Interior provided the BLM's recommendation to the President. The President recommended that 69 areas, totaling approximately 1.9 million acres in Utah, be designated as part of the National Wilderness Preservation System by Congress. To date, with few exceptions, Congress has not acted on that recommendation.

There is no designated wilderness on public lands in the VFO.

#### 3.16.3.2 PLANNING AREA PROFILE

WSAs are roadless, natural, provide outstanding opportunities for solitude or primitive and unconfined recreation, and may have supplemental values (such as ecological, geological, or other features of scientific, educational, scenic, or historical value).

There are six WSAs in the VFO (Table 3.16.4) (Figure 29 in the Maps section). The WSAs, established and protected under the authority of Section 603 of FLPMA, are managed according to the *Interim Management Policy and Guidelines for Lands under Wilderness Review* (IMP, BLM Manual Handbook H-8550-1), to preserve their wilderness values until Congress either designates them wilderness or releases them for other uses. Only Congress can designate a WSA

as wilderness or release it from the protective mandate of FLPMA. The status of WSAs will not change as a result of this resource management planning process. In October 1991, the Secretary of Interior provided BLM's recommendations to the President. The President recommended that 69 WSAs, totaling approximately 1.9 million acres in Utah be designated as part of the National Wilderness Preservation System by Congress.

**Table 3.16.4. Wilderness Study Areas**

<b>Name</b>	<b>Acreage</b>
Book Cliffs Mountain Browse ISA	400 acres
Bull Canyon	600 acres
Daniels Canyon	2,496 acres
Diamond Breaks	3,900 acres
West Cold Springs	3,200 acres
Winter Ridge	42,462 acres
<b>Total: 6 areas</b>	<b>53,058 acres</b>

## 3.17 SPECIAL STATUS SPECIES

### 3.17.1 REGIONAL OVERVIEW

#### 3.17.1.1 FEDERALLY LISTED SPECIES

Special status species include those plant and animal species federally listed as threatened, endangered, proposed and/or candidate, as well as BLM and State of Utah sensitive plant and animal species. The Federal Endangered Species Act (ESA) of 1973 (Public Law 93 - 205, as amended), provides protection to federally listed threatened, endangered, and candidate species from actions that may jeopardize their existence. This could occur through direct harm, activities resulting in increased stress during critical life history stages such as nesting, migration or wintering, loss or degradation of critical habitat, or loss or degradation of occupied or potential habitat.

Table 3.17.1 identifies all threatened, endangered, and candidate species occurring within the VPA area of influence which includes Daggett, Duchesne, Uintah, and the northern portion of Grand County, Utah as of February 26, 2004.<sup>3</sup> The information regarding the status and habitats of federally listed species in Table 3.17.1 is from data provided by the BLM and FWS status data current as of February 26, 2004. Definitions of terms used in Table 3.17.1 are provided below.

**Endangered Species** – Any species that is in danger of extinction throughout all or a significant portion of its range.

**Threatened Species** – Any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

<sup>3</sup> Only those species that have a known occurrence in the small portion of Grand County within the VPA are represented.

**Candidate Species** – Any species for which substantial biological information exists to support the biological appropriateness of proposing to list the species as endangered or threatened.

**Critical Habitat** – Specific areas that contain physical or biological features essential for the conservation of a listed species and that may require special management considerations or protection.

**Experimental Population** – A population that has been reintroduced outside of its current range but within its historical range.

**Recovery Plan** – A plan prepared by the US Fish and Wildlife Service for threatened and endangered species that establishes objectives and methods to ensure the survival of the species and recover it sufficiently so that the species can be delisted or removed from the threatened and endangered species list.

There are 13 listed and 2 candidate species within the VPA. All of these species are both known to occur and have additional potential habitat in the VPA. Of these 15 species, there are 4 wildlife, 4 fish, and 7 plant species. Slightly more than half of the species are upland species, dependent on specific soil or geologic formations for suitable habitat, such as white calcareous shale or steep rocky canyons. These species include the Mexican spotted owl, horseshoe milkvetch, Barneby ridge-cress, White River beardtongue, clay reed-mustard, shrubby reed-mustard, Pariette cactus and Uinta Basin hookless cactus. The black-footed ferret is an upland species that requires large contiguous blocks of active prairie dog colonies. The ferret is an endangered species that has been reintroduced to northeast Utah as an experimental population. The ferret reintroduction site was Coyote Basin, in Uintah County, a BLM-managed area within the VPA, but the FWS considers all of Uintah and Duchesne Counties to be within the experimental population area. The Canada lynx is an upland species that is dependent on a montane coniferous forest link in the Diamond Mountain area between lynx habitat in the Uinta Mountains to that in the Colorado Rockies.

The remaining six listed species are species that rely predominantly on the Green River, its tributaries, and the associated riparian habitats up to 100-year floodplain limit. These species include the yellow-billed cuckoo, bonytail, Colorado pikeminnow, humpback chub, razorback sucker, and the Ute ladies'-tresses.

Draft or final recovery plans have been prepared for all threatened and endangered species except the Canada lynx.

Critical habitat has been designated for the four Colorado River fish species (bonytail, Colorado pikeminnow, humpback chub, razorback sucker) and the Mexican spotted owl. Critical habitat for the Colorado River fish species occurs along portions of the Green River downstream of its junction with the Yampa River to the Colorado River, and including sections of the Green River in the VPA within Uintah and Grand Counties. Critical habitat has also been established along the lower portion of the Duchesne River. The critical habitat designation includes the 100-year floodplain.

Critical habitat for the Mexican Spotted Owl has been designated in portions of Carbon and Grand Counties, immediately adjacent to, but just outside of the VPA. Substantial suitable canyon habitat occurs in the adjacent Books Cliffs area.

There are numerous activities (generally referred to as "threats") that have resulted in the listing of these species. These include grazing, oil and gas development, loss of prey bases, habitat fragmentation, agricultural development, forestry practices, changes in natural flow and sediment transport regimes as a result of dam operations, flow depletions from irrigation, loss of riparian and wetland habitat, introduction of non-native species, and loss of habitat within specific soil and geologic formation types. The potential continued threats to these species and how the alternative management strategies for the RMP could change these threats are described in Section 4.17.

## 3.17.1.2 FEDERALLY ENDANGERED, THREATENED, CANDIDATE, AND PROPOSED SPECIES

Table 3.17.1. Federally Listed Threatened, Endangered, and Candidate Species Potentially Occurring in the VPA

Common Name Scientific Name	Protection (Federal/State)	Preferred Habitat	Potential for Occurring on BLM Lands
Black-footed ferret <i>Mustela nigripes</i>	Endangered/ Experimental	Grasslands with active prairie dog towns.	Two hundred and fifteen (215) ferrets have been successfully reintroduced into the Coyote Basin since 1999. All active prairie dog towns, or a complex of towns large enough to support ferrets (at least 100 acres) within Duchesne and Uintah Counties, are considered potential black-footed ferret habitat.
Canada lynx <i>Lynx Canadensis</i>	Threatened	Montane coniferous forest.	The range of the Canada lynx extends from Canada and Alaska south to Maine, the Rocky Mountains, and the Great Lakes region. Although sightings of the Canada lynx in Utah over the past twenty years have been very rare, the Diamond Mountain area provides a linkage area between lynx habitat in the Uinta Mountains to that in the Colorado Rockies.
Mexican Spotted Owl <i>Strix occidentalis lucida</i>	Threatened	Steep rocky canyons; substantial suitable habitat is present, though no critical habitat is present.	The Mexican Spotted Owl (MSO) ranges from southern Utah and Colorado through the mountains of Arizona, New Mexico, and West Texas into the mountains of Central Mexico. They typically prefer old growth mixed conifer ponderosa pine, or evergreen oak forest, and associated deciduous riparian forests. In Utah, MSOs are a permanent resident that nest in the deep, sheer-walled, sandstone or rocky canyons of the Green and Colorado River basins. Forested habitats (old growth mixed conifer ponderosa pine, or evergreen oak forest, and associated deciduous riparian forests) are suitable for foraging and dispersal. There have been two reports of MSOs in the Book Cliffs.
Yellow-billed Cuckoo <i>Coccyzus americanus occidentalis</i>	Candidate (State-listed threatened)	Dense lowland riparian habitat at 2,500 to 6,000 feet elevation; usually found within 300 feet of water.	The Yellow-billed Cuckoo is a neotropical migrant that nests in localized riparian valleys throughout Utah. The Ouray Wildlife Refuge and other locations along the Green River sustain the largest breeding population of Yellow-billed Cuckoo in the State of Utah with an estimated 10 to 20 pairs.

**Table 3.17.1. Federally Listed Threatened, Endangered, and Candidate Species Potentially Occurring in the VPA**

Common Name Scientific Name	Protection (Federal/State)	Preferred Habitat	Potential for Occurring on BLM Lands
Bonytail <i>Gila elegans</i>	Endangered	The habitat requirements of the bonytail are not well known because the species was extirpated from most of its historic range prior to extensive fishery surveys. Critical habitat has been designated along the Green River in Uintah and Grand Counties.	The bonytail was historically common to abundant in warm-water reaches of larger rivers in the Colorado River Basin from Mexico to Wyoming. It is currently a very rare species in the Colorado River Basin, with only a few individuals having been found in the last decade. Very low numbers of bonytail still occur in the Upper Colorado River basin in Gray Canyon of the Green River and at Black Rocks on the Colorado River and at the confluences of the Green and Yampa rivers and the Green and Colorado rivers. The majority of bonytail are being held in culture facilities and reintroduction efforts are under way. Several thousand hatchery-reared bonytails have recently been reintroduced in the Colorado River near Moab and in the Green River at the confluence with the Yampa River.
Colorado pikeminnow <i>Ptychocheilus lucius</i>	Endangered	Adult Colorado pikeminnow use a variety of habitat types, depending on time of year, but primarily use shoreline runs, eddies, backwater habitats, seasonally flooded bottoms, and side canyons. Critical habitat has been designated for Colorado pikeminnow along the Green River in Uintah, Carbon, Emery, and Grand counties. This critical habitat includes the 100-year floodplain.	This species' range is restricted to the Upper Colorado River basin, upstream of Glen Canyon Dam. They are most abundant in the Upper Green River (between the mouth of the Yampa River and head of Desolation Canyon) and Lower Green River (between the Price and San Rafael rivers). Other concentration areas include the Yampa River, the lower 21 miles of the White River, the Ruby and Horsethief Canyon area between Westwater, Utah and Loma, Colorado, and in the San Juan River between Lake Powell and Shiprock, New Mexico.

Table 3.17.1. Federally Listed Threatened, Endangered, and Candidate Species Potentially Occurring in the VPA

Common Name Scientific Name	Protection (Federal/State)	Preferred Habitat	Potential for Occurring on BLM Lands
Humpback chub <i>Gila cypha</i>	Endangered	Suitable habitat for this species is characterized by a wide variety of riverine habitats, especially canyon areas with fast currents, deep pools, and boulder habitat. Adults require eddies and sheltered shoreline habitats maintained by high spring flows. Young require low-velocity shoreline habitats, including eddies and backwaters, that are more prevalent under base-flow conditions.	This species originally inhabited the mainstem of the Colorado River from what is now Lake Mead to the canyon areas of the Green and Yampa River basins. Currently, it appears restricted in the Upper Basin to the Colorado River at Black Rocks and at Westwater and Cataract Canyons, in the Yampa River at Yampa Canyon, and in the Green River at Desolation/Gray Canyons. In the Lower Basin, humpback chub are only found in the mainstem Colorado River in Marble and Grand Canyons and in the Little Colorado River. Critical habitat has been designated along the Green River in Uintah and Grand counties.
Razorback sucker <i>Xyrauchen texanus</i>	Endangered	Habitats required by adults include rivers with deep runs, eddies, backwaters, and flooded off-channel environments in the spring; runs and pools often in shallow water associated with submerged sandbars in summer; and low-velocity runs, pools, and eddies in winter. Young require nursery environments with quiet, warm, shallow water such as tributary mouths, backwaters, or inundated floodplain habitats in rivers, and coves or shorelines in reservoirs. Critical habitat for this species is the same as that of the Colorado pikeminnow.	Historically, the razorback sucker were widely distributed in warm-water reaches of larger rivers of the Colorado River Basin from Mexico to Wyoming, but is currently found in small numbers in the Green River, upper Colorado River, and San Juan River subbasins; lower Colorado River between Lake Havasu and Davis Dam; reservoirs of Lakes Mead and Mohave; in small tributaries of the Gila River Subbasin (Verde River, Salt River, and Fossil Creek); and in local areas under intensive management such as Cibola High Levee Pond, Achii Hanyo Native Fish Facility, and Parker Strip. The largest population of razorback sucker in the Upper Basin is found in the low-gradient, flat-water reaches of the middle Green River between the Duchesne River and Yampa River. Known spawning sites are located in the lower Yampa River and in the Green River near Escalante Ranch between river km 492 and 501.

Table 3.17.1. Federally Listed Threatened, Endangered, and Candidate Species Potentially Occurring in the VPA

Common Name Scientific Name	Protection (Federal/State)	Preferred Habitat	Potential for Occurring on BLM Lands
Barneby ridge- cress <i>Lepidium barnebyanum</i>	Endangered/NA	This species requires shallow, fine-textured soils intermixed with rock fragments. The Barneby ridge-cress is found along semi-barren ridges in piñon-juniper woodlands, at elevations ranging from 6,100 ft to 6,550 ft (1,860 m to 1,965 m).	There may be suitable habitat for this species on BLM lands, but there are no known populations (UDWR 2002b). The Barneby ridge-cress is located on the Uintah and Ouray Reservation, Utah. The VPA encompasses the total population, located on either side of Indian Creek south of Starvation Reservoir and the town of Duchesne. Three separate stands make up the total population, ranging across approximately five miles (8 km) (USFWS 1993).
White River beardtongue <i>Penstemon scariosus</i> var. <i>albifluvis</i>	Candidate/ NA	Occurs in pinyon-juniper, desert shrub, and mixed desert shrub communities at elevations ranging 4,600 to 6,800 feet elevation. Found at the lower members of the Green River Formation, growing on sparsely vegetated shale slopes.	White River beardtongue is currently known to occur on surficial outcrops of oil shale on 714 acres in southern Uintah County and southeast Duchesne County, Utah.
Clay reed- mustard <i>Schoenocrambe argillacea</i>	Threatened/ NA	Found on the contact zone between the upper Uinta and lower Green River Formations, typically at elevations ranging from 4,800 to 5,800 feet elevation. It inhabits mixed desert shrub communities of Indian ricegrass and pygmy sagebrush on the shale slopes of the Evacuation Creek Member of the Green River Formation. Plants may be found growing on protected north-facing slopes.	Three clay-reed-mustard populations of fewer than 10,000 individuals each are currently known to occur in the Book Cliffs, Uintah County, Utah. The species is known to occur on steep slopes and cliffs overlooking the Green River, Hill Creek and Willow Creek. Currently known populations occur within a 15 mi x 8 mi area (24 km x 12 km; 1,541 acres) along the Green River from Willow Creek to Sand Wash. Populations may also occur above Sand Wash and Nine Mile Canyon on steep slopes that are problematic for population counts and surveys.
Shrubby reed- mustard <i>Schoenocrambe suffrutescens</i>	Endangered/ NA	Found on the Evacuation Creek Member of the Green River Shale Formation on calcareous shales in pygmy sagebrush, mountain mahogany, juniper, and mixed desert shrub communities (5,400–6,000 feet).	The shrubby reed-mustard is currently known to occur on 3,150 acres in oil shale lenses in the Hill Creek drainage, Willow Creek drainage, and Badland Cliffs.

**Table 3.17.1. Federally Listed Threatened, Endangered, and Candidate Species Potentially Occurring in the VPA**

<b>Common Name Scientific Name</b>	<b>Protection (Federal/State)</b>	<b>Preferred Habitat</b>	<b>Potential for Occurring on BLM Lands</b>
Pariette cactus <i>Sclerocactus brevispinus</i>	Threatened/ NA (USFWS 2007)	Occurs on fine soils forming desert pavement in clay badlands derived from the Uinta Formation in sparse salt desert shrubland from 4,600 to 4,900 feet elevation	Occurs as a single population of approximately 8,000 individuals within a 50 square-mile (18,000 acre) area from the Pariette Drainage south of Myton, Utah to the mouth of Pariette Draw south of Ouray, Utah (USFWS 2006). The total area of potential habitat includes an estimated 15,000 acres of the VFO (USFWS 2007).
Uinta Basin hookless cactus <i>Sclerocactus wetlandicus</i>	Threatened/ NA (USFWS 2007)	Occurs on Quaternary and Tertiary alluvium soils overlain with cobbles and pebbles in cold desert shrub and pinyon-juniper communities on alluvial river terraces, valley slopes, and rolling hills of the Duchesne River, Green River, and Mancos Formations from 4,300 to 6,560 feet elevation.	The current population is estimated at 13,000-26,000 plants that are patchily to densely distributed from the confluence of the Green, White, and Duchesne Rivers near Ouray, Utah south along the Green River to the vicinity of Sand Wash, including concentrations near the mouth of Pariette Draw and along the base of the Badlands Cliffs (USFWS 1990, 2005; SWCA 2006, 2007; Glisson 2007; UDWR 2007).
Ute Ladies'-tresses <i>Spiranthes diluvialis</i>	Threatened/ NA	Wet meadow and other riparian habitats that are subject to fluvial erosion and deposition. May also be found near springs, seeps, and lakeshores where there is sufficient ground water. This plant can be found on various substrates in riparian habitats between 4,265 and 6,800 feet elevation.	Ute ladies'-tresses is found in sporadic locations throughout the interior western United States. Within the Uinta Basin, the Ute ladies'-tresses occurs along the Green River in Brown's Park (UT), Browns' Park (CO), Dinosaur National Monument, and near the confluence with the Yampa River. The species also occurs on Ashley Creek, within Ashley Valley, along Big Brush Creek, the upper Duchesne River, and tributaries to the Duchesne River.

**3.17.1.3 STATE-LISTED WILDLIFE SPECIES AND BLM-LISTED SENSITIVE PLANT SPECIES**

Both the BLM and State of Utah maintain lists of sensitive plant and animal species. The restricted distributions, specialized habitat requirements, and population pressures (human induced and natural) facing special status species contribute to a high potential for federal listing, thus, their populations are of conservation interest. The BLM Manual 6840 specifies that they will manage State-listed plants and animals "to the extent that they are consistent with other Federal laws". BLM policy for BLM-listed sensitive species is to manage the species as if they were candidate species for federal listing so that they do not become listed, while also fulfilling other federal law mandates. The BLM has a policy of entering into conservation agreements and other conservations measures to protect both State- and BLM-listed species.

There are 28 other special status species in the VPA that are listed in Table 3.17.2. This includes 14 wildlife, 4 fish, and 14 plant species. Of the 14 plant species, 13 species are soil endemics, which means that they are restricted to specific soil types. The dependence of these species on locally unique geological formations and soil parent materials make them particularly susceptible to habitat loss.

There are four bird, four fish, and one plant species that are dependent upon streams, rivers and associated wetlands. The remaining species are primarily upland species that have a variety of habitat requirements including grasslands, desert shrub, woodland, mature forest, and caves within forested areas.

Threats to sensitive species that could result in their listing as federally threatened or endangered species are similar to the threats experienced by listed species. These threats include sensitivity to human disturbance, poisoning, changes in flow regimes, loss of riparian wetlands, timber harvesting, restriction to unique soil or geologic formations, competition from non-native species, overgrazing, and habitat degradation or loss due to agricultural practices, oil and gas development, and/or urban encroachment.

Table 3.17.2. State-listed and BLM-listed Special Status Species Potentially Occurring in the VPA.

Common Name Scientific Name	Protection*	Preferred Habitat	Potential for Occurring on BLM Lands
<b>State-listed and BLM-listed Special Status Mammal Species</b>			
Townsend's big-eared bat <i>Corynorhinus townsendii</i>	SP/SD	Forested areas; roosts and hibernates in caves, mines, and buildings.	The Townsend's big-eared bat is found throughout much of western North America including areas in the Uinta Mountains and the Book Cliffs. It is a cave-roosting species that move into man-made caves such as mines and buildings. Unlike many other bats, they are unable to crawl into crevices and usually roost in enclosed areas where they are vulnerable to disturbance. The Townsend's big-eared bat is quite sensitive to human disturbance, and this appears to be the primary cause of population decline for this species. This bat is colonial during the maternity season, when compact clusters of up to 200 individuals might be found. Maternity roosts form in the spring and remain intact during the summer. Site fidelity is high, and if undisturbed, the bats will use the same roost for many generations.
White-tailed prairie dog <i>Cynomys leucurus</i>	SP	Grasslands	White-tailed prairie dogs form colonies in parts of northeastern Utah, Colorado, Wyoming, and Montana. The white-tailed prairie dog is the main food source of the Utah population of the endangered black-footed ferret that were reintroduced to northeastern Utah. Major threats to the white-tailed prairie dog include habitat loss, poisoning, and disease.
<b>State-listed and BLM-listed Special Status Bird Species</b>			
American White Pelican <i>Pelecanus erythrorhynchos</i>	SD	Marshes, lakes, and rivers.	American White Pelicans summer in the interior of North America around major water bodies and winter along the shore of the Gulf Coast and Baja California. The species is extremely sensitive to human disturbance on its nesting grounds and is adversely impacted by loss of foraging habitat, environmental contaminants, and water level fluctuations. As many as 200 American white pelicans can be found between Pariette, Pelican Lake, and the Ouray National Wildlife Refuge during the spring and summer.

Table 3.17.2. State-listed and BLM-listed Special Status Species Potentially Occurring in the VPA.

Common Name Scientific Name	Protection*	Preferred Habitat	Potential for Occurring on BLM Lands
Bald Eagle <i>Haliaeetus leucocephalus</i>	CS	Riparian areas with tall trees.	Migratory Bald Eagles winter throughout the state in riparian, low-elevation forest, and desert habitats. There are several winter roosts along the Duchesne, Green and White Rivers and one nest on the White River a few miles upstream of the Colorado/Utah border. The species is recovering across its range, and it was recently proposed that the species be delisted. However, the number of nesting pairs in Utah has remained extremely low.
Bobolink <i>Dolichonyx oryzivorus</i>	SP/SD	Wet meadow, wet grassland, and irrigated agricultural areas.	The Bobolink was historically common but is now a rare nester in flooded grasslands and wet meadows of northern Utah. It summers in the northern regions of North America and winters in South America. Most of the birds migrate east of the Great Plains. The range of the Bobolink has decreased in Utah and across its entire range, because of habitat loss from drought and agricultural practices such as early season hay cutting, grassland conversion, and overgrazing. Habitat for the Bobolink occurs in the mid elevations of the VPA in the Uinta Mountains and the Book Cliffs and has been observed at the Pariette Wetlands.
Burrowing Owl <i>Athene cunicularia</i>	SP	Open grassland and prairies.	Burrowing Owls are neotropical migrants, nest underground in burrows, and are typically found in open desert grassland and shrubland areas that are level and well drained. They depend on burrowing mammals for nest sites and are often associated with prairie dog colonies. The decline of the owl's population across its range appears to be due primarily to agricultural practices, use of pesticides, and the decline of prairie dog colonies. Habitat for burrowing owls occurs throughout the lower elevations of the Uinta Basin. Many of the areas where Burrowing Owls are nesting have been identified and mapped by VFO personnel.

Table 3.17.2. State-listed and BLM-listed Special Status Species Potentially Occurring in the VPA.

Common Name Scientific Name	Protection*	Preferred Habitat	Potential for Occurring on BLM Lands
Ferruginous Hawk <i>Buteo regalis</i>	Threatened	Grasslands, agriculture lands, sagebrush/saltbush/greasewood shrub lands, and at the periphery of pinyon-juniper forests. Nests in juniper trees, cliffs, buttes, and creek banks.	The Ferruginous Hawk is a neotropical migrant breeding from southwestern Canada to central Arizona, New Mexico, and northern Texas, and wintering in California to northern Mexico. It is a year-round resident from Nevada through western and southern Utah, northern Arizona, and New Mexico, to eastern Colorado and South Dakota. In Utah, the Ferruginous Hawk nests at the edge of juniper habitats and open, desert, and grassland habitats in the western, northeastern, and southeastern portions of the state. Ferruginous Hawks are highly sensitive to human disturbance and are also threatened by habitat loss from oil and gas development, agricultural practices, and urban encroachment. They have experienced a decline across much of their range and have been extirpated from some of their former breeding grounds in Utah. Habitat for Ferruginous Hawk occurs in the lower and mid elevations of the VPA in the Uinta Mountains and the Book Cliffs and many of the active nest sites in the VPA have been identified and mapped. There are 271 known nesting sites in the VPA, 34 of which are currently active. Eighty-eight percent of these active and inactive nest sites have roads and pipelines within the ½-mile buffer established for these nest sites meant to limit surface-disturbing activities in close proximity to these nests.
Grasshopper Sparrow <i>Ammodramus savannarum</i>	SP/SD	Dry grasslands; characterized by short to mid-height clumps of grass with few to no shrubs.	The Grasshopper Sparrow is a neotropical migrant was considered to be historically abundant in the State of Utah; however, there are currently only a few known breeding sites in the grasslands of northern Utah. The Grasshopper Sparrow ranges over most of the United States during the summer and in the south and in Mexico during the winter. Much of this species' former habitat has been lost to agricultural and urban encroachment and overgrazing. These birds nest in semi-colonial groups in dry grasslands, characterized by short to mid-height clumps of grass with few to no shrubs. Habitat for Grasshopper Sparrow occurs in the grasslands of the Uinta Basin although there has been no documented occurrences in the VPA.

Table 3.17.2. State-listed and BLM-listed Special Status Species Potentially Occurring in the VPA.

Common Name Scientific Name	Protection*	Preferred Habitat	Potential for Occurring on BLM Lands
Greater Sage-grouse <i>Centrocercus urophasianus</i>	SP/SD	Sagebrush plains, foothills, and mountain valleys.	Greater Sage-grouse are found in the sagebrush foothills and plains of the Intermountain Region. Since 1967, the abundance of male grouse on known breeding grounds in Utah has declined approximately 50%. Brood counts and harvest data show a similar downward trend. Habitat loss and fragmentation from agricultural encroachment, urbanization, and overgrazing are the primary threats to the Greater Sage-grouse. Habitat for Greater Sage-grouse occurs in the mid elevations of the VPA in the Uinta Basin and the Book Cliffs. Many studies have been conducted on Sage-grouse in Utah and in the Uinta Basin. One of the strongest populations in the State of Utah has been shown to occur on Diamond Mountain. Many of the active leks and nesting areas in the VPA have been identified and mapped.
Lewis' Woodpecker <i>Melanerpes lewis</i>	SP/SD	Burned-over Douglas fir, mixed conifer, pinyon-juniper, riparian, and oak woodlands, but is also found in the fringes of pine and juniper stands, and deciduous (cottonwood) forests. Dead trees and stumps are required for nesting. Wintering grounds are over a wide range of habitats, but oak woodlands are preferred.	The Lewis' Woodpecker is a year-round resident to western North America and, in Utah, is occasionally found in the riparian habitats of the Uinta Basin and along the Duchesne and Green Rivers. They breed in open Ponderosa Pine forests and cottonwood dominated riparian bottoms and winter primarily along low-elevation cottonwood dominated riparian bottoms. Nests have been found on the Green River, Lake Fork River, and in Ponderosa Pine forests on the Uinta Mountains. Formerly common in several areas of the state, the species distribution is currently reduced, and the species is experiencing a range-wide decline. This woodpecker usually feeds on flying insects in open areas interspersed with trees in the spring and summer. It feeds primarily on fruits and nuts in the fall and winter. It is adversely affected by loss of habitat from water development and agricultural practices and may be increasingly affected by competition for nest cavities from non-native bird species.

Table 3.17.2. State-listed and BLM-listed Special Status Species Potentially Occurring in the VPA.

Common Name Scientific Name	Protection*	Preferred Habitat	Potential for Occurring on BLM Lands
Long-billed Curlew <i>Numenius americanus</i>	SP/SD	Uncultivated rangelands and pastures near water.	The Long-billed Curlew is a neotropical migrant that summers in the upland meadows and rangelands of western North America. It forages in moist meadow wetlands and upland habitats. The curlew is adversely affected by human disturbance and habitat loss from agricultural practices. Habitat for long-billed curlew occurs in the mid elevations of the Uinta Mountains and the Book Cliffs and it has been observed in the VPA.
Northern Goshawk <i>Accipiter gentilis</i>	CS	Mature mountain forest and riparian zone habitats.	The Northern Goshawk is a neotropical migrant that occurs across the northern regions of North America in scattered populations primarily in mature mountain forest and valley cottonwood habitats. The species is adversely affected by loss of habitat from timber harvest and development in riparian areas. Because Goshawks occur in low-density populations, they are particularly susceptible to population loss. Goshawk populations appear to have declined across their range, particularly in the Colorado Plateau ecoregion. Areas of potentially suitable nesting habitat for Northern Goshawk consist of coniferous forest and mixed-aspen forest types, dominated by spruce, fir, pine, and aspen. Populations of Northern Goshawk have been identified in the mid elevations of the VPA in the Uinta Mountains and the Book Cliffs.
Three-toed Woodpecker <i>Picoides tridactylus</i>	SD	Coniferous forests, generally above 7,800 feet elevation.	The Three-toed Woodpecker nests and winters in northern coniferous forest and mixed-aspen forest types dominated by spruce, fir, pine, and aspen, usually above 7,800 feet elevation, in the northern regions of North America and the Rocky Mountains. Small populations have been located along the highest elevations of the Book Cliffs and possibly Diamond Mountain. The species is negatively affected by forest management practices such as clear cutting and fire suppression.
<b>State-listed and BLM-listed Special Status Reptile Species</b>			
Smooth greensnake <i>Opheodrys vernalis</i>	SP/SD	Moist grassy areas and meadows.	The smooth greensnake typically inhabits meadows, grassy marshes, and moist grassy fields along forest edges. Its distribution ranges from northeastern Utah into central Colorado and northern New Mexico, and into the Northern Plains from the Canadian border south to Kansas and Missouri.

Table 3.17.2. State-listed and BLM-listed Special Status Species Potentially Occurring in the VPA.

Common Name Scientific Name	Protection*	Preferred Habitat	Potential for Occurring on BLM Lands
<b>State-listed and BLM-listed Special Status Fish Species</b>			
Bluehead sucker <i>Catostomus discobolus</i>	SP	Fast flowing water in high gradient reaches of mountain rivers.	The bluehead sucker are typically associated with fast flowing rocky riffles in higher gradient reaches of small to large rivers in the Colorado River drainage including the Green, White, and Duchesne rivers and their tributaries as well as in the Bonneville and Snake River basins. Flow alteration, habitat loss/alteration, and the introduction of non-native fish species have been identified as significant causes of the decline of this species.
Colorado River cutthroat trout <i>Oncorhynchus clarki pleuriticus</i>	CS	Cool, clear water of high-elevation streams and lakes.	There are 20 known populations of purestrain Colorado River cutthroat trout in northeastern Utah. Most existing populations of this species are restricted to areas above 7,000 feet elevation. These populations are being managed by the State of Utah under a multiagency conservation agreement aimed at reducing or eliminating the threats to this species (CRCT Task Force 2001). Habitat alteration and the introduction of non-native fish species have been identified as the primary threats to this species. UDWR currently has plans to reestablish Colorado River cutthroat trout in the Bitter Creek and Upper Willow Creek areas of the Book Cliffs. Habitat restoration activities have been ongoing and these areas will be chemically treated prior to reintroduction of Colorado River cutthroat trout to remove non-native fish species. The only existing population of Colorado River cutthroat trout on BLM lands in the VPA is found in Sears Creek (water code: II BQ).
Flannelmouth sucker <i>Catostomus latipinnis</i>	SP	Large rivers, where they are often found in deep pools of slow-flowing, low-gradient reaches.	Flannelmouth sucker are typically associated with rocky pools and slow flowing, low-gradient reaches in the large rivers of the Colorado River drainage including the Green, White, and Duchesne rivers. Flow alteration, habitat loss/alteration, and the introduction of non-native fish species have been identified as significant causes of the decline of this species.

**Table 3.17.2. State-listed and BLM-listed Special Status Species Potentially Occurring in the VPA.**

Common Name Scientific Name	Protection*	Preferred Habitat	Potential for Occurring on BLM Lands
Roundtail chub <i>Gila robusta</i>	Threatened	Large rivers, and is most often found in murky pools near strong currents.	Roundtail chub are found in moderate-sized rivers in the Colorado River drainage including the Green and Duchesne rivers. Adults are generally associated with pools and eddies with overhead cover, often congregating below rapids while juveniles generally inhabit shallower habitats than adults. Roundtail chubs are also found in large reservoirs in the drainage. They are carnivorous, opportunistic feeders, taking terrestrial and aquatic insects, especially midges, mayflies, and caddis flies, as well as snails, crustaceans, fish, and sometimes-filamentous algae. This fish was once much more common throughout the Colorado River system than it is today. Habitat modification (e.g., stream channelization, damming, removal of riparian vegetation) and establishment of non-native predators are probably the primary factors contributing to the decline of this species.
<b>State-listed and BLM-listed Special Status Plant Species</b>			
Park rockcress <i>Arabis vivariensis</i>	Sensitive	Occurs on the Weber Formation sandstone and limestone outcrops in mixed desert shrub and pinyon-juniper communities at 5,000 to 6,000 feet elevation.	The park rockcress is found in Dinosaur National Monument and on 30 acres on Diamond Mountain and Cliff Ridge.
Hamilton milkvetch <i>Astragalus hamiltonii</i>	Sensitive	Occurs on Asphalt Ridge, Mowry, Dakota and Wasatch Formations and Lapoint and Dry Gulch Members of the Duchesne Formation in pinyon-juniper and desert shrub communities at 5,240 to 5,800 feet elevation.	The Hamilton milkvetch is currently known from only 19 sites (329 acres) between Lapoint and Vernal, Utah.
Owenby's thistle <i>Cirsium owenbyii</i>	Sensitive	Occurs on the east flank of the Uinta Mountains in the sagebrush, juniper, and riparian communities at 5,500 to 6,200 feet elevation.	The Owenby's thistle is currently known from only a few sites in Brown's Park (53 acres), Diamond Mountain and Cliff Ridge.

Table 3.17.2. State-listed and BLM-listed Special Status Species Potentially Occurring in the VPA.

Common Name Scientific Name	Protection*	Preferred Habitat	Potential for Occurring on BLM Lands
Goodrich stinkweed ( <i>Cleomella palmeriana</i> var. <i>goodrichii</i> )	Sensitive	Typically occurs in heavy clay soils on eroded clay and shale slopes of the Mancos, Tropic and Morrison Formations in salt desert shrub communities from 4,000 to 6,000 feet elevation.	Goodrich stinkweed is known only from Rainbow Draw in Uintah County, Utah and from the Salmon-Baker area in Lemhi County, Idaho. The size and distribution of extant populations is not known.
Untermann daisy <i>Erigeron untermannii</i>	Sensitive	Occurs in the pinyon-juniper communities on calcareous shales and sandstones of the Uinta and Green River formations at 7,000 to 7,800 feet elevation.	The Untermann daisy is an endemic to the West Tavaputs Plateau in Duchesne County, Utah.
Alcove bog-orchard <i>Habenaria zothecina</i>	Sensitive	Occurs on moist stream banks, seeps, and hanging gardens of the Weber Sandstone Formation in mixed-desert shrub, pinyon-juniper, and oakbrush vegetation communities from 4,000 to 8,690 feet elevation.	Potential alcove bog-orchid habitat occurs in Dinosaur National Monument and elsewhere in Uintah County. There are currently no confirmed populations within the VFO (personal communication between J. H. Hornbeck, SWCA, and Clayton Newberry, BLM, June 30, 2008).
Rock hymenoxys <i>Hymenoxys lapidicola</i>	Sensitive	Occurs on rock crevices in the pinyon-juniper woodland or ponderosa pine-manzanita woodland communities from 5,700 to 8,100 feet elevation.	The rock hymenoxys is endemic to Cliff Ridge in Uintah County, Utah and adjacent regions of Dinosaur National Monument.
Huber's pepperweed <i>Lepidium huberi</i>	Sensitive	Rock crevices, eroding parent material and alluvial soils of the Chinle, Park City and Weber Formations in the Uinta and Green River Formation in the Book Cliffs. 5,000-8,000 ft.	Huber's pepperweed is known to occur in Big Brush Creek Gorge in the Uinta Mountains and has the potential to occur on the Utah side of the East Tavaputs Plateau.

**Table 3.17.2. State-listed and BLM-listed Special Status Species Potentially Occurring in the VPA.**

Common Name Scientific Name	Protection*	Preferred Habitat	Potential for Occurring on BLM Lands
Goodrich blazingstar ( <i>Mentzelia goodrichii</i> )	Sensitive	Occurs on steep, highly erosive, marly-calciferous shale escarpments of the Parachute Creek Member of the Green River Formation from 8,100 to 8,800 feet elevation.	Goodrich blazingstar is a narrow endemic of the West Tavaputs Plateau in southern Duchesne County, Utah. It is known from the escarpments of Argyle, Indian, Sowers and Willow Canyons, the margin of Avintaquin Canyon and Gray Head Peak, and adjacent regions in the Badlands Cliffs. The size and distribution of extant populations is not known.
Stemless penstemon <i>Penstemon acaulis</i>	Sensitive	Occurs on semi-barren substrates in pinyon-juniper and sagebrush-grass communities at 5,840 to 7,285 feet elevation.	The stemless penstemon is currently known from nine sites in Brown's Park, Daggett County, Utah.
Gibbens penstemon (Gibbens beardtongue) <i>Penstemon gibbensii</i>	Sensitive	Occurs on sandy and shaley (Green River Shale) bluffs and slopes with juniper, thistle, <i>Eriogonum</i> , <i>Elymus</i> , serviceberry, rabbitbrush, and <i>Thermopsis</i> at 5,500 to 6,400 feet elevation.	Gibbens penstemon is currently known at only one site (6 acres) in Brown's Park, Daggett County, Utah.
Goodrich penstemon (Goodrich beardtongue) <i>Penstemon goodrichii</i>	Sensitive	Occurs on the Duchesne River Formation on blue-gray to reddish bands of clay badlands at 5,590 to 6,215 feet elevation.	Goodrich penstemon is currently known from 24 sites in the Lapoint-Tridell-Whiterocks area.
Graham's beardtongue <i>Penstemon grahamii</i>	Sensitive	Occurs on gravelly clay soils in pinyon-juniper woodlands on semi-barren knolls of white calcareous shale in sparsely vegetated desert shrub and pinyon-juniper communities from 4,691 to 6,758 feet elevation.	Graham's Beardtongue is currently known to occur on 1,287 acres in East Duchesne and Uintah Counties, Utah.

**Table 3.17.2. State-listed and BLM-listed Special Status Species Potentially Occurring in the VPA.**

Common Name Scientific Name	Protection*	Preferred Habitat	Potential for Occurring on BLM Lands
Uinta greenthread ( <i>Thelesperma caespitosum</i> )	Sensitive	Occurs on dry, poorly developed soils on shale or marl slopes and benches and multicolored clay hills of the Parachute Creek Member of the Green River Formation or the Uinta Formation in mountain shrub/pinyon-juniper woodland communities from 5,900 to 8,860 feet elevation.	Endemic to Sweetwater County, Wyoming and the West Tavaputs Plateau of the Uinta Basin, Duchesne County, Utah. The size and distribution of extant populations is not known.

\*Protection:

CS: A species of concern being managed under a multi agency conservation agreement with the goal to keep the species from being federally listed.

Sensitive: Listed by the State of Utah, or BLM for plants, as a species sensitive to disturbance.

SD: Listed by the State of Utah as a species of special concern due to its limited distribution within the state.

SP: Listed by the State of Utah as a species of special concern due to declining population sizes within the state.

Threatened: Listed by the State of Utah as a species faced with substantial risk of extinction.

## **3.18 VEGETATION**

### **3.18.1 DOMINANT VEGETATION COMMUNITIES**

The vegetation on lands administered by the BLM within the VPA was mapped in conjunction with the Natural Resources Conservation Service (NRCS). Lands within the VPA under other jurisdictions were not analyzed. Because the soil associations were mapped to a minimum size of 50 acres, the designated vegetation associations only show changes in community types of a minimum of 50 acres as well, making the complex mosaic of natural vegetation not visible at this level of detail. The vegetation associations within the VPA were then classified using vegetation categories defined by the BLM and by GAP analysis (Edwards et al. 1996).

Vegetation across the VPA ranges from desert shrub to boreal forest. The following seven vegetation types are identified in the VPA: plains grassland/herbaceous, desert shrub, sagebrush/perennial grass, pinyon-juniper, mountain shrub, and conifer, which includes aspen/forb. Other minor vegetation/cover types are riparian areas and wetlands, and badlands. Descriptions of the identified vegetation types, including their associated plant species and general locations within the VPA, are provided below. The following associations occur intermixed throughout the VPA.

#### **3.18.1.1 PLAINS GRASSLAND/HERBACEOUS**

This vegetation type is dominated by herbaceous species and includes a few solitary shrubs. The plains grassland/herbaceous type is found in only a small portion of the VPA, but many of the species that compose it are found in the understory of the other associations. Most wildlife species use this area at some time during the year.

#### **3.18.1.2 DESERT SHRUB**

Vegetation of the desert shrub type typifies the cold desert environment. It composes approximately 20% of the VPA, mainly in the center of the planning area (e.g., Antelope Flat, Clay Basin, and half of the Myton Bench Area), and is located at the lower elevations from 4,800 to 6,000 feet. This type is characterized by shrubs such as shadscale, winterfat, Mormon tea, Gardner's saltbush, mat saltbush, four-winged saltbush, rabbitbrush, and greasewood (Table 3.18.1). The understory is sparse and may contain Indian ricegrass, galletta, scarlet globemallow, bud sagebrush, spring parsley, and textile onion. Soil salinity is relatively high.

Vegetation treatments or manipulations are not very successful in this type of community, due to the shallow soils and low moisture availability.

**Table 3.18.1. Common Plants in the Desert Shrub Community in the VPA\***

Scientific Name	Common Name
<b>Shrubs</b>	
<i>Atriplex canescens</i>	Four-winged saltbush
<i>Atriplex confertifolia</i>	Shadscale
<i>Atriplex corrugata</i>	Mat saltbush
<i>Atriplex gardneri</i>	Gardner's saltbush
<i>Artemisia spinescens</i>	Bud sage
<i>Ceratoides lanata</i>	Winterfat
<i>Chrysothamnus</i> spp.	Rabbitbrush species
<i>Ephedra nevadensis</i>	Mormon tea
<i>Sarcobatus vermiculatus</i>	Greasewood
<b>Grasses and Forbs</b>	
<i>Agropyron dasystachyum</i> var. <i>dasystachyum</i>	Thickspike wheatgrass
<i>Allium textile</i>	Textile onion
<i>Arenaria</i> spp.	Sandwort
<i>Cymopterus</i> spp.	Spring parsley
<i>Eriogonum</i> spp.	Buckwheat
<i>Descurainia pinnata</i>	Tansy mustard
<i>Hilaria jamesii</i>	Galleta
<i>Phlox</i> spp.	Phlox
<i>Poa sandbergii</i>	Sandberg bluegrass
<i>Poa</i> spp.	Bluegrasses
<i>Sitanion hystrix</i>	Squirreltail
<i>Sphaeralcea</i> spp.	Globemallow
<i>Sporobolus airoides</i>	Alkali sacaton
<i>Stipa hymenoides</i>	Indian ricegrass

\*Plant names follow A Utah Flora (Welsh et al. 1993).

### 3.18.1.3 SAGEBRUSH/PERENNIAL GRASS

The sagebrush association covers approximately 57% of the VPA. This association is composed mainly of black sagebrush, basin big sagebrush, Wyoming big sagebrush, and mountain big sagebrush (Table 3.18.2). Other important shrubs are rabbitbrush, Mormon tea, and bitterbrush. Basin big sagebrush and Wyoming big sagebrush dominate the zone between 5,000 and 7,000 feet. Typically, the basin big sagebrush is found in areas of well-drained soils that receive 10-16 inches of annual precipitation, and Wyoming big sagebrush occupies drier, shallow soils that receive 8-12 inches of annual precipitation. Mountain big sagebrush is dominant in areas over 7,000 feet in elevation that receive 14-20 inches of annual precipitation (Welsh et al. 1993).

The herbaceous understory is typically composed of bluebunch wheatgrass, Idaho fescue, western wheatgrass, Junegrass, Indian ricegrass, and many needlegrasses. Many forbs also occur in this area and are an important resource for Sage-grouse. Common forb species include balsamroot, mules ears, Indian paintbrush, sego lily, larkspur, phlox, and mustards (Edwards et al. 1994).

Wyoming and mountain big sagebrush are declining throughout the VPA, as evidenced by the existing, decadent, even-aged stands. Beginning in the late 1990s, drought accelerated the decline, which resulted in a sage die off and die back. Some areas had sagebrush mortality while others had re-growth of sagebrush in subsequent years. Where sagebrush died and the understory was cheat grass, the density of cheat grass increased. The native perennial grassland understory has also been invaded by annual species such as cheatgrass; some invasions cover thousands of acres. Prescribed burning may be used to treat these areas, which would also benefit wildlife habitat and the wildland urban interface. The sagebrush association provides important wildlife habitat in the form of crucial winter range for deer and elk and essential habitat and forage for Sage-grouse. Domestic livestock grazing occurs in this association, as does recreation.

**Table 3.18.2. Species Commonly Associated with Sagebrush/ Perennial Grassland Communities in the VPA\***

Scientific Name	Common Name
<b>Shrubs</b>	
<i>Artemisia nova</i>	Black sagebrush
<i>Artemisia tridentata</i> ssp. <i>tridentata</i>	Basin big sagebrush
<i>Artemisia tridentata</i> ssp. <i>vaseyana</i>	Mountain big sagebrush
<i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>	Wyoming big Sagebrush
<i>Chrysothamnus viscidiflorus</i>	Douglas rabbitbrush
<i>Ceratoides lanata</i>	Winterfat
<i>Ephedra nevadensis</i>	Mormon tea
<i>Purshia tridentata</i>	Antelope bitterbrush
<b>Grasses and Forbs</b>	
<i>Astragalus</i> spp.	Milkvetch
<i>Balsamorhiza</i> spp.	Balsamroot species
<i>Brassica</i> spp.	Mustards species
<i>Calochortus nuttallii</i>	Sego lily
<i>Delphinium</i> spp.	Larkspur species
<i>Erigeron</i> spp.	Fleabane species
<i>Elymus cinereus</i> var. <i>cinereus</i>	Great Basin wildrye
<i>Elymus smithii</i>	Western wheatgrass
<i>Elymus spicatus</i>	Bluebunch wheatgrass
<i>Erysimum asperum</i>	Wallflower
<i>Festuca</i> spp.	Fescue species
<i>Koeleria macrantha</i>	Junegrass

<i>Stipa</i> spp.	Needlegrass species
<i>Stipa hymenoides</i>	Indian ricegrass
<i>Wyethia amplexicaulis</i>	Mules ears

\*Plant names follow A Utah Flora (Welsh et al. 1993).

### 3.18.1.4 PINYON-JUNIPER

This association occurs at slightly higher elevations than the sagebrush. Typically, there is a wide transition zone from juniper-sagebrush to juniper, so the boundaries between these associations are indistinct.

In the juniper-dominated areas, the understory's percent cover generally decreases. Therefore, this association has many management challenges. Vegetation manipulation, in the form of chaining and prescribed burns, has been used in the past. (In the 1960s and 1970s, 11,600 acres in the VPA were chained and reseeded successfully, and in the 1980s, chaining occurred in Wood Canyon in the Nine Mile area and in Browns Park.) Through vegetation manipulation, openings that are beneficial to wildlife and ecosystem health can be created. Dense stands of juniper provide high-quality nesting habitat and thermal cover, but little forage value. Many more animal species can use this association if the juniper stands have a varied age class and structure. Common plant species in this association are shown in Table 3.18.3.

**Table 3.18.3. Species Commonly Associated with Pinyon-Juniper Communities in the VPA\***

Scientific Name	Common Name
<b>Trees</b>	
<i>Pinus edulis</i>	Pinyon pine
<i>Juniperus osteosperma</i>	Juniper

<i>Phlox</i> spp.	Phlox species
<i>Stipa hymenoides</i>	Indian ricegrass

\*Plant names follow A Utah Flora (Welsh et al. 1993).

### 3.18.1.5 MOUNTAIN SHRUB

This association is sometimes called browse, because a large proportion of the species in this association are of high forage and cover value for wildlife. Dominant shrub species include serviceberry, gamble oak, mountain mahogany, snowberry, squaw apple, antelope bitterbrush, and sagebrush (Table 3.18.4). The sagebrush may occasionally grow densely in areas, but generally, it is less than 50% of the overall composition in this association. Common herbaceous species include showy goldeneye, whorled buckwheat, hoary aster, sticky geranium, and a variety of native grasses. Mountain shrub occurs in more sheltered microclimates within the VPA than the sagebrush/perennial grass association.

**Table 3.18.4. Species Commonly Associated with Mountain Shrub Communities in the VPA\***

Scientific Name	Common Name
<b>Shrubs</b>	
<i>Artemisia tridentata</i>	Sagebrush
<i>Ceanothus</i> spp.	Buckbrush species
<i>Cercocarpus montanus</i>	Mountain mahogany
<i>Amelanchier</i> spp.	Serviceberry species
<i>Purshia tridentata</i>	Antelope bitterbrush
<i>Quercus gambelii</i>	Gamble oak
<i>Ribes cereum</i>	Wax currant
<i>Symphoricarpos oreophilus</i>	Mountain snowberry
<b>Grasses and Forbs</b>	
<i>Agastache urticifolia</i>	Hyssop
<i>Delphinium</i> spp.	Larkspur species
<i>Elymus glaucus</i>	Blue wildrye
<i>Elymus trachycaulus</i>	Slender wheatgrass
<i>Eriogonum heracleoides</i>	Whorled buckwheat

**Table 3.18.4. Species Commonly Associated with Mountain Shrub Communities in the VPA\***

Scientific Name	Common Name
<i>Eriogonum</i> spp.	Buckwheat species
<i>Erigeron</i> spp.	Fleabane species
<i>Festuca</i> spp.	Fescue species
<i>Geranium viscosissimum</i>	Sticky geranium
<i>Viguiera multiflora</i>	Showy goldeneye
<i>Mahonia repens</i>	Oregon grape
<i>Machaeranthera canescens</i>	Hoary aster
<i>Lupinus</i> spp.	Lupine species
<i>Phlox</i> spp.	Phlox species
<i>Poa</i> spp.	Bluegrass species
<i>Penstemon</i> spp.	Penstemon species
<i>Senecio</i> spp.	Groundsel species
<i>Stipa</i> spp.	Needlegrass species
<i>Trifolium</i> spp.	Clover species

\*Plant names follow A Utah Flora (Welsh et al. 1993)

**3.18.1.6 CONIFER FOREST: CONIFER/ASPEN, ASPEN/FORB, AND SPRUCE/FIR**

These three smaller vegetation associations combine to form the conifer forest association. The conifer forest association occurs at the highest elevations, mostly at the outer fringes of the VPA, covering approximately 4% of the total land area within the VPA. Douglas fir, spruce, ponderosa pine, and aspen communities are scattered throughout the higher elevations (7,500–10,500 feet). Because of the elevation, cheatgrass is not a significant threat. Elk, deer, and grouse frequently use this association in the summer. Domestic livestock also use this association for its forage and cover resources. Common species are shown in Table 3.18.5.

**Table 3.18.5. Species Commonly Associated with Conifer Forest Community in the VPA\***

Scientific Name	Common Name
<b>Trees</b>	
<i>Pseudotsuga menziesii</i>	Douglas fir
<i>Abies</i> spp.	Fir species
<i>Picea</i> spp.	Spruce species
<i>Pinus ponderosa</i>	Ponderosa pine
<i>Pinus</i> spp.	Pine species
<i>Populus tremuloides</i>	Quaking aspen
<b>Shrubs</b>	
<i>Ribes</i> spp.	Currant species

**Table 3.18.5. Species Commonly Associated with Conifer Forest Community in the VPA\***

Scientific Name	Common Name
<i>Rosa woodsii</i>	Wood rose
<i>Salix</i> spp.	Willow species
<i>Sambucus pubens</i>	Elderberry
<i>Symphoricarpos oreophilus</i>	Snowberry
<b>Grasses and Forbs</b>	
<i>Achillea millefolium</i>	Western yarrow
<i>Aquilegia coerulea</i>	Columbine
<i>Delphinium occidentale</i>	Tall larkspur
<i>Elymus trachycaulus</i>	Slender wheatgrass
<i>Frasera speciosa</i>	Green gentian
<i>Festuca</i> spp.	Fescue species
<i>Geranium</i> spp.	Geranium species
<i>Heracleum lanatum</i>	Cow parsnip
<i>Melica bulbosa</i>	Oniongrass
<i>Lupinus</i> spp.	Lupine species
<i>Mertensia</i> spp.	Bluebell species
<i>Phleum alpinum</i>	Alpine timothy
<i>Stipa</i> spp.	Needlegrass species

\*Plant names follow A Utah Flora (Welsh et al. 1993).

### 3.18.1.7 RIPARIAN AREAS AND WETLANDS

Approximately 16,000 acres of floodplains are found along the Green and White Rivers and Bitter, Evacuation, Sweetwater, and Willow Creeks in the Book Cliffs portion of the VPA. The Diamond Mountain portion of the VPA contains 15,650 acres of riparian areas as well as perennial and intermittent streams (BLM 1993b).

The ecological condition of the wetland and riparian areas in the VPA is considered to be threatened by flow alterations, non-native plant species, and grazing. Whitetop and tall whitetop are firmly established in the Green River watershed and in moist places that receive high pressure from recreation. Tamarisk is also well established along the river corridors, and *Phragmites* stands are increasing in size and distribution.

### 3.18.1.8 BADLANDS

In the Uinta Basin, badlands are characterized by Mancos shales, which occur as red and gray banded, eroded mudstones and sandstones and shale layers of the Uinta Formation. Mancos shales are high in selenium, and sometimes they have a sandstone cap layer. The badlands association is scattered throughout the resource area, but it comprises only 3% of the total area.

Vegetation on the badlands is very sparse; extensive areas of bare ground occur. Vegetation generally grows in areas where water can collect and at the base of slopes. A few annuals are tolerant of the side slopes in wet years, but such seasons are short. Gardner's saltbush and mat saltbush are the dominant species.

Antelope use these areas for forage and bedding, especially in the winter. Domestic sheep use the shrubs on the base slopes and in transition zones with other vegetation types. Some steeper, vertical slopes and knobs are used by raptors for nest sites. Wildlife use of this community is low in comparison to other communities, but it is relatively important to the wildlife that do use it.

### **3.18.2 INVASIVE SPECIES AND NOXIOUS WEEDS**

At least 23,000 acres of noxious and undesirable weeds are a management concern, spreading and becoming a common threat to many areas, within the VPA (BLM 2001). Many large infestations in the area also occur on private and Tribal lands adjacent to or near BLM lands. Of particular management concern are potential and existing populations of invasive species in the oil and gas fields that are receiving increased activity and interest. Human activities, OHV use and vehicles, construction activities, soil disturbance, wind, wildlife movement, and domestic livestock grazing activities can increase the spread and establishment of noxious weeds.

Noxious weeds are identified and recognized by the federal government, the state, and local counties. Within the VPA, the BLM office would control all weeds designated as noxious, as per regulations. For a list of the noxious weeds for the VPA, refer to Table 3.18.6.

The Upper Green River Cooperative Weed Management Area, which includes Daggett County in Utah and Sweetwater County in Wyoming, was formed to manage weeds across lands under various jurisdictions and to pool resources for weed control activities and education. The Uinta Basin Cooperative Weed Management Area was organized in 2003 to meet similar objectives. Current collaborative weed management agencies include the NPS, BLM, USFS, UDWR, Ute Tribe, and SITLA. One result of collaborative efforts is the Red Creek Tamarisk Project. The tamarisk is being controlled both in Wyoming and Utah on the Red Creek watershed.

Russian knapweed, spotted knapweed, Canada thistle, tall whitetop, whitetop, musk thistle, Scotch thistle, and leafy spurge have been singled out as the most invasive species and have become the priority for management and control due to their expanding populations on BLM lands in the VPA. Russian knapweed occurs from Myton to Browns Park with large infestations on private and Tribal lands in the Roosevelt area and the Green River corridor. Also of concern are the increasing populations of Russian knapweed in the oil and gas fields. So far, two populations of spotted knapweed are known: one is located on Diamond Mountain, the other on Blue Mountain. An infestation of diffuse knapweed was located on Blue Mountain, resulting in a special emphasis area for control. One infestation of leafy spurge occurs on BLM lands; however, there are also populations on nearby private land. Canada thistle is a problem in moist areas, especially where livestock use is prevalent. Scotch thistle is coming in as patches scattered throughout the VPA. Whitetop is a problem scattered across the VPA and is increasing in the oil and gas fields. Tall whitetop has major infestations on all land ownerships in all three counties, especially in the Green River corridor.

Henbane and houndstongue are undesirable plants that are targeted by the BLM for control on the VPA due to the increased infestations on native rangelands. These species are prevalent in the Argyle Ridge area, and Nine Mile Canyon. In the Book Cliff portion of the VPA they are prevalent on Seep Ridge and in the Willow Creek watershed. Henbane is a threat in the Browns Park area due to heavy infestations in Wyoming, where it is not controlled.

Russian thistle, halogeton, and cheatgrass are undesirable weed species that occur throughout the Uinta Basin, Clay Basin, and Browns Park. These three plants are already heavily established along the roadsides, and the populations increase with oil field development. Cheatgrass has become so widespread that control efforts are focused on reducing its density through large-scale habitat manipulation programs, and not by individual sprayings. In 1992, a cheatgrass inventory identified 55,700 acres as having greater than 60% cheatgrass cover, and 162,000 acres were identified as having 10-60% cheatgrass cover. The cheatgrass infestation in the VPA has increased and is a major management concern.

Tamarisk has effectively established itself along all the riparian ecosystems, as well as in patches where moisture accumulates in the desert shrub and sagebrush/grass communities. Some control has been gained over the tamarisk infestations via herbicide use in Red Creek and Browns Park. Some areas of tamarisk within Utah are currently protected as designated critical habitat for the federally endangered southwestern willow flycatcher, which further complicates its management. However, it should be noted that the VPA does not contain designated critical habitat for the southwestern willow flycatcher. Tamarisk was listed as a county noxious weed in Uintah County as of 2003.

**Table 3.18.6. Noxious Weeds and Undesired Plant Species**

Common Name	Scientific Name	Status	Known Distribution
Bermudagrass	<i>Cynodon dactylon</i>	State Noxious Weed	No populations known at this time
Dyer's woad	<i>Isatis tinctoria</i>	State Noxious Weed	Found on private land in Duchesne and Uintah Counties
Field bindweed (wild morning glory)	<i>Convolvulus arvensis</i>	State Noxious Weed	Occasional. Heavy infestations in farm and city lands
Johnsongrass	<i>Sorghum halepense</i>	State Noxious Weed	No populations known at this time
Knapweed, diffuse	<i>Centaurea diffusa</i>	State Noxious Weed	One population on Blue Mountain
Knapweed, Russian	<i>Centaurea repens</i>	State Noxious Weed	Heavy infestations especially in Pelican Lake area, Green River, Browns Park and adjacent lands to Myton, to Roosevelt. Increasing in the oil and gas fields
Knapweed, spotted	<i>Centaurea maculosa</i>	State Noxious Weed	Known populations on Diamond Mountain and Blue Mountain

Table 3.18.6. Noxious Weeds and Undesired Plant Species

Common Name	Scientific Name	Status	Known Distribution
Knapweed, squarrose	<i>Centaurea squarrosa</i> or <i>Centaurea virgata</i>	State Noxious Weed	No populations known at this time
Leafy spurge	<i>Euphorbia esula</i>	State Noxious Weed	Small population on ditch area, some on private lands
Medusahead	<i>Taeniatherum caput-medusae</i>	State Noxious Weed	No populations known at this time
Purple loosestrife	<i>Lythrum salicaria</i>	State Noxious Weed	Coming into east Duchesne County. No populations known on BLM lands at this time
Quackgrass	<i>Agropyron repens</i> or <i>Elytrigia repens</i>	State Noxious Weed	Occasional
Tall whitetop (perennial pepperweed)	<i>Lepidium latifolium</i>	State Noxious Weed	Very prevalent along all riparian areas and moist patches
Canada thistle	<i>Cirsium arvense</i>	State Noxious Weed	Scattered along riparian areas
Musk thistle	<i>Carduus nutans</i>	State Noxious Weed	Scattered
Scotch thistle (cotton thistle)	<i>Onopordum acanthium</i>	State Noxious Weed	Scattered
Whitetop (hoary cress)	<i>Cardaria draba</i>	State Noxious Weed	Very prevalent along all riparian areas and moist patches
Yellow starthistle	<i>Centaurea solstitialis</i>	State Noxious Weed	No populations known at this time
Russian olive	<i>Elaeagnus angustifolia</i>	Duchesne and Uintah County Noxious Weed	Scattered along riparian areas
Salt cedar	<i>Tamarix ramosissima</i>	State Noxious Weed	Riparian areas, seeps, springs, wetlands, wash beds & wash banks, roadsides, stock ponds, occasionally in open areas with high water table
<b>Other Undesirable Plant Species</b>			
Black henbane	<i>Hyoscyamus niger</i>	Undesired Plant Species	Very prevalent in Book Cliffs, Nine Mile Canyon, and Argyle
Bull thistle	<i>Cirsium vulgare</i>	Undesired Plant Species	Occasional
Buffalobur	<i>Solanum rostratum</i>	Undesired Plant Species	No populations known at this time
Camelthorn	<i>Alhagi camelorum</i>	Undesired Plant Species	Occasional
Common cocklebur	<i>Xanthium strumarium</i>	Undesired Plant Species	Occasional

Table 3.18.6. Noxious Weeds and Undesired Plant Species

Common Name	Scientific Name	Status	Known Distribution
Common crupina	<i>Crupina vulgaris</i>	Undesired Plant Species	No populations known at this time
Goat's rue	<i>Galega officinalis</i>	Undesired Plant Species	No populations known at this time
Jointed goatgrass	<i>Aegilops cylindrica</i>	Undesired Plant Species	No populations known at this time
Low larkspur	<i>Delphinium nuttallianum</i>	Undesired Plant Species	No populations identified for control. Common native plant
Poison hemlock	<i>Conium maculatum</i>	Undesired Plant Species	No populations known at this time
Poverty weed	<i>Iva axillaris</i>	Undesired Plant Species	Occasional
Purple starthistle	<i>Centaurea calcitrapa</i>	Undesired Plant Species	No populations known at this time
Silverleaf nightshade	<i>Solanum elaeagnifolium</i>	Undesired Plant Species	No populations known at this time
St. John's wort	<i>Hypericum perforatum</i>	Undesired Plant Species	No populations known at this time
Velvetleaf	<i>Abutilon theophrasti</i>	Undesired Plant Species	No populations known at this time
Water hemlock	<i>Cicuta douglasii</i>	Undesired Plant Species	No populations identified for control. Common native plant
Wild proso millet	<i>Panicum miliaceum</i>	Undesired Plant Species	No populations known at this time
Yellow nutsedge	<i>Cyperus esculentus</i>	Undesired Plant Species	No populations known at this time
Toadflax, Dalmatian	<i>Linaria dalmatica</i>	Undesired Plant Species	No populations known at this time
Toadflax, yellow	<i>Linaria vulgaris</i>	Undesired Plant Species	One population known in Chipita
Whorled or poison milkweed	<i>Asclepias subverticillata</i>	Undesired Plant Species	Occasional
Halogeton	<i>Halogeton glomeratus</i>	Undesired Plant Species	Numerous infestations
Cheatgrass	<i>Bromus tectorum</i>	Undesired Plant Species	Numerous major infestations
Houndstongue	<i>Cynoglossum officinale</i>	Undesired Plant Species	Very prevalent in Book Cliffs, Nine Mile Canyon, and Argyle
Common teasel	<i>Dipsacus fullonum</i>	Undesired Plant Species	Becoming common along Upper Green River

### 3.19 VISUAL RESOURCES

The current management objective for visual resources is to manage the public lands in such a way as to preserve those scenic vistas that are deemed most important and to design or mitigate all visual intrusions so that the intrusions do not exceed the established Visual Resource Management (VRM) class objectives. Activities within the VPA that could potentially cause visual intrusions and have an impact on scenic quality are primarily surface-disturbing activities, including minerals exploration and development, OHV use, trail and/or road development, and fire management.

#### 3.19.1 VISUAL RESOURCE MANAGEMENT (VRM) CLASSES

The BLM uses the VRM system to inventory, manage, and set objectives for visual resources. The VRM system uses visual management classes (Class I through IV, Class I and Class II being the most protective) to designate permissible levels of landscape alteration, with the broad goal of protecting the visual quality of public lands. The assignment of VRM classes is based on the management decisions made in the RMP. All actions proposed during the RMP process that would result in surface disturbance must consider the importance of the visual values and the impacts that proposed actions could have on these values. The VRM class objectives are described in Appendix J. However, a brief summary of the VRM classes objectives are: VRM Class I: preserve the existing character of the landscape; VRM Class II: retain the existing character of the landscape with a low level of landscape change; VRM Class III: partially retain the existing character of the landscape with only moderate change to the landscape; VRM Class IV: major modifications are allowed to the existing character of the landscape, and the level of change can be high.

An area is assigned a VRM class objective based on its scenic quality, the level of visual sensitivity of the area, and the viewing distance of the area. Once an area has been assigned a VRM class, the area classification can be used to determine the impacts of proposed activities on visual resources and to analyze the level of disturbance that an area can tolerate before the proposed activity exceeds the VRM objectives for the area (BLM 1992).

#### 3.19.2 REGIONAL OVERVIEW

The entire VPA has been visually inventoried and classified according to the VRM classification system. As the VPA is located in the Uinta Basin, its visual quality is diverse, ranging from areas that are visually homogeneous to areas with unique and spectacular visual quality. The areas of highest scenic quality are found along the Book Cliffs, in the Bitter Creek Drainage, along portions of the White and Green River corridors, within the Browns Park ACEC, in the vicinities of Red Mountain and Diamond Mountain, and areas that border Dinosaur National Monument (Bartel 2002; see Figure 32 in the Maps section).

Areas being managed as VRM Class I include: Winter Ridge, Bull Canyon, West Cold Springs, Diamond Breaks, and Daniels Canyon WSAs, and the Book Cliffs Mountain Browse Natural Area/Instant Study Area (ISA).

Areas being managed as VRM Class II are: Nine Mile Canyon, the Upper Book Cliffs, the White River Corridor, the Upper Green River and the Green River Corridor from Dinosaur National Monument to State Highway 40, and Red Mountain-Dry Fork ACEC.

The remainder of the VPA is being managed as either VRM Class III or VRM Class IV.

Throughout the VPA, unmanaged OHV use is visually evident which, although localized, is long-term. New roads and trails are being created by OHV use, and OHVs are cutting trails across and over highly visible ridgelines. At present, the only area managed for OHV use is near Fantasy Canyon (including Devils Playground). The areas of highest OHV use (and corresponding visual degradation) are:

1. in the vicinity of Buckskin Hills, north of the town of Vernal;
2. an area to the north of Red Wash, in the vicinity of Bourdette Draw; and
3. an area south of the Bonanza Power Plant and north of the White River corridor.

Throughout the VPA, the rapid increase of petroleum and natural gas exploration and extraction are also visually evident. However, through visual mitigation and careful placement of drilling well pads, this development is not presently exceeding VRM class objectives.

The proximity of intense exploration and development near areas of high scenic quality and the increasing number of people seeking recreation in the VPA are creating resource-use conflicts, particularly in the White River corridor and the Book Cliffs Divide.

## **3.20 WILD HORSES**

This section describes the affected environment concerning wild horses in the Bonanza Herd Area (HA), the Hill Creek HMA, and the Winter Ridge Herd Area (HA). Approximately 2,340 animal unit months (AUMs) are currently allocated to support 195 horses in the Hill Creek Herd Area. No forage has been allocated for horses in the Bonanza Herd Area and the Winter Ridge Herd Area.

### **3.20.1 BONANZA HERD MANAGEMENT AREA**

In 1984, the wild horse population in the Bonanza Herd Area was estimated at approximately 40 horses (BLM 1985a). Prior to completion of the 1985 Book Cliffs RMP, plans were discussed to limit the herd to approximately 50 horses. However, the final decision was to remove all wild horses because of management conflicts. The rationale for the decision was based on unresolved conflicts associated with the manageability and protection of the horses. There was a perception that the horses could not be managed to achieve and maintain a thriving natural ecological balance, as required by the Wild Horse and Burro Act (BLM 2001).

In 1986, the BLM conducted a wild horse gather within the Bonanza HA. The Ute Tribe filed a complaint alleging ownership of the gathered horses. A national organization, Wild Horse Organized Assistance (WFOA), notified the BLM that if all of the horses were removed they

would bring suit against the BLM, citing as precedent an Interior Board of Land Appeals decision disallowing total removal from a herd area in Nevada. Consequently, the horses removed during the 1986 gather were returned to the Ute Tribe, based on Consent Decree 86-C-0821G issued by the United States District Court, Central Division. In turn, the Ute Tribe relinquished all claims on 13 wild horses within the herd area that had not been gathered. As part of the court order, and at the intercession of WHOA, the Ute Tribe agreed to deliver 26 unbranded wild horses to the BLM from the Pyramid Lake Paiute Reservation in Nevada. These horses were subsequently released into the Bonanza HA.

In 1998, as a result of detection of equine infectious anemia (EIA) disease in horses gathered by the Ute Tribe from lands adjacent to the HA, the BLM, the Animal Plant Health Inspection Service (APHIS), the Utah Department of Agriculture and Food, and the Ute Tribe entered into an agreement to gather and test all horses in the Uinta Basin, including the Bonanza horses, for EIA. In 1999, the BLM gathered the Bonanza wild horses and tested them for EIA. Some wild horses tested positive for EIA, were subsequently disposed of, and in June 2000, 72 disease-free horses were returned to the HA.

As mentioned above, in July 2001 the Book Cliffs RMP decision regarding the Bonanza HA was amended. The amended plan established the herd area as a herd management area (HMA) and provided guidelines for the long-term management of wild horses at an appropriate management level (AML) of 85 horses. However, the Bonanza herd (at a population of 92 individuals) was gathered in November 2001 to comply with a court order, which required the BLM to remove all of the wild horses from the HMA. The horses were placed either in the BLM's Adopt-A-Horse program or in sanctuaries.

Approximately 16 miles of the western boundary of the Bonanza HA (fenced) abuts the Uintah and Ouray Indian Reservation.

### **3.20.2 WINTER RIDGE HERD AREA**

According to the 1985 Book Cliffs RMP, the Winter Ridge wild horses were to be gathered and removed; however, the decision has not been implemented. The rationale for the 1985 decision to remove this herd was that the area might not be suitable habitat for wild horses. Because of the high elevation of the area, deep snow (24-40 inches annually) can accumulate during the winter months, putting a wild horse herd in this area at risk. In 2003, 40 wild horses were gathered and removed from the Winter Ridge Herd Area to ease stress on native rangelands caused by grazing and to maintain the well-being of the wild horses remaining in the area.

This herd area is bordered by state grazing allotments that permit domestic horses to graze. Currently, there is little or no fencing between the state and federal allotments. Should Winter Ridge be designated as an HMA, a fenceline agreement may need to be negotiated between the state, the permittee, and the BLM to minimize possible trespass situations between wild and domestic horses, or the BLM may need to negotiate with the state of Utah to eliminate domestic horses from those adjacent state allotments.

### **3.20.3 HILL CREEK HERD MANAGEMENT AREA**

The Hill Creek Extension of the Uintah and Ouray Indian Reservation separates the Hill Creek HMA into two parts: the northwestern and the southeastern.

In 2001, lands within the northwestern part, known as Naval Oil Shale Reserve Number 2 (NOSR-2) lands, were transferred to the Ute Tribe. Until the date of transfer, the BLM managed the surface resources on these lands, including wild horses, but the transfer allowed the Ute Tribe to manage, protect, and assert control over any horse located or found within the boundary of this parcel. The northern boundary of the transferred parcel is unfenced, so wild horses and Tribal horses, particularly those on either side of the unfenced boundary have been intermingling. Tribal and wild horses can potentially intermingle even in areas where fences exist: most existing fences are in need of maintenance or replacement.

As a result of the transfer of the NOSR-2 lands, the Hill Creek HMA can no longer be managed as one unit without greatly impacting Tribal lands. Thus, for the purposes of analysis in the VPA, the Hill Creek HMA will be considered as two herd areas: 1) Hill Creek Northwest/Wild Horse Bench and 2) Hill Creek Southeast/Agency Draw.

#### **3.20.3.1 HILL CREEK NORTHWEST/WILD HORSE BENCH**

The transfer of the NOSR-2 lands to the Tribe resulted in the reduction of the HMA by 48,000 acres, or approximately 35%. This part of the HMA was estimated to contain approximately 50-60% of the total wild horse habitat. In the Wild Horse Bench portion of the Hill Creek Herd Area is a resident herd of approximately 100 horses, composed of several bands.

Livestock grazing within the HMA has been permitted to the Ute Tribe, although the Tribe has not used this allotment for over twenty years. The livestock grazing allotment is called Lower Showalter.

Wild horses are also currently using an area north of and adjacent to the HMA, bordered on the east by Tribal Lands and on the west by the Green River. Comprising approximately 30,347 acres, the horses have established home ranges there. Up until now, the area has not been considered crucial to the long-term survival of the herd and was not included in the original delineation of the HMA (BLM 1983a).

#### **3.20.3.2 HILL CREEK SOUTHEAST/AGENCY DRAW**

This portion of the Hill Creek HMA comprises approximately 55% private land (owned by Utah Oil Shale Corporation), 35% BLM land, and 10% state land. Maintaining wild horses in an area in which 65% of the land is in non-federal ownership could severely limit the ability of the BLM to manage them. If the BLM were requested to remove the wild horses from the private and state land, Southeast/Agency Draw would essentially be split into two parts. However, in the past, these two owners have not objected to wild horses grazing their land.

The HMA is bordered on the south by Tribal lands. In this area, horses move freely between public and Tribal lands. As Tribal lands are higher in elevation, during the winter season, horses tend to move from Tribal lands in the south onto public lands to the north. As a result of this seasonal migration, winter census counts for the HMA are typically two to three times higher than late summer counts (150-170 horses in winter, compared to 40-50 in summer). During the summer, the few springs and ponds in the herd area provide only enough water to support a resident herd of 40-50 horses, and so the majority of the horses move back to the Tribal land at that time. The population estimate for BLM/Tribal horses that use this portion of the HMA is presently unknown. The BLM and the Tribe gathered over 510 horses from this general area in 2002–2003 because drought conditions were negatively impacting the herds and range conditions.

Similar to horses in the Wild Horse Bench area, horses in the Agency Draw area are also using land outside the herd area boundary. This 22,865-acre area, Big Pack Mountain, has not been considered crucial to the long-term survival of the herd and was not included in the original delineation of the HA (BLM 1983a). Big Pack Mountain is bordered on its other three sides by private or Tribal lands.

### **3.21 WILDLIFE AND FISHERIES RESOURCES**

The terrestrial wildlife species found in the VPA are typical of the intermountain region of the United States. These species include big game species such as mule deer, Rocky Mountain elk, pronghorn antelope, bighorn sheep, moose, black bear, and mountain lion. Additional species of concern in the VPA fall within the general categories of upland game species, raptors, waterfowl and shorebirds, fish and aquatic species, neotropical migrants, and small mammals and reptiles. Wildlife resources in the VPA are currently managed as directed by the Diamond Mountain RMP and Book Cliff RMP. These RMPs focus on managing habitat conditions instead of wildlife populations. Management goals for most wildlife populations in the VPA are determined primarily by UDWR, with the exception of federally protected wildlife populations, which are determined by USFWS. The current VPA RMPs allocate forage for elk, deer, and antelope. Additionally the Diamond Mountain RMP allocates forage for moose and bighorn at the level identified by the UDWR's prior stable numbers and long-term wildlife population management goals. Resource allocations for raptors, reptiles, amphibians, and other non-game species in the VPA are limited to protecting individuals and the habitat of state and federally listed species, and designating spatial and temporal buffers for nesting raptors.

The BLM's management of wildlife habitat in the VPA has had, and will continue to have, an impact on both local communities and those that exist outside of the Uinta Basin. There is considerable regional interest in the overall condition and management of the VPA. In the past, a majority of the local interest has been focused on big-game management and associated recreational activities. In recent years, however, non-consumptive uses in the VPA, such as tourism and wildlife viewing, have been increasing with the continued expansion of Utah's tourism industry. Because many of the wildlife species found in the VPA regularly cross public, private, and tribal lands, a collaborative effort between all land managers and owners has been essential for effective wildlife management in the VPA.

The UDWR has designated five wildlife management units within the VPA to aid in the management of these wildlife species. Seventy-six percent of Unit 17 (Wasatch Mountains) is located outside of the VPA. Of the remaining lands within the VPA designated part of this unit, the BLM administers only 1,245 acres, therefore, the wildlife management goals and objectives relative to this unit were not included in this analysis. The remaining four wildlife management units, and their sub-units, are outlined in Table 3.21.1. UDWR has developed, or is presently developing, wildlife management plans for the aforementioned big game wildlife species as well as fisheries and upland game populations.

**Table 3.21.1. Wildlife Management Units within the VPA**

Unit/Sub-unit number	Unit/Sub-unit name	Acres of Unit in the VPA	Acres of Unit in the VPA Managed by BLM
8, 8b 8c	North Slope Uinta Mountains West Daggett Three Corners	365,651	62,528 (17% of Unit)
9 9a 9b 9c 9d	South Slope Uinta Mountains Yellowstone Vernal Diamond Mountain Bonanza	2,775,395	711,092 (26% of Unit)
10 10a	Book Cliffs Bitter Creek and Little Creek	1,225,726	652,440 (53% of Unit)
11 11a	Nine Mile Anthro	706,163	296,756 (42% of Unit)

### 3.21.1 WILDLIFE ASSOCIATED WITH THE VPA

#### 3.21.1.1 MULE DEER

Mule deer occupy most ecosystems in Utah but generally attain their greatest densities in shrublands in areas characterized by rough, broken terrain and abundant browse and cover. Many mule deer populations migrate between summer and winter ranges. Mule deer summer range habitat types on BLM-administered lands in the VPA consist primarily of oak, sagebrush, Douglas fir, and Utah juniper vegetation types. Winter range habitat primarily consists of Utah juniper, prickly pear, sagebrush, galleta, greasewood, and Fremont cottonwood vegetation types. Areas of high winter use in the Book Cliffs included areas of open pinyon/juniper woodland interspersed with four-wing saltbush and sagebrush in Lower McCook Ridge, Indian Ridge, and Big Park (Karpowicz 1984).

The amount of overall crucial winter range and the migration corridor for mule deer that the BLM manages is outlined in Table 3.21.2. The target wintering mule deer herd size and annual harvest for these three wildlife management units are described in Table 3.21.3.

**Table 3.21.2. Mule Deer Habitat in the VPA**

Unit	Overall range		Crucial winter range		Migration corridor	
	Total Area (acres)	Acres Managed by BLM	Total Area (acres)	Acres Managed by BLM	Total Area (acres)	Acres Managed by BLM
Book Cliffs	1,203,853	651,819	355,992	58,361	58,361	47,091
Nine Mile	667,440	262,357	39,959	0	0	0
North Slope Uinta Mountains	349,738	61,526	105,949	0	0	0
South Slope Uinta Mountains	2,774,731	0	479,253	0	0	0
<b>Total</b>	<b>4,995,762</b>	<b>975,702</b>	<b>981,153</b>	<b>58,361</b>	<b>58,361</b>	<b>47,091</b>

**Table 3.21.3. Wildlife Management Goals for Mule Deer**

Unit Number	Unit Name (subunit)	Estimated Population Size* <sup>1</sup>	Population Objective <sup>1**</sup>	Buck-to-Doe Ratio	Buck Size	Annual Harvest
8b, 8c	North Slope (West Daggett and Three Corners)	5,000	6,200	15:100	30% being 3 point or better	600
9a	South Slope (Yellowstone)	11,200	13,000	15:100	30% being 3 point or better	1,500
9b, 9c	South Slope (Vernal and Bonanza)	10,100	13,000	15:100	30% being 3 point or better	1,000
9d	South Slope (Diamond Mountain)			25:100	30% being 3 point or better	Limited Entry
10a	Book Cliffs (Bitter Creek and Little Creek)	7,200	15,000	25:100	30% being 3 point or better	Limited Entry
11a	Nine Mile (Anthro)	2,950	8,500	15:100	30% being 3 point or better	250

\*Some of these units are estimated at about ½ of population objectives due to drought impacts and low productivity.

\*\* Population objectives are updated on an annual basis.

### 3.21.1.2 ROCKY MOUNTAIN ELK

The season and function of use of elk habitats help distinguish various types of winter ranges, production areas (calving grounds), and/or summer range. Production or calving areas are used from mid-May through June and typically occupy higher elevation sites than winter range. Calving grounds are usually characterized by aspen, montane coniferous forest, grassland/

meadow, and mountain brush habitats, and are generally in locations where cover, forage, and water are in close proximity (Fitzgerald et al. 1994). In western Colorado, for instance, most females calve within 660 feet of water (Seidel 1977). Crucial winter range is considered to be the part of the local deer and elk range where approximately 90% of the local population is located during an average of five winters out of ten from the first heavy snowfall to spring green-up.

The amount of crucial winter range for elk that the BLM manages is outlined in Table 3.21.4. The management goals for these four wildlife management subunits are described in Table 3.21.5.

**Table 3.21.4. Rocky Mountain Elk Habitat in the VPA**

Unit	Overall range		Crucial winter range	
	Total Area (acres)	Acres managed by BLM	Total Area (acres)	Acres managed by BLM

### 3.21.1.3 PRONGHORN

Pronghorn are common in Utah, where it primarily occurs in desert, grassland, and sagebrush habitats where they feed mainly on browse. Pronghorn are often found in small groups, and are usually most active during the day.

The lower elevations of the VPA sustain several pronghorn herds, which are highly valued by local sportsmen and wildlife enthusiasts. The BLM and UDWR maintain several guzzler systems in these areas to provide a water source for pronghorn during summer months. The pronghorn populations in the VPA have been adversely affected by historic range degradation and habitat loss in the sagebrush steppe habitat type as well as periodic drought conditions. The management goals for the pronghorn herds in these wildlife management units have not been finalized (UDWR 2001). Locations and total acreage of pronghorn habitat managed by the BLM in the VPA are shown in Table 3.21.6. Current population trends are given in Table 3.21.7. Population objectives are not currently available.

**Table 3.21.6. Pronghorn Habitat in the VPA**

Unit	Total Area (acres)	Acres managed by BLM
Book Cliffs	122,968	85,973
Nine Mile	317,512	179,321

### 3.21.1.4 BIGHORN SHEEP

Rocky Mountain bighorn sheep can be found in small herds in northern-eastern Utah. Bighorn sheep have experienced significant declines in numbers in the early 1900s due to disease, habitat degradation, and hunting. Bighorn sheep require separation from domestic sheep to prevent the transmission of diseases, against which they have no natural defenses. Utah has been involved in an aggressive program for the past 30 years to restore bighorn sheep to their native habitat. Bighorn sheep currently exist in two areas in northern-eastern Utah, including areas adjacent to BLM-administered lands along the upper Green River, and in the Book Cliffs area. The current population estimate for bighorn sheep along the upper Green River (the West Daggett (8b) and Three Corners (8c) subunits of the North Slope wildlife management unit) is 182 individuals (Hersey and Aoude 2006). The total 2006 bighorn harvest from these management units was 4 individuals. Occasional sightings have also been documented in the Book Cliffs. These herds are all the result of reintroduction efforts and will likely continue to be augmented with additional reintroductions. Additional bighorn sheep reintroductions are proposed in the Browns Park/Diamond Mountain area. Water and vegetation improvements have also benefited these bighorn sheep populations. A management plan for bighorn sheep in the state of Utah has been developed. Locations and acreage of bighorn sheep habitat in the VPA is shown in Table 3.21.8.

**Table 3.21.8. Rocky Mountain Bighorn Sheep Habitat in the VPA**

Unit	Total Area (acres)	Acres managed by BLM

North Slope Uinta Mountains	95,751	14,740
South Slope Uinta Mountains	405,481	38,805
<b>Total</b>	<b>1,134,503</b>	<b>281,547</b>

### 3.21.1.5 MOOSE

Moose occur in the Rocky Mountains and the northeastern portion of the Intermountain West (Zeveloff and Collett 1988). Prior to 1918, moose were not known to occur in Utah. Since that time, they have been recorded on the north slope of the Uinta Mountains where their numbers have slowly increased. This increase has been attributed to an increase in beaver populations and the subsequent proliferation of marsh areas with which moose are typically associated (Zeveloff and Collett 1988). From the Uinta population, moose have dispersed and/or been transplanted to a variety of locations throughout the state. Although they may range widely across habitat types, moose are primarily associated with boreal forests and riparian areas. Moose are predominantly browsers and rely on the stems, bark, and leaves of a variety of trees and shrubs for forage. Year-round forage includes willow, fir, and quaking aspen. During the summer, grasses, forbs, and aquatic vegetation typically compose a large portion of the moose diet (Zeveloff and Collett 1988).

There are resident populations of moose in the North Slope Uinta Mountains, South Slope Uinta Mountains, Book Cliffs, and Nine Mile wildlife management units. Acreage of habitat in these units is shown in Table 3.21.9. Moose habitat is generally associated with early stages of seral development and shrub growth. Annual flooding and habitat management techniques, such as

prescribed burnings, are thought to improve habitat for moose. Current population trends are given in Table 3.21.10.

**Table 3.21.9. Moose Habitat in the VPA**

Unit	Total Area (acres)	Acres managed by BLM

### 3.21.1.6 BISON

The Ute Tribe maintains an introduced bison population on tribal lands in the Hill Creek portion of the Book Cliffs. These bison can be frequently found on BLM lands adjacent to Ute Tribal lands in the southern Book Cliffs where suitable bison habitat has been identified.

### 3.21.1.7 BLACK BEAR

In the VPA, black bears are typically associated with forested or brushy mountain environments and wooded riparian corridors and seldom use open habitats (Zeveloff and Collett 1988). Black bears tend to be nocturnal and tend to shy away from human contact. They are generally omnivorous with preferred foods including berries, honey, fish, rodents, birds and bird eggs, insects, and nuts. Black bears obtain most of their meat from carrion. From November to April, bears enter a period of winter dormancy. Winter dens are located in caves, under rocks, or

beneath the roots of large trees where they are kept nourished and insulated by a thick layer of fat (Zeveloff and Collett 1988).

The VPA sustains several large populations of black bear, some of which are traditionally thought to be the highest density black bear population in the state of Utah. A long-term study being conducted by BYU has shown that the black bear population in the Book Cliffs area has local concentrations of individuals in the Horse Canyon, Main Canyon, and Trail Canyon areas. The factors that make these areas support such high bear populations are still being investigated, but initial studies have shown that good habitat conditions with respect to elevation, permanent water sources, cover, and diversity of food, as well as isolation from human disturbance has raised concerns about potential impact on resource development in these areas on these populations (Pers. Comm. Hal Black, 1/13/04). The amount of black bear habitat that the BLM manages in the VPA is outlined in Table 3.21.11.

**Table 3.21.11. Black Bear Habitat in the VPA**

Unit	Total Area (acres)	Acres managed by BLM
Book Cliffs	232,792	108,291
Nine Mile	156,051	32,144
North Slope Uinta Mountains	155,511	0
South Slope Uinta Mountains	1,044,332	56,304
<b>Total</b>	<b>1,588,686</b>	<b>196,739</b>

### 3.21.1.8 MOUNTAIN LION

The mountain lion inhabits most ecosystems in Utah. However, it is most common in the rough, broken terrain of foothills and canyons, often in association with montane forests, shrublands, and pinyon-juniper woodlands (Fitzgerald et al. 1994). Mule deer is the mountain lion's preferred prey species. Consequently, mountain lion seasonal use ranges generally parallel those of mule deer.

Mountain lions are widespread and occur frequently throughout middle and upper elevations of the VPA where populations are considered stable. The amount of winter range for mountain lions that the BLM manages is the same as the mule deer habitat outlined in Table 3.21.2.

### 3.21.1.9 UPLAND SPECIES

Upland game in the VPA include populations of Blue Grouse, California Quail, Chukar Partridge, Greater Sage-grouse, Ruffed Grouse, Mourning Dove, Ring-necked Pheasant, Rio Grand Turkey, Merriam's Wild Turkey, and desert and mountain cottontail rabbit. Annual fluctuations for most upland game bird and small mammal populations closely correlate with annual climatic patterns. Mild winters and early spring precipitation during the months of March, April, and May are associated with increases in upland game populations. Warm, dry weather during the early summer, especially in June, is generally considered vital for the survival of newly born young of many upland game species. Ring-necked Pheasant and Greater Sage-grouse

are two upland game species that have experienced a long-term decline as a result of the degradation and loss of important sagebrush steppe and grassland habitat (UDWR 2000). The Greater Sage-grouse is discussed further in the sensitive species section (Section 3.17).

#### **3.21.1.10 WATERFOWL, SHOREBIRDS, AND WADING BIRDS**

The VPA is associated with the western portion of the Central Flyway, which guides migrating birds along the Rocky Mountains and the Great Plains. Because of the arid climate of the VPA, migration routes are often associated with riparian corridors and wetland or lake stopover areas. There are several important waterfowl habitats in the VPA including the Pariette Wetlands, Pelican Lake, and the Green and White rivers. Waterfowl, shorebirds, and wading bird populations are primarily associated with the Pariette Wetlands, Ouray National Wildlife Refuge, and other wetland areas such as Browns Park waterfowl management area (WMA), Mallard Springs WMA, Stewart Lake WMA, and Pelican Lake. These wetlands are an oasis in the Uinta Basin, surrounded by the harsh, arid desert landscape of northeast Utah. Mallard, Gadwall, Cinnamon Teal, Pintail, and Canada Geese are the most common waterfowl species observed in these areas. Herons, egrets, Black-necked Stilts, and various sandpipers are the more common wading birds seen. Other kinds of birds less frequently seen are American White Pelican, Sandhill Crane, American Bittern, and White-faced Ibis.

The Pariette Wetlands Refuge managed by the BLM includes over 9,000 acres (6,504 acres of desert uplands and 2,529 acres of open water, wetland, and riparian habitat) in Pariette Draw. The wetlands feature a perennial flowing stream, 23 man-made freshwater ponds with alkali bulrush, and other emergent vegetation. The marshes, wet meadows, grain fields, and irrigation structures in Pariette have been constructed to improve available habitat for waterfowl and other wildlife species in the area.

The Ouray National Wildlife Refuge consists of approximately 19 square miles of bottomland and river surface along 12 linear miles of the Green River. The Ouray refuge was originally established to provide habitat for breeding and migrating waterfowl. More specifically, the primary objective was to provide food and cover for 14 species of nesting ducks. While the purpose for which the Refuge was established has not changed, the methods of achieving the purpose have changed. Management strategies today are focused on managing water to mimic the natural floodplains that existed before dams were erected along the Green River. Portions of protective levees throughout the Refuge have been removed to allow more frequent flooding. The river feeds five bottomlands within the river floodplain, including Johnson Bottom, Leota Bottom, Wyasket Lake, Sheppard Bottom, and Woods Bottom, as it winds through the Wildlife Refuge. In late May, as natural flooding occurs, ponds are formed, spurring the growth of semi-aquatic plants which provide food and cover for ducks and other wildlife. In addition, these ponds serve as nurseries for the endangered fish species of the Colorado River system.

#### **3.21.1.11 RAPTORS**

There are 20 species of raptors found in the VPA, all of which are federally protected under the Migratory Bird Treaty Act. In addition, several raptor species are Utah State-protected. These raptor species are discussed further in the Special Status Species section (Section 3.17). Special

habitat needs for all of these raptor species include the protection of nest sites, foraging areas, and roosting or resting sites. Buffer zones are usually recommended around raptor nest sites during the early spring and summer when raptors are raising their young. The most utilized raptor nesting habitats in the VPA are generally found along riparian areas, juniper-desert shrub transition areas, and cliff faces.

An inventory of raptors within the Vernal Field Office boundary was completed in August 2003 by Utah State University – Uinta Basin. This study focused on determining the nesting requirements and the seasonally important raptor habitats located on public lands within the VPA boundary. GIS locations and the demographics of each raptor nest site identified during the inventory were recorded. This information was added to an expandable GIS database that will track nest site and other important raptor habitat locations. Special habitat needs relative to raptors are generally associated with limiting disturbance during the nesting season and maintaining small mammal populations as a prey base. Electrocution from power lines and environmental contaminants continue to be a threat to some raptor species in the VPA.

#### **3.21.1.12 OTHER NON-GAME SPECIES**

Because of the variety of habitats found within the VPA, the VPA contains a high diversity of non-game species such as neotropical migrants and other birds, small mammals, amphibians, and reptiles. The VPA contains various riparian, marsh, talus slope, aspen-conifer, pinyon-juniper, and ridge top habitats used by these wildlife species. A list developed by the USFWS, UDWR, Partners in Flight of neotropical migrants, and other sensitive bird species found in the VPA is provided in Appendix H, Table 33. Other common neotropical migrants and other bird, small mammal, amphibian, and reptile species to the VPA include the American Crow, American Kestrel, Black-capped Chickadee, Common Raven, Green-tailed Towhee, Horned Lark, House Finch, Song Sparrow, Vesper Sparrow, Western Kingbird, Western Meadowlark, black-tailed and white-tailed jackrabbits, golden-mantled ground squirrel, raccoon, red fox, coyote, common sagebrush lizard, common side-blotched lizard, gopher snake, and greater short-horned lizard. Several small mammal, amphibian, and reptile surveys have been conducted in the VPA. Many of these non-game species are also harder to study and monitor because of low population sizes and/or secretive behavior. However, the BLM is acquiring basic habitat and population information on non-game species listed by state and federal agencies as special status species.

Neotropical migrants, small mammals, amphibians, and reptiles often have special habitat needs. Areas in the VPA with the highest concentrations and diversity of these species are generally associated with riparian areas. Amphibian populations have been shown to be particularly susceptible to disturbance activities and increases in chemical pollutants in their habitats. A study of the reptile, amphibian, and small mammal species found in the Book Cliffs area was conducted by Brigham Young University in 1995 and 1996. These studies concluded that a large proportion of small mammals and all amphibian species in the study area had the potential to be significantly impacted by grazing in riparian and wetland areas. Most of the reptile species were associated with talus slopes and rock faces and appeared to be at little risk from all conceivable management options. Additionally, the UDWR has identified that many neotropical migrants rely on riparian areas and corridors for nesting and migration purposes.

### 3.21.1.13 FISHERIES AND AQUATIC SPECIES

The riparian and aquatic habitat in the VPA is generally associated with the Green and White river drainages. Aquatic species in the VPA include several special status fish species such as bonytail, Colorado pikeminnow, humpback chub, razorback sucker, roundtail chub, bluehead sucker, Colorado River cutthroat trout, and flannelmouth sucker, which are discussed further in the special status species section. The Green and White rivers provide critical habitat for several of these fish species. A primary concern with the riparian areas in the VPA is the effect of decreased regeneration of cottonwood and willow stands and the invasion of non-native plant species such as salt cedar (*Tamarix* sp.) and Russian olive (*Elaeagnus angustifolia*) on riparian and aquatic wildlife species.

There are several important cold- and warm-water fisheries within the VPA, including Matt Warner, Calder, Crouse, Steinaker, Red Fleet, Cottonwood, and Brough reservoirs; Pelican Lake; and the White and Green rivers and their tributaries. Most of the reservoirs in the resource area are managed as cold-water fisheries and are stocked with salmonids by the UDWR. The Green River below Flaming Gorge Dam and Pelican Lake have been designated by the state of Utah as waters to be managed under the Blue Ribbon Fisheries Initiative because of the quality angling they provide. The Pariette Wetlands have also been identified as an important aquatic area in the VPA. However, maintenance of the nonnative fisheries associated with the VPA have adversely impacted the recovery of several special status fish species found in the VPA, including the Colorado River cutthroat trout, bonytail, Colorado pikeminnow, humpback chub, and razorback sucker (Hawkins and Nesler 1991).

Aquatic species are often used as indicator species of ecosystem health. These species often need protection from resource utilization such as recreation, grazing, mineral extraction, and invasive non-native species. These species may be impacted by resource management decisions made outside the VPA (e.g., the operation of Flaming Gorge Dam on the Green River).

### 3.21.2 HABITAT FRAGMENTATION

Habitat fragmentation is a process that causes the disruption and transition of once large continuous blocks of wildlife habitat into less continuous habitat, primarily through human disturbances such as land clearing and other surface disturbances, and the conversion of vegetation from one type to another. Wildlife habitats in the VPA include aquatic, riparian, grassland, desert shrub, badlands, sagebrush steppe, pinyon/juniper woodland, mountain shrub, and conifer forest. These vegetation types are also discussed further in the Vegetation Section. Fragmentation of these habitat types due to activities such as oil and gas development, road and pipeline construction, fence construction on rangelands and dam construction on waterways, or other resource development and land conversion can have a number of detrimental impacts on wildlife species. Habitat fragmentation generally results in some direct impact on wildlife from the initial loss of habitat associated with the alteration. Additional indirect impacts of this habitat loss may also affect the surrounding habitats by increasing the amount of transitional and avoidance space associated with the surrounding habitats. Increasing the edge habitats has been shown to accelerate ecological processes, increase the ability of invading plant or animal species to becoming established in the interior of the patch, and decrease functional habitat use for a variety of wildlife species. Interior species also become more vulnerable to decreasing chances

of successful dispersal from occupied patches and colonization to unoccupied patches because of the decreased size and connectivity of the patches.

The VPA presently contains large areas of disturbed wildlife habitat. Fragmentation has become an issue in areas where mineral, agriculture, and other types of land development is currently occurring. Reducing the effects of habitat fragmentation on wildlife species include determining thresholds for disturbance, conserving existing habitats on an ecosystem level, providing usable corridors between neighboring patches, and controlling the invasion of undesirable species into these refuges. UDWR maintains a database that identifies important areas for many of the game and sensitive species in the VPA including intact riparian areas, important habitats for mule deer, Rocky Mountain elk, Greater Sage-grouse, Ferruginous Hawk, black-footed ferret, etc. The impacts on wintering mule deer and other big game animals from an increasing density of natural gas wells, roads, and associated human activities in the northern Book Cliffs area was analyzed in a four-year baseline study (1998–2002) by the UDWR. The UDWR identified that accelerated oil and gas development in the Book Cliffs area has the potential to further displace big game animals and increase habitat fragmentation during the winter period, thereby lowering the relative carrying capacity of the range. The UDWR recommended that this baseline study be continued for an additional three years to establish long-term distributional trends of wintering big game populations and to determine the potential impact that oil and gas development may have on these populations in the north Book Cliffs area. Efforts will continue to be made to identify and maintain existing important habitats and their interconnecting corridors. A description of the existing habitat fragmentation can be found in Tables 20 to 32 in Appendix H.

## **3.22 WOODLANDS AND FOREST RESOURCES**

### **3.22.1 REGIONAL OVERVIEW**

Woodland resources comprise lands producing forest tree species that may be used as non-sawtimber products and sold in units other than board feet. By contrast, forest resources are used for sawtimber products and may be sold in board feet. For management purposes in the VPA, forest resources have been grouped with woodland resources.

Woodland resources within the VPA begin at mid-elevations, where sagebrush communities of the lower, more arid areas become dominated by pinyon pine and juniper (5,000 to 8,000 ft). Generally, woodland resources within the VPA consist of pinyon pine, Utah juniper, and Gambel oak. Forest species, the source of most forest resources, are found at higher elevations (Colorado Plateau 2002). Forest resources include ponderosa pine, aspen, Douglas fir, and minor quantities of spruce, white fir, limber pine, and subalpine fir. The stands with commercial value are located south of the town of Myton, in the Five Mile, Trail Canyon, and Big Wash areas; the south Diamond Mountain Rim; the northern slopes of Diamond Mountain; in Browns Park, near Diamond Mountain; in the drainages that flow into Argyle Canyon; and the southern portions of the Book Cliffs (BLM 1990, 2002).

In the southern part of the VPA, in the vicinity of the Book Cliffs, the principal woodland species consist of pinyon pine, Utah juniper, and Rocky Mountain juniper. High-production

areas containing these species generally have slopes of less than 25% and have not been recently burned. In the higher elevations, Douglas fir and aspen generally grow on northern and eastern slopes (at 6,000–8,500 feet) and at the heads of canyons, where soil moisture is near the surface. Cottonwoods grow along the White and Green River bottoms and generally do not grow more than 100 yards from the rivers' edges. Stands also include Russian olive and tamarisk. Mature, single-storied stands of cottonwood grow along old river channels, oxbows, and sandbars. Some areas near Diamond Mountain in the northern portion of the VPA support forest species such as Douglas fir, ponderosa pine, and aspen. Douglas fir is the dominant species in these higher elevation areas, composing up to 70% of the canopy coverage (Diamond Mountain MSA 1990). Approximately 2,000 acres of ponderosa pine exist here as well, some as relict stands.

### **3.22.2 WOODLAND AND FOREST PRODUCTS**

The most desirable woodland and forest products, sought after by both commercial and private interests, include sawtimber, fuelwood, posts, and Christmas trees. Interest in biomass is increasing and is expected to continue to grow as new uses and technologies develop. There is also a limited demand for other woodland products such as shrubs, trees, and seeds. The demand for woodland products continues to increase; however, the ability to satisfy the demand for woodland products is limited by the available woodland resource.

Commercial sales or commercial harvesting of forest resources are permitted by the BLM., Douglas fir, ponderosa pine, limber pine, aspen, and cottonwood trees may be sold in designated areas to protect forest stands from disease or to prevent wildland fires (BLM 1996).

Historically, pinyon pine has been the preferred species for fuelwood, but juniper has become popular as well. In the past, both of these woodland species were harvested following chainings, but most of the wood within these areas has been removed. Cutting of green wood is now a more common practice for commercial woodcutters.

Trees used as posts are generally found on the more productive, pinyon-juniper sites, where the soils are deep and well drained. Trees suitable for posts have become more difficult to find because they have been searched out and cut by local residents for many years. The areas where significant numbers of post-trees still grow are remote and not easily reached.

The annual demand for cut Christmas trees remains high, but the quantity of good-quality pinyon pine, the Christmas tree of choice, is limited (BLM 2002). Demand for Christmas trees from the VPA is primarily local, but each year, enough trees are sold to only partially satisfy local demand. Past sales of Christmas trees for personal use have been limited to approximately 600–800 trees. Live pinyon pine are also sold for landscaping.

Current management of woodland resources focuses on prescribed burns, burning of slash piles, and commercial and personal greenwood sales of pinyon pine and juniper. The BLM monitors commercial woodcutting periodically to ensure that woodcutters remain in compliance with permit stipulations.

## 4.0 ENVIRONMENTAL CONSEQUENCES

---

### 4.1. INTRODUCTION

This chapter presents the environmental consequences of the management actions proposed under the five alternatives and the Proposed RMP described in Chapter 2. These management actions were developed as alternative ways of resolving the issues that pertain to current Vernal Field Office (VFO) management and allocation of public land resources, their use, and protection. Decisions by the Bureau of Land Management (BLM) about resource use and management in the Vernal Planning Area (VPA) will be based on this issue analysis.

Alternative A would protect important environmental values and sensitive resources while allowing the development of oil and gas resources, recreational facilities, and other human uses. Alternative B would emphasize direct human actions. Alternative C would minimize human activities within the VPA. Alternative D (No Action) would be a continuation of existing management practices defined in the Diamond Mountain Resource Management Plan (RMP) and in the Book Cliffs RMP. Alternative E would emphasize the protection of all non-Wilderness Study Area (WSA) lands with wilderness characteristics. The Proposed RMP is a combination of decisions pulled from the various alternatives that best meet the goals and objectives of the plan.

This RMP/environmental impact statement (EIS) provides a landscape-scale, "big picture" level of analysis, and in most cases, the exact locations of projected development and other changes are not known at this time. Impacts for each specific resource or resource use presented in Chapter 3 are described under each alternative and by each issue that would affect that resource. Impacts are defined as modifications to the existing environment brought about by implementing an alternative. Impacts can be beneficial or detrimental, can result from the action directly or indirectly, and can be long-term, short-term, temporary, or cumulative in nature.

For the analysis, BLM staff has used existing data, current methodologies, professional judgments, and projected actions and levels of use. The analysis takes into account the mitigation measures and stipulations described in Chapter 2. If impacts are not discussed, the analysis has indicated that none would occur or their magnitude would be negligible.

Impacts from actions to be carried out under more than one alternative are discussed under the first applicable alternative and the Proposed RMP. This discussion then is referenced under the other pertinent alternatives and the Proposed RMP.

#### 4.1.1. ANALYTICAL ASSUMPTIONS

The following are the general assumptions used for issue assessment under all alternatives and the Proposed RMP. Assumptions associated with a single issue (e.g., wildlife habitat) are included within the alternative discussion for that issue.

- All resource actions recognize valid existing rights.

- The entire planning area is assigned one of the following leasing constraints for oil and gas development:
  - Open to oil and gas leasing subject to standard lease terms
  - Open to oil and gas leasing subject to moderate constraints (TL/CSU)
  - Open to oil and gas leasing subject to major constraints (NSO)
  - Administratively closed to oil and gas leasing
- The BLM would have the funding and workforce to implement the selected alternative.
- There would be no management decision-related restrictions in the RMP that apply to Utah's State Institutional and Trust Lands Administration (SITLA) lands. The BLM would continue to guarantee reasonable access to inholdings as required by law. Therefore, there should be negligible or minimal economic impact of BLM decisions on SITLA lands.
- Additional National Environmental Policy Act (NEPA) analysis would be required to determine the impacts from site-specific actions (activity plans) and to identify additional mitigating measures.
- All lands identified for disposal are free of encumbrances and can be disposed. This includes cultural resource clearances.
- Demand for recreational activities (both dispersed and concentrated), energy production, vegetative resources and wildlife (non-consumptive and consumptive) use would increase.
- Short-term impacts are those that would last for fewer than five years.
- Long-term impacts are those that would last for five years or more.
- State highways and county roads through the VPA will remain open for access.
- All decisions, projects, activities, and mitigation for the alternatives would be completed as described in Chapter 2 and Appendix K (Surface Stipulations Applicable to all Surface-disturbing Activities).
- Acreages were calculated using GIS technology and there may be slight variations in total acres between disciplines. These variations are negligible and will not affect analysis.
- The Hill Creek Extension (188,500 acres) was not leased in the Book Cliffs RMP and therefore is not included in the total acreage calculations of Alternative D (No Action).
- Reasonable access to state lands, across BLM lands, would be provided under all alternatives.

#### **4.1.2. ASSUMPTIONS AND METHODOLOGY FOR MINERALS DEVELOPMENT**

In 2002, the BLM prepared a projected reasonable foreseeable development (RFD) scenario to project environmental impacts across a 15-year period; this RFD has been modified (2008) for oil and gas development only to project environmental impacts for up to 5 years. Development projections included in-depth reviews of potential for occurrence, past well production, current well production, and future potential for production. During the pendency of this planning effort (beginning with public meetings in 2001 and 2002 for scoping purposes through the notification in the Federal Register on January 14, 2005, of the availability of the Draft RMP/EIS), the RFD

scenario, which is a planning tool and not a prediction or limit to development, did not track completely with the pace of development in the Uinta Basin. The BLM has carefully monitored industry trends and believes that the RFD used as an analytical tool in this Proposed RMP can be considered accurate up to approximately 5 years from the time the Record of Decision (ROD) is signed. Within the next five-year timeframe, the BLM will monitor the impacts to resources of continued development in the VPA and ensure that the impacts disclosed in this Proposed RMP are not exceeded by the pace of development.

The potential for occurrence and future oil and gas activity is presented in Table 4.1.2. This activity includes potential mineral development on state, private, U.S. Forest Service (USFS), tribal, BLM, and U.S. Fish and Wildlife Service (USFWS) administered lands within the planning area. Table 4.1.3 shows present and historic cumulative surface disturbance for all lands. Tables 4.1.4a and 4.1.4b describe the cumulative surface disturbance for the RFD.

Predicted surface disturbance for oil and gas development by alternative and the Proposed RMP on BLM lands only was calculated by multiplying the percent of BLM lands open for development under each of the alternatives and the Proposed RMP by the total number of wells predicted for all lands. The resultant number of wells was multiplied by surface disturbance assumptions per well (Table 4.1.1) to arrive at total disturbance (See specific resource chapters for applicable calculations). It should be noted that the total number of wells cited in the RFD report do not represent upper limits on the number of wells that could be drilled in the VPA during the life of the plan. The RFD well totals were developed for the purposes of assessing impacts for decision-making. The total number of wells permitted will be determined through site-specific NEPA analysis of field development projects.

**Table 4.1.1. Disturbance Assumptions**

Management Activity	Disturbed Acres
Access road construction	0.20 mile per well (0.73 acres surface disturbance per well)
Well pad construction	2.4 acres surface disturbance per well 0.9 acre surface disturbance per well will be reclaimed within 1 year after completion of operations
Existing pipeline systems	Gathering/Injection Lines: 0.47 acre surface disturbance per well (producing, shut-in, temporarily abandoned, and service wells) Transmission Lines: 0.15 mile per well (producing, shut-in, temporarily abandoned, and service wells). 0.79 acre surface disturbance per well (producing, shut-in, temporarily abandoned, and service wells). Approximately 1/3 of pipeline surface disturbance will be reclaimed in short term.
Power lines	Ten (10) percent of wells (producing, shut-in, temporarily abandoned, and service wells) will have electrification. Where power lines are present, the length will approximate access road length. Existing activity accounts for approximately 73 miles of power lines. Future development activity will result in approximately 119 additional miles of power lines. There will be approximately 0.25 acre of surface disturbance per mile of power line.

### **4.1.3. ASSUMPTIONS AND METHODOLOGY FOR AIR QUALITY MODELING**

Air quality modeling for this document is based on the initial acreages proposed for Alternatives A, B, C, and D in June and July 2004. Alternative E was formulated later than the other Alternatives and was determined to be the same as C, but managing for non-WSA lands with wilderness characteristics. For the purposes of the air quality analysis, Alternative E is assumed to be the same as C. Similarly, the assumptions relevant to oil and gas development as they pertain to air quality are identical for the Proposed RMP and Alternative A. Projected well numbers and road-related air quality impacts were based on these proposed acreages. The total acreages for potential mineral development for Alternatives A, B, C and D have changed somewhat over time as additional considerations and information has been brought forward through the assessment process. For Alternatives A, B and C/E, and the Proposed RMP, the changes are very small and represent less than 1% difference from the acreages and well numbers modeled for air quality impacts. In the case of Alternative D (No Action), the acreage used in the modeling assessment is approximately 6% greater than that currently available for leasing. This difference is specific to air quality modeling. When the air quality modeling was undertaken, the Hill Creek extension (encompassing approximately 188,500 acres in total) was included in the acreage totals for modeling. However, in the intervening timeframe, it was decided that because the Hill Creek Extension was not leased in the Book Cliffs RMP this acreage should have not been included in the modeling for Alternative D (No Action). Air quality modeling for Alternative D (No Action) does not reflect the withdrawal of the 188,500 acres and therefore exhibits a slight overestimation of air quality impacts for this alternative. Given the conservative nature of the assumptions used and boundary conditions employed for the air quality modeling, these differences are considered to be minor at most and the modeled air quality impacts for these alternatives remain valid.

### **4.1.4. TYPES OF IMPACTS TO BE ADDRESSED—DIRECT, INDIRECT, AND CUMULATIVE**

Direct impacts are attributable to implementation of an alternative that affect a specific resource and generally occur at the same time and place. Indirect impacts can result from one resource affecting another (e.g., soil erosion and sedimentation affecting water quality) or can be later in time or removed in location, but are still RFD. Long-term impacts are those that would substantially remain for many years or for the life of the project. Temporary impacts are short-term or ephemeral changes to the environment that return to the original condition once the activity is stopped, such as air pollutant emissions caused by earthmoving equipment during construction. Short-term impacts result in changes to the environment that are stabilized or mitigated rapidly and without long-term effects, such as surface disturbance that is revegetated immediately after earthmoving is completed. Impacts can vary from a slightly discernible change to a full modification or elimination of the environmental condition. Cumulative impacts could also occur as the result of past, present, and RFD future actions by federal, state, and local governments, private individuals and entities in or near the VPA.

#### **4.1.5. IMPACTS TO CRITICAL ELEMENTS**

##### **4.1.5.1. IMPACTS OF ALTERNATIVES ON PRIME AND UNIQUE FARMLANDS**

All alternatives and the Proposed RMP in this Final EIS are consistent with the intent of the Secretary of Agriculture Memorandum 1827 for prime land. The project does not include any use of prime farmland nor does it impact any prime farmland soils (NRCS 1990).

##### **4.1.5.2. IMPACTS OF ALTERNATIVES ON INVASIVE AND/OR NOXIOUS NON-NATIVE PLANTS**

Vegetation and surface-disturbing activities would occur under all alternatives and the Proposed RMP in this Final EIS. These disturbances all increase the risk of propagation of invasive or noxious non-native plants. However, effective implementation of management actions common to all of the alternatives would prevent the risk from becoming greater than at present and would help to reduce risk in the long-term.

##### **4.1.5.3. INCOMPLETE OR UNAVAILABLE INFORMATION**

This analysis was done using the best-available information that is believed to be sufficient for a programmatic analysis of the impacts of multi-discipline decisions on management direction on a planning area-wide basis. This includes but is not limited to landscape level data such as GAP-level vegetation data, State Soil Geographic (STATSGO) data, and field-office information on wildlife habitat boundaries. Additional site-specific data (including cultural resource surveys, TES surveys, etc.) will be required to complete site-specific NEPA analysis necessary prior to implementation of fire and fuel management activities.

## **4.10. NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

Non-WSA lands with wilderness characteristics are areas having 5,000 acres, or areas less than 5,000 acres that are contiguous to designated wilderness, WSAs, or other lands administratively endorsed for wilderness; or in accordance with the Wilderness Act's language, areas "of sufficient size as to make practicable its preservation and use in an unimpaired condition". These are areas in a natural or undisturbed condition that provide outstanding opportunities for solitude or primitive forms of recreation (non-motorized and non-mechanized activities in undeveloped settings). BLM used the same criteria for determining wilderness characteristics as in the 1979 wilderness inventory. The 5,000 acre value was helpful to BLM in making preliminary judgments, but it was not considered a limiting factor.

The Proposed RMP and all of the alternatives would impact the values of non-WSA lands with wilderness characteristics to some degree. Generally, actions that create surface disturbance adversely affect the natural characteristics of these areas and the setting for experiences of solitude and primitive recreational activities. Motorized uses in these areas detract from opportunities for both solitude and primitive forms of recreation.

Under the Proposed RMP, all or parts of 15 non-WSA lands with wilderness characteristics, totaling 106,178 acres would be managed with emphasis on protection of the areas wilderness characteristics. All or parts of 11 non-WSA lands with wilderness characteristics, totaling 171,418 acres would be managed with emphasis on other resources values and uses. Under Alternatives A, B, C, and D, no non-WSA lands with wilderness characteristics would be managed with specific emphasis on protection of the wilderness characteristics. Under Alternative E, all 25 non-WSA lands with wilderness characteristics would be managed with emphasis on protection of wilderness characteristics on 277,596 acres (see Table 2.1.10.)

The analysis that follows will disclose the effects of the various actions prescribed under the Proposed RMP and each alternative on the wilderness characteristics of non-WSA lands with wilderness characteristics proposed for management and protection of those characteristics and non-WSA lands with wilderness characteristics that are proposed for management with emphasis on other resource values and uses.

### **4.10.1. IMPACTS COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES**

#### **4.10.1.1. FIRE MANAGEMENT**

Prescribed fire would be used under the Proposed RMP and all alternatives to restore native vegetation communities; to maintain and enhance forage for livestock and wildlife; and to reduce fuel loading to prevent catastrophic wildfires.

Prescribed fire treatments would restore vegetation communities and a more natural or desired composition of forbs, grasses, shrubs, and trees, enhancing a more natural landscape. In the short term, a burned landscape may reduce visitor attraction to non-WSA lands with wilderness characteristics and opportunities for primitive recreation. In the long-term, however, a more

natural landscape would benefit the natural characteristics of the non-WSA lands with wilderness characteristics and enhance the setting and opportunities for primitive forms of recreation, including hiking, backpacking, hunting, wildlife viewing, and nature study. Enhancing forage for wildlife would support and enhance opportunities for primitive recreation, including hunting and wildlife viewing. Reducing fuel loading and the risk of catastrophic wildfire would protect the settings that support primitive recreation opportunities.

In the short term, fire operations (e.g., aircraft over-flights and fire line construction) would adversely impact both the natural landscape and characteristics of non-WSA lands with wilderness characteristics. The noise and presence of the people, equipment, and operations would also reduce opportunities for solitude and conflict with primitive forms of recreation. In the long-term, however, surface disturbance associated with the fire treatment would be restored, with little to no net effect on natural characteristics of the land. The effects of fire operations on opportunities for solitude and primitive recreation would cease, restoring those opportunities. When fencing and seeding are used to aid in restoration of the vegetation community, livestock exclusion fences would have a short-term, temporary impact on the natural characteristics of the non-WSA lands with wilderness characteristics. Introducing a fence would add a human-made structure to the landscape, diminishing the natural characteristics in the short term, and until it is removed.

Wildfire suppression would be permitted in non-WSA lands with wilderness characteristics, with similar impacts as described for prescribed fire above. The suppression operation would result in the same physical disturbances to the land, and thus the natural characteristics of the non-WSA lands with wilderness characteristics. The scale or degree of impact, however, may vary depending on the size and severity of the fire and the resources at risk. The impacts of the noise and presence of people and equipment would also be the same as described for prescribed fire, with variation for size and severity of the wildland fire.

The long-term effects of emergency site reclamation (ESR) on the wilderness characteristics of the non-WSA lands with wilderness characteristics, however, would vary, depending on the ESR objectives and methods employed to achieve those objectives. Restoration of healthy vegetation communities that protect watersheds and support wildlife would enhance the natural characteristics of the non-WSA lands with wilderness characteristics and the settings needed for primitive recreational opportunities.

The methods used to restore vegetation communities, however, would result in both short and long-term effects on the natural characteristics of an area. Revegetation methods that use aerial or broadcast seeding would leave less evidence of human intervention on the landscape, and little effect on the natural characteristics of the non-WSA lands with wilderness characteristics. In pinyon-juniper communities it is often necessary to remove standing dead vegetation to facilitate seeding. This is done by chaining, cutting, and/or chipping. If these methods are used in non-WSA lands with wilderness characteristics, as the evidence of human manipulation of the landscape would be readily apparent and remain for many years, reducing the apparent naturalness of the land. Except in emergency situations, methods used to restore wildland fires in non-WSA lands with wilderness characteristics that are being managed for those characteristics would employ methods that are consistent with protection of wilderness characteristics.

#### **4.10.1.2. LANDS AND REALTY**

Under the Proposed RMP and all alternatives, lands would be recommended for withdrawal from entry under the mining laws for the protection of natural and cultural resource values. Closure of lands to mining (e.g., gold, silver, and uranium) would prevent surface disturbances to the landscape that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Mineral withdrawals would also prevent the presence and noise of mining operations (people, vehicles, and equipment) that would diminish opportunities for solitude and conflict with primitive forms of recreation (e.g., hiking, backpacking, hunting, river floating, wildlife viewing, and nature study).

Under the Proposed RMP and all alternatives, most of the public lands in the VPA would be retained in public ownership and managed under the principles of multiple use and sustained yield for the benefit of the American people. Retention of public lands would facilitate the BLM's ability to manage the various resource values and uses, including wilderness characteristics. Further, non-federal lands may be acquired to maintain or enhance public use and resource values, through exchange or from willing sellers.

Under the Proposed RMP and all alternatives, the identification of utility corridors for future placement of power lines and pipelines, and the identification of avoidance areas for corridors would both degrade and protect the wilderness characteristics of non-WSA lands with wilderness characteristics. If corridors were located through non-WSA lands with wilderness characteristics, the placement of utility lines would introduce human-made structures to the landscape and degrade the natural condition of the lands. The presence of these facilities would change the setting required to support primitive forms of recreation from an undeveloped landscape to a more developed and industrial landscape. The presence and operation of utility lines would also reduce opportunities for solitude. On the other hand, if non-WSA lands with wilderness characteristics were identified as areas of avoidance for placement of utility corridors, the natural characteristics and opportunities for solitude and primitive recreation would be protected.

Under the Proposed RMP and all alternatives, easements would be acquired to improve access to public lands. Acquisition of easements would improve access to some of the non-WSA lands with wilderness characteristics, providing additional opportunities for primitive recreational activities.

#### **4.10.1.3. LIVESTOCK AND GRAZING MANAGEMENT**

Under the Proposed RMP and all alternatives, livestock (cattle and sheep) would continue to graze on public lands in non-WSA lands with wilderness characteristics. Levels of livestock use (AUMs) on public lands are set to ensure vegetation communities will meet standards for rangeland health, including proper functioning condition of riparian zones, and the BLM monitors the rangeland to ensure those standards and conditions are met. When a healthy vegetation condition is maintained, there would be no degradation of the natural characteristics of the non-WSA lands with wilderness characteristics. Healthy vegetation communities would maintain and enhance wildlife habitat and populations, ensuring continued opportunities for primitive forms of recreation, including hunting, wildlife viewing, and nature study. Under the Proposed RMP and all alternatives, the health of vegetation communities would be protected,

and, therefore, there would be no degradation to the natural characteristics of the non-WSA lands with wilderness characteristics.

Often, it is necessary to construct fences and waters to support livestock grazing. In order to ensure proper distribution of livestock over an allotment and proper levels of forage utilization, fences and waters are constructed to manage livestock. The introduction of human-made structures on the landscape would degrade the natural characteristics of the non-WSA lands with wilderness characteristics, to some degree. However, improved livestock distribution and forage utilization would protect and enhance the condition of the vegetation community and thus the natural characteristics of the non-WSA lands with wilderness characteristics. If a minimal number of fences or waters could be constructed in non-WSA lands with wilderness characteristics and still meet the objectives of protecting wilderness characteristics, they may be permitted. Livestock management facilities are proposed under the Proposed RMP and all alternatives.

#### **4.10.1.4. MINERALS**

Under the Proposed RMP and all alternatives, development of existing oil and gas leases would result in the loss of wilderness characteristics on between 14% and 100% of 11 different non-WSA lands with wilderness characteristics, totaling between 117,470 acres and 171,412 acres. Construction of roads, well pads, compressors, pipelines, and power lines would disturb vegetation and soil and the natural characteristics of the non-WSA lands with wilderness characteristics. The presence of people, vehicles, and equipment, and the physical disturbance to the landscape would diminish opportunities for solitude and conflict with primitive forms of recreation.

However, under the Proposed RMP and all alternatives, lands would be proposed for withdrawal from entry under the mining laws in some of the non-WSA lands with wilderness characteristics. Closure to mining would prevent surface disturbances that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics and would exclude the presence and noise of people, vehicles, equipment, and structures that would diminish opportunities for solitude and conflict with opportunities for primitive recreation.

#### **4.10.1.5. RECREATION**

Under the Proposed RMP and all alternatives, portions of the VPA would be managed for primitive recreational opportunities and the settings needed to support those activities and desired experiences. Under the Proposed RMP and every alternative, management for primitive recreation would maintain and enhance the opportunities for primitive and unconfined recreation and the experience of solitude in some of the non-WSA lands with wilderness characteristics.

Under the Proposed RMP and all alternatives, portions of the VPA would be managed for motorized recreation, including OHV use, back country driving, sightseeing, and vehicle-supported camping, picnicking, and hunting. Under the Proposed RMP and all alternatives, motorized uses would degrade opportunities for solitude and primitive recreation in some of the non-WSA lands with wilderness characteristics. Under Proposed RMP and Alternatives A, B, C,

and D (No Action), motorized travel would be permitted on some of the vehicle routes in non-WSA lands with wilderness characteristics. The noise and presence of vehicles would degrade opportunities for solitude and conflict with primitive forms of recreation. Under Alternative E, motorized use of routes would only be permitted on the boundaries of non-WSA lands with wilderness characteristics. However, use of those boundary routes would degrade opportunities for solitude near the edges of non-WSA lands with wilderness characteristics. As visitors move away from the boundary of the non-WSA lands with wilderness characteristics, further into the heart of the area(s), the impacts of the noise and presence of vehicles on solitude and primitive recreation would lessen.

#### **4.10.1.6. RIPARIAN AND WETLAND RESOURCES**

Under the Proposed RMP and all alternatives, riparian systems would be managed to achieve proper functioning condition. Protection and improvement of riparian vegetation communities in non-WSA lands with wilderness characteristics would enhance the natural characteristics of portions of some of the non-WSA lands with wilderness characteristics. Protection and improvement of riparian areas would also enhance habitat for aquatic and terrestrial wildlife and would enhance opportunities for primitive recreation.

Sometimes it is necessary to construct facilities to manage and improve riparian areas. Construction of exclosure fences, for example, would introduce human-made structures to the landscape and degrade the natural characteristics of the riparian portion of the non-WSA lands with wilderness characteristics, to some degree. Many of these structures would be temporary and would be removed upon achieving proper functioning condition. Rehabilitation of the riparian vegetation condition, however, would restore the natural characteristics of the riparian portion of non-WSA lands with wilderness characteristics.

#### **4.10.1.7. SPECIAL DESIGNATIONS**

Special designations are proposed under Proposed RMP and all of the alternatives. These areas include ACECs, suitable Wild and Scenic Rivers, and WSAs. Generally, ACECs and Wild and Scenic Rivers are established to protect water courses, wildlife, vegetation, cultural resources, scenic quality, and recreational opportunities, and management of them would limit surface disturbances and offer protection to the natural characteristics of some of the non-WSA lands with wilderness characteristics. Protection of natural landscapes would protect and enhance the settings and opportunities for both solitude and primitive types of recreation.

Under the Proposed RMP and all alternatives, WSAs would be managed to protect their wilderness characteristics. Where WSAs are contiguous to non-WSA lands with wilderness characteristics, protection of the WSA would extend or expand opportunities for solitude and primitive forms of recreation found in the non-WSA lands with wilderness characteristics to a larger area, enhancing the opportunity.

#### **4.10.1.8. VISUAL RESOURCES**

Under the Proposed RMP and all alternatives, visual resource management objectives would protect natural landscapes, and thus wilderness characteristics, but would also provide opportunities for landscape changes that would degrade the natural characteristics of non-WSA lands with wilderness characteristics. Management under VRM Class I (preservation of the characteristics landscape) and Class II (retention of the characteristics landscape) objectives would prevent and minimize disturbance to the landform and vegetation and would prevent the placement of structures that are apparent on the landscape, thus protecting the natural characteristics of some of the non-WSA lands with wilderness characteristics. However, management objectives under VRM Class III (partial retention of the characteristic landscape) and Class IV (management for landscape change) provide for more landscape change. With those objectives, surface disturbance to landform and vegetation and placement of structures that are apparent on the landscape would be permitted. This would degrade the natural characteristics of some of the non-WSA lands with wilderness characteristics and alter the setting needed to support opportunities for solitude and primitive types of recreation.

#### **4.10.1.9. WILDLIFE AND FISHERIES**

Under the Proposed RMP and all alternatives, the BLM would implement a variety of actions to maintain, enhance, and protect habitats for a diversity of fish and wildlife species. Degraded habitats would be restored. Habitat would be managed for large blocks that provide for the life cycle requirements of fish and wildlife species. These actions would lead to healthy and diverse wildlife populations throughout the VPA. For example, under the Proposed RMP and all alternatives, the cottonwood vegetation community along the Green and White Rivers would be protected and restored, where needed, to maintain important winter habitat for Bald Eagles. The presence of a variety of wildlife would provide for primitive recreation activities (i.e., hunting, wildlife viewing, photography, and nature study) in the non-WSA lands with wilderness characteristics.

There are no actions common to the Proposed RMP and all the alternatives for air quality, cultural resources, hazardous materials, paleontology, soil and water resources, or socio-economics, which would impact non-WSA lands with wilderness characteristics. These resources are analyzed in the Alternatives Impacts Section (4.10.2).

#### **4.10.2. ALTERNATIVE IMPACTS**

##### **4.10.2.1. IMPACTS OF CULTURAL RESOURCES DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

###### **4.10.2.1.1. PROPOSED RMP**

###### **4.10.2.1.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under this the Proposed RMP, cultural resource sites and areas of high site density would be protected from surface disturbance caused by OHV use by limiting motorized travel to designated routes in the Little Hole/Devils Hole area. This action would have direct, short- and long-term benefits to the natural characteristics of the Lower Flaming Gorge non-WSA lands with wilderness characteristics by limiting surface disturbance caused by OHV use to the designated routes and by not expanding OHV use to other areas of the non-WSA lands with wilderness characteristics. However, while limiting OHV use to designated routes would prevent surface disturbance that would impact the naturalness of this non-WSA lands with wilderness characteristics, the noise and presence of OHVs on these routes would have an adverse impact on opportunities for solitude and primitive recreation activities when OHVs travel on these routes.

###### **4.10.2.1.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under the Proposed RMP, cultural resource sites and areas of high site density would be protected from surface disturbance caused by OHV use by limiting motorized travel to designated routes in the Upper Willow Creek area. This action would have direct, short- and long-term benefits to the natural characteristics of the Wolf Point non-WSA lands with wilderness characteristics by limiting surface disturbance caused by OHV use to the designated routes and by not expanding OHV use to other areas of the non-WSA lands with wilderness characteristics. Limiting OHV use to designated routes and offering portions of the Four Mile Wash area for oil and gas leasing subject to NSO would also protect areas of high cultural resource site density by limiting surface disturbance and vehicle use to designated routes. This action would also have direct, short- and long-term benefits to the natural characteristics of the Four Mile Wash portion of the Desolation Canyon non-WSA lands with wilderness characteristics. However, while limiting OHV use to designated routes would prevent surface disturbance that would impact the naturalness of these non-WSA lands with wilderness characteristics, the noise and presence of OHVs on these routes would have an adverse impact on opportunities for solitude and primitive recreation activities when OHVs travel on these routes.

**4.10.2.1.2. ALTERNATIVE A****4.10.2.1.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under this alternative, the benefits of limiting surface disturbance by OHV use to protect cultural resources, and thus wilderness characteristics, would be the same as described for the Proposed RMP.

**4.10.2.1.3. ALTERNATIVE B****4.10.2.1.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under this alternative, the benefits of limiting surface disturbance by OHV use to protect cultural resources, and thus wilderness characteristics, would be the same as described for the Proposed RMP. However, the benefits of offering oil and gas leases with an NSO stipulation in the Four Mile Wash area of Desolation Canyon non-WSA lands with wilderness characteristics would not be realized. Under this alternative, leases would be issued with standard stipulations resulting in surface disturbance and impacts to the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of oil and gas exploration and development would also adversely impact opportunities for solitude and primitive recreation activities.

**4.10.2.1.4. ALTERNATIVE C****4.10.2.1.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under this alternative, cultural sites and areas of high site density would be protected from surface disturbance caused by OHV use and oil and gas development by closing the Little Hole/Devils Hole and Four Mile Wash areas to OHV use and oil and gas leasing. These actions would have direct, short- and long-term benefits to the natural characteristics of the Lower Flaming Gorge and Desolation Canyon non-WSA lands with wilderness characteristics by preventing surface disturbance caused by OHV driving cross-country (as permitted in Alternative D, No Action) and oil and gas exploration and development. Further, closing these areas to OHV use and oil and gas development would provide short- and long-term benefits to opportunities for solitude and primitive recreation activities in these areas by excluding the presence and noise of OHVs and oil and gas development from these non-WSA lands with wilderness characteristics.

In Upper Willow Creek OHV travel would be permitted on designated routes. The effects of this action on the wilderness characteristics of Wolf Point non-WSA lands with wilderness characteristics would be the same as Proposed RMP. Under this alternative, oil and gas leases would be subject to timing and controlled surface use stipulations, resulting in surface disturbance and impacts to the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of oil and gas exploration and development would also adversely impact opportunities for solitude and primitive recreation activities.

**4.10.2.1.5. ALTERNATIVE D (No Action)****4.10.2.1.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Alternative D (No Action) would not limit OHV use near high-density cultural sites, and these sites would be open to oil and gas leasing. This alternative would have long-term, adverse impacts on the wilderness characteristics of Lower Flaming Gorge, Wolf Point, and Desolation Canyon non-WSA lands with wilderness characteristics by permitting surface-disturbing activities that would alter the landscape and natural characteristics of these areas. Further, the noise and presence of OHVs and oil and gas development would degrade opportunities for solitude and conflict with primitive recreation activities these areas offer.

**4.10.2.1.6. ALTERNATIVE E****4.10.2.1.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Alternative E would have the same impacts on cultural sites and areas of high site density and wilderness characteristics in the Lower Flaming Gorge, Wolf Point, and Desolation Canyon non-WSA lands with wilderness characteristics as described in Alternative C, except Wolf Point would also be closed to OHV use and oil and gas leasing, preventing surface disturbance that would degrade the wilderness characteristics of the non-WSA lands with wilderness characteristics.

**4.10.2.1.7. SUMMARY**

In summary, Alternatives C and E would provide the highest level of protection to cultural sites and areas of high site density and wilderness characteristics in the Lower Flaming Gorge, Wolf Point, and Desolation Canyon non-WSA lands with wilderness characteristics. The Proposed RMP and Alternatives A and B would provide some protection but less than that provided by Alternatives C and E. Alternative D (No Action) would provide the least protection to cultural resources and wilderness characteristics.

**4.10.2.2. IMPACTS OF FIRE MANAGEMENT DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS.****4.10.2.2.1. PROPOSED RMP****4.10.2.2.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

The Proposed RMP would provide for prescribed fire treatments on approximately 156,425 acres per decade. Where fire treatments occurred in non-WSA lands with wilderness characteristics being managed to protect their wilderness characteristics, the effects on wilderness values would be both short- and long-term. Further, the degree of impact would vary by vegetation community

and landform. For example, the effects of fire that burned in a pinyon-juniper community in mountainous terrain would remain longer and remain more visible to the visitor than a fire that burned on a sage brush flat.

Prescribed fire treatments would restore native vegetation communities and a more natural composition of forbs, grasses, shrubs, and trees, enhancing a more natural landscape. In the short-term, a burned landscape may reduce opportunities for primitive recreation. In the long-term, however, a more natural landscape would benefit the natural characteristics of the non-WSA lands with wilderness characteristics and enhance the setting and opportunities for primitive forms of recreation. Restoration and maintenance of native vegetation communities would also support wildlife populations that continue to provide opportunities for primitive forms of recreation like hunting, wildlife viewing, photography, and nature study.

In the short term, fire operations (i.e., aircraft over-flights and fire line construction) would adversely impact both the natural landscape and characteristics of the non-WSA lands with wilderness characteristics. The noise and presence of the people, equipment, and operations would also adversely impact opportunities for solitude and primitive forms of recreation. In the long term, however, surface disturbance associated with the fire treatment would be restored, with little to no net effect on naturalness. And, the effects of fire operations on opportunities for solitude and primitive recreation would cease, restoring those opportunities. When fencing and seeding are used to aid in restoration of the vegetation community, the livestock enclosure fences would have a short-term, temporary impacts on the natural characteristics of the non-WSA lands with wilderness characteristics. Introducing a fence would add a human-made structure to the landscape, diminishing the natural characteristics in the short-term until it is removed.

#### **4.10.2.2.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Where prescribed fire treatments occurred in non-WSA lands with wilderness characteristics being managed for other resource values and uses, the effects of the fire and the burning operations would be generally the same as for non-WSA lands with wilderness characteristics being managed to protect their wilderness characteristics. However, in these non-WSA lands with wilderness characteristics (not being managed to protect their wilderness characteristics), fire line construction could be more substantial. In forest and woodland vegetation communities, chain saws could be used to create fuel breaks for fire line construction, resulting in more substantial evidence of human manipulation of the land (cut logs, stumps, and cleared lines through vegetation). This type of surface disturbance would remain evident on the land for longer periods of time, reducing the natural characteristics of the non-WSA lands with wilderness characteristics.

**4.10.2.2.2. ALTERNATIVE A, B, AND C****4.10.2.2.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

These alternatives would also provide for prescribed fire treatments on approximately 156,425 acres per decade. The impacts to the wilderness characteristics of the non-WSA lands with wilderness characteristics would be the same as described under the Proposed RMP for those non-WSA lands with wilderness characteristics managed for resource values and uses other than wilderness characteristics.

**4.10.2.2.3. ALTERNATIVE D (NO ACTION)****4.10.2.2.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Alternative D (No Action) would prescribe fire on up to 27,950 acres in the Book Cliffs area and 22,950 acres in the Diamond Mountain area. The effects, whether adverse or beneficial, would be the same as those described under Proposed RMP for non-WSA lands with wilderness characteristics being managed for other resource values and uses, but on a smaller scale than under the Proposed RMP.

**4.10.2.2.4. ALTERNATIVE E****4.10.2.2.4.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

The Proposed RMP would provide for prescribed fire treatments on approximately 156,425 acres per decade, with impacts to the wilderness characteristics of all 25 non-WSA lands with wilderness characteristics (277,596 acres) the same as described for the Proposed RMP for the non-WSA lands with wilderness characteristics managed to protect their values.

**4.10.2.2.5. SUMMARY**

In summary, fire management would have long-term, beneficial impacts on vegetation, and thus on the natural quality of the non-WSA lands with wilderness characteristics. The Proposed RMP and Alternatives A, B, C, and E would have generally equivalent impacts on this resource. Alternative D (No Action) would have the least beneficial impacts on the natural quality because fewer acres would be treated with prescribed fire.

### **4.10.2.3. IMPACTS OF LANDS AND REALTY MANAGEMENT DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

#### **4.10.2.3.1. PROPOSED RMP**

##### **4.10.2.3.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

The Proposed RMP proposes withdrawals to preclude locatable mineral entry into the Green River Scenic Corridor in Browns Park, the White River, Lears Canyon, and the Book Cliffs Natural Area. The proposed withdrawals, totaling 17,814 acres, would prohibit entry for locatable mining, protecting the existing characteristics of the landscape. Withdrawing lands from mineral entry in these areas would prevent surface disturbance and protect the natural characteristics of 1,779 acres of the Lower Flaming Gorge, 171 acres of the Cold Spring Mountain, and 6,720 acres of the White River non-WSA lands with wilderness characteristics. Further, prohibition of mining would preserve the opportunities for both solitude and primitive forms of recreation in each of these non-WSA lands with wilderness characteristics.

Under the Proposed RMP, BLM would pursue public access to the White River at the mouth of Cowboy Canyon, Bonanza Bridge, and the Wagon Hound Road. This action would enhance public access to the White River non-WSA lands with wilderness characteristics, protecting and enhancing opportunities to participate in primitive and unconfined forms of recreation in this area.

Under the Proposed RMP, non-WSA lands with wilderness characteristics managed to protect their wilderness characteristics would be managed as ROW avoidance areas. Avoidance from future ROW development for pipelines and power lines would prevent surface disturbance and the placement of human-made structures on the land. This action would protect the natural characteristics of the landscape and the setting needed to support opportunities for solitude and primitive recreation.

##### **4.10.2.3.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Withdrawing lands from mineral entry would prevent surface disturbance and protect the natural characteristics of 3 acres of the Cripple Cowboy non-WSA lands with wilderness characteristics. Further, prohibition of mining would preserve the opportunities for both solitude and primitive forms of recreation in each of these non-WSA lands with wilderness characteristics.

Under the Proposed RMP, BLM would pursue acquisition of Indian Trust Lands in Bitter Creek and Willow Creek and near the confluence of South and Sweetwater Canyons. These actions would enhance public access to the Bitter Creek, Rat Hole, Cripple Cowboy, Hells Hole Canyon, Sweet Water, and Wolf Point non-WSA lands with wilderness characteristics, protecting and enhancing opportunities to participate in primitive and unconfined forms of recreation in these areas.

**4.10.2.3.2. ALTERNATIVE A****4.10.2.3.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

The effects of pursuing access to public lands and proposing mineral withdrawals would be the same as described under the Proposed RMP, except that none of the non-WSA lands with wilderness characteristics would be managed to protect their wilderness characteristics.

**4.10.2.3.3. ALTERNATIVE B****4.10.2.3.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Alternative B also proposes withdrawals to preclude locatable mineral entry into the Green River Scenic Corridor in Browns Park, the White River, Lears Canyon, and the Book Cliffs Natural Area. The effects on the wilderness characteristics of Lower Flaming Gorge, Cold Spring Mountain, White River, and Cripple Cowboy non-WSA lands with wilderness characteristics would be the same as described in Proposed RMP.

Public access to the White River would not be pursued and acquisition of Indian Trust Lands would only be sought for BLM administrative purposes under this alternative. The actions would provide no enhancement of public access to participate in primitive recreation activities in a natural setting.

**4.10.2.3.4. ALTERNATIVE C****4.10.2.3.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

The effects of pursuing access to public lands and proposing mineral withdrawals would be the same as described under the Proposed RMP, except that mineral withdrawal would also be proposed for lands in the Lower Green River ACEC on 17,063 acres. Withdrawing lands from mineral entry in this area would protect the natural characteristics on 8,572 acres of the Desolation Canyon non-WSA lands with wilderness characteristics. Prohibition of mining would also preserve the opportunities for solitude and primitive recreation activities in the Desolation Canyon non-WSA lands with wilderness characteristics.

**4.10.2.3.5. ALTERNATIVE D (NO ACTION)****4.10.2.3.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under this alternative, BLM would recommend mineral withdrawals in the Green River Scenic Corridor in Browns Park, relict vegetation areas, and the Lower Green River, totaling about 30,900 acres. Mineral withdrawals under this alternative would prevent surface disturbance and

protect the natural landscape and characteristics of the Cold Spring Mountain (171 acres), Lower Flaming Gorge (1,779 acres), and Desolation Canyon (8,572 acres) non-WSA lands with wilderness characteristics. Without mining operations, there would be no presence and noise of people, equipment, and mining operations, and thus these would not impact opportunities for solitude and primitive recreation in these areas.

#### **4.10.2.3.6. ALTERNATIVE E**

##### **4.10.2.3.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

The effects of pursuing access to public lands would be the same as described under the Proposed RMP. Under this alternative, non-WSA lands with wilderness characteristics would be managed as ROW avoidance areas. Avoidance from future ROW development for pipelines and power lines would protect the wilderness characteristics of these areas, including the natural characteristics of the landscape of all the non-WSA lands with wilderness characteristics. Further, under Alternative E, all non-WSA lands with wilderness characteristics would be recommended for withdrawal from mineral entry. Withdrawal from mining entry would have the same impacts as described in Proposed RMP, except on a much larger area (277,596 acres). Protection of the natural landscape would also preserve the setting needed to support primitive forms of recreation and experiences of solitude.

#### **4.10.2.3.7. SUMMARY**

In summary, Alternative E would provide the greatest protection to the wilderness characteristics of the non-WSA lands with wilderness characteristics by proposing to withdraw all non-WSA lands with wilderness characteristics from locatable mineral entry and by avoiding the areas as locations for future utility ROWs. The Proposed RMP and other alternatives provide comparable protection to the wilderness characteristics of non-WSA lands with wilderness characteristics, though Alternative B does not seek to secure as much access to public lands as the Proposed RMP and other alternatives.

#### **4.10.2.4. IMPACTS OF LIVESTOCK AND GRAZING MANAGEMENT ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

##### **4.10.2.4.1. PROPOSED RMP AND ALTERNATIVES A AND C**

##### **4.10.2.4.1.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under the Proposed RMP and these alternatives, lands acquired in the Nine Mile area would not be grazed by livestock to enhance riparian and watershed values. The resulting improvement of riparian and watershed condition would enhance the wilderness characteristics of Desolation Canyon non-WSA lands with wilderness characteristics. Without livestock grazing, the vegetation and soil condition of the watershed would improve, also improving the natural characteristics of the non-WSA lands with wilderness characteristics. Further, improved natural

condition would sustain the setting needed to support wilderness-related recreation opportunities (primitive and unconfined recreation) and the experience of solitude wilderness visitors seek.

#### **4.10.2.4.2. ALTERNATIVE B**

##### **4.10.2.4.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative B, livestock grazing would be permitted on lands acquired in the Nine Mile area if use does not detract from riparian values and recreation objectives. At proper levels of use, grazing would not adversely impact the riparian conditions of Nine Mile Canyon. While there would be some visual evidence of livestock use in the canyon (presence of livestock, feces, trampling of soil, and consumption of vegetation), rangeland health and riparian condition would be maintained, and the natural characteristics of the Desolation Canyon non-WSA lands with wilderness characteristics would be maintained to the average visitor. For some visitors, the presence of livestock would diminish the desired experience (connection with the natural world and experiences of solitude). However, this effect would be seasonal. Livestock would not graze in the canyon year long. At other times of the year, livestock would be gone, trampled soils would recover, and vegetation would re-grow, reducing the effect to the visitor.

#### **4.10.2.4.3. ALTERNATIVE D (NO ACTION)**

##### **4.10.2.4.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative D (No Action), grazing management actions are unspecified on lands acquired in the Nine Mile area. Because grazing is guided by livestock objectives set in the *Standards for Rangeland Health and Guidelines for Grazing Management* and the riparian areas are managed by objectives of Proper Functioning Condition, this alternative would have impacts on Desolation Canyon non-WSA lands with wilderness characteristics like Alternative B. Proper levels of livestock use are guided by grazing and riparian objectives. These objectives would not permit degradation of the lands. However, because livestock would still be present during periods of the year, the effects on wilderness characteristics would be the same as described for Alternative B.

#### **4.10.2.4.4. ALTERNATIVE E**

##### **4.10.2.4.4.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under this alternative, lands acquired in the Nine Mile area would not be grazed by livestock to enhance riparian and watershed values. The resulting improvement of riparian and watershed condition would enhance the wilderness characteristics of Desolation Canyon non-WSA lands with wilderness characteristics as described under the Proposed RMP and Alternatives A and C, except that under this alternative, Desolation Canyon non-WSA lands with wilderness characteristics would be managed to protect its wilderness characteristics.

**4.10.2.4.5. SUMMARY**

In summary, under the Proposed RMP and Alternatives A, C, and E there would be no impact of livestock grazing on non-WSA lands with wilderness characteristics from acquisition of lands in Nine Mile Canyon, because grazing would not be permitted on the acquired lands. Alternatives B and D (No Action), however, would allow for livestock grazing, with seasonal impacts on opportunities for solitude and primitive recreation activities due to the presence of livestock in the Desolation Canyon non-WSA lands with wilderness characteristics.

**4.10.2.5. IMPACTS OF MINERALS AND ENERGY RESOURCES ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

Given the resource development potential, past levels of production, presence of leases, and ongoing exploration and development, the following assumptions for oil and gas exploration and development were used in the analysis of impacts to non-WSA lands with wilderness characteristics.

- The number of wells projected in each development area would not be evenly distributed throughout the development area. Greater densities of wells would cluster in areas of exploration interest and resource discovery and production.
- Lessees would exercise rights on existing leases (valid existing rights) in areas of high and moderate potential with a past or current demonstration of interest in exploration and development.
- 75% of the wells drilled would produce oil or gas.
- 75% of the producing wells would be producing at any given time.
- The average life of a well would be 25 years.
- There would be 0.20 miles of new road construction per well and 0.73 acres of surface disturbance per well.
- There would be 2.4 acres of surface disturbed per well; 0.9 acres would be reclaimed within 1 year.
- The number of miles of pipelines would equal the numbers of miles of new roads.
- Average well spacing would be 80 acres.
- 10% of the wells would have electrification. The length of power lines would approximately equal the miles of road. There would be approximately 0.25 miles of surface disturbance per mile of power line.

The potential for oil and gas development in the VPA was derived from the Mineral Potential Report for the Vernal Planning Area (BLM 2004). Definitions of high ("H"), medium ("M"), and undetermined ("ND") oil and gas development potential can be found in that publication. For analysis purposes, high and medium potential are considered as reasonably foreseeable for development, while undetermined potential is considered to indicate that development is unlikely to occur. Areas are considered to have undetermined oil and gas potential because of a lack of useful data. Within the VPA, these areas typically lack data due to a dearth of current or

historical exploration, and they are therefore considered unlikely to be developed within the life of this plan.

A number of variables would influence the degree of impact to non-WSA lands with wilderness characteristics, including where surface-disturbing activities occur, land form or topography, vegetation type, sequence of development, and reclamation time. Soil types and climate would affect the time it takes to reclaim disturbances. Successful reclamation would take about 5–10 years.

Construction and operation of oil and gas wells and associated support facilities, including roads, surface and buried pipelines, power lines, and compressor stations would create soil and vegetation disturbance and the presence of permanent structures that would degrade the natural characteristics of non-WSA lands with wilderness characteristics. In addition to site-specific surface disturbance, the cumulative number of wells and density of spacing would change the natural landscape to an industrial landscape.

The noise of construction and operation of producing wells, including the presence of work crews, vehicles, and equipment, would degrade opportunities for solitude and conflict with primitive recreational opportunities in proximity to industrial development. As recreational visitors move away from the sources of development, the sights and sounds of development would diminish. However, it can be expected that sights and sounds from development would reduce opportunities for solitude and primitive and unconfined recreation up to 1/2 mile beyond the direct loss of natural characteristics. Given the number and spacing of industrial facilities, it would be difficult to escape the adverse effects on solitude and primitive recreation activities throughout the areas with wilderness characteristics.

It can be expected that as a result of oil and gas development and production, entire non-WSA lands with wilderness characteristics would lose their natural characteristics and opportunities for solitude and primitive recreation activities. Table 4.10.1 summarizes the impacts from the Proposed RMP and each of the alternatives to each of the non-WSA lands with wilderness characteristics found in the VPA.

Because the precise location of solid mineral development (Gilsonite, phosphate, mineral materials, and locatable minerals) is unknown, for analysis purposes the following assumptions for solid mineral exploration and development were used in the analysis of impacts to non-WSA lands with wilderness characteristics.

- The assessment of potential effects is based on the overall acreage open to development.
- The greater the surface disturbance, the greater the potential to impact the wilderness characteristics of non-WSA lands with wilderness characteristics.

**4.10.2.5.1. PROPOSED RMP****4.10.2.5.1.1. Oil, Gas, and Coal Bed Natural Gas (CBNG)**Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Under Proposed RMP, the 15 non-WSA lands with wilderness characteristics managed to protect their wilderness characteristics would be closed to oil and gas leasing, except for White River which would be open subject to an NSO stipulation. These leasing stipulations would prevent occupancy and surface disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Protection of the natural characteristics would also maintain the setting needed for support opportunities for solitude and primitive recreation activities.

Under the Proposed RMP, parts (between 11% and 89%) of five of the non-WSA lands with wilderness characteristics being managed to protect those characteristics (Bourdette Draw, Bull Canyon, Daniels Canyon, Diamond Mountain, and Mountain Home – See Table 4.10.1 below), totaling 18,286 acres, are currently leased for oil and gas production. However, given the mineral potential of the areas and past and current interest in exploration and production, it is not expected that these lands would be affected by oil and gas operation (exploration, development, and production) under the Proposed RMP.

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

All or parts (between 54% and 100%) of 11 non-WSA lands with wilderness characteristics, totaling up to 150,421 acres, would lose their natural characteristics and opportunities for solitude and primitive recreation due to surface disturbance and the presence and noise of people and equipment during exploration for and development of oil and gas resources in the VPA.

- Bitter Creek
- Cripple Cowboy
- Desolation Canyon
- Hell's Hole Canyon
- Hideout Canyon
- Lower Bitter Creek
- Mexico Point
- Rat Hole
- Sweet Water Canyon
- White River
- Wolf Point

These areas are located in oil and gas development areas with moderate to high potential for further development. Given the resource potential, level of past production, existing leases, and ongoing exploration and development, it is anticipated these 11 non-WSA lands with wilderness characteristics would lose all or most of their wilderness characteristics. The impacts to naturalness and opportunities for solitude and primitive recreation activities would be the same as described above.

#### 4.10.2.5.1.2. Other Mineral Resources

##### Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Phosphate is present on 11,719 acres of lands in the Bourdette Draw, Daniels Canyon, Moonshine Draw, and Mountain Home non-WSA lands with wilderness characteristics. Under the Proposed RMP, these non-WSA lands with wilderness characteristics would be managed to protect those characteristics and all 11,719 acres would be closed to phosphate leasing. Closure to leasing and development would prevent surface disturbance and protect the natural characteristics and opportunities for solitude and primitive recreation of these four non-WSA lands with wilderness characteristics.

There is 1 mile of Gilsonite veins on about 5 acres located in the portion of White River non-WSA lands with wilderness characteristics that would be managed to protect those characteristics. These lands would be closed to solid mineral leasing and no surface disturbance or impacts to wilderness characteristics would result.

Mineral materials would be closed to leasing on 25,688 acres in Beach Draw, Bourdette Draw, Bull Canyon, Cold Spring Mountain, Daniels Canyon, Dead Horse Pass, Diamond Breaks, Diamond Mountain, Lower Flaming Gorge, Moonshine Draw, Mountain Home, Stuntz Draw, White River, and Wild Mountain.

Under the Proposed RMP, 8,670 acres in portions of three non-WSA lands with wilderness characteristics would be proposed for withdrawal from entry under the mining laws: Cold Spring Mountain, Lower Flaming Gorge, and White River. Withdrawal from mineral entry would prevent surface disturbance that would reduce the natural characteristics of these areas, and prevent the presence and noise of people, equipment, and structures that would diminish solitude and conflict with opportunities for primitive recreation activities.

##### Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

There are 9 miles of Gilsonite on about 44 acres (determined based on an average width of 40 feet for Gilsonite) in Desolation Canyon (1 mile) and White River (8 miles) non-WSA lands with wilderness characteristics that would not be managed to protect their wilderness characteristics. These lands would be open for solid mineral leasing.

Mineral materials (e.g., sand, gravel, and building stone) would be open to leasing on 30,490 acres in 4 separate non-WSA lands with wilderness characteristics: Bitter Creek, Desolation Canyon, Lower Bitter Creek, and Wolf Point.

Under the Proposed RMP, 3 acres in a portion of the Cripple Cowboy non-WSA lands with wilderness characteristics would be proposed for withdrawal from entry under the mining laws. Withdrawal from mineral entry would prevent surface disturbance that would degrade the natural characteristics. Closure to entry would also prevent the presence and noise of people, vehicles, and equipment that would diminish opportunities for solitude and conflict with opportunities for primitive recreation activities.

The impacts from projected development of Gilsonite, phosphate, mineral materials, and locatable minerals are difficult to quantify because specific locations for these operations have not been determined and development is dependent on market demand and technology. However, generally, it can be said that these types of operations typically result in small to medium-sized surface disturbances that would degrade the natural characteristics of localized parts of the non-WSA lands with wilderness characteristics, if they were to occur in any of the areas listed above. Further, the presence and noise of people and equipment would degrade opportunities for solitude and conflict with opportunities for primitive forms of recreation. Road construction to new mine sites would reduce the roadless nature and natural characteristics of the non-WSA lands with wilderness characteristic.

Development potential for Gilsonite, phosphate, and mineral materials is moderate to high, and exploration and development is likely. Development potential for locatables is moderate. Very little development is expected.

This assessment is based on acres open to development, as compared to Alternative D (No Action). The more acres open to mineral leasing, the more potential for surface disturbance and degradation of the wilderness characteristics of non-WSA lands with wilderness characteristics. Under the Proposed RMP, 10,531 fewer acres would be open to phosphate leasing as under Alternative D (No Action), and 1 less mile of Gilsonite would be available for leasing under the Proposed RMP than under Alternative D (No Action). And, 28,975 fewer acres would be open to disposal of mineral materials. Under the Proposed RMP, 13,086 more acres would be available for mineral entry than under Alternative D (No Action).

#### **4.10.2.5.2. ALTERNATIVE A**

##### **4.10.2.5.2.1. Oil, Gas, and Coal-bed Natural Gas (CBNG)**

###### Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

All or parts (between 70% and 100%) of 11 non-WSA lands with wilderness characteristics, totaling up to 153,768 acres, would lose their natural characteristics and opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources in the VPA.

- Bitter Creek
- Cripple Cowboy
- Desolation Canyon
- Hell's Hole Canyon
- Hideout Canyon
- Lower Bitter Creek
- Mexico Point
- Rat Hole
- Sweet Water Canyon
- White River
- Wolf Point

These areas are located in oil and gas development areas with moderate to high potential for further development. Given the resource potential, level of past production, existing leases, and ongoing exploration and development, it is anticipated these 11 non-WSA lands with wilderness characteristics would lose all or most of their wilderness characteristics. The impacts to

naturalness and opportunities for solitude and primitive recreation would be the same as described above.

#### **4.10.2.5.2.2. Other Mineral Resources**

##### Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Phosphate would be available for leasing on 11,515 acres in Bourdette Draw, Daniels Canyon, Moonshine Draw, and Mountain Home non-WSA lands with wilderness characteristics, and closed to leasing on 204 acres in Moonshine Draw and Mountain Home non-WSA lands with wilderness characteristics. In all, 10 miles of Gilsonite would be open to leasing on about 49 acres (determined based on an average width of 40 feet for Gilsonite) in Desolation Canyon, and White River non-WSA lands with wilderness characteristics.

Mineral materials (e.g., sand, gravel, and building stone) would be open to leasing on 53,084 acres in 17 separate non-WSA lands with wilderness characteristics: Beach Draw, Bitter Creek, Bourdette Draw, Bull Canyon, Cold Spring Mountain, Daniels Canyon, Dead Horse Pass, Desolation Canyon, Diamond Breaks, Diamond Mountain, Lower Flaming Gorge, Moonshine Draw, Mountain Home, Stuntz Draw, White River, Wild Mountain, and Wolf Point. Mineral materials would be closed to leasing on 13,872 acres in Bourdette Draw, Bull Canyon, Cold Spring Mountain, Desolation Canyon, Diamond Breaks, Diamond Mountain, Lower Bitter Creek, Lower Flaming Gorge, Mountain Home, and White River.

Under Alternative A, 8,673 acres in portions of four non-WSA lands with wilderness characteristics would be proposed for withdrawal from entry under the mining laws: Cold Spring Mountain, Cripple Cowboy, Lower Flaming Gorge, and White River. This would leave 268,923 acres open to entry under the mining laws in all or portions of each of the non-WSA lands with wilderness characteristics.

The impacts from projected development of Gilsonite, phosphate, mineral materials, and locatable minerals are difficult to quantify because specific locations for these operations have not been determined and development is dependent on market demand and technology. However, generally, it can be said that these types of operations typically result in small to medium-sized surface disturbances that would degrade the natural characteristics of localized parts of the non-WSA lands with wilderness characteristics, if they were to occur in any of the areas listed above. Further, the presence and noise of people and equipment would degrade opportunities for solitude and conflict with opportunities for primitive forms of recreation. Road construction to new mine sites would reduce the roadless nature of the non-WSA lands with wilderness characteristic.

Development potential for Gilsonite, phosphate, and mineral materials is moderate to high, and exploration and development is likely. Development potential for locatables is moderate. Very little development is expected.

This assessment is based on acres open to development, as compared to Alternative D (No Action). The more acres open to mineral leasing, the more potential for surface disturbance and degradation of the wilderness characteristics of non-WSA lands with wilderness characteristics.

Under Alternative A, 984 more acres would be open to phosphate leasing than under Alternative D (No Action), and 1 more mile of Gilsonite would be available for leasing under Alternative A than under Alternative D (No Action). However, 6,381 fewer acres would be open to disposal of mineral materials. Under Alternative A, 13,086 more acres would be available for mineral entry than under Alternative D (No Action).

#### **4.10.2.5.3. ALTERNATIVE B**

##### **4.10.2.5.3.1. Oil, Gas, and Coal Bed Natural Gas (CBNG)**

###### Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

The impacts of oil and gas development on the natural characteristics and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics would be the same as described for Alternative A, for the same 11 areas, though more acres would lose their wilderness characteristics—up to 171,412 acres.

##### **4.10.2.5.3.2. Other Mineral Resources**

###### Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under Alternative B, phosphate would be available for leasing on 11,515 acres in Bourdette Draw, Daniels Canyon, Moonshine Draw, and Mountain Home non-WSA lands with wilderness characteristics, and closed to leasing on 204 acres in Moonshine Draw and Mountain Home non-WSA lands with wilderness characteristics. A total of 10 miles of Gilsonite would be open to leasing on about 48 acres (acres determined based on an average width of 40 feet of Gilsonite) in the Desolation Canyon and White River non-WSA lands with wilderness characteristics.

Mineral materials (i.e., sand, gravel, and building stone) would be open to leasing on 63,926 acres in 18 separate non-WSA lands with wilderness characteristics: Beach Draw, Bitter Creek, Bourdette Draw, Bull Canyon, Cold Spring Mountain, Daniels Canyon, Dead Horse Pass, Desolation Canyon, Diamond Breaks, Diamond Mountain, Lower Bitter Creek, Lower Flaming Gorge, Moonshine Draw, Mountain Home, Stuntz Draw, White River, Wild Mountain, and Wolf Point. Mineral materials would be closed to leasing on 13,872 acres in Bourdette Draw, Bull Canyon, Cold Spring Mountain, Desolation Canyon, Diamond Breaks, Diamond Mountain, Lower Flaming Gorge, Mountain Home, and White River.

Under Alternative B, 8,673 acres in portions of four non-WSA lands with wilderness characteristics would be proposed for withdrawal from entry under the mining laws: Cold Spring Mountain, Cripple Cowboy, Lower Flaming Gorge, and White River. This would leave 268,923 acres open to entry under the mining laws in all or portions of each of the non-WSA lands with wilderness characteristics.

The impacts from projected development of Gilsonite, phosphate, mineral materials, and locatable minerals are difficult to quantify because specific locations for these operations have not been determined and development is dependent on market demand and technology. However, generally, it can be said that these types of operations typically result in small to

medium-sized surface disturbances that would degrade the natural characteristics of localized parts of the non-WSA lands with wilderness characteristics, if they were to occur in any of the areas listed above. Further, the presence and noise of people and equipment would degrade opportunities for solitude and conflict with opportunities for primitive forms of recreation. Road construction to new mine sites would reduce the roadless nature of the non-WSA lands with wilderness characteristic.

Development potential for Gilsonite, phosphate, and mineral materials is moderate to high, and exploration and development is likely. Development potential for locatables is moderate. Very little development is expected.

This assessment is based on acres open to development, as compared to Alternative D (No Action). The more acres open to mineral leasing, the more potential for surface disturbance and degradation of the wilderness characteristics of non-WSA lands with wilderness characteristics. Compared to Alternative D (No Action), 984 more acres would be open to phosphate leasing than under Alternative D (No Action), and 1 more mile of Gilsonite would be available for leasing than under Alternative D (No Action). And, 4,461 more acres would be open to disposal of mineral materials. Under Alternative B, 13,086 more acres would be available for mineral entry than under Alternative D (No Action).

#### **4.10.2.5.4. ALTERNATIVE C**

##### **4.10.2.5.4.1. Oil, Gas, and Coal Bed Natural Gas (CBNG)**

###### Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under Alternative C the impacts of oil and gas development on the natural characteristics and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics would be the same as those described for Alternative B, for the same areas, except that fewer acres would be affected. All or parts (between 51% and 100%) of the same 11 non-WSA lands with wilderness characteristics discussed in Alternative B, totaling up to 123,571 acres, would lose their natural characteristics and opportunities for solitude and primitive recreation due to oil and gas development and production.

##### **4.10.2.5.4.2. Other Mineral Resources**

###### Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under Alternative C, phosphate would be available for leasing on 11,509 acres in the Bourdette Draw, Daniels Canyon, Moonshine Draw, and Mountain Home non-WSA lands with wilderness characteristics, and closed to leasing on 210 acres in Moonshine Draw and Mountain Home non-WSA lands with wilderness characteristics. A total of 9 miles of Gilsonite would be open to leasing on about 44 acres (acres determined based on an average width of 40 feet for Gilsonite) in the White River non-WSA lands with wilderness characteristics.

Mineral materials (e.g., sand and gravel and building stone) would be open to leasing on 34,106 acres in 15 separate non-WSA lands with wilderness characteristics: Bitter Creek, Bourdette

Draw, Bull Canyon, Cold Spring Mountain, Daniels Canyon, Dead Horse Pass, Desolation Canyon, Diamond Breaks, Diamond Mountain, Lower Bitter Creek, Lower Flaming Gorge, Moonshine Draw, Mountain Home, White River, and Wild Mountain. Mineral materials would be closed to leasing on 32,850 acres in Beach Draw, Bitter Creek, Bourdette Draw, Bull Canyon, Cold Spring Mountain, Daniels Canyon, Desolation Canyon, Diamond Breaks, Diamond Mountain, Lower Flaming Gorge, Moonshine Draw, Mountain Home, Stuntz Draw, White River, and Wolf Point.

Under Alternative C, 17,245 acres in portions of five non-WSA lands with wilderness characteristics would be proposed for withdrawal from entry under the mining laws: Cold Spring Mountain, Cripple Cowboy, Desolation Canyon, Lower Flaming Gorge, and White River. This would leave 260,351 acres open to entry under the mining laws in all or portions of each of the non-WSA lands with wilderness characteristics.

The impacts from projected development of Gilsonite, phosphate, mineral materials, and locatable minerals are difficult to quantify because specific locations for these operations have not been determined and development is dependent on market demand and technology. However, generally it can be said that these types of operations typically result in small to medium-sized surface disturbances that would degrade the natural characteristics of localized parts of the non-WSA lands with wilderness characteristics, if they were to occur in any of the areas listed above. Further, the presence and noise of people and equipment would degrade opportunities for solitude and conflict with opportunities for primitive forms of recreation. Road construction to new mine sites would reduce the roadless nature of the non-WSA lands with wilderness characteristic.

Development potential for Gilsonite, phosphate, and mineral materials is moderate to high, and exploration and development is likely. Development potential for locatables is moderate. Very little development is expected.

This assessment is based on acres open to development, as compared to Alternative D (No Action). The more acres open to mineral leasing, the more potential for surface disturbance and degradation of the wilderness characteristics of non-WSA lands with wilderness characteristics. Under Alternative C, 978 more acres would be open to phosphate leasing than under Alternative D (No Action), and the same number of miles of Gilsonite (9) would be available for leasing as Alternative D (No Action). However, 25,359 fewer acres would be open to disposal of mineral materials. Under Alternative C, 365 fewer acres would be available for mineral entry than under Alternative D (No Action).

#### **4.10.2.5.5. ALTERNATIVE D (NO ACTION)**

##### **4.10.2.5.5.1. Oil, Gas, and Coal Bed Natural Gas (CBNG)**

###### Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

The impacts of oil and gas development on the natural characteristics and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics would be the

same as described for Alternative C, for the same areas, except that 22,200 more acres would be affected: up to 145,711 acres.

#### **4.10.2.5.5.2. Other Mineral Resources**

##### Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Phosphate would be available for leasing on 10,531 acres in the Bourdette Draw, Daniels Canyon, Moonshine Draw, and Mountain Home non-WSA lands with wilderness characteristics, and closed to leasing on 1,188 acres in Moonshine Draw and Mountain Home non-WSA lands with wilderness characteristics. A total of 9 miles of Gilsonite would be open to leasing on about 44 acres (acres determined based on an average width of 40 feet for Gilsonite) in the Desolation Canyon, Lower Bitter Creek, and White River non-WSA lands with wilderness characteristics.

Mineral materials (e.g., sand and gravel and building stone) are open to leasing on 59,465 acres in 18 separate non-WSA lands with wilderness characteristics: Beach Draw, Bitter Creek, Bourdette Draw, Bull Canyon, Cold Spring Mountain, Daniels Canyon, Dead Horse Pass, Desolation Canyon, Diamond Breaks, Diamond Mountain, Lower Bitter Creek, Lower Flaming Gorge, Moonshine Draw, Mountain Home, Stuntz Draw, White River, Wild Mountain, and Wolf Point. Mineral materials are closed to leasing on 7,490 acres in Bourdette Draw, Bull Canyon, Cold Spring Mountain, Desolation Canyon, Diamond Breaks, Diamond Mountain, Lower Flaming Gorge, Mountain Home, and White River.

Under Alternative D (No Action), 10,522 acres in portions of three non-WSA lands with wilderness characteristics would be proposed for withdrawal from entry under the mining laws—Cold Spring Mountain, Desolation Canyon, and Lower Flaming Gorge. This would leave 267,074 acres open to entry under the mining laws in all or portions of each of the non-WSA lands with wilderness characteristics.

The impacts from projected development of Gilsonite, phosphate, mineral materials, and locatable minerals are difficult to quantify because specific locations for these operations have not been determined and development is dependent on market demand and technology. However, generally it can be said that these types of operations typically result in small to medium-sized surface disturbances that would degrade the natural characteristics of localized parts of the non-WSA lands with wilderness characteristics, if they were to occur in any of the areas discussed above. Further, the presence and noise of people and equipment would degrade opportunities for solitude and conflict with opportunities for primitive forms of recreation. Road construction to new mine sites would reduce the roadless nature of the non-WSA lands with wilderness characteristic.

Development potential for Gilsonite, phosphate, and mineral materials is moderate to high, and exploration and development is likely. Development potential for locatables is moderate. Very little development is expected.

This assessment is based on acres open to development. The more acres open to mineral leasing, the more potential for surface disturbance and degradation of the wilderness characteristics of non-WSA lands with wilderness characteristics. Alternative D (No Action) would open 10,531

acres to phosphate leasing, 984 fewer acres than under the Proposed RMP and Alternative B and 978 fewer acres than under Alternative C. Alternative D (No Action) would make 9 miles of Gilsonite available for leasing, the same as under Alternative C, but 1 mile less than under the Proposed RMP and Alternative B. Under Alternative D (No Action), 59,465 acres would be open for mineral material disposal, more than the Proposed RMP and Alternative C, but 4,461 fewer acres than Alternative B. Under Alternative D (No Action), 35,900 acres would be recommended for withdrawal from entry under the mining laws, 13,086 more than under the Proposed RMP and Alternatives A and B, but 365 fewer acres than Alternative C.

#### **4.10.2.5.6. ALTERNATIVE E**

##### **4.10.2.5.6.1. Oil, Gas, and Coal Bed Natural Gas (CBNG)**

###### Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Due to the presence of existing leases, parts (between 14% and 85%) of 11 non-WSA lands with wilderness characteristics totaling up to 117,470 acres would lose their natural characteristics and opportunities for solitude and primitive recreation due to exploration, development, and production of oil and gas resources in the VPA:

- Bitter Creek
- Cripple Cowboy
- Desolation Canyon
- Hell's Hole Canyon
- Hideout Canyon
- Lower Bitter Creek
- Mexico Point
- Rat Hole
- Sweet Water Canyon
- White River
- Wolf Point

These areas are located in oil and gas development areas with moderate to high potential for further development. Given the resource potential, level of past production, existing leases (exercise of valid existing rights), and ongoing exploration and development, it is anticipated these 11 non-WSA lands with wilderness characteristics would lose part of their natural characteristics and opportunities for solitude and primitive recreation. The impacts to naturalness and opportunities for solitude and primitive recreation would be the same as those described for Proposed RMP above.

##### **4.10.2.5.6.2. Other Mineral Resources**

###### Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

While phosphate occurs on 11,719 acres in the Bourdette Draw, Daniels Canyon, Moonshine Draw, and Mountain Home non-WSA lands with wilderness characteristics, it would be closed to leasing under this alternative. All 10 miles of Gilsonite found in Desolation Canyon, Lower Bitter Creek, and White River would be closed to leasing under Alternative E. Further, 66,956 acres of mineral materials found in Beach Draw, Bitter Creek, Bourdette Draw, Bull Canyon, Cold Spring Mountain, Daniels Canyon, Dead Horse Pass, Desolation Canyon, Diamond Breaks, Diamond Mountain, Lower Bitter Creek, Lower Flaming Gorge, Moonshine Draw, Mountain

Home, Stuntz Draw, White River, Wild Mountain, and Wolf Point would be closed to mineral material disposal. Under Alternative E, 277,596 acres in all 25 non-WSA lands with wilderness characteristics would be proposed for withdrawal from entry under the mining laws.

The impacts from projected development of Gilsonite, phosphate, mineral materials, and locatable minerals are difficult to quantify because specific locations for these operations have not been determined and development is dependent on market demand and technology. However, generally it can be said that these types of operations typically result in small to medium-sized surface disturbances that would degrade the natural characteristics of localized parts of the non-WSA lands with wilderness characteristics, if they were to occur in any of the areas listed above. Further, the presence and noise of people and equipment would degrade opportunities for solitude and conflict with opportunities for primitive forms of recreation. Road construction to new mine sites would reduce the roadless nature of the non-WSA lands with wilderness characteristic.

Development potential for Gilsonite, phosphate, and mineral materials is moderate to high, and exploration and development is likely. Development potential for locatables is moderate. Very little development is expected.

This assessment is based on acres open to development, as compared to Alternative D (No Action). The more acres open to mineral leasing, the more potential for surface disturbance and degradation of the wilderness characteristics of non-WSA lands with wilderness characteristics. Because the emphasis of Alternative E is to protect the wilderness characteristics of non-WSA lands with wilderness characteristics, these lands would not be available for leasing for any of the solid mineral leasables. Compared to Alternative D (No Action), 10,531 fewer acres open to phosphate leasing, 9 fewer miles would be open to Gilsonite leasing, and 59,465 fewer acres would be open to mineral material disposal. All 277,596 acres of non-WSA lands would be recommended for withdrawal from mineral entry—241,696 more acres unavailable for hardrock mining than under Alternative D (No Action). As a result, there would be no impacts on the wilderness characteristics of the non-WSA lands with wilderness characteristics, subject to valid existing rights.

#### **4.10.2.5.6.3. Summary**

Under the Proposed RMP and all alternatives, portions (between 14% and 100%) of 11 of the non-WSA lands with wilderness characteristics would lose their wilderness characteristics due to the development of oil and gas resources (exercise of valid existing rights on existing leases). Construction of roads and well pads and ancillary facilities would degrade the natural landscape. The presence of people and equipment and the operation of the exploration and production facilities would diminish or eliminate opportunities for solitude and primitive recreation. Oil and gas development would degrade the wilderness characteristics of between 117,470 acres and 171,412 acres, depending on the Proposed RMP or alternative, of the total 277,596 acres of non-WSA lands with wilderness characteristics in the VPA.

Under Alternatives A, B, C, and D (No Action), the anticipated development of some phosphate, Gilsonite, and mineral materials leases would have the same types of impacts on the wilderness

characteristics on up to 18 non-WSA lands where these resource values are located. Under the Proposed RMP and Alternatives A, B, C, and D (No Action), most of the non-WSA lands with wilderness characteristics would be open to entry under the mining laws. A few projects are anticipated that would have generally small to moderate, localized impacts on the wilderness characteristics of the non-WSA lands with wilderness characteristics. Under Alternative E, however, all 277,596 acres of the non-WSA lands with wilderness characteristics would be recommended for mineral withdrawal, protecting the wilderness characteristics of these lands.

**Table 4.10.1 Proposed RMP and Alternative Impacts to Non-WSA Lands with Wilderness Characteristics**

Name of Area	Oil & Gas as Development Potential			Proposed Lease Stipulations (Acres)				Currently under Lease (Acres)	Wilderness Characteristic Lost (Acres)		
	H	M	U	Standard Stipulations	Timing and Controlled Surface Use	NSO	Closed to Leasing		Direct loss of natural characteristics during life of the Plan (acres)	Reduction (directly or indirectly) in quality of the opportunities for solitude and primitive and unconfined recreation due to sights and sounds of development (acres)	Total area affected during life of the plan (acres and %)

#### **4.10.2.6. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

There are 25 areas outside of existing WSAs totaling 277,596 acres that were inventoried and found to have wilderness characteristics. See Table 3.10.1 for a list of areas by name and acreage with wilderness characteristics (Figure 26).

##### **4.10.2.6.1. PROPOSED RMP**

#### **Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under Proposed RMP, 15 non-WSA lands with wilderness characteristics, totaling 106,178 acres (see Table 2.1.10, Proposed RMP and Alternatives), would be managed with the following prescription to ensure the presence of their wilderness characteristics:

- Visual resource management (VRM) Class II objectives
- OHV use limited to designated routes
- Closed to oil and gas leasing, except in White River non-WSA lands with wilderness characteristics. There leases would be offered with a no surface occupancy (NSO) stipulation
- No geophysical exploration permitted except with hand-carried geophone lines
- Closed to solid mineral leasing
- Closed to disposal of mineral materials
- Open to mineral entry under the mining laws
- Public lands retained in federal ownership
- Avoidance for location of utility ROWs
- Closed to woodland products (firewood, posts/poles, Christmas trees) harvest
- No cross country travel (up to 300 feet) to access camp sites
- When compatible with the goals and objectives for management of non-WSA lands with wilderness characteristics:
  - Vegetation and fuel treatments permitted using prescribed fire and mechanical and chemical methods
  - Construction of wildlife waters, livestock facilities, and minimal recreation facilities permitted
  - Excavation of cultural resources sites permitted
  - Excavation of fossils permitted
- Wildfire suppression permitted. Fire lines and other disturbances would be reclaimed following suppression activities.

Many elements of the prescription to protect the wilderness characteristics of the 15 non-WSA lands with wilderness characteristics would prevent surface disturbances that would degrade the

natural characteristics of these areas. Closure of the 15 non-WSA lands with wilderness characteristics to oil and gas leasing (except in White River, which would be leased with an NSO stipulation), closure to solid mineral leasing, closure to mineral material sales, and closure to harvest of woodland products would all prevent surface disturbances that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Protection of the undeveloped nature of the non-WSA lands with wilderness characteristics would also maintain the setting needed to support primitive forms of recreation and experiences of solitude.

Other elements of the prescription to protect the wilderness characteristics of the non-WSA lands with wilderness characteristics would permit, when compatible with the management objectives of the non-WSA lands with wilderness characteristics, limited or minimal degrees of surface disturbance and construction of human-made facilities. Management to visual resource management Class II objectives, ROW avoidance objectives, and allowance for construction of minimal livestock, wildlife, and recreation facilities would result in some small amount of surface disturbance and placement of minimal structures in the non-WSA lands with wilderness characteristics, but not to the degree that these changes would be readily apparent on the land.

Other permitted actions in the 15 non-WSA lands with wilderness characteristics being managed to protect those characteristics would result in temporary surface disturbance and degradation of the natural characteristics for the benefit of resource management, science, and education. Excavation of cultural resource sites and fossil sites would yield important information about the cultural and natural resources of the non-WSA lands with wilderness characteristics. Upon completion of excavations, sites would be rehabilitated, and the natural characteristics of the lands restored. The presence and noise of these excavation operations would diminish opportunities for solitude, and depending on methods, conflict with primitive forms of recreation. These impacts, however, would end upon completion of excavation and restoration of the sites.

While limiting motorized (OHV) travel to designated routes in the non-WSA lands with wilderness characteristics would prevent expansion of OHV use and surface disturbance that degrade the natural characteristics of these lands, the noise and presence of motor vehicles would degrade opportunities for solitude and conflict with primitive forms of recreation like hiking, backpacking, wildlife viewing, and nature study.

Use of prescribe fire to maintain and restore vegetation communities, reduce fuel loading, rehabilitate watershed condition, and maintain or restore forage for wildlife and livestock would result, primarily, in naturally appearing disturbances to the land (fire). In the long term, restoration of desired vegetation communities would benefit the natural characteristics of the non-WSA lands with wilderness characteristics. The prescribed burning operation, however, would also temporarily reduce opportunities for solitude and conflict with primitive recreation opportunities, caused by the presence and noise of personnel, vehicles, and equipment needed to manage the fire. Fire lines and other surface disturbances would be rehabilitated following the burning operation, restoring the natural characteristics of the non-WSA lands with wilderness characteristics.

Retaining public lands in non-WSA lands with wilderness characteristics in public ownership would ensure BLM would have the continued ability to manage these lands to protect their wilderness characteristics.

Under the Proposed RMP, the 15 non-WSA lands with wilderness characteristics managed to protect those characteristics, however, would remain open to entry (mining claim staking, exploration, and production) under the 1872 Mining Law. This action would result in an occasional small to moderate sized surface mining operation that would degrade the natural characteristics and opportunities for solitude and primitive recreation.

#### **Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under the Proposed RMP, no specific actions are prescribed to directly protect or enhance the wilderness characteristics of all or portions of 11 non-WSA lands with wilderness characteristics. Thus, there would be no effect on the wilderness characteristics of the non-WSA lands with wilderness characteristics.

##### **4.10.2.6.2. ALTERNATIVES A, B, C, AND D (NO ACTION)**

#### **Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under these alternatives, there would be no specific actions prescribed to directly protect or enhance the wilderness characteristics of all 25 of the non-WSA lands with wilderness characteristics that have those values (277,596 acres). Thus, there would be no effect on the wilderness characteristics of the non-WSA lands with wilderness characteristics.

##### **4.10.2.6.3. ALTERNATIVE E**

#### **Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under Alternative E, all 25 non-WSA lands with wilderness characteristics, totaling 277,596 acres (see Table 2.1.10 Proposed RMP and Alternatives), would be managed by the following prescription to protect their wilderness characteristics:

- Visual resource management (VRM) Class I objectives
- Closed to OHV use
- Closed to oil and gas leasing
- Closed to solid mineral leasing
- Closed to disposal of mineral materials
- Proposed for withdrawal from mineral entry
- Public lands retained in federal ownership
- Avoidance from location of utility ROWs

- Closed to permitted commercial and personal-use wood cutting and seed collecting
- Closed to new road construction
- Maintenance of existing facilities permitted
- When compatible with the goals and objectives for management of non-WSA lands with wilderness characteristics:
  - Vegetation and fuel treatments permitted using prescribed fire
  - Construction of wildlife waters, livestock facilities, and minimal recreation facilities permitted
  - Excavation of cultural resources sites permitted
  - Excavation of paleontological resources permitted
- No actions would be allowed that would degrade the wilderness characteristics of the non-WSA lands with wilderness characteristics.

Under Alternative E, the management prescription prescribed to protect the wilderness characteristics of the 25 non-WSA lands with wilderness characteristics would have the same effect on those characteristics as described under the Proposed RMP, with the following exceptions.

The visual resource management objective would be Class I. The objective of Class I is to preserve the characteristic landscape. This objective would strictly limit, or even prohibit, actions that cause surface disturbances and result in the degradation of the natural characteristics of the non-WSA lands with wilderness characteristics.

Closure of the non-WSA lands with wilderness characteristics to motorized vehicle (OHV) use would protect not only the natural characteristics of the non-WSA lands with wilderness characteristics, but also opportunities for solitude and primitive forms of recreation. Closure to OHV use would prevent surface disturbance caused by motor vehicles. Closure to OHV use would also prevent the noise and presence of people and vehicles that degrade opportunities for solitude and conflict with other primitive forms of recreation.

Under Alternative E, all non-WSA lands with wilderness characteristics would be recommended for withdrawal from mineral entry under the mining laws. Under withdrawal, no mining would be permitted and there would be no resultant surface that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics or opportunities for solitude or primitive forms of recreation.

Under this alternative, no road construction would be permitted. This would maintain roadless and natural characteristics of the non-WSA lands with wilderness characteristics, prevent surface disturbance that degrades the natural characteristics of the non-WSA lands with wilderness characteristics, prevent degradation of opportunities for solitude, and prevent conflicts with primitive forms of recreation.

This management prescription would protect the wilderness characteristics of all of the non-WSA lands with wilderness characteristics with those values.

#### **4.10.2.7. IMPACTS OF RECREATION DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

##### **4.10.2.7.1. PROPOSED RMP**

##### **4.10.2.7.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

The Proposed RMP would manage 2,831 acres along the White River as an SRMA for river-related recreation opportunities, including float boating, camping, and hiking. The SRMA includes portions of the White River immediately downstream the non-WSA lands with wilderness characteristics. Coupled with the lands managed for their wilderness characteristics, the SRMA would generally retain the natural characteristics of the landscape, allowing minor development consistent with VRM Class II objectives. Retaining the natural characteristics of the setting would support opportunities for solitude and primitive forms of recreation.

Under the Proposed RMP, Blue Mountain (42,729 acres) would be managed as a SRMA with recreation focus on hang-gliding, rock climbing, historic interpretation, and OHV use of designated routes. The SRMA includes 13,335 acres of the Bourdette Draw non-WSA lands with wilderness characteristics. The management prescription for that portion of the SRMA that includes the non-WSA lands with wilderness characteristics would limit OHV use to designated routes, manage landscapes as VRM Class II, and close the area to oil and gas leasing. Management to VRM Class II objectives (to retain the landscape character) would limit surface disturbance that would impact the natural characteristics of the non-WSA lands with wilderness characteristics. While parts of the non-WSA lands with wilderness characteristics are leased, oil and gas occurrence potential is undetermined, and development is not anticipated. Limiting OHV use to designated routes (about 4 miles) would prevent further surface disturbance of the landscape, and thus its natural characteristics, but the noise and presence of motorized vehicles would degrade opportunities for solitude and conflict with primitive recreation activities found in the non-WSA lands with wilderness characteristics.

The Proposed RMP would manage 18,490 acres in Browns Park as an SRMA with recreation focus on outstanding scenic vistas and enhancement of resources, including riparian, fish, special status species, and water quality, and the associated recreation uses, including water-based recreation, hunting, hiking, biking, horseback riding, OHV driving, camping, and cultural interpretation; as well as the construction of facilities needed to support these activities. The SRMA includes all or portions of the Mountain Home (507 acres), Cold Springs Mountain (3,225 acres), and Lower Flaming Gorge (4,318 acres) non-WSA lands with wilderness characteristics. The management prescription for that portion of the SRMA that includes the three non-WSA lands with wilderness characteristics would close the area to leasing. The prescription for OHV travel in the non-WSA lands with wilderness characteristics within the SRMA would limit travel to designated routes. And, the non-WSA lands with wilderness characteristics in the SRMA would be managed by VRM Class II objectives. In the northern portion of the SRMA (that includes part of Mountain Home non-WSA lands with wilderness characteristics), mineral occurrence potential is moderate to high, but interest in exploration and production has not been demonstrated. No surface disturbance connected with exploration and production is anticipated that would alter the natural characteristics of the non-WSA lands with

wilderness characteristics. Limiting motorized travel to about 3 miles of designated routes in the Mountain Home and Cold Spring Mountain non-WSA lands with wilderness characteristics would prevent expansion of surface disturbance that would degrade the natural landscape. However, the noise and presence of vehicles would temporarily diminish opportunities for solitude and conflict with primitive forms of recreation.

#### **4.10.2.7.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

The Proposed RMP would manage 44,168 acres in Nine Mile Canyon as a SRMA to protect high-value cultural resources and scenic vistas. The SRMA includes a portion (23,058 acres) of the Desolation Canyon non-WSA lands with wilderness characteristics. OHV travel in the non-WSA lands with wilderness characteristics portion of the SRMA would be limited to designated routes and the area would be managed with VRM Class II objectives (retention of the characteristic landscape) in the canyon bottom and Class III objectives (partial retention) on the table lands above the canyon. Mineral resources would be leased with a no surface occupancy stipulation for the canyon bottom and standard stipulation on the table lands. Portions of the non-WSA lands with wilderness characteristics are already leased, the potential for mineral occurrence is moderate to high, and development is anticipated. No surface occupancy on future leases in the canyon bottom would prevent further landscape modifications that would degrade the natural characteristics of the Desolation Canyon non-WSA lands with wilderness characteristics. But, exploration and development on existing leases and new leases with standard stipulations would result in surface disturbance that would alter the natural characteristics of the table lands above the canyon. Limiting motorized travel to designated routes (19 miles) would prevent surface disturbance from expansion of OHV use that would adversely impact the natural characteristics of the non-WSA lands with wilderness characteristics. The noise and presence of vehicles on these routes, however, would degrade opportunities for solitude and conflict with primitive, non-motorized recreation uses of the area. While management of the area for VRM Class II objectives would minimize surface disturbance and impacts to the natural characteristics of the non-WSA lands with wilderness characteristics, it would not prevent that disturbance.

#### **4.10.2.7.2. ALTERNATIVE A**

##### **4.10.2.7.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Alternative A would manage 24,183 acres along the White River as an SRMA for river-related recreation opportunities, including float boating, camping, wildlife viewing, hunting, fishing, hiking, and historic interpretation. The SRMA includes portions of the White River non-WSA lands with wilderness characteristics. In the canyon, the SRMA prescription would generally retain the natural characteristics of the landscape, allowing minor development consistent with VRM Class II objectives, except where the ROW corridor crosses the river canyon. Generally, retaining a natural setting would support opportunities for solitude and primitive forms of recreation. Location of a utility line in the proposed corridor would change that portion of the

landscape to a more developed character, and would not be conducive to opportunities for solitude or primitive recreation activities.

Under this alternative, Blue Mountain (42,758 acres) would be managed as a SRMA with recreation focus on hang-gliding, wildlife viewing, hunting, sight seeing, photography, horseback riding, camping, hiking, rock climbing, historic interpretation, and OHV use of designated routes. The SRMA includes Bourdette Draw non-WSA lands with wilderness characteristics. The management prescription for that portion of the SRMA that includes the non-WSA lands with wilderness characteristics would limit OHV use to designated routes, manage landscapes as VRM Classes I, II, and IV, and allow for oil and gas leasing with timing and controlled surface use stipulations. Management to VRM Class I (preservation of the characteristic landscape) and II (retain the landscape) would limit surface disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Areas along the Miners Draw Road would be managed VRM Class IV and would permit development that would alter the landscape and natural characteristics of the non-WSA lands with wilderness characteristics. Oil and gas leasing with timing and controlled surface use would allow exploration and development that would alter the landscape. However, while parts of the non-WSA lands with wilderness characteristics are leased, oil and gas occurrence potential is undetermined, so development is not anticipated. Limiting OHV use to designated routes (about 4 miles) would prevent further surface disturbance of the landscape, and thus its natural characteristics, but the noise and presence of motorized vehicles would degrade opportunities for solitude and conflict with primitive recreation activities found in the non-WSA lands with wilderness characteristics.

Alternative A would manage 273,486 acres in the Book Cliffs as a SRMA with emphasis on a frontier mystique of adventure and discovery; opportunities for unconfined recreation with limited facilities. Activities would include wildlife viewing, hunting, hiking, backpacking, OHV driving, camping, viewing cultural sites, picnicking, mountain biking, photography, and horseback riding. This SRMA includes all or portions of the Bitter Creek, Rat Hole Ridge, Cripple Cowboy, Hells Hole Canyon, Sweet Water Canyon, and Wolf Point non-WSA lands with wilderness characteristics. The management prescription for that portion of the SRMA that includes the non-WSA lands with wilderness characteristics would limit OHV use to approximately 34 miles of designated routes, manage landscapes as VRM Classes II and III, and allow for oil and gas leasing with timing and controlled surface use stipulations (also a small area of standard stipulations in Bitter Creek non-WSA lands with wilderness characteristics). Management to VRM Class II would limit surface disturbance that would generally protect the natural characteristics of the non-WSA lands with wilderness characteristics. Management to VRM Class III would allow for surface disturbance and development that would alter the landscape and natural characteristics of the non-WSA lands with wilderness characteristics. Wolf Point, Sweetwater Canyon, Cripple Cowboy, Hells Hole Canyon, and Rat Hole Ridge would be managed by VRM Class II objectives. Bitter Creek would be managed under both Class II and III objectives. Oil and gas leasing with timing and controlled surface use stipulations would allow exploration and development that would alter the landscape. Because the SRMA is located in an area with moderate and high potential for oil and gas occurrence, development is likely. Limiting OHV use to designated routes would prevent further surface disturbance of the landscape and thus degradation of the natural characteristics, but the noise and presence of

motorized vehicles would degrade opportunities for solitude and conflict with primitive recreation activities found in the non-WSA lands with wilderness characteristics.

Alternative A would manage 52,720 acres in Browns Park as an SRMA with recreation focus on outstanding scenic vistas and enhancement of resources and associated activities including riparian, fish, special status species, water quality, water-based recreation, hunting, hiking, biking, horseback riding, OHV driving, camping, and cultural interpretation, as well as the construction of facilities needed to support these activities. The SRMA includes all or portions of the Mountain Home, Cold Springs Mountain, Lower Flaming Gorge, and Dead Horse Pass non-WSA lands with wilderness characteristics. The management prescription for that portion of the SRMA that includes Lower Flaming Gorge non-WSA lands with wilderness characteristics would close the area to leasing, while the other non-WSA lands with wilderness characteristics would allow leasing with timing and controlled surface use stipulations in the SRMA. The prescription for OHV travel in the non-WSA lands with wilderness characteristics within the SRMA would limit travel to designated routes, except Lower Flaming Gorge, which would be closed to OHV use. And, the non-WSA lands with wilderness characteristics in the SRMA would be managed by VRM Class II objectives. The area south of the Green River between Little Hole and Fire Flat, extending around the Taylor Flat subdivision to Rye Grass Draw, would be managed for primitive recreation opportunities, closed to OHV use, and closed to surface-disturbing activities. This prescription would protect the wilderness characteristics (natural characteristics, and opportunities for solitude and primitive recreation) in the Lower Flaming Gorge non-WSA lands with wilderness characteristics. In the northern portion of the SRMA (that includes parts of Mountain Home and Cold Spring Mountain non-WSA lands with wilderness characteristics), mineral occurrence potential is moderate. Interest in exploration and development, however, has not been demonstrated and surface disturbance that would alter the natural characteristics of the non-WSA lands with wilderness characteristics is not anticipated. Limiting motorized travel to about 3 miles of designated routes in the Mountain Home and Cold Spring Mountain non-WSA lands with wilderness characteristics would prevent expansion of surface disturbance that would degrade the natural landscape. However, the noise and presence of vehicles would temporarily impact opportunities for solitude and conflict with primitive forms of recreation. There are no routes designated for OHV travel in the Dead Horse Pass non-WSA lands with wilderness characteristics.

Alternative A would manage 81,168 acres in Nine Mile Canyon as a SRMA to protect high-value cultural resources and scenic vistas. The SRMA includes a portion (20,989 acres) of the Desolation Canyon non-WSA lands with wilderness characteristics. OHV travel in the non-WSA lands with wilderness characteristics portion of the SRMA would be limited to designated routes and the area would be managed with VRM Class II objectives in the canyon bottom and Class III objectives on the table lands above the canyon. Mineral resources would be leased with a no surface occupancy stipulation for the canyon bottom and standard stipulation on the table lands. Portions of the non-WSA lands with wilderness characteristics are already leased, and potential for mineral occurrence is moderate to high. So, development is anticipated. No surface occupancy on future leases in the canyon bottom would prevent further landscape modifications that would degrade the natural characteristics of the Desolation Canyon non-WSA lands with wilderness characteristics. But, exploration and development on existing leases and new leases with standard stipulations would result in surface disturbance that would alter the natural

characteristics of the table lands above the canyon. Limiting motorized travel to designated routes (19 miles) would prevent surface disturbance from expansion of OHV use that would adversely impact the natural characteristics of the non-WSA lands with wilderness characteristics. The noise and presence of vehicles on these routes, however, would degrade opportunities for solitude and conflict with primitive, non-motorized recreation uses of the area. While management of the area for VRM Class II objectives would minimize surface disturbance and impacts to the natural characteristics of the non-WSA lands with wilderness characteristics, it would not prevent that disturbance.

#### **4.10.2.7.3. ALTERNATIVE B**

##### **4.10.2.7.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative B, the White River would be managed for recreation use with minimal management oversight. OHV use would be closed along the river and limited to routes elsewhere. As a result, the river itself would provide opportunities for non-motorized recreation like floating, fishing, camping, hunting, and wildlife viewing. Motor vehicles, however, would have point access to the river on existing routes, providing for OHV driving and vehicle-supported camping, fishing, and picnicking, but this would also create some conflict with non-motorized river users. Motorized recreation uses and unlimited visitor group sizes would detract from opportunities for solitude and conflict with primitive and unconfined recreation uses.

Under this alternative, Blue Mountain would not be managed as a SRMA, but the area would be managed as part of the field office Extensive Recreation Management Area (ERMA). Dispersed motorized and non-motorized recreation uses would continue with minimal facility construction. Non-motorized, undeveloped forms of recreation would enhance opportunities for solitude and primitive and unconfined recreation and would not create surface disturbances that would degrade the natural characteristics of the Bourdette Draw non-WSA lands with wilderness characteristics. However, where motorized recreation uses occurred in the non-WSA lands with wilderness characteristics, and if even minimal facilities were constructed to support recreation activities, the resulting surface disturbance of construction of facilities would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Further, the noise and presence of vehicles and facilities would impact opportunities for solitude and conflict with primitive and unconfined forms of recreation.

Under this alternative, like Blue Mountain, the Book Cliffs region would not be managed as a SRMA, but the area would be managed as part of the field office ERMA. Dispersed motorized and non-motorized recreation uses would continue with minimal facility construction. Non-motorized, undeveloped forms of recreation would enhance opportunities for solitude and primitive and unconfined recreation and would not create surface disturbances that would degrade the natural characteristics of the Bitter Creek, Rat Hole Ridge, Hells Hole Canyon, Sweetwater, Cripple Cowboy, and Wolf Point non-WSA lands with wilderness characteristics. However, where motorized recreation uses occurred in the non-WSA lands with wilderness characteristics, and if even minimal facilities were constructed to support recreation activities, the resulting surface disturbance of construction of facilities would degrade the natural

characteristics of the non-WSA lands with wilderness characteristics. Further, the noise and presence of vehicles and facilities would diminish opportunities for solitude and conflict with primitive and unconfined forms of recreation.

Under Alternative B, Browns Park would be managed as an 17,000-acre SRMA with recreation focus on outstanding scenery, riparian, fisheries, special status species, and water quality, and the associated recreation uses, including water-based recreation, hunting, hiking, biking, horseback riding, OHV driving, camping, and cultural interpretation; and construction of facilities would be needed to support these activities. The SRMA includes portions of the Mountain Home (507 acres), Cold Springs Mountain (3,226 acres), and Lower Flaming Gorge (4,312 acres) non-WSA lands with wilderness characteristics. The impacts to non-WSA lands with wilderness characteristics would be the same as those described for Alternative A, for those non-WSA lands with wilderness characteristics located in the slightly smaller SRMA.

Under this alternative, Nine Mile Canyon would be managed as a 44,181-acre SRMA to protect areas of high cultural resource site density and scenic vistas. The SRMA would include part of the Desolation Canyon non-WSA with wilderness characteristics (23,053 acres), with impacts to the non-WSA lands with wilderness characteristics as described under the Proposed RMP.

#### **4.10.2.7.4. ALTERNATIVE C**

##### **4.10.2.7.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values**

Alternative C would manage 47,130 acres along the White River as an SRMA, with impacts that same as described for Alternative A, but include all of the White River non-WSA lands with wilderness characteristics.

Under this alternative, Blue Mountain would be managed as a 42,758-acre SRMA, with impacts that are the same as those described under Alternative A.

Alternative C would manage 273,486 acres within the Book Cliffs as a SRMA. The impacts would be the same as those described for Alternative A, except the Wolf Creek and Bitter Creek drainages and the head of Sweetwater Canyon would be closed to oil and gas leasing. Closure to leasing would prevent surface disturbance from exploration and development, protecting the natural characteristics of the Wolf Point, Cripple Cowboy, Bitter Creek, Rat Hole Ridge, and Sweetwater non-WSA lands with wilderness characteristics. However, portions of these non-WSA lands with wilderness characteristics are already leased, and given the moderate to high potential for mineral occurrence, impacts to their roadless character, natural characteristics, and opportunities for solitude and primitive recreation would be the same as those described under Alternative A.

Under Alternative C, Browns Park would be managed as a 52,720-acre SRMA, with impacts to non-WSA lands with wilderness characteristics being the same as those described for Alternative A.

Under this alternative, Nine Mile Canyon would be managed as an 81,168-acre SRMA, with impacts to non-WSA lands with wilderness characteristics being the same as those described for Alternative A.

#### **4.10.2.7.5. ALTERNATIVE D (No ACTION)**

##### **4.10.2.7.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Designation of Browns Park and Nine Mile Canyon SRMAs under Alternative D (No Action) would be very similar to that proposed under Proposed RMP, with impacts being the same as those described for Proposed RMP. No SRMAs would be designated for the Book Cliffs, White River, or Blue Mountain under this alternative. Recreation use in the non-WSA lands in these areas would be managed as part of the VFO Extensive Recreation Management Areas (ERMA) with impacts that same as described under Alternative B above.

#### **4.10.2.7.6. ALTERNATIVE E**

##### **4.10.2.7.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Designation of SRMAs under Alternative E would be the same as that proposed under Alternative A, with impacts being the same as those described for Alternative A. Designation of the White River SRMA, however, would be the same as proposed under Alternative C, with impacts that same as described for Alternative C. Under this alternative, however, non-WSA lands with wilderness characteristics located in any of the SRMAs would be managed to protect their wilderness characteristics and to provide for primitive and non-motorized/non-mechanized forms of recreation, and the settings needed to support those types of activities (undeveloped and unmodified landscapes) and experiences. As a result, the roadless and natural characteristics of the non-WSA lands with wilderness characteristics would be preserved, as would the opportunities for solitude and primitive recreation it provides.

#### **4.10.2.7.7. SUMMARY**

In summary, management of SRMAs under Alternative E would provide the greatest level of protection to the wilderness characteristics of the non-WSA lands with wilderness characteristics, followed by the Proposed RMP and Alternatives A and C. Management of the non-WSA lands with wilderness characteristics portions of the SRMAs for natural landscapes, non-motorized uses, and opportunities for solitude and primitive recreation would protect the wilderness characteristics of these areas under the Proposed RMP and Alternative E. Alternatives B and D (No Action) would provide less protection of wilderness characteristics.

#### **4.10.2.8. IMPACTS OF TRAVEL, ROADS, AND TRAILS DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

##### **4.10.2.8.1. PROPOSED RMP**

##### **4.10.2.8.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

The Proposed RMP would improve and develop up to 400 miles of trails for non-motorized uses. Mechanized use (mountain bikes) would also be permitted. Developing additional trails for hiking and horseback riding would provide added opportunities for primitive forms of recreation, where the trails are located in non-WSA lands with wilderness characteristics. Trails are planned in many non-WSA lands with wilderness characteristics managed for protection of those characteristics, including Daniels Canyon, Lower Flaming Gorge, Mountain Home, and others. Development of trails for mountain bikes would be in conflict with the primitive forms of recreation typically found, and managed for, in lands with wilderness characteristics. If there were substantial levels of use on the trails (by foot, horse, and/or bike) in the non-WSA lands with wilderness characteristics, the visitor's ability to find and experience solitude would be reduced. Construction of new trails would create surface disturbance that would detract from the natural characteristics of the landscape and non-WSA lands with wilderness characteristics, depending on the type of landform and vegetation cover. The change to the natural landscape, however, would be expected to be minimal, and new trails would provide added opportunities for primitive recreation activities.

The Proposed RMP would not allow motorized use off roads or trails to retrieve big game taken while hunting. Where this activity might occur in non-WSA lands with wilderness characteristics, this management action would reduce surface disturbance caused by OHV use that directly reduces the natural characteristics of non-WSA lands with wilderness characteristics. Further, this action would reduce the presence and noise of vehicles and the impacts to opportunities for solitude and primitive and unconfined recreation uses.

Under Proposed RMP, 6,202 acres would be designated as "open" to cross-country OHV travel. None of these open areas are located in non-WSA lands with wilderness characteristics, so there would be no impact of motor vehicles or use on wilderness characteristics.

Under the Proposed RMP, 1,643,475 acres would be designated "limited" to OHV travel. The limitation would require vehicles to travel on designated routes (4,860 miles). Except for portions of the Lower Flaming Gorge and White River non-WSA lands with wilderness characteristics, OHV use in most of the other non-WSA lands with wilderness characteristics (258,074 acres) would be limited to designated routes. This limitation would confine disturbance to soils and vegetation caused by motor vehicle use to the existing 113 miles of routes and result in no additional degradation of the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of vehicles using these routes, however, would reduce the opportunity of visitors to find solitude in the non-WSA lands with wilderness characteristics, especially in proximity to the routes. And, motorized uses would conflict with primitive and unconfined recreation opportunities sought in the non-WSA lands with wilderness characteristics.

Under the Proposed RMP, 75,845 acres would be closed to OHV use, including portions of the Lower Flaming Gorge (11,245 acres) and White River (6,833 acres) non-WSA lands with wilderness characteristics. This closure would prevent surface disturbance caused by motorized travel and the resultant impacts to the natural characteristics of the non-WSA lands with wilderness characteristics. Further, closure to OHV use would protect opportunities for solitude and prevent motorized uses that conflict with primitive forms of recreation in these areas. The wilderness characteristics of these two non-WSA lands with wilderness characteristics would be unaffected by OHV travel.

#### **4.10.2.8.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Development of 400 miles of additional trails for hiking and horseback riding would provide added opportunities for primitive forms of recreation, where the trails are located in non-WSA lands with wilderness characteristics. Trails are planned in many non-WSA lands with wilderness characteristics, including Bitter Creek, Cripple Cowboy, and others. Development of trails for mountain bikes would be in conflict with the primitive forms of recreation typically found, and managed for, in lands with wilderness characteristics. Substantial levels of use on the trails (by foot, horse, and/or bike) would reduce the visitor's ability to find and experience solitude. Construction of new trails would create surface disturbance that would detract from the natural characteristics of the landscape and non-WSA lands with wilderness characteristics, depending on the type of landform and vegetation cover. The change to the natural landscape, however, would be expected to be minimal.

Under the Proposed RMP, new permitted roads would be rehabilitated after serving their intended purposes. In the short-term, new roads constructed in non-WSA lands with wilderness characteristics would reduce the roadless character of the non-WSA lands with wilderness characteristics. Depending on the location of the road, it may even reduce the size of the non-WSA lands with wilderness characteristics, as lands with wilderness characteristics are roadless. Motor vehicle use of these newly constructed roads would also reduce a visitor's ability to find solitude and conflict with primitive, non-motorized forms of recreation. Depending on the purpose of the road, the impacts would be long-term, as well. For example, a newly constructed road to a producing oil or gas well would remain in place for an average of 25 years (Mineral Report, June 2004). However, upon successful reclamation, the natural characteristics of the non-WSA lands with wilderness characteristics would return. The nature of the landform and vegetation would affect the success of the reclamation efforts (partial or total). Cuts and fills for road construction on steep slopes and removal of old growth forest vegetation would be more difficult to restore and would take longer to return to a natural condition than a road constructed through a grassland or sage brush flat.

The Proposed RMP would also allow for the improvement or development of 800 miles of motorized trails. Trail improvement or construction would create surface disturbance that would have direct, adverse impacts on the landscape and natural quality of the non-WSA lands with wilderness characteristics, if any of the trails were developed in the non-WSA lands with wilderness characteristics (that decision would be made at the activity-level stage of planning following completion of the RMP). Development of motorized trails would conflict with the

primitive forms of recreation typically found, and managed for, in lands with wilderness characteristics. And, the presence and noise of dirt bikes or ATVs would reduce opportunities for solitude visitors seek in areas with wilderness characteristics. Construction of new trails would create surface disturbance that would detract from the natural characteristics of the landscape and non-WSA lands with wilderness characteristics, depending on the type of landform and vegetation cover. Indirect, long-term, adverse impacts would be produced by soil erosion, trail widening, and unmanaged extension of the trail system by OHVs.

The Proposed RMP would not allow motorized use off roads or trails to retrieve big game taken while hunting. Where this activity might occur in non-WSA lands with wilderness characteristics, this management action would reduce surface disturbance caused by OHV use that directly reduces the natural characteristics of non-WSA lands with wilderness characteristics. Further, this action would reduce the presence and noise of vehicles and the impacts to opportunities for solitude and primitive and unconfined recreation uses.

Under Proposed RMP, 6,202 acres would be designated as "open" to cross-country OHV travel. None of these open areas are located in non-WSA lands with wilderness characteristics, so there would be no impact of motor vehicles or use on wilderness characteristics.

Under the Proposed RMP, 1,643,475 acres would be designated "limited" to OHV travel. The limitation would require vehicles to travel on designated routes (4,860 miles). Use in most all of the non-WSA lands with wilderness characteristics (258,074 acres) would be limited to designated routes. This limitation would confine disturbance to soils and vegetation caused by motor vehicle use to the existing 113 miles of routes and result in no additional degradation of the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of vehicles using these routes, however, would reduce the opportunity of visitors to find solitude in the non-WSA lands with wilderness characteristics, especially in proximity to the routes. And, motorized uses would conflict with primitive and unconfined recreation opportunities sought in the non-WSA lands with wilderness characteristics.

Under the Proposed RMP, 75,845 acres would be closed to OHV use. This closure would prevent surface disturbance caused by motorized travel and the resultant impacts to the natural characteristics of the non-WSA lands with wilderness characteristics. Further, closure to OHV use would protect opportunities for solitude and prevent motorized uses that conflict with primitive forms of recreation in these areas.

#### **4.10.2.8.2. ALTERNATIVE A**

##### **4.10.2.8.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative A, the impact of travel, roads, and trails decision on the wilderness characteristics of non-WSA lands with wilderness characteristics would be the same as described for the Proposed RMP, except that no non-WSA lands with wilderness characteristics would be managed with emphasis on protection of wilderness characteristics.

**4.10.2.8.3. ALTERNATIVE B****4.10.2.8.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative B, hiking, horseback riding, and mechanized (non-motorized) trails would not be improved or developed. Thus, there would be no benefit to primitive and unconfined forms of recreation (hiking and horseback riding) sought by visitors to areas with wilderness characteristics. However, there would also be no conflict between mountain bike users of trails and hikers and horseback riders.

Under this alternative, new permitted roads would not be rehabilitated after serving their intended purposes. They would be left as parts of the transportation system on public lands. If these roads were constructed in non-WSA lands with wilderness characteristics, they would reduce the roadless character of the affected non-WSA lands with wilderness characteristics and reduce the size of the area with wilderness characteristics because lands with wilderness characteristics are roadless. The presence and noise of continued motor vehicle use of these newly constructed roads would also reduce a visitor's ability to find solitude and conflict with primitive, non-motorized forms of recreation.

This alternative, like the Proposed RMP and Alternative A, would also allow the improvement or development of 800 miles of motorized trails. If these trails were developed in non-WSA lands with wilderness characteristics, the impacts would be the same as described under the Proposed RMP and Alternative A.

Alternative B would allow motorized use off roads or trails to retrieve big game taken while hunting. Where this activity occurs in non-WSA lands with wilderness characteristics, it would result in a one-time pass, in and out of the area, and generally minor amounts of surface disturbance caused by motor vehicles that would reduce the natural characteristics of non-WSA lands with wilderness characteristics. Because the use would be a one-time event, depending on the terrain and vegetation type, surface disturbance should be temporary and naturally rehabilitate. The presence and noise of vehicles, however, would diminish opportunities for solitude and conflict with primitive and unconfined recreation uses of the non-WSA lands with wilderness characteristics.

Under Alternative B, 5,434 acres in the VPA would be designated as "open" to cross country OHV travel. None of these open areas are located in non-WSA lands with wilderness characteristics, so there would be no impacts of motor vehicles on wilderness characteristics.

Under this alternative, 1,659,901 acres would be designated "limited" to OHV travel. The limitation would require vehicles to travel on designated routes (4,861 miles). Except for portions of the White River non-WSA lands with wilderness characteristics, OHV use in most all of the other non-WSA lands with wilderness characteristics (274,022 acres) would be limited to 114 miles of designated routes, with impacts the same as those described under the Proposed RMP and Alternative A for areas designated limited to OHV travel.

Under this alternative, 60,187 acres would be closed to OHV use, including portions of the White River non-WSA lands with wilderness characteristics (2,948 acres), with impacts the same as those described under the Proposed RMP and Alternative A, for areas closed to OHV travel.

#### **4.10.2.8.4. ALTERNATIVE C**

##### **4.10.2.8.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Alternative C proposes to improve and develop up to 400 miles of trail for non-motorized uses, including hiking, horseback riding, and mountain biking. The impacts of this action on the wilderness characteristics of non-WSA lands with wilderness characteristics would be the same as those described for the Proposed RMP and Alternative A.

Under this alternative, new permitted roads would be rehabilitated after serving their intended purposes. The impacts to the wilderness characteristics of non-WSA lands with wilderness characteristics of this action would be the same as described under the Proposed RMP and Alternative A.

Under this alternative, motorized trails would not be developed, and consequently this decision would result in no impacts to the natural characteristics of the non-WSA lands with wilderness characteristics, nor opportunities for solitude or primitive recreational activities.

Alternative C would not allow motorized use off road or trail to retrieve big game taken while hunting. The impacts to the wilderness characteristics of non-WSA lands with wilderness characteristics would be the same as those described under the Proposed RMP and Alternative A.

Under Alternative C, 5,434 acres in the VPA would be designated as "open" to cross-country OHV travel. None of these open areas are located in non-WSA lands with wilderness characteristics, so there would be no impacts of motor vehicles on wilderness characteristics.

Under this alternative, 1,353,529 acres would be designated "limited" to OHV travel. The limitation would require vehicles to travel on designated routes (4,707 miles), including the Bitter Creek, Bourdette Draw, Desolation Canyon, Diamond Mountain, Hells Hole Canyon, and Mountain Home non-WSA lands with wilderness characteristics. The impacts of limiting motorized travel on 26,266 acres to 57 miles of designated routes on the wilderness characteristics of these areas would be the same as those described for the Proposed RMP and Alternative A.

Under Alternative C, 366,559 acres would be closed to OHV use, including most of the Lower Flaming Gorge, Cold Spring Mountain, Diamond Breaks, Diamond Mountain, Wild Mountain, Moonshine Draw, Bourdette Draw, Daniels Canyon, Bull Canyon, White River, Bitter Creek, Lower Bitter Creek, Bitter Creek, Rat Hole Ridge, Cripple Cowboy, Sweetwater Canyon, Wolf Point, and Desolation Canyon non-WSA lands with wilderness characteristics. The effect of OHV closure of 250,716 acres on the wilderness characteristics of these non-WSA lands with

wilderness characteristics would be the same as those described for Proposed RMP and Alternative A, but would include more lands with wilderness characteristics.

#### **4.10.2.8.5. ALTERNATIVE D (No Action)**

##### **4.10.2.8.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Alternative D (No Action) proposes 55 miles of hiking and horseback riding trails and 2 miles of mountain bike trails. If these trails are located in any non-WSA lands with wilderness characteristics, the impacts to wilderness characteristics would be the same as those described for the Proposed RMP and Alternative A. As with the Proposed RMP and other alternatives, off-road or off-trail use of OHVs to retrieve game taken while hunting would not be permitted, with impacts as described for the Proposed RMP and Alternative A.

This alternative would maintain a total of 787,859 acres as open to cross country OHV travel, including all, or portions of the Beach Draw, Bourdette Draw, Cold Spring Mountain, Desolation Canyon, Wolf Point, Cripple Cowboy, Bitter Creek, Rat Hole Ridge, Lower Bitter Creek, Sweet Water, Hideout Canyon, White River, Diamond Breaks, Diamond Mountain, Lower Flaming Gorge, Dead Horse Pass, Mountain Home, and Wild Mountain non-WSA lands with wilderness characteristics. Cross-country motorized travel in these non-WSA lands with wilderness characteristics would result in surface disturbance to soils and vegetation that would alter the landscape and diminish the natural characteristics of these non-WSA lands with wilderness characteristics. Further, the presence and noise of motorized vehicles would degrade a visitor's opportunity for solitude and conflict with opportunities for primitive and unconfined recreation activities.

Under this alternative, 887,275 acres would be limited to OHV use, including small to substantial parts of every non-WSA lands with wilderness characteristics. Limiting OHV use on 143,887 acres of non-WSA lands with wilderness characteristics to 228 miles of existing routes would confine soil and vegetation disturbance caused by motor vehicles to those routes and would result in no additional change to the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of vehicles using these routes, however, would reduce the opportunity of visitors to find solitude in the non-WSA lands with wilderness characteristics, especially in proximity to the routes. And, motorized uses would conflict with primitive and unconfined recreation opportunities sought in the non-WSA lands with wilderness characteristics.

Alternative D (No Action) would close 50,388 acres to OHV use, including parts of every non-WSA lands with wilderness characteristics (34,331 acres), except Hideout Canyon. This closure would prevent surface disturbance caused by motorized travel and would protect the natural characteristics of the non-WSA lands with wilderness characteristics. Further, closure to OHV use would eliminate the presence and noise of OHV travel and preserve opportunities for solitude and primitive forms of recreation in these areas. The wilderness characteristics of the non-WSA lands with wilderness characteristics would be unaffected by OHV travel.

**4.10.2.8.6. ALTERNATIVE E****4.10.2.8.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Alternative E proposes to improve and develop up to 400 miles of trails for non-motorized uses, including hiking and horseback riding. The impacts of this action on the wilderness characteristics of non-WSA lands with wilderness characteristics would be the same as those described for the Proposed RMP and Alternative A, except that mountain biking would not be permitted, and thus, the conflicts with primitive forms of recreation would not occur.

Under this alternative, new permitted roads would be rehabilitated after serving their intended purposes. The impacts to the wilderness characteristics of non-WSA lands with wilderness characteristics would be the same as those described under Alternative A.

No motorized routes would be improved or developed under Alternative E. This decision, therefore, would result in no impacts to the natural characteristics of the non-WSA lands with wilderness characteristics nor opportunities for solitude or primitive recreational opportunities.

This alternative would not allow motorized use off-road or off-trail to retrieve big game taken while hunting. The impacts to the wilderness characteristics of non-WSA lands with wilderness characteristics would be the same as those described under the Proposed RMP and Alternative A.

Under Alternative E, 5,434 acres in the VPA would be designated as "open" to cross-country OHV travel. None of these open areas are located in non-WSA lands with wilderness characteristics, so there would be no impacts of motor vehicles on wilderness characteristics.

Under this alternative, 1,326,024 acres would be designated "limited" to OHV travel. The limitation would require vehicles to travel on designated routes (4,654 miles). None of the areas limited to motorized travel include non-WSA lands with wilderness characteristics, so there would be no impacts of limited motor vehicle use on wilderness characteristics.

Under Alternative E, 392,818 acres would be closed to OHV use, including all of the non-WSA lands with wilderness characteristics (277,596 acres). The effect of OHV closure on the wilderness characteristics of these non-WSA lands with wilderness characteristics would be the same as those described for the Proposed RMP and Alternative A, but it would affect more acres, including all of the non-WSA lands with wilderness characteristics.

**4.10.2.8.7. SUMMARY**

In summary, the Proposed RMP and Alternative A, C, and E travel decisions would have the greatest benefit to the wilderness characteristics of non-WSA lands with wilderness characteristics. Alternative D (No Action) would have greater OHV impacts on wilderness characteristics than the Proposed RMP and other alternatives because more acres would be designated open to cross-country OHV travel.

#### **4.10.2.9. IMPACTS OF RIPARIAN/SOILS/WATERSHED DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

##### **4.10.2.9.1. PROPOSED RMP**

###### **4.10.2.9.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Surface-disturbing activities on slopes between 21% and 40% would not be approved without an approved erosion-control strategy. While the strategy would prevent unnecessary and undue degradation of the environment, it would not prevent soil and vegetation disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Further, the presence and noise of people and equipment connected with the proposed project would diminish opportunities for solitude and primitive and unconfined types of recreation typically sought in areas with wilderness characteristics.

The prohibition of surface disturbance on slopes greater than 40% would prevent surface disturbance that would degrade the natural condition of non-WSA lands with wilderness characteristics. The prohibition on disturbance would also protect opportunities for both solitude and primitive forms of recreation.

Restrictions on surface disturbance in active flood plains or within 100 meters of riparian zones would reduce surface disturbance that would degrade the natural characteristics of non-WSA lands with wilderness characteristics that contain floodplains and riparian zones, including Lower Flaming Gorge, Cold Spring Mountain, Mountain Home, White River, and others.

###### **4.10.2.9.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Surface-disturbing activities on slopes between 21% and 40% would not be approved without an approved erosion-control strategy. This strategy would prevent unnecessary and undue degradation of the environment, but it would not prevent soil and vegetation disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of people and equipment connected with a surface-disturbing project would diminish opportunities for solitude and primitive and unconfined types of recreation typically sought in areas with wilderness characteristics.

The prohibition of surface disturbance on slopes greater than 40% would prevent surface disturbance that would degrade the natural condition of non-WSA lands with wilderness characteristics, and protect opportunities for both solitude and primitive forms of recreation.

Restrictions on surface disturbance in active flood plains or within 100 meters of riparian zones would reduce surface disturbance in flood plains and riparian zones that would degrade the natural characteristics of non-WSA lands with wilderness characteristics, including Desolation Canyon, Bitter Creek, and others.

**4.10.2.9.2. ALTERNATIVES A AND C****4.10.2.9.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under these alternatives, the effects of limiting surface disturbance on steep slopes and in floodplains and riparian zones would have the same effects on the wilderness characteristics of non-WSA lands with wilderness characteristics as under the Proposed RMP.

**4.10.2.9.3. ALTERNATIVE B****4.10.2.9.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Surface-disturbing activities on slopes greater than 20% would not be approved without an approved erosion control strategy, resulting in impacts the same as those described for the Proposed RMP on slopes between 21% and 40%. Restrictions on surface disturbance in active flood plains or within 100 meters of riparian zones would have the same effects on the wilderness characteristics of non-WSA lands with wilderness characteristics as described for the Proposed RMP.

**4.10.2.9.4. ALTERNATIVE D (NO ACTION)****4.10.2.9.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under this alternative, no surface disturbance or occupancy for mineral development would be allowed on slopes greater than 40%. The effects of this action on non-WSA lands with wilderness characteristics would be the same as those described for the Proposed RMP. Restrictions on surface disturbance in active flood plains or within 100 meters of riparian zones would have the same effects on the wilderness characteristics of non-WSA lands with wilderness characteristics as the Proposed RMP.

**4.10.2.9.5. ALTERNATIVE E****4.10.2.9.5.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

As with the Proposed RMP and Alternatives A and C, no surface disturbance would be permitted on slopes between 21% and 40% without an approved erosion-control strategy. Further, surface disturbance would not be allowed on slopes over 40%. However, under this alternative, no surface disturbance would be permitted that would impact the natural characteristics of the non-WSA lands with wilderness characteristics. The effects of these actions would preserve the wilderness characteristics of non-WSA lands with wilderness characteristics. Further, restrictions on surface disturbance in active flood plains or within 100 meters of riparian zones would have

the same effects on the wilderness characteristics of non-WSA lands with wilderness characteristics as the Proposed RMP.

#### **4.10.2.9.6. SUMMARY**

Alternative E would provide the most protection of the wilderness characteristics of non-WSA lands with wilderness characteristics because surface disturbance would not be permitted in these areas. The Proposed RMP and Alternatives A and C would mitigate the effects of soil erosion on slopes greater than 20%, but the mitigation would not prevent surface disturbance that degrades the natural characteristics of non-WSA lands with wilderness characteristics.

#### **4.10.2.10. IMPACTS OF SPECIAL DESIGNATION DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

For the purposes of this analysis, "Special Designations" include ACECs established under the Proposed RMP and each alternative, rivers suitable for inclusion in the Wild and Scenic Rivers System under the Proposed RMP and each alternative, and WSAs being managed to protect their wilderness characteristics under the Proposed RMP and each alternative.

Tables 4.10.2 through 4.10.4 show which special designations would be established or recommended under the Proposed RMP and each alternative, their acreage or length, and the non-WSA lands with wilderness characteristics that are wholly or partially located in the special designations.

**Table 4.10.2 Non-WSA Lands with Wilderness Characteristics Located in Special Designations**

**4.10.2.10.1. PROPOSED RMP****4.10.2.10.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under the Proposed RMP, two existing ACECs that include non-WSA lands with wilderness characteristics would be carried forward to protect a variety of relevant and important values. Those ACECs are Red Creek Watershed and Browns Park. The management prescriptions for these ACECs would protect wilderness characteristics in portions of non-WSA lands with wilderness characteristics.

The Red Creek Watershed ACEC (24,475 acres) would be managed to protect high-value wetland and wildlife habitat, including the regionally significant watershed (part of the Green River drainage system) and a Class 1 fishery. Protection of this watershed would help preserve the natural characteristics of those portions of the Cold Spring Mountain (76 acres) and Mountain Home (4,976 acres) non-WSA lands with wilderness characteristics that lie within the

ACEC. Protection of the fishery would enhance the natural values of the non-WSA lands with wilderness characteristics and ensure opportunities for primitive recreational activities (fishing).

In the 18,490-acre Browns Park ACEC, part of the Lower Flaming Gorge non-WSA lands with wilderness characteristics would be closed to leasing and OHV use. The Green River through Browns Park would be open to leasing but with an NSO stipulation. The area of NSO includes a small part of the south end of the Mountain Home non-WSA lands with wilderness characteristics. Otherwise, most of the ACEC would be open to leasing with timing and controlled surface use; OHV use would be limited to designated routes; and visual resource objectives would be Class II. This prescription would limit surface disturbance and would protect the natural characteristics of the Lower Flaming Gorge non-WSA lands with wilderness characteristics. It would also preclude the noise and presence of motorized vehicles and equipment that would reduce opportunities for solitude and conflict with the primitive forms of recreation sought by visitors to lands with wilderness characteristics. The NSO leasing stipulation along the Green River would prevent surface disturbance in small parts of the Mountain Home non-WSA lands with wilderness characteristics. Otherwise, this ACEC prescription would allow for surface disturbances that would alter the landscape and natural characteristics of the non-WSA lands with wilderness characteristics. However, the ACEC is located in an area of undetermined mineral potential, and mineral development is not expected to be substantial. Further, compliance with VRM Class II objectives would minimize surface disturbances and impacts to the natural characteristics of the non-WSA lands with wilderness characteristics. Motorized use of designated routes, however, would adversely impact opportunities for solitude and primitive recreation. The presence and noise of vehicles would detract from the experience of solitude and conflict with primitive recreational uses.

Under the Proposed RMP, 22 miles of the Upper Green River would be recommended for designation as a Wild and Scenic River with a classification of "scenic." Protection of the river (until Congress acts) would preserve the wilderness characteristics of the Lower Flaming Gorge and Cold Spring Mountain non-WSA lands with wilderness characteristics.

Managing the wilderness study areas (WSAs) under the BLM's Interim Management Policy to protect their wilderness values would expand opportunities for solitude and primitive forms of recreation found in the Bull Canyon, Daniels Canyon, Diamond Breaks, and Cold Spring Mountain non-WSA lands with wilderness characteristics to larger land areas, including both the WSAs and contiguous non-WSA lands with wilderness characteristics. This would enhance the opportunities for solitude and primitive recreation.

#### **4.10.2.10.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under the Proposed RMP, two ACECs that include non-WSA lands with wilderness characteristics would be established to protect a variety of relevant and important values. Those ACECs are Nine Mile Canyon and the Lower Green River. The management prescriptions for these ACECs would protect wilderness characteristics in portions of non-WSA lands with wilderness characteristics.

In the 44,168-acre Nine Mile Canyon ACEC, the canyon would be open to oil and gas leasing with an NSO stipulation, while the table lands above the canyon would be open with timing and controlled surface use stipulations. The ACEC prescription would limit OHV travel in the entire ACEC to designated routes, and visual resources management objectives would be Class II in the lower canyon and Class III in the upper canyon and on the tablelands. This prescription would generally prevent surface disturbance to the canyon bottom, protecting its natural characteristics. Given the mineral potential, current industry interest, and production history, however, surface disturbances would be expected in much of the rest of the ACEC and would detract from the natural characteristics of this portion of the Desolation Canyon non-WSA lands with wilderness characteristics. The presence and noise of OHV travel and oil and gas development would diminish the opportunities for solitude on the non-WSA lands with wilderness characteristics and would conflict with primitive forms of recreation typically found in non-WSA lands with wilderness characteristics.

The 8,470-acre Lower Green River Corridor ACEC would be available for oil and gas leasing with timing and controlled surface use stipulations and an NSO stipulation, managed by VRM Class II objectives, and limited to OHV use on designated routes. This prescription would prevent large-scale landscape modifications from oil and gas development in an area of high potential and industry interest, but would allow some developments within VRM objectives, generally protecting the natural characteristics of this portion of the Desolation Canyon non-WSA lands with wilderness characteristics. The presence and noise of OHV use on designated routes would temporarily reduce opportunities for solitude and conflict with opportunities for primitive forms of recreation sought in areas with wilderness characteristics, when vehicles were traveling the routes.

Under the Proposed RMP, 30 miles of the Lower Green River would be recommended for designation as a wild and scenic river with a classification of "scenic." Protection of river values (until Congress acts) would preserve the wilderness characteristics of a portion of the Desolation Canyon non-WSA lands with wilderness characteristics.

Managing the wilderness study areas (WSAs) under the BLM's Interim Management Policy to protect their wilderness values would expand opportunities for solitude and primitive forms of recreation found in the Cripple Cowboy non-WSA lands with wilderness characteristics to larger land areas, including both the WSAs and contiguous non-WSA lands with wilderness characteristics. This would enhance the opportunities for solitude and primitive recreation.

#### **4.10.2.10.2. ALTERNATIVE A**

##### **4.10.2.10.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative A, six ACECs that include non-WSA lands with wilderness characteristics would be established to protect a variety of relevant and important values. Those ACECs are Bitter Creek-PR Spring, Lower Green River, White River, Browns Park, Nine Mile Canyon, and Red Creek Watershed. The management prescriptions for these ACECs would protect wilderness characteristics in portions of non-WSA lands with wilderness characteristics.

In the 68,834-acre Bitter Creek-PR Spring ACEC, the 160-acre parcel around the old growth pinyon forest and the Book Cliffs Mountain Browse Natural Areas (400 acres) would be NSO and closed to oil and gas leasing, closed to wood cutting and OHV use, and would be managed by VRM Class I objectives. This prescription would prevent surface disturbances and motorized uses and would protect the natural characteristics of the non-WSA lands with wilderness characteristics and opportunities for solitude and primitive recreation. Most of the ACEC, however, would be available for leasing, forest treatments, firewood cutting, and OHV use on designated routes. These actions would result in surface disturbances that alter the landscape and natural characteristics of non-WSA lands with wilderness characteristics. The presence and noise of vehicles and equipment would diminish opportunities for solitude and would conflict with more primitive forms of recreation.

The 10,170-acre Lower Green River ACEC would be open for oil and gas leasing with an NSO stipulation, managed by VRM Class II objectives, and limited to OHV use on designated routes. This prescription would prevent large-scale landscape modifications from oil and gas development in an area of high potential and industry interest, but would allow some developments within VRM objectives, generally protecting the natural characteristics of this portion of the Desolation Canyon non-WSA lands with wilderness characteristics. The presence and noise of OHV use on designated routes would temporarily reduce opportunities for solitude and conflict with opportunities for primitive forms of recreation sought in areas with wilderness characteristics, when vehicles were traveling the routes.

Most of the 17,810-acre White River ACEC would be closed to oil and gas leasing or available only with an NSO stipulation. The uplands of the eastern half of the ACEC would be open to leasing with timing and controlled surface use stipulations. The western half of the ACEC would be closed to OHV use, while OHV use in the eastern half of the ACEC would be limited to designated routes. The interior river canyon in the western half of the ACEC would be managed by VRM Class I objectives, while the remainder of the ACEC would be managed VRM Class II. This prescription would generally prevent surface disturbances that reduce the natural characteristics of the White River non-WSA lands with wilderness characteristics, except in the uplands of the eastern half of the ACEC. Here oil and gas leasing is permitted and would lead to surface disturbance due to the high potential for and industry interest in developing oil and gas resources. VRM Class II objectives in the eastern half of the ACEC would permit some surface disturbances that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of OHV use on designated routes in the eastern half of the ACEC would reduce opportunities for solitude and would conflict with primitive forms of recreation when vehicles were traveling the designated routes.

In the 52,721-acre Browns Park ACEC, much of the Lower Flaming Gorge non-WSA lands with wilderness characteristics would be closed to leasing and OHV use. The Green River through Browns Park would be open to leasing but with an NSO stipulation. The area of NSO includes a very small part of the north end of the Dead Horse Pass non-WSA lands with wilderness characteristics and a very small part of the south end of the Mountain Home non-WSA lands with wilderness characteristics. Otherwise, most of the ACEC would be open to leasing with timing and controlled surface use; OHV use would be limited to designated routes; and visual resource objectives would be Class II. This prescription would prevent surface disturbance and

would protect the natural characteristics of the Lower Flaming Gorge non-WSA lands with wilderness characteristics. It would also preclude the noise and presence of motorized vehicles and equipment that would reduce opportunities for solitude and conflict with the primitive forms of recreation sought by visitors to lands with wilderness characteristics. The NSO leasing stipulation along the Green River would prevent surface disturbance in very small parts of the Mountain Home and Dead Horse Pass non-WSA lands with wilderness characteristics. Otherwise, this ACEC prescription would allow for surface disturbances that would alter the landscape and natural characteristics of the non-WSA lands with wilderness characteristics. However, the ACEC is located in an area of undetermined mineral potential, and mineral development is not expected to be substantial. Further, compliance with VRM Class II objectives would minimize surface disturbances and impacts to the natural characteristics of the non-WSA lands with wilderness characteristics. Motorized use of designated routes, however, would adversely impact opportunities for solitude and primitive recreation. The presence and noise of vehicles would detract from the experience of solitude and conflict with primitive recreational uses.

In the 48,000-acre Nine Mile Canyon ACEC, the canyon would be open to oil and gas leasing with an NSO stipulation, while the table lands above the canyon would be open with timing and controlled surface use stipulations. The ACEC prescription would limit OHV travel in the entire ACEC to designated routes, and visual resources management objectives would be Class II in the lower canyon and Class III in the upper canyon and on the tablelands. This prescription would generally prevent surface disturbance to the canyon bottom, protecting its natural characteristics. Given the mineral potential, current industry interest, and production history, however, surface disturbances would be expected in much of the rest of the ACEC and would detract from the natural characteristics of this portion of the Desolation Canyon non-WSA lands with wilderness characteristics. The presence and noise of OHV travel and oil and gas development would diminish the opportunities for solitude on the non-WSA lands with wilderness characteristics and would conflict with primitive forms of recreation typically found in non-WSA lands with wilderness characteristics.

The Red Creek Watershed ACEC (24,475 acres) would be managed to protect high-value wetland and wildlife habitat, including the regionally significant watershed (part of the Green River drainage system) and a Class 1 fishery. Protection of this watershed would help preserve the natural characteristics of those portions of the Cold Spring Mountain (76 acres) and Mountain Home (4,976 acres) non-WSA lands with wilderness characteristics that lie within the ACEC. Protection of the fishery would enhance the natural values of the non-WSA lands with wilderness characteristics and ensure opportunities for primitive recreational activities (fishing).

Under Alternative A, 22 miles of the White River would be recommended suitable for Wild and Scenic River designation with a classification of "wild" in the upper end of the river canyon and "scenic" in the lower end. Protection of river values (until Congress acts on BLM's recommendation) would prevent uses and surface disturbances that would detract from the natural characteristics of 22 miles of the recommended river canyon in the White River non-WSA lands with wilderness characteristics or that would impact opportunities for solitude and primitive recreation in the river canyon. Under this alternative, 22 miles of the Upper Green River would be recommended for designation as a Wild and Scenic River with a classification of

"scenic." As in the case of the White River, protection of the river (until Congress acts) would preserve the wilderness characteristics of the Lower Flaming Gorge non-WSA lands with wilderness characteristics. Further, 30 miles of the Lower Green River would be recommended for designation as a wild and scenic river with a classification of "scenic." Protection of river values (until Congress acts) would preserve the wilderness characteristics of a portion of the Desolation Canyon non-WSA lands with wilderness characteristics.

Managing the wilderness study areas (WSAs) under the BLM's Interim Management Policy to protect their wilderness values would expand opportunities for solitude and primitive forms of recreation found in the Cripple Cowboy, Bull Canyon, Daniels Canyon, Diamond Breaks, and Cold Spring Mountain non-WSA lands with wilderness characteristics to larger land areas, including both the WSAs and contiguous non-WSA lands with wilderness characteristics. This would enhance the opportunities for solitude and primitive recreation.

#### **4.10.2.10.3. ALTERNATIVE B**

##### **4.10.2.10.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative B, four ACECs that include non-WSA lands with wilderness characteristics would be established to protect a variety of relevant and important values. Those ACECs are Red Creek Watershed, Browns Park, Nine Mile Canyon, and the Lower Green River. The management prescriptions for these ACECs would protect wilderness characteristics in portions of the non-WSA lands with wilderness characteristics.

The effects of ACEC management in the Red Creek Watershed ACEC on the wilderness characteristics of Cold Spring Mountain and Mountain Home non-WSA lands with wilderness characteristics would be the same as described under the Proposed RMP.

In the 18,474-acre Browns Park ACEC, part of the Lower Flaming Gorge non-WSA lands with wilderness characteristics would be open to oil and gas leasing subject to an NSO stipulation. The Green River through Browns Park would be open to leasing, also with an NSO stipulation. In Browns Park, the NSO area would include a small part of the south end of the Mountain Home non-WSA lands with wilderness characteristics. Otherwise, most of the ACEC would be open to leasing with timing and controlled surface use, OHV use would be limited to designated routes, and visual resource objectives would be VRM Class I, II, III, and IV.

This prescription would generally prevent surface disturbance and protect the natural characteristics of the riverine parts of the Lower Flaming Gorge, Mountain Home, and Cold Spring Mountain non-WSA lands with wilderness characteristics. However, the noise and presence of motorized vehicles and equipment would reduce opportunities for solitude and would conflict with the primitive forms of recreation sought by visitors to lands with wilderness characteristics. This ACEC prescription would allow for surface disturbances that would alter the landscape and natural characteristics of the non-WSA lands with wilderness characteristics. However, the ACEC is located in an area of undetermined mineral potential, and mineral development is not expected to be substantial. Motorized use of designated routes would

adversely impact opportunities for solitude and primitive recreation. The presence and noise of vehicles would detract from the experience of solitude and would conflict with primitive recreational uses, both opportunities sought by visitors to lands with wilderness characteristics.

In the 44,181-acre Nine Mile Canyon ACEC, the canyon would be open to oil and gas leasing with timing and controlled surface use stipulations and NSO, whereas the table lands above the canyon would be open with standard stipulations. The ACEC prescription would limit OHV travel in the entire ACEC to designated routes, and visual resources management objectives would be VRM Class II in the canyon and VRM Class III and IV on the tablelands. This prescription would generally prevent surface disturbance to the canyon bottom, protecting its natural characteristics. Given the mineral potential, current industry interest, and production history, however, surface disturbances would be expected in much of the rest of the ACEC, detracting from the natural characteristics of this portion of the Desolation Canyon non-WSA lands with wilderness characteristics. The presence and noise of OHV travel and oil and gas development would diminish the opportunities for solitude on the non-WSA lands with wilderness characteristics, and conflict with primitive forms of recreation typically found in lands with wilderness characteristics.

The impacts of the Lower Green River ACEC on Desolation Canyon non-WSA lands with wilderness characteristics would be the same as described under the Proposed RMP.

Under this alternative, 22 miles of the Upper Green River would be recommended for designation as a Wild and Scenic River with a classification of "scenic." Protection of river values (until Congress acts on BLM's recommendation) would prevent uses and surface disturbances that would detract from the natural characteristics of the Lower Flaming Gorge and Cold Spring Mountain non-WSA lands with wilderness characteristics or impact opportunities for solitude and primitive recreation in the river canyon. In addition, 30 miles of the Lower Green River would be recommended for designation as a wild and scenic river with a classification of "scenic." Protection of river values (until Congress acts) would preserve the wilderness characteristics of a portion of the Desolation Canyon non-WSA lands with wilderness characteristics.

Managing the wilderness study areas (WSAs) under BLM's Interim Management Policy to protect their wilderness values would expand opportunities for solitude and primitive forms of recreation found in the Cripple Cowboy, Bull Canyon, Daniels Canyon Diamond Breaks, and Cold Spring Mountain non-WSA lands with wilderness characteristics to larger land areas, including both the WSAs and contiguous non-WSA lands with wilderness characteristics. This would enhance the opportunities for solitude and primitive recreation.

#### **4.10.2.10.4. ALTERNATIVE C**

##### **4.10.2.10.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative C, eight ACECs that include non-WSA lands with wilderness characteristics would be established to protect a variety of relevant and important values. Those ACECs are

Bitter Creek-PR Spring, Four Mile Wash, Lower Green River, White River, Browns Park, Nine Mile Canyon, Main Canyon, and Red Creek Watershed. The management prescriptions for these ACECs would protect wilderness characteristics in portions of the non-WSA lands with wilderness characteristics.

In the 147,425-acre Bitter Creek-PR Spring ACEC, the 160-acre parcel around the old growth pinyon forest and the Bitter Creek, Rat Hole Ridge, Hells Hole Canyon, Cripple Cowboy, and Sweet Water Canyon non-WSA lands with wilderness characteristics would be closed to oil and gas leasing, closed to OHV use (except Hells Hole Canyon non-WSA lands with wilderness characteristics), and managed by VRM Class I objectives. This prescription would prevent surface disturbances and motorized uses and would protect the natural characteristics of the non-WSA lands with wilderness characteristics and opportunities for solitude and primitive recreation. The rest of the ACEC would be available for leasing, forest treatments, firewood cutting, and OHV use on designated routes, but there are no lands with wilderness characteristics in the remainder of the ACEC, so the wilderness characteristics of non-WSA lands with wilderness characteristics would not be affected by these uses.

The 50,280-acre Four Mile Wash ACEC would be closed to oil and gas leasing. The visual resources of the ACEC would be managed for VRM Class II, Class III, and Class IV objectives. The ACEC prescription would limit off-highway vehicles to designated routes. This prescription would generally limit surface disturbance and would maintain the natural characteristics of this portion of the Desolation Canyon non-WSA lands with wilderness characteristics. The presence and noise of vehicle use on designated routes would diminish opportunities for solitude, and conflict with opportunities for primitive and unconfined recreation sought by visitors to lands with wilderness characteristics.

Under this alternative, the 10,170-acre Lower Green River ACEC would be the same area as that described in Alternative A and would be managed by the same prescription. The effect on non-WSA lands with wilderness characteristics, therefore, would be the same as that described under Alternative A.

The river canyon of the 47,130-acre White River ACEC would be closed to oil and gas leasing or available with an NSO stipulation. The uplands would be open to leasing with timing and controlled surface use and standard stipulations. The western half of the ACEC would be closed to OHV use, whereas OHV use in the eastern half of the ACEC would be limited to designated routes. The river canyon in the western half of the ACEC would be managed by VRM Class I objectives, whereas the river canyon in the eastern half of the ACEC would be managed by VRM Class II objectives. The uplands would be managed under VRM Class III and IV objectives. This prescription would generally prevent surface disturbances that reduce the natural characteristics along the river corridor of the White River non-WSA lands with wilderness characteristics, but not in the uplands of the ACEC. Here oil and gas leasing would be permitted and would lead to surface disturbance due to the high potential, industry interest, and production history. VRM Class II objectives in the eastern half of the ACEC would permit some surface disturbances that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of OHV use of designated routes in the

eastern half of the ACEC would reduce opportunities for solitude and would conflict with primitive forms of recreation when vehicles were traveling the designated routes.

Under this alternative, the 52,721-acre Browns Park ACEC would be the same area as that described in Alternative A and would be managed by the same prescription. The effect on non-WSA lands with wilderness characteristics, therefore, would be the same as that described under Alternative A.

In the 81,168-acre Nine Mile Canyon ACEC, the lower canyon in the Desolation Canyon non-WSA lands with wilderness characteristics would be closed to oil and gas leasing, while the remainder of the canyon would be open to leasing subject to NSO or timing and controlled surface use stipulations. The table lands above the canyon would generally be open subject to standard stipulations. OHV use in the ACEC would be limited to designated routes. Visual resources in the canyon portion of the ACEC would be managed under VRM Class II, whereas the uplands would be managed under VRM Class III and IV objectives. This prescription would generally prevent surface disturbance to the Desolation Canyon non-WSA lands with wilderness characteristics because the non-WSA lands with wilderness characteristics would be closed to oil and gas leasing. OHV use, however, would be limited to designated routes. Use of those routes would diminish opportunities for solitude and conflict with primitive recreational activities.

The Main Canyon ACEC (100,915 acres) would be managed to protect important cultural and historic resources and natural systems. Protection of natural systems would help preserve the natural characteristics of those portions of the Wolf Point non-WSA lands with wilderness characteristics (11,783 acres) that lie within the ACEC. Protection of prehistoric and historic cultural resources would enhance the natural characteristics of the non-WSA lands with wilderness characteristics and provide opportunities for primitive recreational activities (study and viewing cultural resources).

Under this alternative, the Red Creek Watershed ACEC would be open to oil and gas leasing subject to an NSO stipulation. OHV use would be permitted, but only on designated routes. This prescription would prevent surface disturbance associated with oil and gas production that would degrade the natural characteristics of the Cold Spring Mountain and Mountain Home non-WSA lands with wilderness characteristics. While limiting motor vehicle use to designated routes would prevent expansion of surface disturbance in the non-WSA lands with wilderness characteristics, allowing use on designated routes would result in the noise and presence of motor vehicles that would diminish opportunities for solitude and conflict with primitive forms of recreation.

Under Alternative C, 44 miles of the White River would be recommended suitable for Wild and Scenic River designation with segment classifications of "scenic," "wild," and "scenic" in the upper, middle, and lower portions of the river canyon, respectively. Further, under this alternative, 19 miles of Nine Mile Creek would be recommended suitable for designation as "scenic" and "recreational." Twenty-two miles of Bitter Creek would be recommended suitable for designation as a "scenic" river. Twenty-two miles of the Upper Green River would be recommended suitable for designation as a "scenic" river. Thirty miles of the Lower Green River would be recommended suitable for designation as a "scenic" river. Protection of river values

(until Congress acts on BLM's recommendation) would prevent uses and surface disturbances that would detract from the natural characteristics of the White River, Desolation Canyon, Bitter Creek, Rat Hole Ridge, Cripple Cowboy, Hells Hole Canyon, Lower Flaming Gorge, and Cold Spring Mountain non-WSA lands with wilderness characteristics. The presence and noise of motor vehicle use of designated routes in the recommended "scenic" and "recreational" segments would reduce opportunities for solitude and would conflict with primitive recreation in these river segments. The impacts would be temporary, however, occurring only when vehicles were present.

Managing the WSAs under BLM's Interim Management Policy to protect their wilderness values would expand opportunities for solitude and primitive forms of recreation found in the Cripple Cowboy, Bull Canyon, Daniels Canyon, Diamond Breaks, and Cold Spring Mountain non-WSA lands with wilderness characteristics to larger land areas, including both the WSAs and contiguous non-WSA lands with wilderness characteristics. This would enhance the opportunities for solitude and primitive recreation.

#### **4.10.2.10.5. ALTERNATIVE D (NO ACTION)**

##### **4.10.2.10.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative D (No Action), four ACECs that include non-WSA lands with wilderness characteristics would be established to protect a variety of relevant and important values. Those ACECs are the Lower Green River Corridor, Browns Park, Nine Mile Canyon, and Red Creek Watershed. The management prescriptions for these ACECs would protect wilderness characteristics in portions of the non-WSA lands with wilderness characteristics.

The 8,470-acre Lower Green River Corridor ACEC would be available for oil and gas leasing with timing and controlled surface use and NSO stipulations, managed by VRM Class II objectives, and OHV use would be closed or limited to designated routes. Most of the ACEC would be available for leasing with NSO, and this prescription would prevent large-scale landscape modifications from oil and gas development in an area of high potential, industry interest, and production history, generally protecting the natural characteristics of this portion of the Desolation Canyon non-WSA lands with wilderness characteristics. VRM Class II objective would generally retain the existing character of the landscape, protecting the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of OHV use on designated routes would temporarily reduce opportunities for solitude and conflict with opportunities for primitive forms of recreation sought in areas with wilderness characteristics, when vehicles were traveling the routes. This effect would not occur in areas closed to OHV use.

In the 52,721-acre Browns Park ACEC, lands along the Green River would be generally open to oil and gas leasing subject to NSO stipulations, closed to OHV use, and managed under VRM Class II objectives. Outside the river, the ACEC would be open to leasing subject to timing and controlled surface use stipulations; OHV use would be limited to designated routes; and visual resources would be managed for partial retention of the landscape and for landscape

modification. This prescription would generally protect the natural characteristics of the Lower Flaming Gorge non-WSA with wilderness characteristics, a small portion of the Mountain Home non-WSA lands with wilderness characteristics, and a portion of the Cold Spring Mountain non-WSA lands with wilderness characteristics in proximity to the river. The portions of the Lower Flaming Gorge non-WSA lands with wilderness characteristics closed to OHV use would preserve opportunities for solitude because there would be no noise or presence of motorized vehicles. In those parts of the Mountain Home and Cold Spring Mountain non-WSA lands with wilderness characteristics where OHV use is limited to designated routes, the presence and noise of motor vehicles would reduce opportunities for solitude and primitive forms of recreation.

Under this alternative, the 44,181-acre Nine Mile Canyon ACEC would be the same area as that described in Alternative B and would be managed by the same prescription. The effect on non-WSA lands with wilderness characteristics, therefore, would be the same as that described under Alternative B.

The effects of ACEC management in the Red Creek Watershed ACEC on the wilderness characteristics of Cold Spring Mountain and Mountain Home non-WSA lands with wilderness characteristics would be the same as described under Proposed RMP.

Under this alternative, 22 miles of the Upper Green River would be recommended for designation as a Wild and Scenic River with a classification of "scenic." Thirty miles of the Lower Green River would be recommended as a "scenic" river. Protection of river values (until Congress acts on BLM's recommendation) would prevent uses and surface disturbances that would detract from the natural characteristics of the Lower Flaming Gorge, Cold Spring Mountain, and Desolation Canyon non-WSA lands with wilderness characteristics. The presence and noise of motor vehicle use of designated routes in the recommended "scenic" segment would reduce opportunities for solitude and would conflict with primitive recreation in these river segments. The impacts would be temporary, however, lasting only when vehicles were present.

Managing the WSAs under BLM's Interim Management Policy to protect their wilderness values would expand opportunities for solitude and primitive forms of recreation found in the Cripple Cowboy, Bull Canyon, Daniels Canyon, Diamond Breaks, and Cold Spring Mountain non-WSA lands with wilderness characteristics to larger land areas, including both the WSAs and contiguous non-WSA lands with wilderness characteristics. This would enhance the opportunities for solitude and primitive recreation.

#### **4.10.2.10.6. ALTERNATIVE E**

##### **4.10.2.10.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under this alternative, the Bitter Creek-PR Spring, Four Mile Wash, Lower Green River, White River, Browns Park, Nine Mile Canyon, Main Canyon, and Red Creek Watershed ACECs would be the same areas as that described in Alternative C and would be managed by essentially the same prescription. In the non-WSA lands with wilderness characteristics portions of the ACECs, the natural characteristics, opportunities for solitude, and opportunities for primitive recreation

would be protected by the management actions prescribed for the non-WSA lands with wilderness characteristics. The effect would be protection of the wilderness characteristics of non-WSA lands with wilderness characteristics.

Under this alternative, the segments of the White River, Nine Mile Creek, Bitter Creek, Upper Green River, and Lower Green River recommended suitable for Wild and Scenic River designation would be the same area as that described in Alternative C and would be managed by the same prescription, except in White River. The segments of the White River would not be recommended suitable for wild and scenic river designation, but would be managed as eligible pending review of a dam construction permit. The effect on non-WSA lands with wilderness characteristics, however, would be the same as that described under Alternative C.

Managing the WSAs under BLM's Interim Management Policy to protect their wilderness values would expand opportunities for solitude and primitive forms of recreation found in the Cripple Cowboy, Bull Canyon, Daniels Canyon, Diamond Breaks, and Cold Spring Mountain non-WSA lands with wilderness characteristics to larger land areas, including both the WSAs and contiguous non-WSA lands with wilderness characteristics. This would enhance the opportunities for solitude and primitive recreation.

#### **4.10.2.10.7. SUMMARY**

Alternatives C and E would provide the most long-term protection of wilderness characteristics of non-WSA lands with wilderness characteristics by designating the most acres as ACECs and by recommending the longest stretches of waterways for protection in the National Wild and Scenic Rivers System, followed by Alternative A. The Proposed RMP and Alternatives B and D would provide some protection of wilderness characteristics of non-WSA lands with wilderness characteristics but less than that provided by Alternative C or E, because they designate a smaller number of ACEC acres and recommend protecting fewer waterways under the Wild and Scenic River System.

#### **4.10.2.11. IMPACTS OF VEGETATION DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

Vegetation treatments are proposed under the Proposed RMP and each alternative in both the Fire Management and Rangeland Improvements Sections of Chapter 2 (see Table 2.1.5 and Table 2.1.12 Proposed RMP and Alternatives). For the purposes of this analysis, it is assumed that the acreages proposed for treatment in the Rangeland Improvement section are in addition to the acreages proposed in the Fire Management section.

##### **4.10.2.11.1. PROPOSED RMP**

###### **4.10.2.11.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under the Proposed RMP, 156,425 acres of vegetation would be treated by prescribed fire per decade. The purpose of these treatments would be to reduce fuel loads, restore fire to the

ecosystem, restore native vegetation communities, and enhance livestock and wildlife forage conditions. In the long term, vegetation treatments with fire would restore native vegetation communities and a more natural composition of grasses, forbs, shrubs, and/or trees in those communities. If these treatments occurred in non-WSA lands with wilderness characteristics managed to protect those characteristics, this objective would enhance the natural characteristics of the non-WSA lands with wilderness characteristics. In the short term, however, operation of a prescribed burning operation would result in disturbance of the landform and vegetation through fire line construction and other activities (e.g., staging areas) needed to manage the fire. Further, the presence and noise of people, vehicles, equipment, and aircraft would eliminate opportunities for solitude and primitive and unconfined recreation in proximity to the fire. The impacts on opportunities for solitude and primitive recreation would be temporary, lasting for the duration of the prescribed burning operation and reclamation. When the fire and reclamation operations are complete, these opportunities would return. Soil and vegetation disturbance from fire line construction and other activities (e.g. staging areas) would diminish the natural characteristics of the non-WSA lands with wilderness characteristics, but reclamation would restore those characteristics in a relatively short period of time.

Also under the Proposed RMP, 34,460 acres of vegetation would be treated to enhance forage condition for livestock grazing. The methods of treatment for this purpose would vary but would most often include fire and/or mechanical treatments (heavy equipment and chainsaws). If these treatments were planned for non-WSA lands with wilderness characteristics, the effects of treatment with fire would be the same as described above. Mechanical treatments, however, would have long-term impacts on the natural characteristics of the non-WSA lands with wilderness characteristics and opportunities for solitude and primitive and unconfined recreation, and would likely not be permitted on a large scale on 106,178 acres of non-WSA lands with wilderness characteristics managed to protect those characteristics under the Proposed RMP. While restoration of native vegetation communities would be beneficial to the natural characteristics of non-WSA lands with wilderness characteristics, the presence and noise of people and equipment would diminish opportunities for solitude and conflict with primitive recreation activities in proximity to the treatment area, in the short-term. In the long term, the noise and presence of people and equipment would be removed and opportunities for both solitude and primitive recreation would return.

#### **4.10.2.11.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

The effects of vegetation treatments in non-WSA lands with wilderness characteristics that are managed for resource values and uses other than wilderness characteristics would be the same as described above (for non-WSA lands with wilderness characteristics managed to protect those characteristics), except that more surface-disturbing fire line construction could be permitted. Chain saws could be used to create fuel breaks for fire line construction, resulting in more substantial evidence of human manipulation of the land (cut logs, stumps, and cleared lines through vegetation). This type of surface disturbance would remain evident on the land for longer periods of time, reducing the natural characteristics of the non-WSA lands with wilderness characteristics.

Also, in non-WSA lands with wilderness characteristics that are managed for other resource values and uses, mechanical treatments (heavy equipment and chainsaws) would be used to meet vegetation objectives. Mechanical treatments (chaining or chipping) would have long-term impacts on the natural characteristics of the non-WSA lands with wilderness characteristics and opportunities for solitude and primitive and unconfined recreation. While restoration of native vegetation communities would be beneficial to the natural characteristics of non-WSA lands with wilderness characteristics, the use of chainsaws, bull dozers, and brush hogs to accomplish the objective would leave an obvious imprint of human activity on the land, an adverse effect on the natural characteristics of non-WSA lands with wilderness characteristics. Also in the short term, the presence and noise of people and equipment would eliminate opportunities for solitude and primitive forms of recreation in proximity to the treatment area. In the long term, a setting clearly manipulated by humans would diminish the opportunities for both solitude and primitive recreation.

#### **4.10.2.11.2. ALTERNATIVE A**

##### **4.10.2.11.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative A, 156,425 acres of vegetation would be treated by prescribed fire per decade. The impacts to the wilderness characteristics of non-WSA lands with wilderness characteristics would be the same as described under the Proposed RMP for non-WSA lands with wilderness characteristics that are managed for resource values and uses others than wilderness characteristics.

Also under this alternative, 34,460 acres of vegetation would be treated to enhance forage condition for livestock grazing. The methods of treatment for this purpose would vary but would often include fire and/or mechanical treatments (heavy equipment and chainsaws). The effect of these treatment methods on the wilderness characteristics of non-WSA lands with wilderness characteristics would be the same as described under the Proposed RMP for non-WSA lands with wilderness characteristics that are managed for resource values and uses others than wilderness characteristics.

#### **4.10.2.11.3. ALTERNATIVE B**

##### **4.10.2.11.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

The effects of vegetation treatments with prescribed fire would be the same as those described under Alternative A. The effects of vegetation treatments to enhance livestock forage would also be the same as those described under Alternative A, except under this alternative 50,900 acres would be treated (16,260 more acres than under Alternative A).

**4.10.2.11.4. ALTERNATIVE C****4.10.2.11.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

The effects of vegetation treatments with prescribed fire would be the same as those described under Alternative A. The effects of vegetation treatments to enhance livestock forage would also be the same as those described under Alternative A, except that under this alternative 45,860 acres would be treated (11,220 more acres than under Alternative A).

**4.10.2.11.5. ALTERNATIVE D (NO ACTION)****4.10.2.11.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative D (No Action), 50,900 acres of pinyon-juniper woodlands and sagebrush communities would be treated with prescribed fire with effects matching those described under Alternative A. The effects of vegetation treatments to enhance livestock forage would also be the same as those described under Alternative A, except that under this alternative 40,390 acres would be treated (5,750 more acres than under Alternative A).

**4.10.2.11.6. ALTERNATIVE E****4.10.2.11.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

The effects of vegetation treatments with prescribed fire would be the same as those described under the Proposed RMP for non-WSA lands with wilderness characteristics managed to protect those characteristics. The effects of vegetation treatments to enhance livestock forage would also be the same as those described under the Proposed RMP for non-WSA lands with wilderness characteristics managed to protect those characteristics, but on all 277,596 acres of non-WSA lands with wilderness characteristics.

**4.10.2.11.7. SUMMARY**

The Proposed RMP and all of the alternatives would have similar effects of vegetation treatments on non-WSA lands with wilderness characteristics. The difference would be the number of acres treated, and the method of treatment. Mechanical treatment methods typically would not be used in non-WSA lands with wilderness characteristics managed to protect those characteristics. Alternatives B and C would treat the same number of acres with prescribed fire and comparable numbers of acres to enhance livestock forage. The Proposed RMP and Alternatives A and E would treat the same number of acres with prescribed fire, but would treat the fewest acres to enhance livestock forage, due to limitations required to protect wilderness characteristics. Alternative D (No Action) treats the fewest acres with prescribed fire but comparable acreages for livestock forage improvement.

#### 4.10.2.12. IMPACTS OF VISUAL RESOURCE MANAGEMENT DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS

There are four objectives for visual resource management (VRM Classes I–IV) that provide for various levels of landscape protection and change. The objective of Class I is to preserve the characteristic landscape whereas the objective of Class IV provides for landscape modifications (see Chapter 3 of the Proposed RMP/Final EIS, Section 3.19, Visual Resources). Land use planning decisions to manage areas by VRM Class I objectives would preserve the characteristics of the landscape. In non-WSA lands with wilderness characteristics, this objective would preserve the natural characteristics of the area. VRM Class II objectives would retain the characteristics landscape, allowing for minor changes to the landform and vegetation. This objective would generally protect the natural characteristics of the land in non-WSA lands with wilderness characteristics. VRM Class III objectives provide for partial retention of the existing character of the landscape, allowing for moderate changes to land and vegetation. This objective is not compatible with preserving the natural characteristics of non-WSA lands with wilderness characteristics. VRM Class IV objectives provide for major modification of the landscape, and this is incompatible with preservation of the natural characteristics of non-WSA lands with wilderness characteristics.

Table 4.10.5 shows the VRM Class I–IV objectives by non-WSA lands with wilderness characteristics, in acres, by the Proposed RMP and alternative.

**Table 4.10.5 Visual Resource Management Objectives by Non-WSA Lands with Wilderness Characteristics Areas**

Non-WSA Lands with Wilderness Characteristics	Proposed RMP (Acres)	Alternative A (Acres)	Alternative B (Acres)	Alternative C (Acres)	Alternative D (No Action) (Acres)	Alternative E (Acres)
<b>Beach Draw</b>						
Class I						898
Class II	898	898	208	898	208	
Class III						
Class IV			690		690	
<b>Bitter Creek</b>						
Class I				32,363		33,488
Class II		12,764		68		
Class III	33,488	20,724		1,057		
Class IV			33,488		33,488	
<b>Bourdette Draw</b>						
Class I		4,342				13,335
Class II	13,335	7,170		13,335		
Class III		1,798	4,365		4,365

**4.10.2.12.1. PROPOSED RMP****4.10.2.12.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under the Proposed RMP, 106,178 acres of 15 non-WSA lands with wilderness characteristics would be managed with visual resource management Class II objectives (see Table 4.10.5 above). The objective of this class is to retain the characteristic landscape, while allowing for some minor level of development or change to the landscape. This landscape objective would generally protect the undeveloped (natural) characteristics of the 15 non-WSA lands with wilderness characteristics managed to protect those characteristics.

**4.10.2.12.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under the Proposed RMP, 132,845 acres of 11 non-WSA lands with wilderness characteristics would be managed by VRM Class III and IV objectives. These objectives would allow for activities that would alter the landscape, and diminish the natural characteristics of these non-WSA lands with wilderness characteristics (see Table 4.10.5 above). However, in four of the non-WSA lands with wilderness characteristics that are proposed for management of resources and uses other than wilderness characteristics (Cripple Cowboy, Desolation Canyon, Rat Hole Ridge, and Wolf Point), 33,324 acres would be managed by Class I and II objectives. These objectives would limit surface disturbance and protect the natural characteristics of these non-WSA lands with wilderness characteristics.

**4.10.2.12.2. ALTERNATIVE A****4.10.2.12.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative A, 148,364 acres would be managed by VRM Class I and II objectives in all or parts of 23 non-WSA lands with wilderness characteristics, limiting surface disturbance and protecting the natural characteristics of those lands in the non-WSA lands with wilderness characteristics. However, 127,595 acres would be managed by Class III and IV objectives in all or parts of 13 non-WSA lands with wilderness characteristics with impacts as described under the Proposed RMP.

**4.10.2.12.3. ALTERNATIVE B****4.10.2.12.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative B, 52,777 acres would be managed by VRM Class I and II objectives in all or parts of 20 non-WSA lands with wilderness characteristics, limiting surface disturbance and protecting the natural characteristics of those lands in the non-WSA lands with wilderness characteristics. However, 224,819 acres would be managed by Class III and IV objectives in all

or parts of 23 non-WSA lands with wilderness characteristics with impacts as described under the Proposed RMP.

#### **4.10.2.12.4. ALTERNATIVE C**

##### **4.10.2.12.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative C, 191,657 acres would be managed by VRM Class I and II objectives in all or parts of 24 non-WSA lands with wilderness characteristics, limiting surface disturbance and protecting the natural characteristics of those lands in the non-WSA lands with wilderness characteristics. However, 85,939 acres would be managed by Class III and IV objectives in all or parts of 10 non-WSA lands with wilderness characteristics with impacts as described under the Proposed RMP.

#### **4.10.2.12.5. ALTERNATIVE D (NO ACTION)**

##### **4.10.2.12.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative D (No Action), 52,626 acres would be managed by VRM Class I and II objectives in all or parts of 20 non-WSA lands with wilderness characteristics, limiting surface disturbance and protecting the natural characteristics of those lands in the non-WSA lands with wilderness characteristics. However, 224,970 acres would be managed by Class III and IV objectives in all or parts of 23 non-WSA lands with wilderness characteristics with impacts as described under the Proposed RMP.

#### **4.10.2.12.6. ALTERNATIVE E**

##### **4.10.2.12.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under Alternative E, 277,596 acres would be managed by VRM Class I objectives in all of the 25 non-WSA lands with wilderness characteristics, limiting surface disturbance and protecting the natural characteristics of those lands in the non-WSA lands with wilderness characteristics.

#### **4.10.2.12.7. SUMMARY**

The visual resource management objectives proposed in Alternative E would provide protection of the natural characteristics of all the non-WSA lands with wilderness characteristics. VRM objectives in Alternative C would provide protection to the natural characteristics of the 191,657 acres in 24 non-WSA lands with wilderness characteristics, followed by Alternative A with 148,364 acres protected in 23 areas. The Proposed RMP would provide protection to natural characteristics on 106,178 acres of 15 non-WSA lands with wilderness characteristics. Visual resource objectives in Alternatives B and D (No Action) provide the least protection to the natural characteristics of the non-WSA lands with wilderness characteristics.

#### **4.10.2.13. IMPACTS OF WILD HORSE DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

There are three wild horse herd management/herd areas in the VPA: Bonanza, Winter Ridge, and Hill Creek. A portion of the White River non-WSA lands with wilderness characteristics (7,449 acres) is located in the Bonanza herd management area. The Wolf Point non-WSA lands with wilderness characteristics is located in the Winter Ridge herd area and a portion of the Desolation Canyon non-WSA lands with wilderness characteristics (16,396 acres) is located in the Hill Creek herd management area.

##### **4.10.2.13.1. PROPOSED RMP**

###### **4.10.2.13.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under the Proposed RMP, no horse herd would be maintained in the Bonanza Herd Area. Any wild or feral horses present would be gathered and removed. An area with wilderness characteristics is natural and provides opportunities for either solitude or primitive recreation. Areas with wilderness characteristics may also possess supplemental values (interesting, special, or unique natural or cultural resource values) in addition to the requisite wilderness characteristics. Wild horses, for example, would be considered a supplemental value. The presence of this resource value would supplement the wilderness characteristics of the White River non-WSA lands with wilderness characteristics. Because a herd would not be maintained in this area, there would be no supplemental benefit to the wilderness characteristics of the non-WSA lands with wilderness characteristics. Further, the primitive recreational activity of viewing wild horses would also be lost.

Because wild horses would be gathered and removed under the Proposed RMP, there would be no need for facilities (fences and water developments) to manage the herd. Thus, there would be no introduction of human-made facilities on the landscape that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Further, there would be no temporary disruption of opportunities for solitude or primitive recreation activities resulting from the noise and presence of people and equipment used during construction of these facilities. However, there would be temporary disruption of opportunities for solitude or primitive recreation from gathering operations due to the noise and presence of people, structures (fences, corrals, or pens), vehicles, and aircraft.

###### **4.10.2.13.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under the Proposed RMP, no wild horse herd would be established in the Hill Creek or Winter Ridge herd areas. Any wild or feral horses present would be gathered and removed. The presence of this resource value would supplement the wilderness characteristics of the Desolation Canyon and Wolf Point non-WSA lands with wilderness characteristics. Because herds would not be maintained in these herd areas, there would be no supplemental benefit to the wilderness

characteristics of the non-WSA lands with wilderness characteristics. Further, the primitive recreational activity of viewing wild horses would also be lost.

Because wild horses would be gathered and removed under the Proposed RMP, there would be no need for facilities (fences and water developments) to manage the herds. Thus, there would be no introduction of human-made facilities on the landscape that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Further, there would be no temporary disruption of opportunities for solitude or primitive recreation activities resulting from the noise and presence of people and equipment used during construction of these facilities. However, there would be a temporary disruption of opportunities for solitude or primitive recreation from gathering operations due to the noise and presence of people, structures (fences, corrals, or pens), vehicles, and aircraft.

#### **4.10.2.13.2. ALTERNATIVE A**

##### **4.10.2.13.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative A, a horse herd would not be re-established in the Bonanza herd management area. Thus, there would be no impacts (beneficial or adverse) on the wilderness characteristics of the White River non-WSA lands with wilderness characteristics.

In the Winter Ridge herd area, a horse herd of 50 to 100 animals would be re-established. An area with wilderness characteristics is natural and provides opportunities for either solitude or primitive recreation. Areas with wilderness characteristics may also possess supplemental values (interesting, special, or unique natural or cultural resource values) in addition to the requisite wilderness characteristics. Wild horses, for example, would be considered a supplemental value. The presence of this resource value would supplement the wilderness characteristics of the Wolf Point non-WSA lands with wilderness characteristics.

In the Hill Creek herd management area, a 70- to 145-animal horse herd would be re-established. Again, the presence of this resource value would supplement the wilderness characteristics of the Desolation Canyon non-WSA lands with wilderness characteristics. In order to re-establish the herd, however, fences would have to be constructed to manage the herds. Construction of fences in the non-WSA lands with wilderness characteristics (if that location was necessary) would add further development of humans to the landscape and degrade the natural characteristics of the land. During construction, the presence and noise of people and equipment building the fences would detract from opportunities for solitude and primitive recreation. When construction ended, the adverse impact on opportunities for solitude and primitive recreation would improve, but the long-term presence of human-made structures on the land would detract from the undeveloped setting needed to support these opportunities.

**4.10.2.13.3. ALTERNATIVE B****4.10.2.13.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative B, the impacts of wild horse management on the wilderness characteristics of Wolf Point and White River non-WSA lands with wilderness characteristics would be the same as described under Alternative A. In the Hill Creek herd management area, including the Desolation Canyon non-WSA lands with wilderness characteristics, all horses would be removed and permits would be offered to the Northern Ute Tribe for up to 100 wild and feral horses. Under Alternative B, it would be necessary to build fences to manage the herd. The introduction of human-made structures on the land would diminish the natural characteristics and opportunities for solitude and primitive recreation in the Desolation Canyon non-WSA lands with wilderness characteristics, if the fences were located in the non-WSA lands with wilderness characteristics. There would also be a temporary disruption of opportunities for solitude or primitive recreation from gathering operations due to the noise and presence of people, structures (fences, corrals, or pens), vehicles, and aircraft. The presence of wild horses, however, would supplement the wilderness characteristics of the Desolation Canyon non-WSA lands with wilderness characteristics and provide opportunities to view wild horses, a primitive recreation activity.

**4.10.2.13.4. ALTERNATIVE C****4.10.2.13.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative C, a horse herd of 40 – 85 animals would be re-established in the Bonanza herd management area. The presence of this resource value would supplement the wilderness characteristics of the White River non-WSA lands with wilderness characteristics. With the herd, however, it would necessary to construct fences and water facilities to manage the horses. Construction of the facilities would further modify the landscape and detract from the natural characteristics of the landscape and would adversely impact opportunities for solitude and primitive recreation. If the facilities were located in the White River non-WSA lands with wilderness characteristics, they would degrade the natural characteristics of the non-WSA lands with wilderness characteristics.

In the Winter Ridge herd area, a 50- to 100-animal horse herd would be established. The effects to wilderness characteristics of the Wolf Point non-WSA lands with wilderness characteristics would be the same as those described for the White River non-WSA lands with wilderness characteristics above, but no fences or waters would be constructed.

In the Hill Creek herd management area, a 70- to 145-animal horse herd would be re-established with impacts to the Desolation Canyon non-WSA lands with wilderness characteristics the same as that described for the White River non-WSA lands with wilderness characteristics above.

**4.10.2.13.5. ALTERNATIVE D (NO ACTION)****4.10.2.13.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

The effects of Alternative D (No Action) in the Bonanza herd management area would be the same as those described for Alternative A—a horse herd would not be re-established. The effects on the natural characteristics of the White River non-WSA lands with wilderness characteristics and opportunities for solitude and primitive recreation would be the same as those described for Alternative A.

In the Winter Ridge herd area, no herd would be established, with effects on the wilderness characteristics being the same as those described for Alternative B.

The Hill Creek herd management area would support a herd of 195 horses under Alternative D (No Action). The presence of wild horses would supplement the wilderness characteristics of the Desolation Canyon non-WSA lands with wilderness characteristics. No facilities are proposed for management of the herd, so no adverse impacts to the natural characteristics of the Desolation Canyon non-WSA lands with wilderness characteristics would be anticipated.

**4.10.2.13.6. ALTERNATIVE E****4.10.2.13.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

The impacts of wild and feral horses and horse management on the wilderness characteristics of the White River non-WSA lands with wilderness characteristics would be the same as described for Alternative C. The impacts of wild and feral horse management on the wilderness characteristics of the Wolf Point non-WSA lands with wilderness characteristics would be the same as Alternative A. The impacts on Desolation Canyon non-WSA lands with wilderness characteristics would be the same as those described for Alternative A.

**4.10.2.13.7. SUMMARY**

Under the Proposed RMP, BLM would no longer manage for wild and feral horses. While there would be no adverse impacts to the natural characteristics of the non-WSA lands with wilderness characteristics, there would also be no benefit to opportunities for primitive recreation (viewing wild horses) or supplemental benefit to wilderness characteristics.

Under Alternatives A, C, D, and E, the BLM would manage for wild and feral horses with the benefits that the presence of wild horses would have on wilderness characteristics and the adverse impacts fence and water construction would have on the natural landscape and opportunities for solitude and primitive recreation. Under Alternative B, the BLM would not manage for wild horses but would offer permits to the Northern Ute Tribe for up to 100 horses. The presence of Tribal horses would have the same benefits to the wilderness characteristics of

the Desolation Canyon non-WSA lands with wilderness characteristics in the Hill Creek herd management area as described under Alternatives A, C, D, and E.

#### **4.10.2.14. IMPACTS OF WOODLAND AND FOREST DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS**

##### **4.10.2.14.1. PROPOSED RMP**

Under Proposed RMP, actions would be implemented to maintain and restore forest and woodlands ecosystems to a condition in which biodiversity is preserved, insects and disease are controlled to normal levels, relict stands are maintained, fuel loads are reduced, historic fire regimes are beginning to be restored, salvage is permitted, forests and woodlands are managed for multiple-use, and sustained yield is allowed through fire and mechanical treatments. Up to 546,152 acres would be treated or harvested. Salvage of forest and woodland products that are dead or dying due to fire, disease, insect kill, or other disturbance would be permitted throughout the VPA.

##### **4.10.2.14.1.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Forest and woodland treatments with fire would restore native vegetation communities and a more natural composition of grasses, forbs, shrubs, and/or trees in those communities. If these treatments occurred in non-WSA lands with wilderness characteristics, this objective would enhance the natural characteristics of the non-WSA lands with wilderness characteristics. In the short term, however, prescribed burning would result in disturbance of the landform and vegetation through fire line construction needed to manage the fire. Further, the presence and noise of people, vehicles, equipment, and aircraft would eliminate opportunities for solitude and primitive and unconfined recreation in proximity to the fire. The impacts on opportunities for solitude and primitive recreation would be temporary, lasting for the duration of the prescribed burning operation and reclamation. When the fire and reclamation operations are complete, these opportunities would return. Soil and vegetation disturbance for fire line construction would diminish the natural characteristics of the non-WSA lands with wilderness characteristics, but reclamation would restore the natural conditions in a relatively short period of time.

Non-WSA lands with wilderness characteristics being managed to protect those characteristics would be closed to woodland products harvesting.

##### **4.10.2.14.1.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Forest and woodland treatments with fire would restore native vegetation communities and a more natural composition of grasses, forbs, shrubs, and/or trees in those communities. If these treatments occurred in non-WSA lands with wilderness characteristics, this objective would enhance the natural characteristics of the non-WSA lands with wilderness characteristics. In the short term, however, prescribed burning would result in disturbance of the landform and vegetation through fire line construction needed to manage the fire. Further, the presence and

noise of people, vehicles, equipment, and aircraft would eliminate opportunities for solitude and primitive and unconfined recreation in proximity to the fire. The impacts on opportunities for solitude and primitive recreation would be temporary, lasting for the duration of the prescribed burning operation and reclamation. When the fire and reclamation operations are complete, these opportunities would return.

Forest and woodland treatment using mechanical methods (heavy equipment and chainsaws) would be allowed in non-WSA lands with wilderness characteristics that would not be managed to protect those characteristics under the Proposed RMP. If mechanical treatments were conducted, the surface disturbance would have long-term impacts on the natural characteristics of the non-WSA lands with wilderness characteristics and opportunities for solitude and primitive and unconfined recreation. While restoration of native vegetation communities would be beneficial to the natural characteristics of non-WSA lands with wilderness characteristics, the use of chainsaws, bull dozers, and brush hogs to accomplish the forest and woodland objectives would leave an obvious imprint of human activity on the land, having an adverse effect on the natural characteristics of the non-WSA lands with wilderness characteristics. Also, in the short term, the presence and noise of people and equipment would eliminate opportunities for solitude and primitive forms of recreation in proximity to the treatment area. In the long term, a setting clearly manipulated by humans would also diminish the opportunities for both solitude and primitive recreation.

In the other non-WSA lands with wilderness characteristics (not managed for their wilderness characteristics), salvage of forest and woodland products would be done by mechanical means with the same impacts to non-WSA lands with wilderness characteristics as described above.

#### **4.10.2.14.2. ALTERNATIVE A**

##### **4.10.2.14.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative A, actions would be implemented to maintain and restore forest and woodlands ecosystems to a condition in which biodiversity is preserved, insects and disease are controlled to normal levels, relict stands are maintained, fuel loads are reduced, historic fire regimes are beginning to be restored, salvage is permitted, forests and woodlands are managed for multiple-use, and sustained yield is allowed through fire and mechanical treatments. Up to 552,152 acres would be treated or harvested. Salvage of forest and woodland products that are dead or dying due to fire, disease, insect kill, or other disturbance would be permitted throughout the VPA.

Forest and woodland treatments with fire would restore native vegetation communities and a more natural composition of grasses, forbs, shrubs, and/or trees in those communities. If these treatments occurred in non-WSA lands with wilderness characteristics, this objective would enhance the natural characteristics of the non-WSA lands with wilderness characteristics. In the short term, however, prescribed burning would result in disturbance of the landform and vegetation through fire line construction needed to manage the fire. Further, the presence and noise of people, vehicles, equipment, and aircraft would eliminate opportunities for solitude and

primitive and unconfined recreation in proximity to the fire. The impacts on opportunities for solitude and primitive recreation would be temporary, lasting for the duration of the prescribed burning operation and reclamation. When the fire and reclamation operations are complete, these opportunities would return. Soil and vegetation disturbance for fire line construction would diminish the natural characteristics of the non-WSA lands with wilderness characteristics, but reclamation would restore the natural conditions in a relatively short period of time. The use of chainsaws to clear vegetation for fire line construction, however, would result in more extensive surface disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics and require a much longer period of time to rehabilitate.

If mechanical treatments (heavy equipment and chainsaws) were conducted for non-WSA lands with wilderness characteristics, the surface disturbance would have long-term impacts on the natural characteristics of the non-WSA lands with wilderness characteristics and opportunities for solitude and primitive and unconfined recreation. While restoration of native vegetation communities would be beneficial to the natural characteristics of non-WSA lands with wilderness characteristics, the use of chainsaws, bull dozers, and brush hogs to accomplish the forest and woodland objectives would leave an obvious imprint of human activity on the land, having an adverse effect on the natural characteristics of the non-WSA lands with wilderness characteristics. Also, in the short term, the presence and noise of people and equipment would eliminate opportunities for solitude and primitive forms of recreation in proximity to the treatment area. In the long term, a setting clearly manipulated by humans would also diminish the opportunities for both solitude and primitive recreation.

Salvage of forest and woodland products would be done by mechanical means with the same impacts to non-WSA lands with wilderness characteristics as described above.

#### **4.10.2.14.3. ALTERNATIVE B**

##### **4.10.2.14.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative B, public use of forest and woodland products would be permitted to achieve desired future conditions (e.g., vegetation treatments). Harvest of forest and woodland species would be permitted by the public with emphasis on achieving the greatest output of products. Up to 554,108 acres would be treated or harvested. The emphasis of this alternative is on the production of forest and woodland products for public use. Under this alternative none of the non-WSA lands with wilderness characteristics would be managed to protect their wilderness characteristics. Thus, the effects of mechanical treatment of up to 554,108 acres on the wilderness characteristics of non-WSA lands with wilderness characteristics, that are not being managed to protect their wilderness characteristics, would be the same as those described under Alternative A. The effects of forest and woodland salvage on non-WSA lands with wilderness characteristics would also be the same as those described in Alternative A.

**4.10.2.14.4. ALTERNATIVE C****4.10.2.14.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Alternative C would have the same effects from forest and woodland treatments and harvest on wilderness characteristics of non-WSA lands with wilderness characteristics as those described in Alternative A. The effects of forest and woodland salvage by mechanical means would be the same as those described for Alternative A, except that salvage would only be allowed in ACECs when forest and woodland resources were threatened. Otherwise, 242,760 acres of ACECs would not be affected by salvage. Because there are several areas of non-WSA lands with wilderness characteristics located in proposed ACECs, the exclusion of salvage from ACECs would prevent surface disturbance that would diminish the wilderness characteristics of non-WSA lands with wilderness characteristics (see Table 4.10.3, Non-WSA Lands with Wilderness Characteristics Located in Special designations).

**4.10.2.14.5. ALTERNATIVE D (NO ACTION)****4.10.2.14.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative D (No Action), up to 88,200 acres of forest and 200,100 acres of woodlands would be treated or be harvested. If any of those treatments (fire or mechanical) occurred in non-WSA lands with wilderness characteristics, the effects would be the same as those described under Alternative A.

**4.10.2.14.6. ALTERNATIVE E****4.10.2.14.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under Alternative E, forest and woodland treatment and harvests as well as salvage would not be permitted with mechanical means (e.g., chainsaws or bulldozers) in non-WSA lands with wilderness characteristics. Forest and woodland treatments, however, could be performed with prescribed fire if consistent with the objectives for management of the wilderness characteristics of the non-WSA lands with wilderness characteristics. As a result, there would be no surface disturbance from mechanical treatments, harvests, or salvage operations and no effects on the natural characteristics of the non-WSA lands with wilderness characteristics. With prescribed fire treatments, the presence and noise of people, vehicles, or equipment would temporarily reduce opportunities for solitude and primitive recreation during the fire operation. When the operation was complete and rehabilitated as needed, those opportunities would return. Forest and woodland treatments would restore native vegetation communities and composition that would benefit the natural characteristics of the non-WSA lands with wilderness characteristics.

**4.10.2.14.7. SUMMARY**

Forest and woodland management under the Proposed RMP and Alternative E would provide the greatest protection of wilderness characteristics in the non-WSA lands with wilderness characteristics. On the other hand, without treatments, in some cases there would be no benefit from the restoration of native plant communities or the composition of plants in those communities. The Proposed RMP and other alternatives would prescribe different areas of land for treatment, harvest, and salvage with similar beneficial effects to non-WSA lands with wilderness characteristics from restoration of native plant communities and similar adverse effects from surface disturbance.

**4.10.2.14.8. SUMMARY**

Alternatives A, B, C, and D (No Action) prescribe no specific actions that would affect (adversely or beneficially) the wilderness characteristics of non-WSA lands with wilderness characteristics. The Proposed RMP, however, prescribes a management scheme that would protect the wilderness characteristics of 15 of the non-WSA lands with wilderness characteristics with those values (106,178 acres) and Alternative E would prescribe measures to protect all of the non-WSA lands with wilderness characteristics (277,596 acres).

**4.10.2.15. SUMMARY OF IMPACTS FROM THE PROPOSED RMP AND ALTERNATIVES****4.10.2.15.1. PROPOSED RMP**

The Proposed RMP provides for management of natural landscapes and opportunities for solitude and primitive forms of recreation by:

- establishing cultural resource protection areas;
- proposing large acreages for protection in special designations (ACECs and Wild and Scenic Rivers);
- limiting surface disturbance on steep slopes;
- establishing a large number of acres for protection of landscapes (scenery) through VRM Class I and II objectives;
- using prescribed fire and mechanical treatments to restore vegetation communities and reduce wildfire hazard; and
- managing 15 non-WSA lands with wilderness characteristics for protection of their wilderness characteristics.

Under the Proposed RMP, however, protection of wilderness characteristics would be less than under Alternatives E.

**4.10.2.15.2. ALTERNATIVE A**

Alternative A provides for management of natural landscapes and opportunities for solitude and primitive forms of recreation by:

- establishing cultural resource protection areas;
- proposing large acreages for protection in special designations (ACECs and Wild and Scenic Rivers);
- limiting surface disturbance on steep slopes;
- establishing a large number of acres for protection of landscapes (scenery) through VRM Class I and II objectives; and
- using prescribed fire and mechanical treatments to restore vegetation communities and reduce wildfire hazard.

Under Alternative A, however, protection of wilderness characteristics would be less than under the Proposed RMP and Alternatives C and E.

#### **4.10.2.15.3. ALTERNATIVE B**

Alternative B provides less emphasis on management of natural landscapes and opportunities for solitude and primitive forms of recreation by:

- using prescribed fire and mechanical treatment to restore vegetation communities and reduce wildfire hazard and
- managing more acres for landscape change through VRM Class III and IV objectives.

#### **4.10.2.15.4. ALTERNATIVE C**

Alternative C places emphasis on management of natural landscapes and opportunities for solitude and primitive forms of recreation by:

- establishing cultural resource protection areas;
- leasing fewer acres for mineral and hydrocarbon development;
- using prescribed fire and mechanical treatment to restore vegetation communities and reduce wildfire hazard;
- proposing larger acreages for special designations (ACECs and Wild and Scenic Rivers); and
- managing large acreages for landscape protection through VRM Class I and II objectives (the most protective VRM classes).

#### **4.10.2.15.5. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) provides the least emphasis on management of natural characteristics and opportunities for solitude and primitive recreation by:

- establishing no cultural resource protection areas;
- using prescribed fire and mechanical treatment to restore vegetation communities and reduce wildfire hazard;
- managing the fewest acres for special designations (ACECs and Wild and Scenic Rivers); and

- managing the most acres for VRM Class III and IV objectives (the least protective VRM classes), the same as Alternative B.

#### **4.10.2.15.6. ALTERNATIVE E**

Alternative E focuses on protection to the natural characteristics and opportunities for solitude and primitive recreation activities of all non-WSA lands with wilderness characteristics by:

- closing the non-WSA lands with wilderness characteristics to OHV use;
- closing the non-WSA lands with wilderness characteristics to oil and gas leasing, solid mineral leasing, and mineral material sales;
- proposing the non-WSA lands with wilderness characteristics for withdrawal from mineral entry;
- avoiding the non-WSA lands with wilderness characteristics for ROW development;
- closing the non-WSA lands with wilderness characteristics to permitted commercial and personal-use wood cutting;
- managing the non-WSA lands with wilderness characteristics for landscape protection through VRM Class I objectives;
- closing the non-WSA lands with wilderness characteristics to road construction; and
- allowing vegetation and fuel treatments with prescribed fire, when compatible with the goals and objectives for management of the non-WSA lands with wilderness characteristics.

#### **4.10.3. MITIGATION MEASURES**

There are a number of actions proposed under the Proposed RMP and all alternatives that would limit surface disturbance, focus on primitive forms of recreation, and maintain or restore vegetation condition, all of which would maintain and enhance the wilderness characteristics of portions of non-WSA lands with wilderness characteristics. Under the Proposed RMP and Alternatives A, B, C, and E, withdrawals from entry under the mining laws would prevent surface disturbance along parts of the Green and White Rivers and would protect the natural condition of the landscape in the Lower Flaming Gorge, White River, and Desolation Canyon non-WSA lands with wilderness characteristics. Under Alternative D (No Action), mineral withdrawals are also proposed for portions of the Green River through Browns Park and the lower Green River, again, protecting the natural condition of the river canyon parts of Lower Flaming Gorge and Desolation Canyon non-WSA lands with wilderness characteristics. Protecting the natural characteristics of the river canyons would enhance the setting required to support opportunities for solitude and primitive forms of recreation.

Under the Proposed RMP and all alternatives, actions to prohibit surface disturbance within floodplains and within 100 meters of riparian zones would protect the natural condition of riparian portions of non-WSA lands with wilderness characteristics. Protection of the natural condition of these areas would also enhance the setting needed to provide opportunities for both solitude and primitive forms of recreation. Further, managing riparian zones to achieve proper functioning condition would maintain and restore vegetation condition and water quality that would enhance the natural condition of riparian portions of the non-WSA lands with wilderness

characteristics and settings that support primitive forms of recreation like floating, hiking, and wildlife viewing.

Under the Proposed RMP and all alternatives, prescribed burning to restore vegetation communities would maintain and enhance the natural characteristics of non-WSA lands with wilderness characteristics, enhance wildlife habitat for hunting, photography, and wildlife viewing, and enhance the visual appeal by introducing variety to the landscape. Under the Proposed RMP, 15 non-WSA lands with wilderness characteristics would be managed to VRM Class II standards. Managing areas by VRM Class II objectives would maintain the natural characteristics of portions of the non-WSA lands with wilderness characteristics. Under Alternative E, all of the non-WSA lands with wilderness characteristics would be managed to VRM Class I standards, providing even more protection of the natural characteristics of these areas, than Class II objectives. Under the Proposed RMP and other alternatives, portions of the non-WSA lands would continue to be managed to that standard, preserving the natural characteristics of the lands. All surface-disturbing activities, regardless of the Proposed RMP and alternative or management action, would be subject to the VRM objectives of the area within which the activity takes place. The visual resource contrast rating system would be used as a tool to analyze the potential site-specific impacts of surface disturbance as well as facility design and placement. Surface-disturbing activities and facilities would then be designed to mitigate their visual impacts and conform to the area's VRM objective. Mitigation would include painting, facility design, and placement/location.

Under the Proposed RMP and Alternatives A, C, and E, recreation management objectives for portions of the White River, Blue Mountain, Book Cliffs, Browns Park, and Nine Mile Canyon SRMAs would provide activities, settings, and experiences for primitive forms of recreation. These objectives would provide protection of the natural characteristics and opportunities for solitude and primitive forms of recreation in portions of the White River, Bourdette Draw, Lower Flaming Gorge, Desolation Canyon, and the Bitter Creek non-WSA lands with wilderness characteristics. These objectives would provide the same benefits to wilderness characteristics for the Desolation Canyon and Lower Flaming Gorge non-WSA lands with wilderness characteristics under Alternative D (No Action). Further, actions to construct up to 400 miles of non-motorized trails under the Proposed RMP and Alternatives A, C, and E and 55 miles of trails under Alternative D (No Action) would provide further opportunities for primitive forms of recreation.

Management of ACEC or wild and scenic river values in Browns Park, Nine Mile Canyon, and the Lower Green River under the Proposed RMP and all alternatives would maintain and enhance wilderness characteristics in portions of the Lower Flaming Gorge and Desolation Canyon non-WSA lands with wilderness characteristics. Management of the ACEC and wild and scenic river values in White River under Alternatives A, C, and E would have the same effect on the wilderness characteristics of portions of the White River non-WSA lands with wilderness characteristics.

#### **4.10.4. UNAVOIDABLE ADVERSE IMPACTS**

Under the Proposed RMP and Alternatives A, B, C, and D (No Action), minerals exploration and development, power line and pipeline construction, road and trail construction, and vegetation treatment with mechanical methods would result in surface disturbances and placement of human-made structures on the landscape that would cause unavoidable adverse impacts on the natural characteristics of non-WSA lands with wilderness characteristics. Further, the noise and presence of people and equipment to implement these treatments and construct these facilities would diminish opportunities for solitude and conflict with primitive recreation activities. The human presence on the landscape would also alter the setting needed to support these opportunities. These impacts to wilderness characteristics would not be mitigated through project location and design.

Under Alternative E, 277,596 acres of non-WSA lands with wilderness characteristics would be closed to OHV travel and surface disturbances that would degrade or diminish the wilderness characteristics of these lands. However, even under this alternative and these prescriptions to protect wilderness characteristics, 117,470 acres would lose their natural characteristics and opportunities for solitude and primitive recreation due to exploration, development, and production of oil and gas resources in the VPA. Existing oil and gas leases and the exercise of valid existing rights under those leases would eliminate the wilderness characteristics in portions of 11 non-WSA lands with wilderness characteristics (see Section 4.10.2.5.6.1 above).

#### **4.10.5. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY**

Under the Proposed RMP and all alternatives, construction of oil and gas exploration access roads and well pads would produce a long-term loss of naturalness and opportunities for solitude and primitive recreation in portions of up to 11 non-WSA lands with wilderness characteristics. Similarly, under the Proposed RMP and Alternatives A, B, C, and D (No Action), OHV driving, woodcutting, and seismic exploration would cause long-term losses of natural characteristics and opportunities for solitude and primitive recreation.

Under the Proposed RMP and all alternatives, the use of prescribed fire for vegetation treatments would, in the long term, enhance vegetation condition and the natural characteristics of non-WSA lands with wilderness characteristics. A more natural landscape would improve opportunities for both solitude and primitive forms of recreation. Further, construction of riparian exclosure fences needed for restoration of riparian areas would degrade the natural characteristics of non-WSA lands with wilderness characteristics in the short term but would enhance the riparian vegetation community in the long term, providing for a more natural landscape and settings for primitive recreational activities. Upon restoration, the exclosure fences would be removed.

Protection of ACEC or wild and scenic river values in Browns Park, Nine Mile Canyon, and the Lower Green River under the Proposed RMP and all alternatives would maintain and enhance wilderness characteristics in portions of the Lower Flaming Gorge and Desolation Canyon non-WSA lands with wilderness characteristics in the long term. Management of the ACEC and wild and scenic river values in White River under Alternatives A, C, and E would have the same long-

term effect on the wilderness characteristics of portions of the White River non-WSA lands with wilderness characteristics.

#### **4.10.6. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS**

Under Alternatives A, B, C, and D, oil and gas wells and well fields that are currently producing; above-ground pipeline and power line corridors and communication sites; forest and woodland treatments by mechanical means (bull dozers and chainsaws); construction of livestock and wildlife waters and fences; construction of roads and trails; allocation of open areas and designated routes for motorized vehicle use; and allocation of areas for the harvesting of forest and woodland products (e.g., timber production and fire wood) would all result in irretrievable degradation of the natural characteristics of non-WSA lands with wilderness characteristics. Further, implementation of these structures, land treatments, and uses would change the natural, undeveloped setting to a more developed and industrial landscape that is not conducive to primitive recreation activities and experiences of solitude. Land and vegetation disturbance, the presence of human-made structures on the land, and the noise and presence of people, equipment, and vehicles would not support an experience of solitude and would conflict with primitive recreational activities.

Under the Proposed RMP, however, 106,178 acres in 15 separate non-WSA lands with wilderness characteristics and under Alternative E, 277,596 acres in 25 separate non-WSA lands with wilderness characteristics would be managed to protect natural characteristics and opportunities for solitude and primitive recreation activities. These areas would be limited and closed to motorized uses and surface-disturbing activities that would degrade or diminish wilderness characteristics. Despite this long-term commitment to protecting undeveloped landscapes, opportunities for solitude, and primitive recreational activities, there would still be an irretrievable loss of wilderness characteristics on 117,740 acres in portions of 11 of the non-WSA lands with wilderness characteristics under Alternative E (see Section 4.10.2.5.6.1 above). Although currently undeveloped, portions of these non-WSA lands with wilderness characteristics have been leased for oil and gas production. Because it is anticipated that the lease holders will exercise their rights under their leases and develop these areas for oil and gas production, the wilderness characteristics of portions of these 11 areas would be irretrievably lost. No irreversible impacts are anticipated.

## 4.11. PALEONTOLOGY

The BLM has identified four objectives for the management of fossil resources on lands it administers. They are: 1) locating, evaluating, managing, and protecting fossil resources; 2) facilitating appropriate scientific, educational, and recreational uses of fossils; 3) ensuring that proposed land uses do not inadvertently damage or destroy important fossil resources; and 4) fostering public awareness of the nation's rich paleontological heritage (BLM 1998:01).

Actions proposed in the Proposed RMP and each of the alternatives for other resources are analyzed here and the possible effects of these actions on paleontological resources are discussed. Because the total number of acres affected by other resource management decisions is not known, qualitative analysis is used to determine which alternative best meets the four goals and objectives identified in the BLM Manual and Handbook H-8270-1 (1998).

In situations where qualitative analyses are used to determine which alternative best meets the BLM's four goals and objectives identified above, a reasonably foreseeable action (RFA) may be used to help predict impacts. The RFAs are potential future actions, such as oil and gas well placement or any other surface-disturbing activity, where specific decisions (e.g., actual location of oil and gas wells) cannot be determined at the programmatic level of this RMP/EIS. The RFAs are not specified allocations or decisions, but a best estimate or a guideline for what actions might be taken in the future. Predictions of potential projects are based on professional judgment regarding approximate project locations, general locality conditions, and design features commonly applied to such projects. These predictions do not definitively determine the outcome of site-specific analysis required prior to implementation of any project.

For the purpose of this RMP, all vertebrate and vertebrate trace fossil (tracks, trails, or other indicators of vertebrate activity) localities were identified as to section, township, and range. The total area included in sections containing one or more vertebrate or vertebrate trace fossil localities within the VPA is approximately 147,062 acres (Class 4 and 5 areas).

Outcrops of geologic units such as the Morrison, Mesaverde, Mancos, Moenkopi, Green River, Uinta, Wasatch, Chinle, Cedar Mountain, and Navajo/Nugget Formations should be considered as Class 3 areas in the VPA. All of these units contain vertebrate fossils in other locations and may require further assessment where they are exposed in the VPA. Areas where these units are covered or obscured are not Class 3 areas. The total area in which vertebrate or other scientifically significant fossils would be expected to occur is approximately 1,173,741 acres. Class 1 and 2 areas make up approximately 446,946 acres of the VPA.<sup>12</sup>

Within the VPA, paleontological resources are most often found where there are outcrops of the Morrison, Mesaverde, Mancos, Moenkopi, Green River, Uinta, Wasatch, Chinle, and Navajo/Nugget Formations. Impacts to paleontological resources result from natural weathering and erosion and from surface disturbance caused by people or animals. Adverse impacts to the resource would be mitigated or avoided through the careful application of mitigation measures prior to surface disturbance. Where mitigation is necessary, fossils are collected and taken to

<sup>12</sup> Calculations for PFYC Class acreages do not include state, tribal, or private lands.

secure repositories, along with contextual data, which preserves the paleontological record. The beneficial impacts of mitigation include the potential for advances in scientific understanding and regional perspectives that would not be known otherwise. Other beneficial impacts result from public education about the resource and involvement in its protection, from partnerships and from the efforts of permitted researchers.

#### **4.11.1. IMPACTS COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES**

Management decisions related to air quality, cultural resources, human health and safety, soils and watersheds, riparian, special status species, special designations, vegetation, wild horses, and wildlife and fisheries would have negligible impacts on paleontological resources, and therefore these decisions will not be further analyzed. The impacts of these actions would be negligible because protecting air quality, protecting cultural resources under section 106, maintaining safety around AML sites and reducing the risks of hazardous materials spills, protecting sensitive soils and water resources, protecting federally listed species and their habitat, restoring and maintaining native vegetation communities, and protecting non-listed wildlife and fish habitats would neither inhibit nor enhance opportunities for the scientific study of important fossil resources nor the opportunities for recreational collection of fossils.

##### **4.11.1.1. FIRE MANAGEMENT AND WOODLAND/FOREST**

Actions related to fire management and woodland/forest management could have long-term direct adverse impacts on paleontological resources due to surface-disturbing activities such as creating fire lines and road building.

##### **4.11.1.2. LIVESTOCK AND GRAZING**

Livestock can have dispersed long-term direct adverse impacts on paleontological resources. Trampling damages and destroys fossils where animals range across outcrops of fossiliferous formations. Livestock could adversely affect paleontological resources in areas of concentration around stock ponds, salt blocks, bedding areas, and along animal trails. Where livestock are eliminated from certain areas, adverse impacts to paleontological resources could occur due to changes in movement patterns.

##### **4.11.1.3. MINERALS**

Exploration for and development of mineral resources can have short-term and long-term adverse effects on paleontological resources. Surface disturbance that results from mineral exploration (including seismic surveys) and development can affect paleontological resources by damaging or destroying them. Adverse effects include physical damage to or destruction of fossils, as well as increased vandalism and theft that result from improved access to fossil localities. However, following the procedures for assessment and mitigation found in the BLM Manual H-8270-1, Chapter III (1998) would reduce or remove the potential for most of these adverse impacts. Public education and, where necessary, law-enforcement actions would reduce unauthorized fossil collecting.

Exploration for and development of mineral resources would also have a potentially beneficial impact on paleontological resources by alerting paleontologist to discoveries in areas that are not currently being researched, potentially resulting in the collection of specimens and data that would not otherwise be recovered.

#### **4.11.1.4. PALEONTOLOGY**

The Proposed RMP and the range of alternatives proposed for managing paleontological resources would have both long- and short-term beneficial effects. The Proposed RMP and all of the alternatives propose appropriate assessment to facilitate scientific research, to encourage partnerships, to manage access to significant fossils, to reduce unauthorized collection of paleontological resources, and to mitigate potential adverse impacts, where necessary, to protect the resources. They also beneficially propose management for recreational collection and use of common invertebrate and plant fossils, with public education on and interpretation of paleontological resources.

#### **4.11.1.5. RANGELAND IMPROVEMENTS**

Management decisions that allow the concentration of livestock in areas where there are significant fossils would cause long-term adverse impacts to paleontological resources. Fences and water sources where animals congregate, if they are placed on or near areas where there are significant fossils, would result in damage or destruction of fossils. However, through required assessment of rangeland improvement projects, paleontological resources would be identified and improvements would be mitigated where the potential for resource damage exists.

#### **4.11.1.6. RECREATION**

The management goals and objectives for recreation would have both adverse and beneficial long-term impacts on paleontological resources. For example, allowing motorized vehicles up to 300 feet from a designated route increases the likelihood that important or major fossil localities in Classes 4 and 5 or Class 3 areas would be inadvertently damaged or vandalized, if discovered. The management goals and objectives for recreation also have the potential to benefit paleontological resources. By implementing public education and environmental awareness programs, such as the BLM's Tread Lightly and Leave No Trace programs, added recreational activities in the VPA would reduce illegal fossil collection, vandalism, or accidental destruction of the resource. Developed recreation sites are closed to recreational fossil collection (see 43 CFR 8365.1-5[b]), and closing developed recreation sites to surface-disturbing activities would reduce the adverse impacts to paleontological resources.

### **4.11.2. PROPOSED RMP AND ALTERNATIVES IMPACTS**

This section summarizes the effects of the management actions (Proposed RMP and all alternatives) proposed in Chapter 2 for paleontological resources. Because the analyses of the management decisions presented in this chapter do not reflect specific projects or actions, some effects can only be expressed qualitatively. Quantitative analysis has been included when possible, based on specific decisions proposed in Chapter 2, as well as estimates of RFAs

described below. In most cases, site-specific analyses would be required to implement resource management decisions affecting paleontological resources. More detailed or locality-specific studies and appropriate environmental documents would be prepared in compliance with NEPA and its implementing regulations, as needed.

Effects analyzed in this chapter include direct, indirect, and cumulative effects of the proposed management decisions to the extent that they were identifiable for analysis. Where applicable, the short-term or long-term nature of these effects is described. Direct effects result from activities planned or authorized by the BLM and occur at the same time and place. Indirect effects are caused by these decisions and occur later in time or farther removed in distance, but are still reasonably foreseeable.

Cumulative effects occur when there are multiple effects on the same resources. They are incremental effects of proposed activities or projects when combined with past, present, and future actions. As stated in 40 CFR 1508.7 (1997), a "'cumulative impact' is the impact on the environment that results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time." The cumulative effects discussed in this chapter address resources for which direct and indirect impacts have been described earlier.

Where surface disturbance occurs within the VPA, the effects on paleontological resources can be beneficial or adverse. Beneficial impacts to paleontological resources would be due to advances in scientific understanding and knowledge of the spatial distribution of significant fossil resources. Adverse impacts would be due to disturbances that are uncontrolled or that increase public access to areas containing important or valuable fossils. Subsurface disturbance would also be detrimental to paleontological resources.

#### **4.11.2.1. IMPACTS OF FIRE MANAGEMENT DECISIONS ON PALEONTOLOGICAL RESOURCES**

##### **4.11.2.1.1. PROPOSED RMP AND ALTERNATIVES A, B, C, AND E**

Under the Proposed RMP and all of the action alternatives prescribed, fire would be allowed on approximately 156,425 acres per decade. Because a far greater number of acres are proposed for prescribed fire under the Proposed RMP and the action alternatives relative to Alternative D (No Action), the Proposed RMP and all of the action alternatives are likely to have greater adverse direct impact on paleontological resources relative to the current management situation.

##### **4.11.2.1.2. ALTERNATIVE D (NO ACTION)**

Under the current management situation, Alternative D (No Action); 27,950 acres in the Book Cliffs RMP; and 22,950 acres in the Diamond Mountain RMP would be treated with prescribed fire and related activities for a total of 50,900 acres. This alternative is likely to have less adverse direct impact on paleontological resources as compared to the Proposed RMP and the action

alternatives, because fewer acres are proposed for treatment that could surface disturbances to the resource.

#### **4.11.2.2. IMPACTS OF LANDS AND REALTY DECISIONS ON PALEONTOLOGICAL RESOURCES**

##### **4.11.2.2.1. PROPOSED RMP**

Under the Proposed RMP, the BLM would pursue assess to the White River at Cowboy Canyon, Bonanza Bridge, and Wagon Hound Road. It would also pursue the acquisition of Indian Trust Lands near the confluence of South and Sweetwater Canyons and in the Bitter Creek and Willow Creek areas. These actions would have potential direct, long- and short-term beneficial effects on paleontological resources as compared to Alternative D (No Action), if resources were present and significant paleontological resources were thus brought under BLM management. Easements such as that proposed at the mouth of Cowboy Canyon would affect paleontological resources by increasing public access to areas that contain geological units that are very rich in fossil localities. Public access to these areas could result in increased unauthorized use or vandalism, which would have more adverse impacts than Alternative D (No Action).

Land withdrawal decisions would preclude mineral entry on 22,814 acres under the Proposed RMP. This would provide some resource protection from minerals-related surface disturbances, but less than Alternative D (No Action) because Alternative D (No Action) would withdraw more acreage (35,900 acres).

Under the Proposed RMP, 106,178 acres of non-WSA lands with wilderness characteristics would be closed to oil and gas leasing and designated as avoidance areas for ROWs. This would have more long-term, beneficial impacts on paleontological resources by reducing surface disturbance-related impacts to the resource as compared to Alternative D (No Action).

##### **4.11.2.2.2. ALTERNATIVE A**

The impacts to paleontological resources would be the same as discussed under the Proposed RMP because the management decisions would be the same.

##### **4.11.2.2.3. ALTERNATIVE B**

Under this alternative, the BLM would pursue only administrative access across Indian trust lands in Bitter Creek, and near the confluence of South and Sweetwater Canyon. Land withdrawal decisions would be the same as under the Proposed RMP.

Under Alternative B, there would be no direct, long- or short-term impacts to paleontological resources within Indian trust lands because public access to potential paleontological resources would not be allowed. Mineral entry land withdrawal decisions would have the same impacts as the Proposed RMP because the decisions are the same. This would provide some resource protection, but less than Alternative D (No Action) because Alternative D (No Action) would withdraw more acreage.

**4.11.2.2.4. ALTERNATIVE C**

Lands and realty decisions under Alternative C would be the same as under the Proposed RMP, except that the BLM would also pursue an easement for the old Uintah Railroad bed from the Utah/Colorado line to Watson in Evacuation Wash. Potential long- and short-term direct impacts to paleontological resources from land acquisition decisions under Alternative C would be similar to those described under the Proposed RMP, but with additional beneficial and adverse impacts discussed under the Proposed RMP that includes the railroad bed easement.

Land withdrawal decisions would be similar to the Proposed RMP, except that additional acres in the Lower Green River ACEC and along the White River would also be precluded from mineral entry. Compared to Alternative D (No Action), the short-term and long-term indirect impacts of Alternative C would be more beneficial by providing greater resource protection than Alternative D (No Action) because more acreage would be withdrawn from mineral entry (a total of 36,265 acres).

**4.11.2.2.5. ALTERNATIVE D (NO ACTION)**

Lands and realty decisions under Alternative D (No Action) are unspecified in the current management plan. Any proposal to acquire or dispose of land would be reviewed to determine its potential to effect paleontological resources.

Land withdrawal decisions would preclude mineral entry on 35,900 acres. This would provide the paleontological resource protection from minerals-related surface disturbances.

**4.11.2.2.6. ALTERNATIVE E**

Proposed lands and realty decisions under Alternative E would be similar to Alternative C, with potential long- and short-term direct impacts to paleontological resources from land acquisition decisions similar to those described under the Proposed RMP, except that approximately 277,596 acres of non-WSA lands with wilderness characteristics within the VPA would be designated as ROW exclusion areas to protect the wilderness characteristics values in these areas. This would have more long-term, beneficial impacts on paleontological resources by reducing surface disturbance-related impacts to the resource as compared to Alternative D (No Action).

Land withdrawal decisions and impacts on paleontology under Alternative E would be the same as discussed under Alternative C. The short-term and long-term indirect impacts of Alternative E would be beneficial by providing greater resource protection than Alternative D (No Action).

**4.11.2.3. IMPACTS OF MINERAL DECISIONS ON PALEONTOLOGICAL RESOURCES**

Minerals decisions under the Proposed RMP and each of the alternatives have the potential to have both beneficial and adverse impacts on paleontological resources within the VPA, as all decisions would involve surface-disturbing activities. The difference between the Proposed RMP and alternatives is in the numbers of acres open to minerals development. For the Proposed RMP and each alternative the number of acres open to surface-disturbing activities is less important than the total size of Class 4 and 5 and Class 3 areas actually disturbed. All proposed actions and

projects related to minerals development would be subject to site-specific NEPA analysis and documentation, as well as agency guidance (i.e., BLM Handbook H-8270-1). Assessment of possible impacts to paleontological resources and recommendations for any necessary mitigation would be required. Because paleontological resources must be assessed and any required mitigation performed by a permitted paleontologist, specimens and data could be collected in areas of mineral development that would otherwise have gone unnoticed, which would be a beneficial impact of minerals development.

#### **4.11.2.3.1. PROPOSED RMP**

In general, the direct effects to paleontological resources resulting from minerals decisions would be related to the level of surface disturbances in Class 4 and 5 or Class 3 areas that occur under the decisions. The greater the level of permitted surface disturbance, the greater would be the potential for encountering paleontological resources in these areas. Under the Proposed RMP, 1,640,569 acres of BLM administered land would be open for oil and gas development and surface disturbances within the VPA under Standard and Timing and Controlled Surface Use leasing stipulations. Potential indirect adverse effects on paleontological resources under the Proposed RMP would include vandalism and unauthorized fossil collection that result from increased human activity within areas of mineral development in Class 4 and 5 and Class 3 areas. Compared to the other alternatives, the Proposed RMP has the third highest number of acres open to surface disturbance related to oil and gas development and the third lowest number of acres closed to surface occupancy or development (273,706). As such, the Proposed RMP has a greater potential for impacts to paleontological resources within the VPA than Alternative D (No Action) and Alternatives C and E, but lower than Alternatives A and B, but only if this disturbance takes place in Class 4 and 5 or Class 3 areas.

#### **4.11.2.3.2. ALTERNATIVE A**

The types of direct and indirect impacts of minerals leasing within the VPA on paleontological resources would be the same as discussed above under the Proposed RMP, but to a greater degree. This is because Alternative A would permit 1,776,782 acres under Standard and Timing and Controlled Surface Use leasing stipulations for oil and gas development. Compared to the other alternatives, Alternative A has the second highest number of acres open to surface disturbances related to minerals oil and gas development and the fifth lowest number of acres closed to surface occupancy or development. So, Alternative A has a greater potential for impacts to paleontological resources within the VPA than Alternative D (No Action), the Proposed RMP alternative, and Alternatives C and E; it would have a lower potential impact than Alternative B, but only if this disturbance takes place in Class 4 and 5 or Class 3 areas.

#### **4.11.2.3.3. ALTERNATIVE B**

The types of long- and short-term direct effects under Alternative B would be the same as those described under the Proposed RMP but of greater magnitude, because management decisions under this alternative would open the largest area for oil and gas minerals leasing (1,819,435 acres). This alternative would manage for the smallest area that would be closed to surface occupancy or any form of minerals development (94,603 acres), as compared to the other action

alternatives and to Alternative D (No Action). So, Alternative B would have a greater potential for adverse impacts to paleontological resources than Alternative D (No Action) and the other action alternatives.

#### **4.11.2.3.4. ALTERNATIVE C**

Direct effects to paleontological resources resulting from mineral decisions under Alternative C are related to the level of surface disturbance in Class 4 and 5 and Class 3 areas that is permitted under the decisions. The greater the level of permitted surface disturbance in these areas, the greater the potential for impact to paleontological resources. Under Alternative C, 1,627,197 acres of BLM administered lands would be open to minerals development. Compared to the Proposed RMP and the other action alternatives, Alternative C would have the third smallest area open to surface disturbance related to oil and gas development and the second highest number of acres closed to surface occupancy or development (286,916). The types of long term and short term direct and indirect impacts to paleontological resources would be the same as discussed above under the Proposed RMP, but to a lesser degree, because a smaller area would potentially be affected. However, the impacts would be greater than Alternative D (No Action). The impacts to the resource, either adverse or beneficial, would depend on the number of Class 4 and 5 and Class 3 acres that would be developed under this alternative.

#### **4.11.2.3.5. ALTERNATIVE D (NO ACTION)**

The direct impacts to paleontological resources resulting from mineral decisions under Alternative D (No Action) are related to the level of surface disturbances in Class 4 and 5 and Class 3 areas that are permitted by minerals decisions. Under Alternative D (No Action), 1,535,974 acres within the VPA would be open to oil and gas development. Alternative D (No Action) would have the second lowest number of acres open to surface disturbance related to oil and gas development and the fourth lowest number of acres closed to surface occupancy or development (189,470).

The types of long- and short-term direct and indirect impacts from minerals surface disturbances under Alternative D (No Action) would be the same as those described under the Proposed RMP.

Indirect impacts to paleontological resources based upon minerals decisions under Alternative D (No Action) are similar to those described for Alternative A but would be of smaller magnitude owing to the lower number of acres available for use and the higher number of acres closed to surface occupancy for oil and gas development (except for Alternative C).

#### **4.11.2.3.6. ALTERNATIVE E**

Under Alternative E, 1,385,454 acres of BLM administered lands would be open to oil and gas minerals development under Standard and Timing and Controlled Surface Use leasing stipulations. The types of impacts would be the same as discussed under the Proposed RMP above, but would be of lesser magnitude than the other alternatives because this alternative would allow the development of the smallest area for minerals development and the largest area

as closed to surface occupancy or any form of minerals development and subsequent surface disturbances.

Compared to the Proposed RMP and the other action alternatives, Alternative E minerals decisions would manage for the smallest area as open to surface disturbance related to oil and gas development and the largest area closed to surface occupancy or minerals surface occupancy or development (414,666 acres). The impacts to the resource, either adverse or beneficial, would depend on the number of Class 4 and 5 and Class 3 acres that would be developed under this alternative.

In summary, the highest adverse impacts to paleontological resources would occur under Alternative B, due to the greatest number of acres open to surface disturbance. Alternative A would have the second highest degree of adverse impacts, followed by Alternatives C and the Proposed RMP. Alternatives D and E would have the lowest levels of adverse impacts to paleontological resources.

#### **4.11.2.4. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON PALEONTOLOGICAL RESOURCES**

##### **4.11.2.4.1. PROPOSED RMP**

Under the Proposed RMP, 106,178 acres of non-WSA lands with wilderness characteristics would be managed under VRM II class objectives, closed to oil and gas leasing and mineral materials disposal, closed to woodland harvesting, and OHV use would be limited to designated routes. All of these decisions would either prohibit or restrict surface disturbances to paleontological resources, which would have long-term, beneficial impacts on the resource. The Proposed RMP would have more beneficial impacts on the resource than Alternative D (No Action) because these non-WSA areas would not be managed to protect their wilderness values under Alternative D (No Action). However, the reduction in potential surface disturbances from other resource uses may also reduce the likelihood that fossils would be discovered and collected, adversely affecting paleontological resources.

##### **4.11.2.4.2. ALTERNATIVES A, B, C, AND D**

There are no proposed management decisions and no acres would be managed as non-WSA areas with wilderness characteristics under any of these alternatives, so there would be no impacts to paleontological resources from these decisions.

##### **4.11.2.4.3. ALTERNATIVE E**

Under Alternative E, non-WSA lands with wilderness characteristics would be managed under VRM I class objectives, closed to OHV use, closed to oil and gas leasing and mineral materials disposal, closed to woodland harvesting, and excluded from ROWs designation. All of these decisions would either prohibit or restrict surface disturbances to paleontological resources, which would have long-term, preservation-related, beneficial impacts on the resource. This alternative would have more beneficial impacts on the resource than Alternative D (No Action)

because approximately 277,596 acres of non-WSA lands with wilderness characteristics would be managed to protect their wilderness values within the VPA, which would also preserve paleontological resources. However, the reduction in potential surface disturbances would also reduce the likelihood that fossils would be discovered and collected, adversely affecting paleontological resources.

#### **4.11.2.5. IMPACTS OF PALEONTOLOGICAL DECISIONS ON PALEONTOLOGICAL RESOURCES**

##### **4.11.2.5.1. PROPOSED RMP, AND ALTERNATIVES A, B, C, D (NO ACTION), AND E**

Paleontological resource decisions for each of the alternatives would have direct, beneficial impacts on paleontological resources within the VPA. Alternatives C and E would provide the greatest protection for paleontological resources through predictive modeling and broad-scale sampling, also requiring assessment (and where needed, mitigation) in all Class 4 and 5 areas, and in Class 3 areas as needed. Under the Proposed RMP and Alternative A, the use of predictive modeling and broad-scale sampling would streamline the process of assessment and the mitigation of potentially adverse impacts caused by surface disturbance and would make it more effective. The Proposed RMP and Alternative A would provide the second highest degree of protection to paleontological resources. The management decisions under Alternatives B and D are similar, with mitigation of impacts as fossils are found. These alternatives would provide the least protection for paleontological resources.

Paleontological Resource Use Permits administered by the BLM Utah State Office for scientific study would provide important information to the VPA about the location and kinds of significant paleontological resources. Providing websites, local interpretive sites, and written information to the public about fossils and hobby collection has the potential to directly increase the public knowledge of the earth sciences and encourage good stewardship, reduce illegal collection, and increase the likelihood that important discoveries would be reported to the BLM.

#### **4.11.2.6. IMPACTS OF RANGELANDS IMPROVEMENT DECISIONS ON PALEONTOLOGICAL RESOURCES**

Paleontological resources would be affected by rangeland improvements if they were placed in areas with fossiliferous units. Generally, the areas proposed for rangeland improvements would be evaluated for significant fossils if they were in areas likely to contain fossils (those areas designated as Class 4 and 5 and Class 3). Those areas containing significant paleontological resources would be protected from damage by placing rangeland fences and other proposed improvements away from fossil localities. In those areas with known fossiliferous units, rangeland improvements structures or projects that would not or could not be moved, such as reservoirs, would be assessed and the potential impacts mitigated, which could beneficially lead to new discoveries and increase scientific knowledge.

##### **4.11.2.6.1. PROPOSED RMP**

Under the Proposed RMP, 34,640 acres of vegetation treatment, 69 miles of fencing, 38 miles of water pipeline, 51 spring developments, and 812 guzzler or reservoir projects would be

completed. These proposed improvements would cause surface disturbances, therefore beneficially increasing the probability of new discoveries. These acreages, miles and numbers of facilities are roughly comparable to those proposed under Alternative D (No Action). It is anticipated that the primary indirect impact would be to increase the potential for adverse, concentrated trampling of paleontological localities located in areas adjacent to fencing or reservoirs on barren bedrock. Where cattle, sheep, or other grazers gather, they could damage or destroy fossils in Class 4 and 5 or Class 3 areas.

#### **4.11.2.6.2. ALTERNATIVE A**

The impacts of rangeland improvements on paleontological resources would be the same as discussed under the Proposed RMP because the management decisions are the same.

#### **4.11.2.6.3. ALTERNATIVE B**

The overall direct adverse impacts from rangeland improvement decisions on paleontological resources under Alternative B would be greater than those described for the Proposed RMP. Under Alternative B, 50,900 acres would be subject to vegetation treatment, 369 miles of fencing would be installed, 51 miles of water pipeline would be installed, 78 well/spring developments would be undertaken, and 1,165 guzzler or reservoir projects would be completed. These improvements would likely impact more surface area than D (No Action), therefore creating a greater probability that paleontological resources would be beneficially discovered and studied, if improvements are in Class 4 and 5 and Class 3 localities. Long- and short-term direct and indirect impacts to paleontological resources from rangeland improvement decisions would be similar to those described for direct impacts under the Proposed RMP, but would be greater under Alternative B if the increased surface disturbance takes place in Class 4 and 5 or Class 3 areas.

#### **4.11.2.6.4. ALTERNATIVE C**

Under Alternative C a total of 45,860 acres would be subject to vegetation treatment, 129 miles of fencing would be installed, 30 miles of water pipeline would be installed, 87 well/spring developments would be undertaken, and 811 guzzler or reservoir projects would be completed. The direct and indirect, short term and long term impacts of rangeland improvement decisions on paleontological resources under Alternative C would be similar to that described for the Proposed RMP, but would be increased slightly in magnitude under Alternative C owing to the overall greater potential for impacts to the resource from range improvement surface disturbances. As Alternative C would affect more area, it also would beneficially increase the probability of new discoveries, when compared to Alternative D (No Action).

#### **4.11.2.6.5. ALTERNATIVE D (NO ACTION)**

The impacts of rangeland improvement decisions on paleontological resources under Alternative D (No Action) would be similar to that described for the Proposed RMP and the other alternatives. Under Alternative D (No Action) a total of 40,390 acres would be subject to vegetation treatment, 65 miles of fencing would be installed, 35 miles of water pipeline would be

installed, 74 well/spring developments would be undertaken and 775 guzzler or reservoir projects would be completed.

The types of long- and short-term direct and indirect impacts to paleontological resources from rangeland improvement decisions would be the same as to those described under the Proposed RMP, but would be slightly greater under Alternative D (No Action), because more area would be disturbed from vegetation treatments, if Class 4 and 5 and Class 3 areas are affected.

#### **4.11.2.6.6. ALTERNATIVE E**

The impacts would be the same as Alternative C because the proposed rangeland improvements would be the same.

In summary, the greatest short-term direct, adverse impacts to paleontological resources due to surface disturbance from rangeland improvements and indirect adverse impacts from livestock trampling would be from Alternative B because the largest area would potentially be disturbed by rangeland improvements. The next greatest adverse impacts would be from Alternatives C and E, followed by Alternative D (No Action). The Proposed RMP and Alternative A would have the least impact on paleontological resources because these alternatives proposed the smallest area for vegetation treatments, the shortest miles of rangeland fencing, and the fewest wells/springs for development.

#### **4.11.2.7. IMPACTS OF RECREATION DECISIONS ON PALEONTOLOGICAL RESOURCES**

Recreation management decisions under the Proposed RMP and each of the alternatives would affect paleontological resources by either increasing visitor use or changing development. Increasing visitor use would affect resources by creating a greater level of surface disturbance, therefore increasing the probability that fossils would be discovered. Conversely, the greater the level of human activity, the greater would be the potential for paleontological resources within a recreational area to be adversely impacted by the number of individuals walking over or visiting paleontological localities. Increased human activity in areas where paleontological resources are present also tends to correspond with increased levels of vandalism, unauthorized collection, and inadvertent damage or destruction of the resource. The beneficial impacts of increased recreational use would be that people might find and report discoveries of important and valuable fossils.

The differing use levels of BLM land designated as SRMAs would affect the paleontological resources in areas known to have these resources. The designation of SRMAs generally increases recreational activity in given areas, but the only areas known to have important fossil localities at present are Blue Mountain, Red Mountain-Dry Fork, Browns Park, and the White River Corridor. Activity plans created for SRMA management would include stipulations to protect unique paleontological resources, which would minimize impacts to the resource.

Direct effects on paleontological resources resulting from recreation decisions under the Proposed RMP and all alternatives would be related to the level of surface disturbance associated with recreational development and with the degree of increased human activity in Class 4 and 5

and Class 3 areas. Potential short- and long-term direct impacts would include increases in levels of unauthorized use and associated vandalism that would accompany increased human activity. It should be noted and it is assumed, however, that regulated recreational use would likely provide better protection to paleontological resources than unregulated use. Collecting common invertebrate and plant fossils for personal, noncommercial use is an accepted, low-impact use of public lands, and could foster a greater appreciation for paleontological resources.

Indirect effects of recreation decisions on paleontological resources would include benefits such as increased public enjoyment of hobby collecting, increased interest in the science of paleontology, and generally more public awareness of these resources and how to preserve them. Potential adverse impacts would be the increased unauthorized collection, inadvertent damage, or vandalism in Class 4 and 5 and Class 3 areas adjacent to developed recreation areas.

#### **4.11.2.7.1. PROPOSED RMP**

Under the Proposed RMP, seven SRMAs would be managed within the VPA, totaling 133,560 acres: 2,831 acres along the White River Corridor, 44,168 acres in Nine Mile Canyon, 18,490 acres in Browns Park, 1,014 acres in Pelican Lake, 24,259 acres on Red Mountain-Dry Fork, 69 acres in Fantasy Canyon, and 42,729 acres on Blue Mountain. Additionally, 400 miles of non-motorized trails would be improved and/or developed, and restrictions would be placed on the use of OHVs for retrieval of big game off of designated routes. A total of 800 miles of motorized OHV trails would be developed or improved under this alternative. New cabin construction for permitted/administrative use would be allowed within the VPA but an attempt would be made to consolidate construction in specific areas at or near existing cabins. Also, under the Proposed RMP 106,178 acres of non-WSA lands with wilderness characteristics would be protected from cross-country OHV travel and closed to oil and gas mineral leasing and woodland harvesting. These decisions would have long term, beneficial impacts on the resource by protecting them from surface disturbances, unmanaged collection, and vandalism. However, the likelihood for discovery of significant paleontological resources would be reduced. Compared to Alternative D (No Action), the Proposed RMP would likely have fewer adverse impacts to paleontological resources and a reduced potential for damage of paleontological resources because more area would be beneficially protected under SRMA management from surface disturbances through SRMA integrated activity plans.

#### **4.11.2.7.2. ALTERNATIVE A**

Under Alternative A, 499,588 acres of the VPA would be managed within SRMAs: 24,183 acres along the White River Corridor, 52,720 acres in Browns Park, 24,259 acres on Red Mountain-Dry Fork, 1014 acres around Pelican Lake, 273,486 acres in the Book Cliffs, 81,168 acres in Nine Mile Canyon, and 42,758 acres on Blue Mountain would be managed as SRMAs. Additionally, 400 miles of non-motorized trails would be improved and/or developed, and restrictions would be placed on the use of OHVs for retrieval of big game off of designated routes. A total of 800 miles of motorized OHV trails would be developed or improved under this alternative. New cabin construction for permitted/administrative use would be allowed within the VPA but an attempt would be made to consolidate construction in specific areas at or near existing cabins. The types of direct and indirect beneficial impacts of recreation management

decisions under this alternative to paleontological resources would be the same as discussed under the Proposed RMP, but to a greater degree because more area would be protected from surface disturbances under increased SRMA management.

Compared to Alternative D (No Action), this alternative would provide fewer adverse impacts to paleontological resources and more beneficial impacts because more area would be protected from surface disturbances.

#### **4.11.2.7.3. ALTERNATIVE B**

Direct effects to paleontological resources resulting from recreation decisions under Alternative B are related to the lack of designation and protection of resources associated with recreational development and use. Under this alternative SRMA management decisions would be the same as Alternative D (No Action): no SRMAs would be designated in the White River Corridor or on Blue Mountain, but Brown's Park (17,000 acres), Pelican Lake (1,014 acres), Nine Mile Canyon (44,181 acres) and Red Mountain-Dry Fork (24,259 acres) would continue to be managed as SRMAs. A total of 86,454 acres would be managed within SRMAs. Additionally, under Alternative B, 800 miles of motorized trails would be improved or developed, and OHV use off of designated trails would be allowed for big game retrieval. Under Alternative B, recreational use in the White River Canyon with minimal supervision would continue; unrestricted and unconfined recreational use of the Book Cliffs would also continue as currently managed and new cabin construction would be allowed within the VPA, but an attempt would be made to consolidate construction in specific areas. Alternative B generally allows and would manage for unrestricted and unconfined use of BLM lands for recreation.

Potential long- and short-term direct and indirect impacts on paleontological resources under Alternative B are similar to those described for the Proposed RMP with the exception that the increased acreage available for unrestricted and unconfined recreational use under Alternative B would result in the increased potential for damage of paleontological resources.

#### **4.11.2.7.4. ALTERNATIVE C**

Alternative C would designate a total of 522,604 acres within SRMAs: 47,130 acres in the White River Corridor, 273,486 acres in the Book Cliffs, 69 acres in Fantasy Canyon, and 42,758 acres on Blue Mountain as new SRMAs. It would maintain 52,720 acres in Browns Park, 81,168 in Nine Mile Canyon, 1,014 acres at Pelican Lake and 24,259 acres on Red Mountain-Dry Fork as existing SRMAs. Additionally, under Alternative C, 400 miles of non-motorized trails would be improved and/or developed, and restrictions would be placed on the use of OHVs for retrieval of big game off of designated routes. No motorized OHV trails would be developed or improved under this alternative. Alternative C would have similar direct adverse effects as discussed under the Proposed RMP, except that the lack of OHV trail development or improvement would reduce the probability of new discoveries of paleontological resources.

Long- and short-term direct and indirect adverse effects on paleontological resources under Alternative C are less than those described for Alternative D (No Action) because more area

would be protected from surface disturbances within SRMAs than under Alternative D (No Action).

#### **4.11.2.7.5. ALTERNATIVE D (NO ACTION)**

As discussed above under Alternative B, Alternative D (No Action) would manage the same number and acreages of SRMAs as that alternative, with the same impacts to paleontological resources. Minimal oversight or lack of designation of new SRMAs would lead to resource degradation due to limited management of these areas. Additionally, 55 miles of non-motorized trails would be improved or developed and the Red Mountain trail would be managed as a motorized OHV trail. No management decisions are specified for OHV use off designated trails for the retrieval of big game. In general, Alternative D (No Action) would manage for unrestricted and unconfined recreational use of most areas within the VPA, which would have adverse impacts on the resource because of the increased likelihood of surface disturbances from OHV use, and from minimal management of front country and back country recreational activities. The potential long- and short-term direct and indirect effects on paleontological resources under Alternative D (No Action) are comparable to those described for Alternative B.

#### **4.11.2.7.6. ALTERNATIVE E**

The impacts would be the same as discussed under Alternative C, except that 157,018 acres of non-WSA lands with wilderness characteristics within the proposed SRMAs would be managed for primitive, non-mechanized recreational opportunities rather than developed recreation. This would result in somewhat less surface disturbance and less adverse, direct impacts on paleontological resources.

#### **4.11.2.7.7. SUMMARY**

In relative terms, Alternatives C and E would manage more areas as SRMAs with fewer trail development miles than Alternative A and the Proposed RMP. Alternatives B and D do not designate new areas as SRMAs and generally allow for unrestricted and unconfined use of BLM lands for recreation. The greatest protection of paleontological resources would be provided by Alternatives C and E, followed by Alternative A and the Proposed RMP, based on the total area protected and managed for resource preservation within SRMAs. Alternatives B and D would provide the least protection for paleontological resources.

### **4.11.2.8. IMPACTS OF TRAVEL DECISIONS ON PALEONTOLOGICAL RESOURCES**

#### **4.11.2.8.1. PROPOSED RMP**

Direct impacts on paleontological resources within the VPA resulting from travel decisions under the Proposed RMP would be expected to be long-term and beneficial as compared to Alternative D (No Action). Travel decisions under the Proposed RMP provide for the opening, closing, or restricting of areas for OHV travel and for the repair, maintenance, upgrade, or realignment of roads causing resource damage. The Proposed RMP also provides for the closure of roads if repair, maintenance, upgrade, or realignment is not possible or feasible to reduce

damage to resources. All of these management decisions would have a potentially direct, beneficial impact on paleontological resources in Class 4 and 5 and Class 3 areas by reducing and/or controlling surface-disturbing, travel-related activities. Under the Proposed RMP, 6,202 acres would be open to unrestricted OHV travel; OHV travel on 1,643,475 acres would be limited to designated routes, and 75,845 acres would be closed to OHV travel.

Both short-term and long-term indirect effects from travel decisions under the Proposed RMP are anticipated to be negligible. Long- and short-term direct impacts on paleontological resources from travel decisions would include increased protection of paleontological resources through the substantial reduction of surface-disturbing activities associated with general travel and open, cross-country OHV use. Paleontological resources in Class 4 and 5 and Class 3 areas that are closed to OHV use or where restrictions are placed on OHV use would receive the greatest benefit. Thus, with the specific controls and restrictions placed on travel activities under the Proposed RMP, the long-term net effect would be an overall decrease in the numbers of localities subject to adverse impacts, as compared to Alternative D (No Action).

#### **4.11.2.8.2. ALTERNATIVE A**

The impacts of travel decisions on paleontological resources would be the same as discussed under the Proposed RMP because the management decisions are the same.

#### **4.11.2.8.3. ALTERNATIVE B**

Under Alternative B, 5,434 acres would be open to unrestricted OHV travel; OHV travel on 1,659,901 acres would be limited to designated routes, and 60,187 acres would be closed to OHV travel.

Long- and short-term direct and indirect adverse impacts to paleontological resources from travel decisions under Alternative B are less than those described for Alternative D (No Action), due to the substantially lower acreage open to unrestricted, cross-country OHV use (and thus the reduced potential for surface disturbances to paleontological resources).

#### **4.11.2.8.4. ALTERNATIVE C**

Alternative C would provide the second greatest benefit to paleontological resources in Class 4 and 5 and Class 3 areas within the VPA by closing a substantially large area to OHV use, managing OHV travel, and improving roadways. Under Alternative C, 5,434 acres would be open to unrestricted, cross-country OHV travel; OHV use on 1,353,529 acres would be limited to designated routes, and 366,559 acres would be closed to OHV travel.

Long- and short-term direct and indirect impacts on paleontological resources from travel decisions under Alternative C are similar to those described under the Proposed RMP, but would be of greater magnitude owing to the increased numbers of acres under Alternative C that would be closed to OHV use. This alternative would have fewer adverse impacts to paleontological resources than Alternative D (No Action) because of the smaller area designated as open to OHV use.

**4.11.2.8.5. ALTERNATIVE D (NO ACTION)**

Current travel management decisions under Alternative D (No Action) are largely unspecified. No specific decisions are specified for the repair, maintenance, upgrade, or realignment of roadways causing damage to resources. Travel designations are specified, however, for OHV use within the VPA, and these designations provide the least protection to paleontological resources from potential travel-related surface disturbances. Under Alternative D (No Action), 787,859 acres are designated as open to unrestricted, cross-country OHV use, largely in Class 4 and 5 and Class 3 areas. There are 887,275 acres that restrict OHV use to designated routes, and 50,388 acres are closed to OHV use.

The large area designated as open to unrestricted OHV use would likely contribute to greater numbers of paleontological localities being subjected to direct impacts resulting from OHV traffic and surface disturbances.

**4.11.2.8.6. ALTERNATIVE E**

Alternative E would provide the greatest benefit to paleontological resources in Class 4 and 5 and Class 3 areas within the VPA by closing a substantially large to OHV use (the most acreage of all the action alternatives and the Proposed RMP), managing OHV travel, and improving roadways. Under Alternative E, 5,434 acres would be open to unrestricted cross-country OHV travel, 1,326,024 acres would be designated to restrict OHV travel to designated routes, and 392,818 acres would be closed to OHV travel. Approximately 53 miles of OHV routes would be closed in non-WSA lands with wilderness characteristics to protect their wilderness values.

The beneficial long- and short-term direct and indirect impacts on paleontological resources from travel decisions under Alternative E would be similar to those described for the Proposed RMP but would be of greater magnitude owing to the increased acreage and miles of routes under Alternative E that would be closed to OHV use. This alternative would have fewer potentially adverse impacts to paleontological resources than Alternative D (No Action) because of the substantially reduced area open to OHV use and the increased area closed to OHV travel.

In summary, the greatest adverse impacts to paleontological resources would be due to Alternative D (No Action). The second highest degree of adverse impacts would come from Alternative B, followed by the Proposed RMP and Alternative A. Alternatives E and C would have the least adverse impacts to paleontological resources due to travel decisions, based on area open to cross-country OHV travel and areas where OHV travel is limited to designated routes.

**4.11.2.9. IMPACTS OF VISUAL RESOURCE MANAGEMENT DECISIONS ON PALEONTOLOGICAL RESOURCES**

Short- and long-term direct and indirect impacts on paleontological resources could result from visual resource management decisions if surface disturbance is controlled and limited, and collection of fossils is not allowed in some VRM class areas. If paleontological resources occur where visual resource management reduce, control, or eliminate surface-disturbing activities, beneficial direct impacts of management decisions would include a reduction in physical damage

to or destruction of fossils. Indirect beneficial impacts would include a reduction in vandalism and theft that result from improved access to fossil localities. Conversely, because increases in surface disturbance also increase the probability that fossils would be discovered, reduction in surface-disturbing activities could also adversely affect paleontological resources. Visual resource management decisions that reduce fossil collection would directly and adversely affect paleontological resources. In all cases, these conclusions are based on the assumption that significant paleontological resources would occur in VRM Class I and Class II areas.

#### **4.11.2.9.1. PROPOSED RMP**

Under the Proposed RMP, 57,776 acres within the VPA would be designated as VRM Class I and managed under VRM objectives to preserve visual resources and scenic quality. This VRM class would impose the greatest limitations on surface-disturbing activities. Another 231,911 acres would be managed under VRM Class II objectives, 786,612 acres would be managed VRM Class III objectives, and 643,641 acres would be managed under VRM Class IV with the least restrictions on surface disturbances. The Proposed RMP would designate a total of 289,687 acres within VRM Class I and II, 122,915 more acres within the two highest VRM classifications than Alternative D (No Action) (see Table 4.19.3 Visual Resources).

Long- and short-term indirect impacts on paleontological resources from visual resource management decisions under the Proposed RMP would include beneficial impacts due to the overall reduction of allowed surface-disturbing activities within the areas managed under VRM Class I and II objectives, and an overall decrease in the numbers of localities subject to surface disturbance, as compared to Alternative D (No Action).

Visual resource management decisions under the Proposed RMP would have a direct beneficial impact to paleontological resources, as compared to Alternative D (No Action), because there would be less surface disturbance and therefore less physical damage to or destruction of fossils. Indirect beneficial impacts would include a reduction in vandalism and theft that result from improved access to fossil localities. However, the reduction in surface disturbance may also reduce the probability that fossils would be discovered and collected, adversely affecting paleontological resources. If fossil collection was not allowed in some areas in order to meet VRM Class I and Class II resource objectives, this would directly adversely affect paleontological resources as well because the likelihood for significant paleontological resource discoveries would be reduced.

#### **4.11.2.9.2. ALTERNATIVE A**

Under Alternative A, 63,136 acres within the VPA would be managed under VRM Class I objectives, 294,773 acres would be managed under VRM Class II objectives, 716,186 acres would be managed under VRM Class III, and 645,845 acres would be managed under VRM Class IV. Compared to the other alternatives, Alternative A would provide a high degree of direct, adverse impacts to paleontological resources because a total of 357,909 acres would be managed under the two highest VRM classifications where the likelihood of significant resource discovery would be reduced by restrictions on surface disturbances. Visual resource management decisions under Alternative A would have less short term and long term direct and indirect

beneficial impact to paleontological resources than do those under Alternative D (No Action) because more area would be protected under the higher VRM classes. However, the same specific controls and restrictions placed on surface-disturbing activities in areas managed as the two highest VRM classes would also result in an overall beneficial decrease in the numbers of localities subject to surface disturbances, as compared to Alternative D (No Action).

#### **4.11.2.9.3. ALTERNATIVE B**

The overall indirect effect of visual resource management decisions on paleontological resources under Alternative B would be roughly comparable to but slightly greater degree than that described for Alternative D. Under Alternative B, 52,764 acres would be managed under VRM Class I objectives, and 114,030 acres would be managed under VRM Class II objectives. Another 199,179 acres would be managed under VRM Class III objectives, and 1,353,967 acres would be managed under VRM Class IV objectives. The VRM designations under this alternative are similar to those currently designated under Alternative D (No Action), and this alternative would designate practically the same acreage under VRM Class I and II as Alternative D (No Action) (166,794 acres), with impacts on paleontological resources similar to those discussed under Alternative D (No Action).

#### **4.11.2.9.4. ALTERNATIVE C**

The direct and indirect, long- and short-term adverse effects of visual resource management decisions on paleontological resources under Alternative C would be greater than that described for any other alternative except Alternative E. Under this alternative, 145,781 acres would be managed under VRM Class I objectives, and 362,660 acres would be managed under VRM Class II objectives. VRM Class III would be designated on 580,846 acres, with VRM Class IV designation on 630,653 acres. Alternative C would manage a total of 508,441 acres under VRM Class I and II objectives, with impacts on paleontological resources as discussed under the Proposed RMP, but to a greater degree because more area would be protected from disturbances (a beneficial impact), but also closed to surface disturbances that could identify localities with significant resources (an adverse impact). Compared to Alternative D (No Action), this alternative would protect 341,669 more acres under VRM Class I and Class II designations, so there would be more adverse and beneficial impacts than Alternative D (No Action).

#### **4.11.2.9.5. ALTERNATIVE D (NO ACTION)**

Under Alternative D (No Action), 53,086 acres would be designated as VRM Class I and 113,686 acres as VRM Class II; 199,192 acres would be designated as VRM Class III and 1,353,976 acres would be designated as VRM Class IV. Under Alternative D (No Action), a total of 166,772 acres would be managed under VRM Class I and II objectives, the smallest area of all the alternatives.

Alternative D (No Action) would have the least beneficial impact to paleontological resources, when compared to the other alternatives, because there would potentially be more surface disturbance and therefore more physical damage to or destruction of fossils. Indirect adverse impacts would include the likelihood of increased vandalism and theft that result from improved

access to fossil localities. However, the increase in surface disturbance would also increase the likelihood that significant sources of fossils would be discovered and collected, beneficially affecting paleontological resources

#### **4.11.2.9.6. ALTERNATIVE E**

The direct and indirect, long- and short-term beneficial effects of visual resource management decisions on paleontological resources under Alternative E would be greater than for any other alternative. Under Alternative E, 334,516 acres would be designated as VRM Class I, and 259,694 acres would be designated as VRM Class II. Approximately 535,586 acres would be designated as VRM Class III, and 590,144 acres as VRM Class IV. With the highest number of acres designated as VRM I and II classes (approximately 594,210 acres) and managed under VRM objectives to restrict or minimize surface disturbances, Alternative E would manage 427,438 more acres within the two highest VRM classifications than Alternative D (No Action). However, if fossil collection was not allowed in some areas in order to maintain VRM I and II management goals, this would directly and adversely affect paleontological resources to a greater extent than the other alternatives.

#### **4.11.3. UNAVOIDABLE ADVERSE IMPACTS**

Loss due to non-recognition, lack of information and documentation, erosion, casual collection, and inadvertent destruction or use would cause resource losses. The rate, extent, intensity, and duration cannot be quantified at this time due to lack of data. As a part of natural environmental processes, paleontological localities will be exposed, remain for a time, and become lost to history if not recorded or studied. The management decisions caused by the action alternatives and Alternative D (No Action) would cause losses over and above the natural attrition rate but cannot be quantified at this time. However, the broad-scale sampling and classification of areas with a high likelihood of containing paleontological resources is expected to greatly reduce the probability of unavoidable adverse impacts to the resource.

#### **4.11.4. SHORT-TERM USES VERSUS LONG-TERM PRODUCTIVITY**

The short-term uses of BLM lands for activities involving surface-disturbance would have long-term impacts on paleontological resources. The surface-disturbing activities affecting paleontological resources would include mineral development, livestock trampling, and constructing fire lines and roads during wildland fire management. Travel decisions involving maintenance, upgrade, and realignment of roads and OHV use would also have long-term adverse impacts on these resources. Providing access for the public through Lands and Realty decisions and OHV use would also increase the potential for vandalism and the inadvertent destruction of paleontological resources.

#### **4.11.5. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS**

Irreversible impacts to paleontological resources would occur where unavoidable adverse impacts destroy or disturb paleontological resources.

## 4.12. RECREATION

### 4.12.1. IMPACTS COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES

Impacts to recreation resources that are common to the Proposed RMP and all alternatives would come from new management direction as described in the Proposed RMP and each alternative and include abandoned mine lands, cultural resource protection, fire management, construction and/or designation of roads and trails, mineral resources development, protection of paleontological resources, changes in recreational opportunities, and designation of ACECs.

In conformance to the BLM's policy on abandoned mine lands, the Proposed RMP and all of the alternatives would establish safety and hazardous conditions priorities to remediate and/or reclaim abandoned mine sites that pose high health and safety risks to the public, and in instances where high-risk sites are located near developed recreation sites. The direct effects would be to beneficially improve recreational opportunities in the long term by enhancing recreation resources adjacent to these sites.

Under the Proposed RMP and all of the alternatives, the current federal laws and agency guidelines in place to protect cultural resources would have long-term beneficial and adverse effects on the recreational resources in the VPA. Long-term beneficial effects would be produced through the preservation of cultural resources. In addition to preserving sites of historic importance, the identification, stabilization and protection of cultural resources would expand recreational and educational opportunities (e.g. sightseeing and interpretive study) within the VPA by preserving cultural sites of recreational interest to visitors. Limiting recreational opportunities in order to minimize cultural resource disturbances would potentially have long-term adverse effects on other recreational opportunities, such as OHV use. Also, specific plans developed for the protection of cultural resources, such as site monitoring, identification, stabilization, and/or restoration plans, would restrict recreational activities in specific areas, in the short-term.

Fire management has the potential to have short-term adverse impacts and long-term beneficial impacts on recreation resources and opportunities within the VPA. Direct short-term, adverse impacts from wildland fire management would cause the closing of developed recreation areas and remote, undeveloped recreation areas in the short-term, producing short-term losses of recreational opportunities in the affected areas. Visual quality, often a component of recreational activities, would be degraded in the short-term as well. In the long-term, by reducing fuel loads, moving the present fire regime toward historic, ecologically sustainable fire conditions, reducing the potential for wildland fire, and creating a visual mosaic of vegetation, wildlife habitat, visual quality would improve; subsequently, recreational opportunities for viewing wildlife and for big game hunting would improve. With these measures, as well as the implementation of emergency stabilization and rehabilitation (ESR) treatments as needed, vegetation communities would be improved, which would provide long-term beneficial impacts by enhancing recreational opportunities and improving scenic quality.

Road and trail construction and maintenance, exchanges or acquisition of lands for the purposes of easing access to public lands and resources and/or contributing to a more efficient and manageable land ownership pattern, would have beneficial impacts on some forms of recreational uses in the long term by improving access to recreation areas and expanding trail-related recreational opportunities (e.g., motorized and non-motorized vehicle use, horseback riding). Acquisition of easements proposed for high-, mid-, and low-priority recreation areas would have a long-term, beneficial effect on the availability and accessibility of recreation areas throughout the VPA. Designation of new motorized trails would serve to increase awareness of the trail system and create an increase in motorized activity in the VPA. This would threaten the integrity of cultural resource and paleontological sites in the vicinity of the trail system, and threaten the recreational and educational values of such sites. Recreational overuse of the trail system would have the potential to damage other natural resource values within areas served by these trails including long-term, adverse impacts to soils, vegetation, riparian areas, and wildlife habitat (and the recreational values that require that these resources remain undisturbed).

Long-term, indirect effects common to the Proposed RMP and all alternatives would include the potential for degradation of recreation resources by off-highway vehicle (OHV) use. This use would also have long-term, indirect adverse effects under all of the alternatives, with varying degrees of adverse resource degradation by the Proposed RMP and each alternative:

- Existing trails would be degraded by OHV overuse.
- Known user conflicts between motorized users and non-motorized users would continue.
- Fewer OHV-designated routes under the Proposed RMP and any alternative would create an increase in cross-country travel, thus increasing the direct, adverse effects of OHV travel.
- OHV use would degrade water resources, soils, riparian areas, and wildlife habitat and, thus, degrade the recreational experiences associated with these resources. Degradation of these resources would intensify with cross-country travel. Resource degradation would be less intense where OHV trails were designated.
- OHV use would increase the risk of wildland fire, which would reduce recreational opportunities in areas affected by fire, or cause closure of areas disturbed by wildland fire.
- Increasing the opportunity for OHV use and fulfilling demand would increase visitation to the area.
- Allowing OHV use in areas where OHV use is not currently allowed would decrease visitation for other forms of recreation, such as mountain biking, hiking, sightseeing, and hunting.

OHV trail designation, under the Proposed RMP and all of the alternatives, would have long-term direct beneficial impacts on recreation by increasing the opportunities for OHV travel, limit resource degradation, and reduce resource use conflicts, and adequately respond to the recreational demand for this particular activity.

The development of mineral resources within the VPA would have direct, adverse impacts on recreational resources in the short- and long-term. Surface disturbances caused by mineral exploration and development, such as the construction of oil and natural gas wells, access roads, pipelines, cross-country seismic exploration; noise; night lighting; and locatable minerals prospects and mines, have the potential to affect vegetation, wildlife, and scenic quality within the VPA and thus, degrade some recreational opportunities within the VPA. However, minerals-related access roads would provide access to portions of the VPA that are currently inaccessible to certain types of recreation uses, such as hunting and OHV use, and this would have long-term beneficial impacts on these recreational activities.

Paleontology management actions to foster public awareness, public appreciation, recreation, and educational opportunities; to encourage recreational collection according to guidelines; and to reduce threats to paleontological resources would have long term, beneficial impacts on recreation, related to the appreciation of and education about paleontology. However, establishment of scientifically significant paleontological sites requiring protection would restrict some forms of recreational opportunities within affected areas. This would have minor adverse impacts on recreation in these restricted areas by reducing recreational opportunities.

Management decisions that provide for a wide range of developed and dispersed recreational activities, while continuing to implement public education and environmental awareness programs to protect and preserve areas within the VPA, would have direct, long-term, beneficial impacts on recreational opportunities and the quality of recreational experiences. Continued management of Pelican Lake and Red Mountain-Dry Fork as SRMAs under the Proposed RMP and all of the alternatives, and continued implementation of management plans to protect historic landmarks within the VPA would allow appropriate recreational use levels while protecting resources, benefiting both traditional and interpretive recreation uses. Comprehensive activity plans for Blue Mountain, Fantasy Canyon, Red Mountain-Dry Fork, and Pelican Lake, which would address appropriate recreational uses and facility development, would have long-term, beneficial impacts on recreation resources by resolving user conflicts and maintaining resource integrity. The BLM would maintain or expand the infrastructure at all recreation sites within the VPA, including (but not limited to) stabilizing and preserving Chipeta, Trujillo, Moonshine, and Rat Hole Cabins; and would ensure the safety of all sites for public use. The following recreational management guidelines, intended to help achieve and maintain healthy public lands as defined by the Standards of Rangeland Health, would have long-term, indirect beneficial impacts on recreation:

- Designating OHV use on BLM-administered lands in order to minimize the impacts on natural resources, would help to reduce conflicts among various users, and would promote public safety. Implementation of a continuous monitoring program and subsequent adaptive management strategies would also reduce indirect impacts of OHV use, such as the degradation of water quality, soil quality, and wildlife habitat.
- Establishing wildlife viewing areas along the Book Cliffs Divide Ridge Road would have a long-term, beneficial effect on recreational wildlife viewing and would potentially increase visitation in the area.
- Designating Special Recreation Management Areas (SRMAs) would protect recreational resources, but also increase awareness of these areas for recreation, and increase

recreational activity in the area. However, there could be adverse impacts if increasing numbers of visitors threaten the integrity of cultural resource and paleontological sites and the recreational and educational value of such sites. Recreational overuse has the potential to adversely impact other resources within these SRMAs.

- Designating some SRMAs as No Surface Occupancy (NSO) areas for oil and gas development and as Closed to mineral leasing would have direct, long-term, beneficial impacts on recreation resources by preserving the natural, undisturbed qualities of these recreation areas. Each SRMA would have a management plan that would specify the limits of mineral resources development.

The designation and management of Areas of Critical Environmental Concern (ACECs) to protect important historic, cultural, scenic, and wildlife values would have long-term beneficial impacts on most recreational activities. Considering OHV use, this designation would limit use to designated routes in certain ACECs, with such use closed in other ACECs. Identification of segments of river corridors considered suitable for designation under the Wild and Scenic River System would beneficially impact these river segments by preserving the recreational opportunities in these areas. All of the proposed ACECs would also remain open to oil and gas leasing, and subject to valid existing mineral leasing rights, which would have long-term adverse impacts on recreational opportunities and the quality of recreational experiences.

Under the Proposed RMP and all of the alternatives, segments of the Upper Green and Lower Green River that have already been recommended to Congress as suitable for designation as part of the Wild and Scenic River System would continue to be managed under their suitability status. These areas would continue to be protected for their outstanding and remarkable values, and free-flowing nature, subject to valid existing mineral rights. This would have long-term beneficial protection-related impacts on recreation, as these river segments would continue to provide recreational opportunities.

#### **4.12.2. PROPOSED RMP AND ALTERNATIVES IMPACTS**

##### **4.12.2.1. IMPACTS OF CULTURAL RESOURCE DECISIONS ON RECREATION**

###### **4.12.2.1.1. PROPOSED RMP**

The development of on- and off-site interpretive facilities at appropriate archaeological and historic sites would broaden the scope of recreation opportunities available to visitors and serve as a draw for additional visitation to the VPA. Off-highway vehicle use in the Uinta Foothills would be limited to designated routes. Off-highway vehicle use in Little/Devils Hole area, Upper Willow Creek areas and Four Mile Wash would be limited to designated routes to protect areas with high densities of cultural sites. These restrictions would have long-term direct, adverse impacts to OHV use by reducing the areas of cross-country travel that OHV users are currently allowed. However, when compared to Alternative D (No Action), the activity restriction described above would have direct, long-term beneficial effects on other recreational opportunities within the VPA by enhancing the opportunities for educational and other recreational activities, and potentially improving the recreational experience of those not participating in motorized (OHV) recreational activities. The OHV restrictions would also

improve visitor safety in those areas where mechanized and non-mechanized users (e.g., hiking, mountain biking, backpacking, and horseback riding potentially mingle, and would reduce resource use conflicts between motorized and non-motorized users.

#### **4.12.2.1.2. ALTERNATIVE A**

Under this alternative, the proposed management decisions would be the same as the Proposed RMP. Therefore, the impacts of cultural resource decisions on recreation would be the same as discussed above.

#### **4.12.2.1.3. ALTERNATIVE B**

The impacts of Alternative B on recreation resources would be similar to the Proposed RMP, and the impacts compared to Alternative D (No Action) for the Uinta Foothills, Little/Devils Hole area, and Upper Willow Creek would be similar to those described under the Proposed RMP. Interpretive facilities would only be developed as mitigation for permitted activities, therefore this alternative would have fewer long-term beneficial impacts than the other action alternatives.

#### **4.12.2.1.4. ALTERNATIVE C**

Under this alternative, the development of interpretive facilities for all appropriate archeological, historical, and cultural resources would have the same effect as described under the Proposed RMP. Closing the Uinta Foothills, Little/Devils Hole area, Four Mile Wash, and Upper Willow Creek area to OHV use would have long-term, adverse effects on OHV recreational opportunities, when compared to Alternative D (No Action). This action would potentially intensify OHV overuse because additional trail development for motorized uses is not a component of Alternative C. The restrictions on OHV use and on oil and gas leasing would have indirect, long-term beneficial impacts to non-motorized recreation by increasing solitude and wildlife viewing opportunities in these areas, when compared to Alternative D (No Action).

#### **4.12.2.1.5. ALTERNATIVE D (NO ACTION)**

This alternative would have no adverse impacts on motorized recreational activities, but a lack of resource protection could have direct, long-term, adverse impacts on these sites and on sightseeing or interpretive/educational activities at these sites. Development of interpretative facilities at Old Rock Saloon and Nine Mile Canyon archeological sites and construction of a facility in Nine Mile Canyon to help manage cultural use in the area would have beneficial effects on recreation by increasing the opportunities for regional cultural interpretation and nature study.

#### **4.12.2.1.6. ALTERNATIVE E**

Under Alternative E, the development of on- and off-site interpretive facilities at archaeological and historic sites would broaden the range of recreation opportunities available to visitors and serve as a draw for additional visitation to the VPA. Closing the Uinta Foothills, Little/Devils Hole area, Four Mile Wash, and Upper Willow Creek area to OHV use would have long-term,

adverse effects on OHV motorized and non-motorized recreational opportunities, when compared to Alternative D (No Action). This action would potentially intensify OHV use in other areas of the VPA because additional trail development for motorized uses is not a component of Alternative E. The restrictions on OHV use and on oil and gas leasing would have indirect, long-term beneficial impacts to non-motorized recreation by increasing solitude and wildlife viewing opportunities in these areas, when compared to Alternative D (No Action).

#### **4.12.2.2. IMPACTS OF FIRE MANAGEMENT DECISIONS ON RECREATION**

##### **4.12.2.2.1. PROPOSED RMP AND ALTERNATIVES A, B, C, AND E**

Permitting prescribed fire on 156,425 acres per decade would limit the number of acres available for recreational activities in a prescribed burn area, during and after burning. These areas would most likely be less desirable for recreation in the short-term until vegetation re-growth occurs. Long-term benefits would result in these areas because of reduced fuel loads, improved wildlife habitat, more diverse landscape variety (scenic quality), and the decreased probability of wildland fire damage to recreation areas, which would enhance opportunities (settings, activities, and experiences) for hunting, wildlife viewing, sightseeing, and similar activities. The Proposed RMP and the action alternatives would have a greater likelihood of adverse short-term impacts and beneficial long-term impacts, when compared to Alternative D (No Action) because of the larger area planned for prescribed burning.

##### **4.12.2.2.2. ALTERNATIVE D (NO ACTION)**

The beneficial and adverse impacts of fire management decisions on recreation under Alternative D (No Action) would be the same as the Proposed RMP and the action alternatives (Alternatives A, B, C, and E) except that the impacts would be reduced in scope and intensity. This is because a total of 50,900 acres would be designated for prescribed burning or other treatments within the VPA as compared to the 156,425 acres/decade designated for prescribed burning under the action alternatives.

#### **4.12.2.3. IMPACTS OF LAND AND REALTY MANAGEMENT DECISIONS ON RECREATION**

##### **4.12.2.3.1. PROPOSED RMP**

Pursuing public access or easements to the White River at the mouth of Cowboy Canyon, Evacuation Creek (from the state line to the creek along the Uintah Railroad bed), Bonanza Ridge and Wagon Hound Road would increase the amount of land accessible for a variety of recreational opportunities, thereby having direct long-term beneficial impacts on recreation resources availability. This alternative would have more beneficial impacts than Alternative D (No Action), which would not specify these areas for public access. The pursued acquisition of Indian Trust Lands in Bitter Creek and near the confluence of the South and Sweetwater Canyons would also have long-term beneficial impacts on recreation by increasing recreational opportunities in these areas. All of these areas would be managed under ERMA or SRMA stipulations, which would have beneficial, protection-related impacts on recreation resources.

Locatable mineral withdrawal or other protective measures that would preclude mineral entry on a total of 24,202 acres including the Green River Scenic Corridor in Browns Park (8,208 acres), along the White River (9,218 acres), in Lears Canyon (1,375 acres), in developed and potential recreation sites (5,000 acres), and the Book Cliffs Natural Area (401 acres) would have long-term beneficial impacts on recreation by protecting natural features and scenic quality in these areas. Compared to Alternative D (No Action), the Proposed RMP would have more beneficial impacts in some areas: Alternative D (No Action) would not preclude mineral entry along the White River and within the Book Cliffs Natural Area; however, Alternative D (No Action) would be more beneficial if total acreage is considered, as Alternative D (No Action) would propose withdrawal of 35,900 acres compared to 24,202 under the Proposed RMP.

Retention of public lands in federal ownership in the 106,178 acres of non-WSA lands with wilderness characteristics managed under this alternative would ensure protection of non-WSA wilderness characteristics values and the setting needed to support non-mechanized, primitive forms of recreation, including hiking, backpacking, horseback riding, wildlife observation, and river floating. Excluding non-WSA lands with wilderness characteristics from the issuance of new rights-of-way (ROWs) would beneficially retain the undeveloped character of these landscapes and the primitive forms of recreation dependent on those settings. The exclusion of ROWs, however, would potentially limit (and adversely impact) mechanized recreational opportunities (i.e., motorized OHV use, mountain biking) commonly available along the access roads to and within the ROWs by limiting the opportunities for these forms of recreation.

#### **4.12.2.3.2. ALTERNATIVE A**

The impacts of proposed pursuance of public access would be the same as discussed above under the Proposed RMP except that the easement from Evacuation Creek (from the state line to the creek along the Uintah Railroad bed) would not be pursued.

Locatable mineral withdrawal or other protective measures that would preclude mineral entry in the Green River Scenic Corridor in Browns Park, the White River, Lears Canyon, the Book Cliffs Natural Area, and developed and potential recreation sites would have long-term beneficial impacts on recreation as discussed above under the Proposed RMP because the management decisions would be the same.

#### **4.12.2.3.3. ALTERNATIVE B**

Administrative access only would be pursued across Indian trust lands in Bitter Creek, and South and Sweetwater Canyons, but recreation-related public access would not be pursued for any area under Alternative B. The impact on recreational opportunities would be the same as Alternative D (No Action).

Locatable mineral withdrawal impacts would be the same as those described under the Proposed RMP.

**4.12.2.3.4. ALTERNATIVE C**

The impacts of pursuing public access through easements and acquisitions under Alternative C would be the same as those described under the Proposed RMP alternative because the management decisions would be the same.

Under this alternative, locatable mineral withdrawal management decisions to preclude mineral entry would be the same as those described under the Proposed RMP, except that the 5,000 acres of developed and potential recreation sites would not be considered for withdrawal and an additional 17,063 acres would be proposed for withdrawal within the Lower Green River ACEC. This would increase the beneficial, protection-related impacts on recreation resources to 41,265 acres. Compared to Alternative D (No Action), this alternative would be more beneficial in the long term because more acreage would be proposed for recreation resource protection.

**4.12.2.3.5. ALTERNATIVE D (NO ACTION)**

The pursuit of public access would be unspecified under Alternative D (No Action). Therefore current management would not improve recreational access or opportunities. Mineral withdrawal would occur on 19,400 acres along the Green River Scenic Corridor in Browns Park, on 3,600 acres of relict vegetation, 7,900 acres within the Lower Green River ACEC, and 5,000 acres of developed and potential recreation sites, totaling 35,900 acres. This would have beneficial preservation-related impacts on recreation resources.

**4.12.2.3.6. ALTERNATIVE E**

Securing public access to White River and in Evacuation Creek would provide additional opportunities for mechanized, and primitive non-mechanized recreational activities, as would acquiring Indian Trust Lands in Bitter Creek and at the confluence of South and Sweet Water Canyons. Pursuing mineral withdrawals (on the same number of acres as Alternative A) in the Green River Scenic Corridor (Browns Park), the White River, Lears Canyon, and the Book Cliffs Natural Area would reduce the potential for surface disturbances and maintain the settings needed to support opportunities for non-mechanized forms of recreation (e.g., hiking, backpacking, river floating, wildlife viewing, and hunting).

Retention of public lands in federal ownership in 277,596 acres of non-WSA lands with wilderness characteristics would ensure protection of wilderness values and the settings needed to support the non-mechanized recreational opportunities discussed above. The exclusion of non-WSA lands with wilderness characteristics from the issuance of new rights-of-way (ROWs) would retain the undeveloped character of these landscapes and the primitive forms of recreation dependent on those settings. Exclusion of ROWs, however, would not provide additional mechanized recreational opportunities commonly available along the access roads to and within the ROWs.

Compared to Alternative D (No Action), Alternative E would have more beneficial impacts on non-mechanized recreation by providing opportunities for these types of activities. The impacts

on mechanized (motorized and non-motorized OHV activities) would be more adverse than Alternative D (No Action) because 277,596 acres would be managed as ROW exclusion areas.

#### 4.12.2.4. IMPACTS OF MINERALS DECISIONS ON RECREATION

As discussed above under subsection 4.10.1 Impacts Common to All Alternatives, minerals-related exploration, development, access road, and infrastructure construction on BLM administered land within the VPA would create surface disturbances, noise, and light pollution that would adversely and beneficially affect recreation resources in the long-term. The proposed acreages available for minerals leasing are tabulated below in Table 4.12.1.

**Table 4.12.1. Mineral Leasing Acreages**

	<b>Proposed RMP</b>	<b>Alternative A</b>	<b>Alternative B</b>	<b>Alternative C</b>	<b>Alternative D (No Action)</b>	<b>Alternative E</b>
Oil and Gas – Standard Stipulations, Timing and Controlled Surface Use	1,640,381	1,780,860	1,819,397	1,627,085	1,536,030	1,499,641
Mineral Materials, Open	389,788	415,395	432,953	388,699	387,700	344,682
Phosphate, Open	76,208	87,724	87,724	63,571	84,600	52,063
Gilsonite (miles/acres)	172 / 36,846	172 / 36,846	172 / 36,846	172 / 36,846	168 / 36,009	163 / 34,967

##### 4.12.2.4.1. PROPOSED RMP

The Proposed RMP would allow minerals development (including oil, gas, mineral materials, and phosphate) with Open, Standard Stipulations, or Timing and Controlled Surface Use on 2,143,223 acres of BLM administered lands within the VPA. Under the Proposed RMP, 106,178 acres of non-WSA lands with wilderness characteristics would be closed to leasing for oil, gas, mineral materials, and phosphate and Gilsonite. Compared to Alternative D (No Action), the Proposed RMP would allow 27,022 more acres of BLM land potentially open to minerals development. The estimated total short-term and long-term surface disturbance would be 8,796 acres (for oil and gas development). As described in subsection 4.10.1, the leasing of areas for oil, gas, CBNG, and other mineral uses would have direct long-term adverse impacts on most recreational opportunities by potentially degrading the natural characteristics of the landscape, and degrading scenic quality and wildlife habitat. Off-highway vehicle access would improve in areas where new minerals-related access and spur roads were built, thus having indirect long-term beneficial impacts on this type of recreational activity by creating more opportunities for OHV recreational travel.

Closure to mineral leasing of 106,178 acres of non-WSA lands with wilderness characteristics under this alternative would place recreational emphasis on opportunities for primitive and unconfined activities (e.g., hiking, backpacking, river floating, hunting, wildlife viewing, and nature study) and opportunities for solitude, as well as the undeveloped settings needed to

support these non-motorized activities and experiences. Opportunities for motorized forms of recreation activities such as backcountry driving and vehicle-supported camping at developed recreation sites such as campgrounds, picnic areas, and interpretive exhibits would be reduced with OHV vehicle travel restricted to designated routes. In those portions of the VPA where mineral leasing continues, exploration and development would contribute to an expanded road system for motorized forms of recreation (e.g., backcountry driving, vehicle-supported camping, and hunting). Proposed withdrawals from mineral entry in non-WSA lands with wilderness characteristics would prevent mining-related disturbances that impact opportunities for primitive forms of recreation, the undeveloped settings needed to support those activities, and the experience people seek while participating in those activities. In those areas open to mineral entry, future exploration and development would likely provide additional recreational opportunities for motorized forms of recreation.

Compared to Alternative D (No Action), the Proposed RMP would have more beneficial impacts on recreation resources and opportunities. This is because, though potentially more area would be available for surface disturbance leasing, the proposed non-WSA lands with wilderness characteristics would have prohibitions on minerals disturbances and would provide recreational opportunities for non-mechanized and mechanized activities.

#### **4.12.2.4.2. ALTERNATIVE A**

Alternative A would allow minerals development (including oil, gas, mineral materials, and phosphate) with Open, Standard Stipulations, or Timing and Controlled Surface Use on approximately 2,320,825 acres of BLM administered lands within the VPA. Compared to Alternative D (No Action), Alternative A would allow 204,624 more acres of BLM land potentially open to minerals development. The estimated total short-term and long-term surface disturbance would be 8,760 acres (for oil and gas development). As described in Section 4.10.1, the leasing of areas for oil, gas, natural gas CBNG, and other mineral uses would have direct long-term adverse impacts on most recreational opportunities by degrading the natural characteristics of the landscape, and degrading scenic quality and wildlife habitat. Off-highway vehicle access would improve in areas where new minerals-related access and spur roads were built, thus having indirect long-term beneficial impacts on this type of recreational activity by providing more opportunities for OHV use.

Compared to Alternative D (No Action), Alternative A would have impacts on recreation resources and opportunities as described above under the Proposed RMP.

#### **4.12.2.4.3. ALTERNATIVE B**

Alternative B would allow mineral development with Open, Standard Stipulations or Timing and Controlled Surface Use on approximately 2,340,112 acres of BLM administered lands within the VPA. Compared to Alternative D (No Action), Alternative B would allow 332,581 more acres of BLM land open to minerals development. The estimated acres of short-term and long-term surface disturbance under this alternative would be 8,909 (for oil and gas development). The impacts would be similar to those discussed under the Proposed RMP, but to a greater degree, because more area within the VPA would be open to minerals disturbances.

**4.12.2.4.4. ALTERNATIVE C**

Alternative C would have fewer adverse impacts to recreation than any of the other alternatives, as it would designate the fewest acres to minerals leasing and development. Alternative C would allow mineral development with Open, Standard Stipulations or Timing and Controlled Surface Use on approximately 2,116,201 acres of BLM administered land within the VPA. The estimated total short-term and long-term surface disturbance would be 8,728 acres (for oil and gas development). Compared to Alternative D (No Action), Alternative C would allow 71,862 acres more of BLM lands to be open to minerals development. The impacts would be similar to Alternative A, but to a lesser degree.

**4.12.2.4.5. ALTERNATIVE D (NO ACTION)**

Under Alternative D (No Action), the estimated minerals-related surface disturbance, both short-term and long-term, would be 8,371 acres (for oil and gas development), with a total area open to mineral development of 2,044,339 acres. The scope and type of impacts to recreation would be similar to the impacts described under Impacts Common to All Alternatives (Section 4.12.1).

**4.12.2.4.6. ALTERNATIVE E**

Under this alternative, non-WSA lands with wilderness characteristics would be closed to leasing for oil, gas, mineral materials, phosphate and Gilsonite. This alternative would allow leasing for oil, gas, phosphate, and mineral materials on 1,931,353 acres. For oil and gas development only, this represents a reduction of 112,986 acres in the total acreage available for leasing when compared to Alternative D (No Action). Thus, Alternative E would have the smallest area open to oil and gas development of all of the alternatives, with impacts to recreation resources and opportunities similar to those discussed under the Proposed RMP but to a lesser degree.

Closure to mineral leasing of non-WSA lands with wilderness characteristics would place recreation emphasis on opportunities for primitive and unconfined activities (as discussed above under the Proposed RMP) and opportunities for solitude, as well as the undeveloped settings needed to support these non-motorized activities and experiences. Opportunities for motorized and/or mechanized forms of recreation activities would be reduced with the closure of 228 miles of vehicle routes and restrictions on recreation developments in the non-WSA lands with wilderness characteristics. In those portions of the VPA where mineral leasing is permitted, exploration and development would beneficially contribute to an expanded road system (and increased recreational opportunities) for motorized forms of recreation (e.g., backcountry driving, vehicle-supported camping, and hunting).

Under Alternative E, proposed withdrawals from mineral entry in non-WSA lands with wilderness characteristics would prevent mining-related disturbances that would impact opportunities for primitive forms of recreation, the undeveloped settings needed to support those activities, and the experience people seek while participating in those activities. In those areas open to mineral entry, future exploration and development would likely (and beneficially) create the opportunities for motorized and mechanized forms of recreation.

In comparing this alternative to Alternative D (No Action), Alternative E would have more beneficial impacts on non-mechanized recreation and fewer beneficial impacts on mechanized recreation. This is because, as discussed above, the non-WSA lands with wilderness characteristics would be closed to mechanized use (motorized and non-motorized OHV use), but available for non-mechanized recreational activities that do not degrade wilderness values.

#### **4.12.2.5. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON RECREATION**

##### **4.12.2.5.1. PROPOSED RMP**

Under the Proposed RMP, 106,178 acres would be managed to protect non-WSA wilderness characteristics that include naturalness, solitude, and opportunities for primitive, remote, backcountry recreation (e.g., hiking, backpacking, river floating, hunting, wildlife viewing). Opportunities for motorized and non-motorized OHV use on designated routes would also be available. This would have long term, beneficial impacts on both non-mechanized and mechanized recreational activities because opportunities for a range of recreation resource users would be available within the proposed non-WSA wilderness characteristics areas. Compared to Alternative D (No Action), the Proposed RMP would have the same impacts because these recreational opportunities would be provided outside non-WSA lands with wilderness characteristics.

##### **4.12.2.5.2. ALTERNATIVES A, B, C, AND D**

Under these alternatives, no actions would be prescribed to specifically protect the wilderness characteristics of non-WSA lands with wilderness characteristics, and therefore there would be no direct impacts to recreation opportunities.

##### **4.12.2.5.3. ALTERNATIVE E**

Under Alternative E, 277,596 acres in 25 areas would be managed to protect wilderness characteristics of size, naturalness, opportunities for solitude, and opportunities for primitive forms of recreation. As discussed under the Proposed RMP alternative, this form of management would provide opportunities for primitive forms of recreation (e.g., hiking, backpacking, river floating, hunting, wildlife viewing, and nature study) and experiences of solitude in natural, undeveloped settings. Under this alternative, opportunities for motorized recreation (e.g., backcountry driving and OHV use) and developed facilities (e.g., campgrounds, picnic areas, and interpretive and wayside exhibits) would not be provided in these areas because OHV travel routes would not be allowed. Compared to Alternative A, this alternative would have more beneficial long-term impacts on non-mechanized forms of recreation because management of these areas would be more compatible with primitive, remote, and backcountry opportunities. As this alternative would not allow OHV use, the impacts on mechanized forms of recreation would be less beneficial than Alternative D (No Action); however opportunities would be provided outside non-WSA lands with wilderness characteristics.

#### **4.12.2.6. IMPACTS OF PALEONTOLOGY DECISIONS ON RECREATION**

##### **4.12.2.6.1. PROPOSED RMP**

The Proposed RMP would provide information on paleontology, local paleontological sites, amateur fossil collecting, and fossil collection rules to the public via websites, publications, and personal contacts. Management decisions would allow the collection of common invertebrate and plant fossils for personal, non-commercial use; issue Paleontological Resources Use Permits for scientific study; and promote or support paleontological investigations in poorly known areas. These management decisions would enhance and beneficially impact paleontology-related recreational opportunities within the VPA by improving information access on known fossil sites for collectors. Under the Proposed RMP, fossil excavations would be limited within the proposed 106,178 acres of non-WSA lands with wilderness characteristics to those actions that meet the goals and objectives for management of the non-WSA lands with wilderness characteristics. Limitations on excavations in non-WSA lands with wilderness characteristics would limit the growth (number of sites) of these potential recreation opportunities.

Compared to Alternative D (No Action), the increase in recreational opportunity (and activity) under the Proposed RMP would be more beneficial to recreation resources because opportunities for allowed fossil collecting would be improved.

##### **4.12.2.6.2. ALTERNATIVES A AND C**

By providing information on paleontology, local paleontological sites, amateur fossil collecting, and fossil collection rules to the public via websites, publications, and personal contacts; allowing collection of common invertebrate and plant fossils for personal, non-commercial use; issuing Paleontological Resources Use Permits for scientific study; and promoting or supporting paleontological investigations in poorly known areas, Alternatives A and C would increase and beneficially impact the recreational opportunities related to paleontology similar to those discussed above under the Proposed RMP. Compared to Alternative D (No Action), the increase in recreational opportunity (and activity) under these alternatives would be more beneficial to recreation resources for the same reasons as discussed under the Proposed RMP.

##### **4.12.2.6.3. ALTERNATIVES B AND D (NO ACTION)**

These alternatives would have negligible impacts on recreation due to the lack of any specific improvements supporting the scientific study and dissemination of paleontological information.

##### **4.12.2.6.4. ALTERNATIVE E**

Under Alternative E, the following activities would increase and provide additional, long-term recreational opportunities related to paleontology: providing information on paleontology, local sites, fossil collecting, and the rules of fossil collecting to the public via websites, publications, and personal contacts; allowing collection of common invertebrate and plant fossils for personal, non-commercial use; issuing Paleontological Resources Use Permits for scientific study; and promoting or supporting paleontological investigations in poorly known areas. The increased

recreational opportunity provided under Alternative E would be more beneficial than that provided under Alternative D (No Action). Fossil excavations would be limited in non-WSA lands with wilderness characteristics to those actions that meet the goals and objectives for management of the non-WSA lands with wilderness characteristics. Limitations on excavations in non-WSA lands with wilderness characteristics would limit the growth (number of sites) of these potential recreation opportunities.

#### **4.12.2.7. IMPACTS OF RECREATION DECISIONS ON RECREATION**

Impacts to recreation from recreation decisions are analyzed through alternative comparisons of Backcountry Byways, Special Recreation Management Areas (SRMAs), trails, mitigation of noise and light, and recreational cabin development.

##### **4.12.2.7.1. PROPOSED RMP**

Recreation management decisions under the Proposed RMP would provide for a range of recreational opportunities within the VPA. A number of existing recreation opportunities would be expanded and improved under this alternative, whereas other opportunities would be limited. New recreation activities would also be established that would expand the range of recreational opportunities. The effects of these changes on existing resources and activities in both the short-term and long-term are discussed below.

##### **4.12.2.7.1.1. Backcountry Byways**

The designation of the Seep Ridge, Book Cliff Divide, and Atchee Ridge Roads as BLM Backcountry Byways under Alternative A would have long-term beneficial impacts on recreation by educating the public about recreational opportunities for backcountry sightseeing and scenic driving. The designation of roads as Utah State Highway Scenic Backcountry Byways would increase awareness of the scenic opportunities associated with these byways, which would increase traffic volume and encourage recreational visitation to the region. These designations would have greater beneficial impacts on recreation resources when compared to Alternative D (No Action), which would not designate Backcountry Byways.

Designation of Backcountry Byways would have long-term, indirect, adverse impacts on air-quality, in the form of increased fugitive dust caused by vehicle traffic. More vehicle traffic would also adversely increase the potential risk of wildland fire and increase the potential for vehicle/wildlife collisions. Designating Backcountry Byways would increase the potential for automobile conflicts with livestock and with minerals resource-related traffic. As increasing numbers of visitors enter more remote areas of the VPA some travelers could experience a reduction in the expectation of semi-primitive, isolated conditions, with some loss of this recreational opportunity.

##### **4.12.2.7.1.2. SRMAs**

The designation of SRMAs on BLM administered land within the VPA would provide recreational opportunities for experiencing outstanding scenic vistas, and enhance recreation-

related resources (e.g., riparian areas, fisheries, special status species, water quality) and associated activities (e.g., water-based recreation; hunting; a comprehensive trail system offering opportunities for hiking, biking, horse riding, and OHV use; camping; and facilities offering cultural and historical resource learning opportunities). The Proposed RMP would beneficially increase the combined acreage of SRMAs from 87,931 acres under current management to 133,560 acres. Each of the SRMAs would manage for the type and range of recreational activities and opportunities that lie within a given SRMA: the proposed Blue Mountain SRMA (42,729 acres) would be managed for OHV use, special recreational activities (e.g., hang gliding, rock climbing), and competitive events; Nine Mile SRMA (44,168 acres) would be managed to protect high-value cultural values and scenic quality. Browns Park SRMA (18,490 acres) would offer a wide variety of land and water opportunities, whereas the White River SRMA (2,831 acres) and Pelican Lake SRMA (1,014 acres) would offer water-based recreational opportunities, in addition to other recreational opportunities. Red Mountain-Dry Fork SRMA (24,259 acres) would continue to provide opportunities for OHV and non-motorized trail activities. The proposed Fantasy Canyon SRMA (69 acres) would offer opportunities for self-guided touring and hiking. In comparison, there would be no expansion of existing SRMAs or proposed new SRMA designations under Alternative D (No Action); thus, the Proposed RMP would have more beneficial impacts on recreational than Alternative D (No Action) because more area within the VPA would be managed under SRMAs to provide recreational opportunities.

Under the Proposed RMP, 106,178 acres of non-WSA lands with wilderness characteristics would shift the focus of recreation to primitive and unconfined activities (e.g., hiking, backpacking, river floating, hunting, and wildlife viewing), opportunities for solitude, and the settings needed to achieve these opportunities. Proposed management stipulations for non-WSA lands with wilderness characteristics would limit OHV use to designated routes, which would adversely reduce the recreational opportunities for motorized and mechanized recreation within these areas.

#### **4.12.2.7.1.3. Trails**

Signing and/or improvement of existing trails and the development of new hiking, horseback and mechanized/non-motorized (i.e., mountain biking) trails would increase the total miles of hiking trails to 400 miles, compared to 55 miles under Alternative D (No Action). The increased number of trail miles would also reduce user densities on the trails, potentially alleviating user conflicts and improving individual users' experiences. Increased development of trails could cause increased adverse impacts to cultural and paleontological sites (and impacts to the recreational and educational value of such sites), and the ensuing increase in human activity would increase the potential for wildland fire (which would cause temporary closures of recreational areas or diminish the scenic quality in recreational areas). Because new areas for mountain biking are currently being sought, increasing non-motorized trails would beneficially impact recreation in the VPA by acting as an attraction to mountain bikers seeking new opportunities outside of existing, and often overcrowded, areas elsewhere in the state.

The improvement/development/signing of 800 miles of motorized trails represents a direct, long-term beneficial impact relative to current conditions under Alternative D (No Action) for OHV use (under Alternative D, No Action, the development of new motorized trails is unspecified).

Currently, the Red Mountain Trail is the only designated motorized trail. The additional number of trail miles would reduce the density of OHV users, increase user safety, and reduce user conflicts. The designation would also alleviate strains on trails currently used for a variety of recreational activities and would potentially reduce overland OHV use.

Prohibiting the use of OHVs for big game retrieval off designated OHV routes would minimize the amount of overland travel by OHV users, thereby minimizing surface disturbances caused by this activity. The ban would have a direct beneficial impact on recreation resources by preserving vegetation, habitat, waterways, and scenic quality within the VPA.

#### **4.12.2.7.1.4. Mitigation of Noise and Light**

The BLM would work in conjunction with the National Park Service and the energy industry to mitigate noise and light pollution adjacent to Dinosaur National Monument. Currently, there are no mitigation procedures in place. Mitigation would have long-term beneficial effects on recreation by limiting noise and light pollution, with corresponding enhancements in the visitor experience.

#### **4.12.2.7.1.5. Cabins**

Proposed would increase the total number of cabins (there are currently five), based on an assessment of needs. Cabins would be constructed near the existing Chipeta, Trujillo, Moonshine, Rat Hole and Wolf Den cabins and at West Water Point, Dick Canyon, and other locations. Increasing the number of cabins would have a long-term, beneficial effect on recreation opportunities, potentially enhancing hunting, mountain biking, hiking, equestrian, and OHV experiences. Increased visitation with longer periods of use extended into historically less-active seasons could adversely affect wildlife and thus, the recreational activity of wildlife viewing, particularly if the activity is extended into crucial wildlife winter ranges.

#### **4.12.2.7.2. ALTERNATIVE A**

##### **4.12.2.7.2.1. Back Country Byways**

The designation of the Seep Ridge, Book Cliff Divide, and Atchee Ridge Roads as BLM Backcountry Byways under Alternative A would have the same long-term beneficial impacts on recreation as discussed under the Proposed RMP because the management decisions are the same.

##### **4.12.2.7.2.2. SRMAs**

Alternative A would beneficially increase the combined acreage of SRMAs from 87,960 acres under current management to 499,588 acres, an increase of 568% when compared to Alternative D (No Action). The increase of 411,660 SRMA-managed acres within the VPA would be the result of expand the existing Browns Park and Nine Mile SRMAs by 71,233 acres (the 24,259-acre Red Mountain-Dry Fork SRMA would remain the same size), with the remaining acreage encompassing the proposed White River, Blue Mountain and Book Cliffs SRMAs. Special

Recreation Management Area-designated acreage would comprise 29% of the 1,725,512 acres of BLM administered lands within the VPA. Each of the five SRMAs would manage for a range of recreational opportunities and activities: Nine Mile SRMA (81,168 acres) would be managed to protect high-value cultural values and scenic quality; Browns Park SRMA (52,720 acres), White River SRMA (24,183 acres) and Pelican Lake SRMA (1,014 acres) would offer water-based recreational opportunities. The western portion of the White River SRMA would be managed under No Surface Occupancy (NSO) stipulations, thus beneficially protecting the area from minerals development and surface disturbances.

The Blue Mountain SRMA (42,758 acres) would also offer a beneficially broad range of recreational opportunities with an emphasis on activities such as hang gliding, hunting, equestrian use, camping, hiking, and rock climbing. Designating 273,486 acres in the Book Cliffs as an SRMA would have long-term beneficial impacts on recreational resources. The SRMA would offer opportunities for unconfined, dispersed, and primitive recreational activities. It should be noted that the Book Cliffs is currently leased for mineral development on approximately 90% of the area proposed as an SRMA, and this existing condition would have long-term adverse impacts on recreational opportunities in the SRMA.

Establishing a comprehensive integrated activity level plan for the 69-acre Fantasy Canyon area would have beneficial protection-related impacts on the area by increase protection of the unique geological formations in the area, and address health and safety considerations. An activity plan would help reduce conflicts between users in Fantasy Canyon, which would have beneficial impacts on recreation resources.

In comparison to Alternative D (No Action), this alternative would have more beneficial impacts on recreational opportunities because more area would be managed under SRMAs to protect recreation resources and provide opportunities for a range of recreational activities.

#### **4.12.2.7.2.3. Trails**

Signing and/or improvement of existing trails and the development of new hiking, horseback and mechanized/non-motorized (mountain biking) trails would increase the total miles of hiking trails to 400 miles, a total increase of 727% when compared to Alternative D (No Action). The increased number of trail miles would also reduce user densities on the trails, potentially alleviating user conflicts and improving individual users' experiences. Increased development of trails could cause increased adverse impacts to cultural and paleontological sites (and impacts to the recreational and educational value of such sites), and the ensuing increase in human activity would increase the potential for wildland fire (which would cause temporary closures of recreational areas or diminish the scenic quality in recreational areas). Because new areas for mountain biking are currently being sought, increasing non-motorized trails would beneficially impact recreation in the VPA by acting as an attraction to mountain bikers seeking new opportunities outside of existing, and often overcrowded, areas elsewhere in the state.

The improvement/development/signing of 800 miles of motorized trails represents a direct, long-term beneficial impact relative to current conditions under Alternative D (No Action) for OHV use. Currently, the Red Mountain Trail is the only designated motorized OHV trail. The

additional number of trail miles would reduce the density of OHV users, increase user safety, and reduce user conflicts. The designation would also alleviate strains on trails currently used for a variety of recreational activities and would potentially reduce overland OHV use.

Prohibiting the use of OHVs for big game retrieval off designated routes would minimize the level of overland travel by OHV users, thereby minimizing surface disturbances caused by this activity. The ban would have a direct beneficial impact on recreation resources by preserving vegetation, habitat, waterways, and scenic quality within the VPA.

The reduction of OHV use in Browns Park would have beneficial protection-related impacts on vegetation, riparian areas, water and soil quality, and wildlife habitat and, thus, would help maintain those resource values important to many other recreationists.

#### **4.12.2.7.2.4. Mitigation of Light and Noise**

Under this alternative, mitigation would be applied (in cooperation with the NPS) to reduce light pollution and sound impacts adjacent to Dinosaur National Monument, which would be beneficial in the short term and long term to recreation users in and adjacent to the Monument.

#### **4.12.2.7.2.5. Cabins**

Alternative A would increase the total number of cabins (there are currently five), based on an assessment of needs. Cabins would be constructed near the existing Chipeta, Trujillo, Moonshine, Rat Hole and Wolf Den cabins and at West Water Point, Dick Canyon, and other locations. Increasing the number of cabins would have a long-term, beneficial effect on recreation opportunities, potentially enhancing hunting, mountain biking, hiking, equestrian, and OHV experiences. Increased visitation with longer periods of use extended into historically less-active seasons could adversely affect wildlife and thus, the recreational activity of wildlife viewing, particularly if the activity is extended into crucial wildlife winter ranges.

#### **4.12.2.7.3. ALTERNATIVE B**

##### **4.12.2.7.3.1. Backcountry Byways**

The impacts would be the same as discussed under the Proposed RMP because the management decisions are the same.

##### **4.12.2.7.3.2. SRMAs**

Management of SRMAs would be the same as Alternative D (No Action). The following existing SRMAs (totaling 86,454 acres or 5% of the BLM-administered VPA) would continue to be managed for their scenic, cultural, wildlife, and/or recreation values:

- Browns Park: continued management of 17,000 acres
- Red Mountain-Dry Fork: continued management of 24,259 acres

- Nine Mile Canyon: continued management of 44,181 acres
- Pelican Lake: continued management of 1,014 acres

The remaining land within the VPA would be managed under ERMA guidelines. With 5% of the BLM-administered area of the VPA managed as SRMAs, the educational and recreational opportunities within the VPA would remain relatively undeveloped. Accessibility and availability of facilities would be difficult and safety would be an issue. As the majority of the land within the VPA would be managed without recreation resources protection, mineral exploration and development, and OHV use would have adverse impacts on non-motorized and non-mechanized recreational resources and opportunities within the VPA. This would maintain resource protection and management at current levels (the same management as Alternative D, No Action).

#### **4.12.2.7.3.3. Trails**

No hiking, horseback riding, or mountain biking (non-motorized/mechanized) trails would be developed under this alternative. However, 800 miles of motorized trails would be improved or developed, with impacts similar to those described under the Proposed RMP. Under this alternative, OHV use for big game retrieval would be allowed, with long term and short term, adverse impacts to soils, vegetation, and scenic quality from off-route surface disturbances.

#### **4.12.2.7.3.4. Mitigation of Noise and Light**

The impacts would be the same as discussed under Alternative A because the management decisions are the same.

#### **4.12.2.7.3.5. Cabins**

The impacts would be the same as discussed under the Proposed RMP because the management actions are the same.

### **4.12.2.7.4. ALTERNATIVE C**

#### **4.12.2.7.4.1. Backcountry Byways**

No Back Country Byways would be designated under this alternative (the same as Alternative D). The management decision to not designate the Seep Ridge, Book Cliff Divide, and Atchee Ridge Routes as Back Country Byways would adversely limit recreational scenic driving opportunities within the VPA.

#### **4.12.2.7.4.2. SRMAs**

SRMA designations and impacts would be the same as discussed under Alternative A for Blue Mountain, the Book Cliffs, Pelican Lake, Nine Mile Canyon, Browns Park, and Red Mountain-Dry Fork. The 69-acre Fantasy Canyon SRMA and 47,130-acre White River SRMA would be

proposed under this alternative. Proposed SRMA designations would have greater direct, long-term beneficial impacts on recreation, when compared to Alternative D (No Action) because more area would be managed to provide recreational opportunities and protect recreation resources. This alternative would manage a total of 522,604 acres as SRMAs compared to 86,454 acres under Alternative D, an increase of 594% when compared to Alternative D (No Action).

#### **4.12.2.7.4.3. Trails**

Trails for hiking, horseback riding, and mechanized (non-motorized) recreation would be developed under this alternative with the same management actions and impacts as discussed under the Proposed RMP. Alternative C would not develop or improve motorized trails, which would be the same management decisions as Alternative D (No Action). By not developing and improving motorized trails, the opportunities for those participating in OHV recreation would be adversely limited. Red Mountain Trail is the only trail currently managed and maintained for motorized use, and the lack of established trails could produce an increase in cross-country travel, thereby increasing the adverse impacts to vegetation, soil and water, wildlife habitat, and scenic quality within the VPA. Without further management or designation of OHV trails, cross-country travel, recreation resource user conflicts, user densities, and safety would remain as OHV-related adverse impacts within the VPA. These adverse impacts would likely intensify in the long term as OHV use increases within the VPA.

Limiting OHV recreation would also have a long-term, beneficial effect on soils, vegetation, riparian health, and wildlife habitat (and the recreational experiences that require that these resources remain undisturbed) by reducing surface-disturbing impacts to resources. Reducing the opportunity for motorized OHV use would also have long-term beneficial impacts on other forms of recreation, such as non-motorized use (e.g., hiking, backpacking, mountain biking, dispersed camping), by decreasing user conflicts on trails. See Section 4.12.2.8 for a further analysis of OHV management decisions and impacts.

#### **4.12.2.7.4.4. Noise and Light Mitigation**

Noise and light near Dinosaur National Park would be mitigated to levels similar to those described under the Proposed RMP with the same impacts.

#### **4.12.2.7.4.5. Cabins**

Under Alternative C no new cabins would be developed, thus having the same impacts as Alternative D (No Action).

#### **4.12.2.7.5. ALTERNATIVE D (NO ACTION)**

##### **4.12.2.7.5.1. Back Country Byways**

The designation of Back Country Byways are unspecified for this alternative.

#### **4.12.2.7.5.2. SRMAs**

Special Recreation Management Areas, activity plans, and non-motorized trail management would be managed as described for Alternative B, with the impacts to recreation as discussed under that alternative.

#### **4.12.2.7.5.3. Trails**

Additional motorized trails would not be developed, with impacts similar to those described under Alternative C, but the existing Red Mountain Trail would continue to be managed under current conditions for motorized OHV use, with impacts as described under Alternative C. Alternative D (No Action) would add 55 miles of non-motorized hiking and/or horseback trails along the Green River, in the Dry Fork, Ashley Creek, Beaver Creek, Willow Creek, Nine Mile areas, and in other places within the VPA. It would add 2 miles of mountain bicycle trails along existing rural roads and trails as well as a non-motorized trail in Sears Canyon. The addition of 55 miles of hiking and horse trails and 2 miles of mountain bike trails would have long-term beneficial impacts on recreation, and the recreational opportunities would be enhanced. However, the trail lengths would be limited, potentially creating direct long-term adverse impacts related to user-density, safety, and resource-use conflicts.

#### **4.12.2.7.5.4. Noise and Light Mitigation**

Under Alternative D (No Action), management of potential noise and light pollution adjacent to Dinosaur Nation Monument is currently unspecified. Minerals development operations (drilling well pads, infrastructure construction and operation, and lighting of these structures) would continue to adversely affect recreation settings and experiences. Based on the reasonably foreseeable development of fluid minerals within the VPA, it is likely that these impacts would intensify in the long term with increasingly adverse impacts to recreation opportunities and experiences adjacent to the Monument.

#### **4.12.2.7.5.5. Cabins**

Under this alternative, management for the construction and operation of additional cabins at or near existing cabins within the VPA is unspecified. Under the current RMP, it is unlikely that there would be beneficial impacts on recreational opportunities nor would there be the likelihood of adverse impacts to wildlife from an additional human presence in or near existing areas with cabins.

#### **4.12.2.7.6. ALTERNATIVE E**

##### **4.12.2.7.6.1. Backcountry Byways**

No backcountry byways would be designated under this alternative, providing no added backcountry driving or OHV opportunities.

**4.12.2.7.6.2. SRMAs**

Eight SRMAs (Book Cliffs, Nine Mile, White River, Fantasy Canyon, Pelican Lake, Blue Mountain, Red Mountain-Dry Fork, and Browns Park) would be designated under Alternative E (with the same impacts and acreages as discussed under Alternative C), focusing recreation management on a variety of opportunities. However, management of 277,596 acres of non-WSA lands with wilderness characteristics to protect their wilderness characteristics would shift the focus of recreation to primitive and unconfined activities (e.g., hiking, backpacking, river floating, hunting, and wildlife viewing), opportunities for solitude, and the settings needed to achieve these opportunities. Within the Blue Mountain, Book Cliffs, Browns Park, Nine Mile, and White River SRMAs, there are one or more areas considered to be non-WSA lands with wilderness characteristics; the protection of these areas' wilderness characteristics would enhance opportunities for primitive recreation (see Table 4.12.2 below).

**Table 4.12.2. Non-WSA Lands with Wilderness characteristics in SRMAs —Alternative E**

<b>SRMA (acres)</b>	<b>Non-WSA Lands with Wilderness Characteristics</b>	<b>Non-WSA Lands with Wilderness Characteristics in SRMA (acres)</b>
Blue Mountain (42,729 acres)	Bourdette Draw	13,328
Book Cliffs (273,486 acres)	Bitter Creek	33,484
	Cripple Cowboy	13,603
	Hells Hole Canyon	2,125
	Rat Hole	11,367
	Sweet Water	6,994
	Wolf Point	10,461
Browns Park (52,720 acres)	Cold Spring Mountain	8,649
	Dead Horse Pass	1,666
	Lower Flaming Gorge	11,296
	Mountain Home	2,102
Nine Mile (81,168 acres)	Desolation Canyon	20,989
White River (47,130 acres)	White River	21,167

With the shift in focus to primitive forms of recreation in portions of these SRMAs, however, opportunities for motorized recreation (e.g., backcountry driving, vehicle-supported camping) and activities at developed recreation sites (campgrounds, interpretive exhibits) would be reduced with the closure of 57 miles of vehicle routes and restrictions on recreation developments to maintain a natural landscape.

#### 4.12.2.7.6.3. Trails

Signing and improving existing trails and developing new hiking, horseback, and mountain biking trails would increase the total number of trail miles to 400, with impacts as discussed under Proposed. The increased number of trail miles would reduce user densities on the trails, potentially alleviating user conflicts and improving individual users' experiences. Increased development of trails and the ensuing increase in human activity could cause increased adverse impacts to cultural and paleontological sites and the recreational and educational value of such sites. Increased visitation would also increase the potential for wildland fire and could lead to temporary closure of affected recreational areas and the temporary reduction of scenic quality in the affected area. New areas for mountain biking are currently being sought. Additional non-motorized trails would provide additional mountain biking opportunities outside of existing and often overcrowded areas elsewhere in the VPA and the state.

Alternative E would not develop or improve motorized trails as is prescribed in Alternative D (No Action). Thus, opportunities for backcountry driving and OHV recreation would be limited to the road and trail system that currently exists. Red Mountain Trail is the only trail currently managed and maintained for motorized use. The lack of additional trails could produce an increase in cross-country travel, thereby increasing the adverse impacts to vegetation, soil, water, wildlife habitat, and scenic quality within the VPA. Without further OHV opportunities, overland riding, user conflicts, elevated user densities, and the decline in visitor safety would continue within the VPA.

Limiting OHV recreation, however, would have a long-term, beneficial effect on soils, riparian and upland vegetation, and wildlife habitat (and the recreational experiences dependent on these resources), by reducing surface disturbance to these resources. Reducing the opportunity for OHV use would also have long-term beneficial impacts on non-motorized forms of recreation (e.g., hiking, mountain biking, backpacking) by decreasing user conflicts on trails. Please refer to Section 4.12.2.8 of the DEIS for a further analysis of OHV management decisions and impacts.

#### 4.12.2.7.6.4. Mitigation of Lights and Noise

The BLM would work in conjunction with the National Park Service and the energy industry to mitigate noise and light pollution adjacent to Dinosaur National Monument. Currently, there are no mitigation procedures in place. Mitigation would have long-term beneficial effects on recreation opportunities by limiting noise and light pollution and the corresponding enhancements in the recreation setting and desired visitor experience.

#### 4.12.2.7.6.5. Cabins

Under Alternative E, no new cabins would be developed, providing no additional support for hunting, mountain biking, hiking, horse back riding/packing, or backcountry driving and OHV use. Without additional cabins for visitor to use, use seasons would not be extended. The impacts would be the same as discussed under Alternative D (No Action).

#### 4.12.2.8. IMPACTS OF SPECIAL DESIGNATION DECISIONS ON RECREATION

Under the Proposed RMP and all of the alternatives, WSAs would be managed to maintain their suitability for designation as Wilderness (according to and as directed in the IMP) until Congress either designates an area as Wilderness or releases an area from wilderness consideration. Wilderness Study Areas within the VPA encompass 53,058 acres (see Special Designation Section 4.16 for a detailed discussion of these areas). The IMP stipulates that these special designation areas would exclude OHV use except on prior, existing "ways," prohibit construction of permanent structures, and preserve wilderness values. The impacts to non-mechanized recreational use would be beneficial in the long term because opportunities would continue to be available for these activities. The impacts to mechanized and motorized users would continue to be adverse in the long term because the opportunities for these activities would be very limited or prohibited.

##### 4.12.2.8.1. PROPOSED RMP

The effects of special designations management decisions under the Proposed RMP would have impacts on recreation throughout the VPA. Areas of Critical Environmental Concern (ACECs) totaling 131,700 acres would be established or maintained in the following locations:

- Browns Park: 18,490 acres
- Lower Green River: 8,470 acres
- Red Mountain-Dry Fork: 24,285 acres
- Nine Mile Canyon: 44,168 acres
- Lears Canyon: 1,375
- Pariette: 10,437
- Red Creek: 24,475

While managed as ACECs, Browns Park, Nine Mile Canyon, and Red Mountain-Dry Fork would receive comprehensive integrated activity plans, with direct long-term beneficial protection-related impacts that would address SRMA values. Both sites have a broad range of valuable resources including high scenic quality, wildlife habitat, cultural, historic, and recreational opportunities. Each of the above ACEC designations would impact OHV use as such use would either be closed or limited to designated routes. Restrictions on motorized use would be balanced by new trails under the Proposed RMP (see Section 4.12.2.8).

As noted in Section 4.12.1, all proposed ACECs would be available for oil and gas leasing, and subject to valid existing mineral leasing rights. These potential mineral leaseings would have long-term adverse impacts on the range of recreational opportunities and the quality of recreation experiences.

The Proposed RMP would have fewer beneficial impacts to recreation due to the decreased acres of special designation areas when compared to Alternative D (No Action). While Alternative D (No Action) would not designate any new ACECs nor expand any currently designated areas,

Alternative D (No Action) would maintain a total of 165,944 ACEC acres within Pariette Wetlands, Red Creek Watershed, Lears Canyon, Browns Park, the Lower Green River, Nine Mile Canyon, and Red Mountain-Dry Fork (34,247 acres more than the Proposed RMP).

The Proposed RMP would continue to protect eligible WSR segments along the Upper and Lower Green River, but this would be less protective than Alternative D (No Action). Under Alternative D (No Action), suitability findings would not be made on either the White or Green rivers, but would maintain and continue to protect eligible segments along the White River, and Upper and Lower Green River. Under the Proposed RMP, segments along Evacuation Creek, Bitter Creek, and Argyle Creek would also not be identified as suitable for Wild or Scenic designation.

#### **4.12.2.8.2. ALTERNATIVE A**

Under Alternative A, ACECs totaling 345,850 acres would be established or maintained in the following locations:

- Bitter Creek: 68,834 acres
- Browns Park: 52,721 acres
- Coyote Basin: 87,743 acres
- Lower Green River: 10,170 acres
- Nine Mile Canyon: 48,000 acres
- Red Mountain-Dry Fork: 24,285 acres
- White River: 17,810 acres
- Lears Canyon: 1,375
- Pariette: 10,437
- Red Creek: 24,475

The Bitter Creek ACEC would be designated as an ACEC/Research Natural Area (RNA) due to its high-value, old growth pinyon pines, cultural resources, historic features, and high-quality watersheds. This would have long-term protection-related beneficial impacts on the area, and visitors to this ACEC would benefit from the special protection given to its unique ecosystem.

Coyote Basin would also be designated as an ACEC/RNA due to the white-tailed prairie dog, numerous special status wildlife species, and the high-value ecosystems that support this wildlife. Wildlife viewing opportunities would be enhanced within this ACEC.

While managed as ACECs, Browns Park and Nine Mile Canyon would receive comprehensive integrated activity plans, with direct long-term beneficial protection-related impacts that would address SRMA values. Both sites have a broad range of valuable resources including high scenic quality, wildlife habitat, cultural, historic, and recreational opportunities. Each of the above ACEC designations would impact OHV use as such use would either be closed or limited to

designated routes. Loss of these areas for motorized use would be balanced by new trails proposed under Alternative A (see Section 4.12.2.8).

Managing Red Mountain-Dry Fork as an ACEC for recreational purposes, specifically for OHV use, would enhance the recreation experience, diminish the adverse impacts from OHVs in this area, reduce direct, adverse resource-use conflicts between OHV and non-OHV users, and improve health and human safety.

As noted in Section 4.12.1, with the exception of portions of the White River and the Browns Park ACECs, all of the proposed ACECs would be available for oil and gas leasing, and subject to valid existing mineral leasing rights. These potential mineral leaseings would have long-term adverse impacts on the range of recreational opportunities and the quality of recreation experiences from surface disturbances that would affect scenic quality and setting.

This alternative would have more beneficial impacts to recreation due to the increased number of special designation areas than Alternative D (No Action), which would not designate any new ACECs nor expand any currently designated areas.

Alternative A would identify Wild and Scenic River suitability designations along segments of the White River, which would increase the number of free-flowing river miles and preserve cultural and scenic natural resources along the rivers (and thus, the recreational opportunities that are supported by cultural and scenic resources) within the suitability designation areas. These suitability designated river segments would have greater long-term protection-related beneficial impacts on recreation resources than Alternative D (No Action), under which suitability findings would not be made on either the White or Green rivers. Under Alternative A, segments along Evacuation Creek, Bitter Creek, and Argyle Creek would not be identified for Wild or Scenic designation.

#### **4.12.2.8.3. ALTERNATIVE B**

Under Alternative B, ACECs totaling 170,886 acres would be established or maintained in the following locations:

- Browns Park: 18,474 acres
- Coyote Basin: 47,659 acres
- Nine Mile Canyon: 44,181 acres
- Red Mountain-Dry Fork: 24,285 acres
- Lears Canyon: 1,375
- Pariette: 10,437
- Red Creek: 24,475

Under Alternative B there would be one new ACEC designated or expanded in the VPA (within Coyote Basin). Coyote Basin would be established as an ACEC/Research Natural Area for protection of the black-footed ferret and associated prey. This ACEC designation would have minor beneficial impacts on recreation, as the area would be designated for the protection and

enhancement of ferret habitat, and recreational opportunities for wildlife viewing would be possible. The total acreage proposed for designation as ACECs under this alternative would be 29,290 acres more than the 141,596 ACEC acres that would be maintained under Alternative D (No Action). Therefore the impacts on recreation under Alternative B would be more beneficial to recreation than Alternative D (No Action).

There would be no new Wild and Scenic River suitability designations under Alternative B but this alternative would maintain previously recommended segments along the Upper and Lower Green River, which would have the same impacts on this recreation resource as Alternative D (No Action).

#### **4.12.2.8.4. ALTERNATIVE C**

Under Alternative C, the greatest number of acres within the BLM-administered VPA would be designated as ACECs, when compared to Alternative D (No Action), which would not expand or designate any new ACECs. Areas of Critical Environmental Concern (ACECs) totaling 681,310 acres would be established or maintained in the following locations:

- Bitter Creek and Bitter Creek/PR Spring: 147,425 acres
- Browns Park: 52,721 acres
- Coyote Basin Complex: 124,161 acres
- Four Mile Wash: 50,280 acres
- Lower Green River: 10,170 acres
- Main Canyon: 100,915 acres
- Middle Green River: 6,768 acres
- Nine Mile Canyon: 81,168 acres
- Red Mountain-Dry Fork: 24,285 acres
- White River: 47,130 acres
- Lears Canyon: 1,375
- Pariette: 10,437
- Red Creek: 24,475

Compared to Alternative D (No Action), acreages for ACEC designation would be designated or increased in Bitter Creek, in the Coyote Basin-Snake John- Kennedy Wash sub-complexes, Four Mile Wash, along the Lower and Middle Green River, in Main Canyon, Nine Mile Canyon, and Red Mountain-Dry Fork. These new ACECS or enlarged, existing ACECS, would directly benefit recreation resources as described under Alternative A. The Coyote Basin, Snake John, and Kennedy Wash ACEC would include the Myton Bench and Shiner areas that would also offer protection to reintroduced black-footed ferrets, but would have beneficial impacts on recreation within the VPA, as described under Alternative A. These increases in acreage would beneficially improve and enhance non-motorized recreation opportunities in the long-term as

described in the Proposed RMP, although adverse impacts to recreation from oil and gas leasing could still occur. An ACEC designation for Four Mile Wash would be unique to this alternative and, further, would classify the area as an Outstanding Natural Area because of its high scenic quality, primitive recreational opportunities, riparian ecosystems, and special status fish species. This would have long-term beneficial protection-related impacts on recreation resources. An integrated activity level plan would provide additional site-specific management prescriptions and resource protection. The area would be closed to oil and gas leasing and OHV use would be limited to designated routes, which would have direct, long-term beneficial impacts on the area's recreation resources.

Alternative C would add 164 miles of Wild and Scenic River suitability designations for segments of the White River, Nine Mile Creek, Middle Green River, Evacuation Creek, Bitter Creek, and Argyle Creek, increasing the number of free-flowing river miles and preserving the cultural- and scenic-resource-based recreational opportunities within the designated areas. This alternative would have the greatest number of river miles of Wild and Scenic Rivers designated, having greater long-term direct beneficial impacts on recreation resources when compared to Alternative D (No Action).

#### **4.12.2.8.5. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would maintain ACECs (totaling 165,944 acres) in the following locations:

- Browns Park: 52,721 acres
- Lower Green River: 8,470 acres
- Nine Mile Canyon: 44,181 acres
- Red Mountain-Dry Fork: 24,285 acres
- Lears Canyon: 1,375
- Pariette: 10,437
- Red Creek: 24,475

The ACECs currently established for the Lower Green River, Lears Canyon, Red Creek, Pariette, Browns Park, Red Mountain-Dry Fork, and Nine Mile Canyon (totaling 141,596 acres) would continue to have long-term beneficial protection-related impacts on recreation within these areas, with impacts to recreation as described under the Proposed RMP.

The Browns Park, Nine Mile Canyon, and Red Mountain-Dry Fork ACECs would continue to be managed as noted in the Proposed RMP, however, management under this alternative would also be less restrictive. Comprehensive integrated activity plans would not be developed and there would be fewer restrictions on oil and gas leasing. Off-highway vehicle use and VRM classifications would be unspecified. Alternative D (No Action) would provide protection to deer winter range, special status species, outstanding scenic, cultural, riparian, and fisheries resources, which would have beneficial, indirect impacts on recreational opportunities.

**4.12.2.8.6. ALTERNATIVE E**

Fourteen ACECs totaling 681,310 acres would be designated under Alternative E (the same as Alternative C):

- Bitter Creek and Bitter Creek/PR Spring: 147,425 acres
- Browns Park: 52,721 acres
- Coyote Basin Complex: 124,161 acres
- Four Mile Wash: 50,280 acres
- Lower Green River: 10,170 acres
- Middle Green River: 6,768 acres
- White River: 47,130 acres
- Main Canyon: 100,915 acres
- Red Mountain-Dry Fork: 24,285 acres
- Nine Mile Canyon: 81,168 acres
- Lears Canyon: 1,375
- Pariette Wetlands: 10,437
- Red Creek Watershed: 24,475

These ACECs would be designated and managed for a variety of relevant and important values, including natural landscapes and scenery, wildlife, critical wildlife habitat, riparian and wetland ecosystems, old growth forests, cultural and historic properties, and relict vegetation communities. These values provide for a wide variety of recreation opportunities, from motorized to non-motorized activities and developed to dispersed activities in a variety of settings. Management of these values varies from protection of unmodified landscapes and special status wildlife species to development of oil and gas and vegetation manipulation.

Ten of the ACECs designated under this alternative include non-WSA lands with wilderness characteristics (see Table 4.12.3). Non-WSA lands with wilderness characteristics would be managed to protect their wilderness characteristics and to provide opportunities for primitive forms of recreation (e.g., hiking, backpacking, river floating, hunting, wildlife viewing, and nature study) and experiences of solitude in natural, undeveloped settings. Opportunities for motorized recreation (e.g., OHV and backcountry driving) and developed facilities (e.g., interpretive and wayside exhibits) would be provided outside non-WSA lands with wilderness characteristics.

The impacts of these ACEC designations under this alternative would be more beneficial to recreation when compared to Alternative D (No Action) because more acreage would be protected from surface disturbances caused by mineral leasing, mineral materials disposal, new road construction, and ROWs that could otherwise adversely impact recreational opportunities and experiences.

**Table 4.12.3. Non-WSA Lands with Wilderness Characteristics in ACECs—Alternative E**

<b>ACEC</b>	<b>Non-WSA Lands with Wilderness Characteristics</b>	<b>Acreage of Non-WSA Lands with Wilderness Characteristics</b>
Bitter Creek	Bitter Creek Cripple Cowboy Hells Hole Canyon Rat Hole Sweet Water	33,433 13,579 38 11,337 4
Bitter Creek/P.R. Spring	Bitter Creek Cripple Cowboy Hells Hole Canyon Sweet Water	7 15 2,087 6,982
Browns Park	Cold Spring Mountain Diamond Breaks Dead Horse Pass Lower Flaming Gorge Mountain Home	8,649 1 1,665 11,274 2,089
Coyote Basin–Snake John	Bourdette Draw	13
Four Mile Wash	Desolation Canyon	43,014
Lower Green River	Desolation Canyon	5,242
Main Canyon	Wolf Point	11,783
Nine Mile Canyon	Desolation Canyon	19,470
Red Creek Watershed	Cold Spring Mountain Mountain Home	76 4,976
White River	White River	21,167

**4.12.2.9. IMPACTS OF TRAVEL/ROADS AND TRAILS DECISIONS ON RECREATION****4.12.2.9.1. PROPOSED RMP**

Under the Proposed RMP, areas within the VPA designated as Open to OHV cross-country travel would be limited to approximately 6,202 acres (a decrease of approximately 781,657 acres when compared to Alternative D, No Action). The impacts of limiting the number of open-designated acres would be long-term direct and indirect, adverse and beneficial on recreation. Long-term direct adverse effects would include the reduction in opportunities for OHV cross-country recreation-related travel. This loss would be offset by the 800 miles of trails proposed for OHV use in Alternative A. However, the long-term, beneficial effects of increased protection of soil, water, and wildlife habitat (which would preserve the quality of recreational activities associated with these resources) would counter the adverse effects of travel decisions. The reduction in noise, surface disturbances, visual quality degradation, and resource-use conflicts with other recreational activities would have direct long-term beneficial impacts on recreation. Indirect beneficial impacts to recreational activities that require high visual quality would result from the reduction in soil erosion and fugitive dust produced by OHV activities.

Areas designated as Limited to Designated Routes for OHV travel would be increased to 1,643,475 acres (an increase of 756,200 acres from current management as discussed in Alternative D, No Action), which would have direct long-term beneficial impacts on recreation by increasing the level of OHV management within the VPA. This would have direct beneficial impacts on recreation by reducing recreational resource-use conflicts. Under the Proposed RMP, OHV travel limited to designated routes would include the 106,178 acres of non-WSA lands with wilderness characteristics.

Designating areas as Closed to OHV travel would be increased from 50,388 acres (under Alternative D, No Action) to 75,845 acres (an increase of 25,457 acres) and the miles of designated routes would increase from zero miles under existing conditions (Alternative D, No Action) to 4,860 miles. This increase in designated closed OHV routes would have direct, long-term beneficial impacts on other non-motorized recreational opportunities activities by reducing recreation resource-use conflicts, and by reducing the OHV-related disturbances to soil, water, and wildlife habitat resources. Increasing the number of OHV closed acres within the VPA would have minor restriction-related adverse impacts on OHV use, but the long-term direct and indirect benefits of reduced surface disturbances and reduced resource-use conflicts with other recreational activities would counter the adverse effects on OHV use.

#### **4.12.2.9.2. ALTERNATIVE A**

The impacts of travel decisions on recreation would be the same as discussed above under the Proposed RMP because the management decisions are the same.

#### **4.12.2.9.3. ALTERNATIVE B**

Areas open to OHV travel would decrease to 5,434 acres (a decrease of 782,425 acres when compared to current management as described in Alternative D, No Action).

Areas limited to OHV travel would increase to 1,659,901 acres (an increase of 772,626 acres from current management as described in Alternative D, No Action).

Areas closed to OHV travel would increase to a total of 60,187 acres (an increase of 9,799 acres compared to Alternative D, No Action), the least amount of all the alternatives.

The number of miles of routes designated would increase from zero miles under existing conditions (Alternative D, No Action) to 4,860 miles.

The effects of Alternative B would be similar to those described under the Proposed RMP, for areas open to OHV travel. Areas designated as closed to OHV use would be reduced, which would reduce surface disturbances caused by overland OHV travel. Alternative B would have long-term beneficial impacts on other recreation resources similar to those described under the Proposed RMP.

**4.12.2.9.4. ALTERNATIVE C**

The impacts of road, trail, and OHV management decisions would be similar to those described under the Proposed RMP. There would be 5,434 acres open to cross-country OHV travel (the same as Alternative B), and the impacts of open OHV areas would be similar to those described under the Proposed RMP.

Areas designated as limited to designated routes for OHV travel would be increased to 1,353,529 acres (an increase of 466,254 acres from current management as described in Alternative D, No Action), allowing for increased use in a more managed setting, and potentially sustaining the existing levels of OHV use.

Areas closed to OHV travel would be increased from 50,388 acres (under Alternative D, No Action) to 366,559 acres, which would have direct long-term beneficial impacts on soil, water, and wildlife habitat resources.

The number of miles of routes designated would increase from zero miles under existing conditions to 4,707 miles.

Alternative C would be the most restrictive on OHV use. A decrease in the number of acres available for OHV use would have long-term beneficial impacts on other non-motorized forms of recreation by reducing resource-user conflicts and by enhancing and/or protecting recreation resources as described under the Proposed RMP.

Alternative C would also provide the highest degree of protection for natural resources, and create the lowest potential damage to natural resources from OHV-caused surface disturbances. This would have direct and indirect long-term beneficial impacts on all recreational activities within the VPA.

**4.12.2.9.5. ALTERNATIVE D (NO ACTION)**

Current management practices designate a total of 787,859 acres as open to cross-country OHV travel, 887,275 acres as limited to designated routes, and 50,388 acres as closed to OHV use. No OHV routes would be designated under this alternative. Travel management under current conditions would be less restrictive to OHV users when compared to the action alternatives, but would maintain the current adverse impacts to natural and cultural resources and to non-motorized users, as discussed above. The adverse impacts of OHV-caused surface disturbances to soil, water, visual quality, and wildlife habitat would continue, as would recreational resource-use conflicts between motorized, non-motorized, and non-mechanized recreation resource users.

**4.12.2.9.6. ALTERNATIVE E**

Under Alternative E, 5,434 acres would be open to cross-country OHV travel, the same as under Alternatives B and C and a reduction of 782,425 acres from Alternative D (No Action). Under this alternative, motorized travel would be focused on designated routes, not cross-country.

While the experience of cross-country driving would be limited to 5,434 acres, motorized travel for access and recreation would still be available on 4,654 miles of road and trails.

The area limited to designated routes for OHV travel would increase to 1,326,024 acres (an increase of 438,749 acres) from current management described in Alternative D (No Action). Limiting motorized travel to designated routes would emphasize an "on-road/trail" experience of varying degrees of challenge and risk, depending on the quality of the route traveled. Further limiting motorized travel to designated routes would place more management controls on the traveler, but sustaining the existing levels of OHV use is anticipated. The number of miles of routes formally designated for motorized use would increase from 0 miles under existing conditions (Alternative D, No Action) to 4,654 miles under Alternative E, although these routes would still be driven under Alternative D (No Action).

Areas closed to OHV travel would increase to 392,818 acres (an increase of 342,430 acres) from current management in Alternative D (No Action). Closure to cross-country travel would have direct long-term beneficial impacts on soils, water, and wildlife habitat and on the primitive and non-motorized forms of recreation dependent on those resources and settings. In the areas closed to OHV travel, the focus would be placed on primitive and non-motorized forms of recreation, including hiking, backpacking, river floating, hunting, wildlife viewing, nature study, sightseeing, and others. Included in the areas closed to OHV travel would be the 24 non-WSA lands with wilderness characteristics (277,596 acres). Here, recreation emphasis would be placed on primitive forms of recreation, experiences of solitude, and the undeveloped settings that support those activities and experiences.

There are 228 miles of routes that exist in the non-WSA lands with wilderness characteristics. Under this alternative, these routes would be closed to motorized travel, foreclosing the opportunity for backcountry driving, vehicle-supported camping, and other motorized forms of recreation.

#### **4.12.2.10. IMPACTS OF VISUAL RESOURCE MANAGEMENT DECISIONS ON RECREATION**

The following activities are dependent on visual resources and would be affected more by decisions related to visual resources:

- Sight-seeing (the primary reason for current visitation to the VPA)
- Scenic driving
- Wildlife viewing
- Nature study

Many recreational activities in the VPA are related, in some way, to scenic quality. The degree to which scenic quality would be maintained is directly related to the degree to which the recreational experience would be maintained. Because VRM Classes I and II are most desirable for the recreation experience, the long-term beneficial effects of VRM upon recreation under the Proposed RMP and each alternative are represented as acreages categorized as VRM Class I or

Class II. Table 4.12.4 below summarized the VRM class designations within the BLM-administered portion of the VPA.

**Table 4.12.4. VRM Class Acreages for the Proposed RMP and each Alternative**

<b>VRM Class</b>	<b>Proposed RMP</b>	<b>Alternative A</b>	<b>Alternative B</b>	<b>Alternative C</b>	<b>Alternative D (No Action)</b>	<b>Alternative E</b>
VRM I	57,776	63,136	52,764	145,781	53,086	334,516
VRM II	231,911	294,773	114,030	362,660	113,686	259,694
VRM III	786,612	716,186	199,179	580,846	199,192	535,586
VRM IV	643,641	645,845	1,353,967	630,653	1,353,976	590,144
<b>Total</b>	<b>1,719,940</b>	<b>1,719,940</b>	<b>1,719,940</b>	<b>1,719,940</b>	<b>1,719,940</b>	<b>1,719,940</b>
<b>VRM I and II</b>	<b>289,687</b>	<b>357,909</b>	<b>166,794</b>	<b>508,441</b>	<b>166,772</b>	<b>594,210</b>
<b>VRM III and IV</b>	<b>1,430,253</b>	<b>1,362,031</b>	<b>1,553,146</b>	<b>1,211,499</b>	<b>1,553,168</b>	<b>1,125,730</b>

#### **4.12.2.10.1. PROPOSED RMP**

The Proposed RMP would increase the current acreage of VRM Classes I and II by 122,915 acres (from 166,772 acres under Alternative D (No Action) to 289,687 acres under the Proposed RMP). This increase would more have long-term beneficial effect on recreation throughout the VPA, when compared with Alternative D (No Action).

#### **4.12.2.10.2. ALTERNATIVE A**

Alternative A would increase the current acreage of VRM Classes I and II by 191,137 acres to a total of 357,909 acres. This increase would have more long-term beneficial effect on recreation throughout the VPA, when compared with Alternative D (No Action).

#### **4.12.2.10.3. ALTERNATIVES B AND D (NO ACTION)**

Maintaining 166,794 acres as VRM Classes I and II under Alternative B (very similar to acreages designated under Alternative D, No Action) would have the same low protection-related beneficial impacts on the scenic quality component of recreation resources as Alternative D (No Action).

#### **4.12.2.10.4. ALTERNATIVE C**

The management actions under Alternative C would increase VRM Class I and Class II designated areas by 341,669 acres to 508,441 acres throughout the BLM administered VPA. When compared to current conditions under Alternative D (No Action), this large increase in area for the preservation of scenic quality would have greater long-term beneficial effects on recreational opportunities and activities.

**4.12.2.10.5. ALTERNATIVE E**

Under this alternative, there would be approximately 594,210 acres managed by VRM Class I (preserve the landscape character) and Class II (retain the landscape character) objectives. Class III (partially retain the landscape character) and Class IV (provide for landscape modification) objectives would be prescribed for 1,125,730 acres. Class I and II objectives would limit landscape change but would provide for dispersed and undeveloped recreation opportunities. The opportunities would include a variety of motorized and non-motorized activities like camping, hiking, backpacking, river floating, wildlife viewing, hunting, nature study, and picnicking. Backcountry driving and OHV use would be permitted on designated roads and trails. However, recreation requiring developed sites like campgrounds, picnic areas, or interpretive sites would not be permitted in Class I areas. Non-WSA lands with wilderness characteristics (277,596 acres) would be managed by VRM Class I objectives and provide the same recreation opportunities as described above, except backcountry driving or OHV use. Routes in non-WSA lands with wilderness characteristics would be closed to motorized use in these areas.

**4.12.2.11. SUMMARY****4.12.2.11.1. PROPOSED RMP**

The Proposed RMP would have a moderate degree of adverse impacts when compared to the action alternatives and major beneficial impacts when compared to Alternative D (No Action).

- Increases in oil and gas production would have major adverse impacts on recreational opportunities.
- Increases in OHV management would have adverse impacts on mechanized recreation, by restricting OHV recreational opportunities in the VPA.
- Increases in OHV management would have beneficial impacts on non-mechanized recreation through protection of wildlife, wilderness values, and the reduction of user conflicts.
- Protection of areas as ACECs and management of SRMAs would have a major beneficial impact on recreation. SRMA acreages would be increased from 87,931 to 133,560.

**4.12.2.11.2. ALTERNATIVE A**

This alternative would have impacts from minerals development similar to the Proposed RMP alternative, with a moderate degree of adverse impacts when compared to the other action alternatives and major beneficial impacts to recreation when compared to Alternative D (No Action).

- The acreages designated for OHV management would be the same as the Proposed RMP.
- SRMA acreages would be increased to 499,620, and ACEC designation would be increased to 345,850 acres.
- Designation of 357,909 acres of the VPA under VRM Classes I and II for protection of scenic quality.

- Minerals leasing acreage greater than all of the alternatives except Alternative B.

#### **4.12.2.11.3. ALTERNATIVE B**

This alternative would have the most adverse impacts to recreation resources due to the large number of acres available for oil and gas leasing. This alternative would permit the most acres within the VPA for surface-disturbing minerals development.

- Protection of wildlife and special status species would be the least under this alternative, with the greatest adverse impacts to recreation values and opportunities that are related to these resources.
- No new ACECs would be designated under this alternative, with 123,227 acres maintained as ACECS (less than Alternative D) so there would be fewer resource protection-related beneficial impacts to recreation from these designations than under the current RMP. SRMA acreages would be the same as Alternative D (No Action) (87,931)
- Limited protection of visual resources would have major adverse impacts on recreational opportunities in which scenic quality is an important component.

#### **4.12.2.11.4. ALTERNATIVE C**

This alternative would have the most beneficial impacts on recreation.

- Designation of additional ACECs and eligibility designations of Wild and Scenic River segments would have beneficial impacts on recreation. Designation of the most acreage for SRMA management (522,604) would have major beneficial impacts on all forms of recreation.
- Limits on OHV travel would be greatest under this alternative, producing adverse impacts on mechanized recreational opportunities and beneficial impacts on non-mechanized recreation.
- Limits on oil and gas leasing and increased protection of wildlife and special status species would produce the most beneficial impacts and the least adverse impacts on recreation.
- Designation of the most acreage of the VPA under VRM Classes I and II would provide the most protection to visual resources, and therefore would provide the greatest beneficial impacts to those recreational opportunities in which scenic quality is an important recreational component.

#### **4.12.2.11.5. ALTERNATIVE D (NO ACTION)**

Oil and gas leasing would have a major adverse impact on recreation.

- Lack of limits on OHV use would have major beneficial impacts on motorized recreation, and major adverse impacts on all other types of non-motorized recreation.

- Protecting 141,596 acres currently designated as ACECs) with no eligible Wild and Scenic River segments (but with maintained protection of segments along the Upper and Lower Green River) would provide protection-related beneficial impacts to recreation.
- Limited protection of visual resources would have major adverse impacts on recreational opportunities in which scenic quality is an important component.

#### **4.12.2.11.6. ALTERNATIVE E**

The focus of this alternative would be the protection of non-WSA lands with wilderness characteristics. That protection would have substantial beneficial impacts on primitive and non-mechanized recreation activities, but it would exclude OHV use on 228 miles of routes and activities dependent on developed sites (e.g., campground and interpretive facilities).

- Designation of ACECs and protection of suitable Wild and Scenic River segments would benefit undeveloped forms of recreation dependent on those settings. Designation of SRMA acreages the same as Alternative C (522,604 acres) would have major beneficial impacts on recreational opportunities within the VPA.
- OHV travel would be limited under this alternative, reducing opportunities for cross-country driving, focusing motorized travel to designated routes, and creating added opportunities for non-motorized recreation.
- Management for preservation and retention of the existing landscape character (VRM Classes I and II objectives) would provide the most opportunity for activities and experiences dependent on natural and undeveloped settings.

#### **4.12.2.12. MITIGATION MEASURES**

All of the alternatives would affect recreation resources to varying degrees and so would require varying forms of mitigation measures.

Mitigation measures would include:

- Where prescribed fire treatments overlap recreation areas, promoting recreational use of other areas with similar recreational opportunities.
- Maintaining wildlife viewing opportunities by following mitigation recommendations in the Wildlife and Minerals portions of this RMP.
- Controlling fugitive dust with dust suppressants along scenic byways, oil and gas development areas, and major recreational access routes.
- Separating recreational uses and opportunities, temporally or spatially, to mitigate conflict between user groups.
- Educating the users of recreation resources on the impacts that their activities have on the natural environment, in an effort to reduce the adverse impacts on natural resources, especially by OHV users.

**4.12.3. UNAVOIDABLE ADVERSE IMPACTS**

Some mineral development activities associated with the management actions of the Proposed RMP and the alternatives would have unavoidable, adverse impacts on recreation resources. Exploration and development would fragment hunting areas and impact OHV and non-motorized trails.

**4.12.4. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY**

Short-term use of recreation resources in the VPA would result in negligible impacts on the long-term productivity of the resource.

**4.12.5. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS**

No irreversible impacts to recreation resources or activities are anticipated. There would likely be irretrievable impacts to recreation resources (from a loss of vegetation and from surface disturbances directly and indirectly causing a reduction in scenic quality) produced by cross-country OHV use, and by minerals development in areas formerly used for solitary, remote, and unconfined recreation.

## 4.13. RIPARIAN AND WETLAND RESOURCES

Impacts to riparian areas in the VPA would be a result of surface-disturbing activities and forage use both within and outside of the riparian zones and are subject to restrictions to insure conditions are improved or at least not degraded. The Utah BLM Standards for Rangeland Health apply to riparian resources in the VPA. The Proposed RMP and all alternatives must adhere to Standard 2 of these standards, "Riparian and wetland areas [must be] in properly functioning condition (PFC). Stream channel morphology and functions are appropriate to soil type, climate, and function" (BLM 1997).

As identified in the preliminary riparian inventory, the VFO would maintain 295 miles and 3,674 acres of riparian areas currently in proper functioning condition. Also, the VFO would improve 133 miles and 1,452 acres functioning at risk and 79 miles and 1,213 acres not in properly functioning condition. These are preliminary numbers and will change as the inventory is completed. Monitoring by the permittee and the BLM would be used to determine the trend and condition of riparian areas (considering the soil type, climate, and land form). Site-specific conditions would need to be documented before modifying any prescriptions.

There are several potential impacts that would adversely affect riparian resources:

- Upland surface disturbance could cause a loss of vegetation that could accelerate soil erosion, which would in turn cause sedimentation in adjacent streams.
- Loss of riparian vegetation would lead to reduced riparian condition and loss of PFC.
- Degradation of riparian-wetland soils would lead to reduced riparian condition and loss of PFC.
- Drawdown of groundwater levels from oil, gas, and CBNG leasing could lead to dewatering of riparian areas.
- Roads would result in an indefinite to permanent loss of vegetation that can increase soil erosion and sedimentation. This can potentially result in channel instability and changes in channel types and/or less stable to instable channel cross sections in certain watersheds.

Decisions making lands unavailable for upland surface disturbance and riparian corridor disturbance may benefit riparian resources. Beneficial impacts may result from stubble height requirements, utilization levels, reduced use, and season of use changes that are proposed in some of the alternatives.

### 4.13.1. IMPACTS COMMON TO ALL

Under the Proposed RMP and all alternatives, management actions for the following resources would result in negligible impacts to riparian resources: air quality, cultural resources, hazardous materials, human health and safety, and paleontological resources. This is because protecting air quality, maintaining safety around AML sites and reducing the risks of hazardous materials spills and spill-site cleanup, protecting cultural resources under Section 106, protecting known fossil areas for fossil scientific study and recreational fossil collection, and would neither degrade nor improve the water, soil and vegetation components that comprise riparian resources.

Accordingly, the impacts of management actions for each of these resources are not analyzed further in this section.

The BLM would take measures to ensure riparian area productivity and sustainability in the event of wildland fire, drought, or other natural disasters, by reducing or eliminating livestock, wild horses, and/or wildlife forage allocations, reducing or eliminating recreational activities (camping and campfires, OHV use, etc.), and reducing or eliminating mineral exploration and acquisition until riparian conditions are properly functioning. Cultural and paleontological resource management would not have any effect on riparian resources.

Fire Management practices would have short-term, direct adverse impacts to riparian resources through practices such as prescribed burning or fuels reduction by increasing erosion rates, which could result in stream sedimentation. However, these fire management activities would reintroduce the natural fire return interval in the long term, decreasing or eliminating the occurrence of catastrophic rangeland fires, and promoting more productive rangelands, resulting in less soil degradation and subsequent stream sedimentation.

Effects to riparian resources specified under forage and wild horse management decisions would be short-term, direct, and potentially beneficial, depending on season of use and duration. These decisions would also have long-term direct beneficial impacts to riparian resources by improving riparian conditions. AUMs would be adjusted for livestock, wild horses, and/or wildlife when monitoring shows that riparian condition is not at PFC.

Effects from lands and realty decisions would be direct and long-term. Land withdrawals would have a beneficial effect on riparian resources by precluding areas from mineral entry and would result in riparian resource protection. Increasing visitor access to river segments would have long-term, indirect adverse impacts to riparian resources by increasing visitor traffic, bank trampling, and spread of noxious weeds. With respect to right of ways, the BLM has strict riparian area reclamation and restoration guidelines regarding linear projects such as pipelines; therefore, no impacts are expected.

Long-duration grazing would impact riparian areas through loss of vegetative cover and trampling of soils, potentially leading to riparian area degradation. Limited livestock grazing, when properly managed, would benefit riparian areas by stimulating new growth in riparian vegetation. Effects on riparian vegetation vary between seasons of use. For example, grazing riparian areas in late spring allows vegetation to grow through summer and into the fall, where it can protect banks during critical spring runoff and late summer thunderstorms. Any changes to season of use or AUMs would need to be in compliance with Standard 2 (and all other standards) of the Utah BLM Standards for Rangeland Health.

Effects of minerals decisions on riparian resources would be adverse, long-term, and direct, resulting in upland erosion and subsequent stream sedimentation through surface-disturbing activities. The impacts analysis represents relative risks of adverse impacts to riparian resources for the Proposed RMP and all alternatives, due to the incomplete riparian inventory data. Site-specific analyses would need to be undertaken on a case-by-case basis to establish quantitative impacts. Reclamation and restoration of oil and gas, locatable minerals, surface minerals, and

alternative energy sites would be required upon abandonment of the site, resulting in less stream sedimentation. The risks of accidental release of hazardous materials and petroleum products from oil and gas leasing (which includes CBNG) sites would also have an indirect, long-term, adverse impact on riparian resources. Drawdown of groundwater due to techniques used to extract oil, gas, and CBNG could lead to dewatering of riparian areas, increasing the risks of invasive species introduction and reducing water available for riparian ecosystems. Additionally, road development providing access to oil and gas leasing (which includes CBNG) would increase risks sediment runoff and noxious weed infestation into previously undeveloped areas. More roads would also increase access for illegal OHV use in remote riparian areas. Surface mineral developments would not be placed in wetlands and would be at least 100 m from riparian zones, and must occur outside the 100-year floodplain. These stipulations on surface disturbance are discussed in Appendix K, and would be used unless there are no practical alternatives or impacts would be fully mitigated. The limits placed on surface disturbance from locatable minerals would limit the adverse impacts from these activities and there is no measurable difference between alternatives.

Depending on the construction methods and materials used, roads built across riparian areas would result in a direct loss of riparian habitat at the crossing site. The loss of habitat would continue until the reclamation of the road occurs and traffic diminishes to a point that riparian habitat can re-establish itself.

The effects of rangeland improvements on riparian areas would be beneficial, long-term, indirect, and direct. Vegetation treatments would ultimately reduce stream sedimentation and improve riparian vegetative cover. Fencing of riparian areas would reduce impacts from grazing in these areas and development of other water sources away from riparian areas would limit grazing use of river corridors.

The effects of recreation decisions on soils would generally be long-term, indirect, and beneficial, by limiting OHV use to designated areas and by providing management for areas as SRMAs. Adverse effects would occur from increased visitor traffic, development of trails, and OHV use. Adverse impacts would include trampling of banks, compaction of soils, and spread of noxious weeds. Where limits are placed on OHV travel off designated routes for big-game retrieval, beneficial effects would occur. The "Tread Lightly" program is invaluable in educating OHV users to stay on existing trails, thereby decreasing impacts to riparian areas. "Sacrifice" areas would be designated for OHV users in areas that are not ecologically sensitive and present little or no risk to riparian condition and other components identified in the Utah BLM Standards for Rangeland Health.

Riparian management would be designed to improve riparian conditions. The effects of maintaining minimum vegetation stubble height thresholds on riparian vegetation would be beneficial, long-term, and direct. Maintaining plant stubble along the banks traps sediment and reduces stream bank erosion, thereby maintaining or enhancing riparian condition. Managing herbaceous and woody vegetation in riparian areas would have long-term direct beneficial effects by trapping sediment, attenuating floods, and providing stability for banks during periods of high flow. Proper functioning condition is the minimum acceptable goal for riparian areas. Riparian-

wetland areas would be maintained, restored, protected, and/or expanded to achieve PFC with respect to soils, vegetation, and hydrology/water quality.

Soils and watershed management would be beneficial to riparian areas by limiting surface disturbance and requiring erosion control on slopes steeper than 20%. Note: The percent varies by alternative and the Proposed RMP, but they all call for restrictions on slopes greater than 20%. Slopes below 20% would not be required to have erosion control plans and would have short-term adverse impacts to riparian areas through increased sedimentation and runoff. The BLM would reduce or eliminate the discharge of pollutants and sediment into surface waters with stipulations on surface disturbance, providing protection for fish, amphibians, wildlife, and water recreation. Oil and gas well pads would not be permitted in active floodplains, protecting watersheds and riparian areas from sedimentation as well. The BLM would examine the effects of prescribed fire, post fire management, invasive weed control, energy development, grazing, OHV use, and range improvement projects prior to taking action.

Special designation areas would have long-term direct beneficial effects to riparian areas, where management plans are designed to protect riparian ecosystems or limit surface disturbance by designating VRM Class I and II areas. WSR designations would have direct, long-term beneficial impacts to riparian resources by limiting development along river corridors. Increased visitor traffic would have long-term indirect adverse impacts due to increases in bank trampling and recreational use of these river segments. Wilderness study areas would be managed in a manner that does not impair riparian condition, as per Standard 2 of the Utah BLM Standards for Rangeland Health. These designations would not allow surface disturbance, thereby providing direct protection for riparian areas.

The effects of special status species on riparian resources would be beneficial, long-term, and direct by limiting surface development. The Proposed RMP and each of the alternatives offers varying level of protection to special status species and their habitats by placing no-disturbance buffers around critical habitat (e.g., raptor nests). Habitat protection indirectly equates to reduced soil disturbance and stream sedimentation. Inventories of these plant and animal resources would provide well-defined protection areas. Ute ladies'-tresses is the only TES plant that occurs in riparian areas within the VPA. The protection of this species' habitat would provide beneficial, long-term effects to riparian areas through limitation of surface-disturbing activities under all alternatives.

Travel decisions would have direct and indirect, short- and long-term beneficial impacts to riparian resources where newly permitted roads and trails are obliterated or returned to their original condition. Repair by maintenance, upgrade, or realignment of roads causing resource damage, and installation of water crossings designed to allow the free passage of aquatic life would be beneficial to riparian resources as well. Direct and indirect, long- and short-term adverse impacts would occur where riparian areas on BLM land are within areas open to OHV use with no limits on travel.

VRM decisions would be beneficial and long term, and would directly affect riparian resources by precluding some areas from surface disturbance due to their proximity to highways, scenic areas, and special designations. However, adverse, short-term, indirect impacts would occur if

vegetation treatments could not be implemented in VRM-sensitive areas. VRM classes range from I to IV; Class I lands are not open to surface disturbance (full retention), and Class IV lands are available for full development.

Wildlife and fisheries management would have limited direct effects on riparian resources. Introduction of moose populations would have long-term, indirect beneficial impacts on riparian resources by increasing biodiversity in these areas. The BLM would provide habitat for a diversity of wildlife and fish species by limiting fragmentation, resulting in less surface disturbance and stream sedimentation. The effects of wildlife management decisions on riparian resources would be beneficial, long term, and indirect, by limiting surface development within specified wildlife buffer zones. Most of the wildlife and fisheries management decisions involve seasonal constraints and would not necessarily preclude surface-disturbing activities. The only measurable component of wildlife and fisheries management decisions on riparian resources would be the preservation of crucial deer winter range and the enhancement of winter range to mitigate surface disturbance. The Proposed RMP and all alternatives are similar with respect to their effects on riparian resources.

Woodlands and Forest management would generally have long-term indirect, beneficial impacts to riparian resources. The BLM would follow national BLM Forest Health and Forest Management Standards and Guidelines to achieve desired future conditions, and minimize impacts to riparian resources, while providing for multiple forest product use. Adverse, short-term, direct impacts to riparian resources would occur with treatments and harvesting in the form of sedimentation. However, in the long term, treatments and harvesting would have the potential to reintroduce natural fire return intervals, reducing stream sedimentation through fewer catastrophic fires.

#### **4.13.2. THE PROPOSED RMP AND ALTERNATIVES IMPACTS**

Surface-disturbing activities for the Proposed RMP and all alternatives and all effects would generally be adverse to riparian resources through sedimentation. Surface stipulations in Appendix K would be applied to all surface-disturbing activities, and would limit disturbance of riparian areas. Exceptions to these stipulations could be authorized if: a) there are no practical alternatives; b) impacts could be fully mitigated; or c) the action is designed to enhance the riparian resources. Additionally, mineral developments require a network of access roads, which typically require some form of water crossing. The duration of these impacts is dependent on the action.

##### **4.13.2.1. IMPACTS OF FIRE MANAGEMENT DECISIONS ON RIPARIAN RESOURCES**

###### **4.13.2.1.1. ALTERNATIVES A, B, C, E, AND THE PROPOSED RMP**

Alternatives A, B, C, E, and the Proposed RMP would allow approximately 3 times more acreage of prescribed burning in the short term than Alternative D (No Action) (156,425 acres versus 50,900 acres). However, in the long term, these fire management activities would reintroduce the natural fire return interval to an area 3 times greater than that proposed in Alternative D (No Action). This would decrease or eliminate the occurrence of catastrophic

wildland fires, which often require aggressive suppression, promoting more productive rangelands with less soil erosion and stream sedimentation.

#### **4.13.2.1.2. ALTERNATIVE D (NO ACTION)**

Long-term benefits to riparian resources from prescribed fire would be three times less under Alternative D (No Action) than under other alternatives because the area for proposed fire treatments would be smaller.

### **4.13.2.2. IMPACTS OF FORAGE AND WILD HORSE MANAGEMENT DECISIONS ON RIPARIAN RESOURCES**

#### **4.13.2.2.1. ALTERNATIVES A, B, AND THE PROPOSED RMP**

Total AUMs for Alternatives A, B, and the Proposed RMP would be similar; however, Alternative B would have 10% greater forage utilization than Alternative A and the Proposed RMP. Greater forage utilization and more AUMs would put greater stress on riparian areas through loss of cover and trampling. This could potentially result in loss of PFC. The Proposed RMP and these alternatives provide more beneficial impacts to riparian resources than Alternative D (No Action), which has unspecified forage utilization.

#### **4.13.2.2.2. ALTERNATIVE C**

Alternative C has the most beneficial impacts to riparian resources relative to Alternative D (No Action) through reductions in livestock use and retention of AUMs for watershed in many localities.

#### **4.13.2.2.3. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) generally provides no specifications for forage utilization and has the highest allocation of AUMs; therefore, it would provide the least beneficial impacts to riparian resources.

#### **4.13.2.2.4. ALTERNATIVE E**

The impacts would be the same as Alternative C because the decisions are the same.

### **4.13.2.3. IMPACTS OF LANDS AND REALTY DECISIONS ON RIPARIAN RESOURCES**

#### **4.13.2.3.1. ALTERNATIVE A AND THE PROPOSED RMP**

Alternative A and the Proposed RMP would pursue public access to the White River at the mouth of Cowboy Canyon, Bonanza Bridge, and Wagon Hound Road. Additionally, Alternative A and the Proposed RMP would pursue acquisition of Indian Trust lands in Bitter Creek and near the confluence of South and Sweetwater Canyons. These actions would have greater long-term, indirect adverse impacts to riparian resources than Alternative D (No Action), by increasing

visitor use, thereby increasing trampling of banks and spread of noxious weeds. The Proposed RMP and Alternative A would preclude mineral entry on 22,814 acres of land withdrawals, and would therefore have less indirect beneficial impacts to riparian resources than Alternative D (No Action), which would preclude mineral and agricultural entry on 35,900 acres of withdrawal lands.

#### **4.13.2.3.2. ALTERNATIVE B**

Alternative B would not pursue public access to any new lands nor acquisition of Indian Trust lands, therefore would have similar impacts to Alternative D (No Action). This alternative would preclude mineral entry on 19,202 acres of withdrawal lands, therefore having similar impacts to Alternative A.

#### **4.13.2.3.3. ALTERNATIVE C**

Lands and realty decisions and impacts under Alternative C are similar to Alternatives A and the Proposed RMP, except more protective of riparian resources because the BLM would also pursue an easement for the old Uintah Railroad bed from the Utah/Colorado line to Watson in Evacuation Wash. Land withdrawal decisions would be similar to Alternative A and the Proposed RMP, except that 13,451 additional acres would be precluded from mineral entry. Alternative C would have slightly greater indirect beneficial impacts to riparian resources than Alternative D (No Action), because 365 more acres would be withdrawn from mineral entry.

#### **4.13.2.3.4. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) precludes mineral and agricultural entry on 35,900 acres of land. Land access decisions are unspecified under Alternative D (No Action).

#### **4.13.2.3.5. ALTERNATIVE E**

Alternative E would have similar impacts to Alternative C with the exception that the 277,597 acres determined to have non-WSA wilderness characteristics would not be available for disposal or exchange. Riparian areas that lie within non-WSA areas with wilderness characteristics would remain in public ownership and be managed as ROW exclusion areas, which would have additional long-term, beneficial protection-related impacts on riparian resources.

### **4.13.2.4. IMPACTS OF LIVESTOCK AND GRAZING DECISIONS ON RIPARIAN RESOURCES**

#### **4.13.2.4.1. ALTERNATIVE A AND THE PROPOSED RMP**

Alternative A and the Proposed RMP would use a phenology-based system for timing livestock use. This system would use timing of vegetation growth to determine proper grazing limits. Due to limits on grazing time, the Proposed RMP and Alternative A would provide an intermediate amount of direct, long-term beneficial impacts to riparian resources, as compared to Alternatives

B and C. The Proposed RMP and Alternative A would provide greater direct, long-term beneficial impacts than Alternative D (No Action).

#### **4.13.2.4.2. ALTERNATIVE B**

Alternative B would use a billed use-based system for timing livestock use. This system would generally allow more time for grazing than all other alternatives, therefore having more direct, long-term adverse impacts to riparian resources than Alternative D (No Action).

#### **4.13.2.4.3. ALTERNATIVE C**

Alternative C would use an adjudicated system for timing livestock use. This system would allow the least time for grazing, compared to all alternatives. The direct, long-term beneficial impacts to riparian resources would be the highest, as compared to Alternative D (No Action).

#### **4.13.2.4.4. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would use a permitted system for timing livestock use. This system is currently in use and provides an intermediate amount of impacts between other alternatives.

#### **4.13.2.4.5. ALTERNATIVE E**

The impacts on riparian resources would be the same as Alternative C because the resource decisions are the same.

### **4.13.2.5. IMPACTS OF MINERALS DECISIONS ON RIPARIAN RESOURCES**

#### **4.13.2.5.1. PROPOSED RMP**

The Proposed RMP would potentially develop approximately 6,283 oil, gas, and CBNG wells, which is 535 more than Alternative D (No Action). The Proposed RMP would have a higher risk of more indirect, short- and long-term adverse impacts to riparian resources, due to a higher number of wells, more roads, and more acreage of surface disturbance, as compared to Alternative D (No Action).

#### **4.13.2.5.2. ALTERNATIVE A**

Alternative A would potentially develop approximately 6,391 oil, gas, and CBNG wells, which is 428 more than Alternative D (No Action). This alternative would have a higher risk of more indirect, short- and long-term adverse impacts to riparian resources, due to a higher number of wells, more roads, and more acreage of surface disturbance, as compared to Alternative D (No Action).

**4.13.2.5.3. ALTERNATIVE B**

Alternative B would potentially develop approximately 6,391 oil, gas, and CBNG wells, which is 535 more than Alternative D (No Action). This alternative would have the highest risk of indirect, short- and long-term adverse impacts to riparian resources due to a higher number of wells, more roads, and more acreage of surface disturbance, as compared to Alternative D (No Action).

**4.13.2.5.4. ALTERNATIVE C**

Alternative C would potentially develop approximately 6,224 oil, gas, and CBNG wells, which is 368 more than Alternative D (No Action). Compared to Alternatives A and B, this alternative would have the lowest risk of indirect, short- and long-term adverse impacts to riparian resources due a lower number of wells, fewer roads, and fewer acres of surface disturbance. Compared to Alternatives D (No Action), and E adverse impacts to riparian resources would be greater.

**4.13.2.5.5. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would potentially develop approximately 5,856 oil, gas, and CBNG wells in the VPA.

**4.13.2.5.6. ALTERNATIVE E**

Alternative E would potentially develop approximately 6,118 oil, gas, and CBNG wells, which would be 262 more wells than Alternative D (No Action). Compared to Alternatives A, B, and C, this alternative would have the lowest risk of indirect short- and long-term adverse impacts to riparian resources due a relatively lower number of RFD-predicted wells, fewer miles of access roads, and fewer acres of minerals-related surface disturbances. Compared to Alternative D (No Action), the impacts to riparian resources would be more beneficial in the long term because of the greater protection afforded to riparian resources.

**4.13.2.6. IMPACTS OF NON-WSA AREAS WITH WILDERNESS CHARACTERISTICS DECISIONS ON RIPARIAN RESOURCES****4.13.2.6.1. PROPOSED RMP**

Under the Proposed RMP, approximately 106,178 acres with wilderness characteristics would be managed with VRM Class II objectives, closed to oil and gas leasing and closed to woodland product harvest. OHV use would be limited to designated routes. The impacts would be beneficial in the long term because these potential surface disturbances to riparian resources within non-WSA wilderness characteristics areas would not be allowed; however, the impacts would be minor, as the affected area would be comparatively small. Compared to Alternative D (No Action), the Proposed RMP would be more beneficial because it would indirectly protect riparian areas that lie within non-WSA wilderness characteristics areas.

**4.13.2.6.2. ALTERNATIVES A, B, C, AND D**

Under these alternatives, areas with non-WSA areas with wilderness characteristics would not be managed for protection of their wilderness values.

**4.13.2.6.3. ALTERNATIVE E**

Under this alternative, 277,596 acres with wilderness characteristics (including 1,753 acres of riparian area) would be managed as exclusion areas for ROW realty actions, managed under VRM Class I objectives, close to OHV cross-country travel, closed to mineral material disposal and closed to oil and gas and other mineral leasing. The impacts would be beneficial in the long term because these potential surface disturbances to riparian resources within non-WSA wilderness characteristics areas would not be allowed; however, the impacts would be minor, as the affected area would be comparatively small. Compared to Alternative D (No Action), this alternative would be more beneficial because it would indirectly protect riparian areas that lie within non-WSA wilderness characteristics areas.

**4.13.2.7. IMPACTS OF RANGELAND IMPROVEMENT DECISIONS ON RIPARIAN RESOURCES****4.13.2.7.1. ALTERNATIVES A, B, C, E, THE PROPOSED RMP, AND D (NO ACTION)**

Vegetation treatments for rangeland improvement would total 34,640 acres, 50,900 acres, 45,860 acres, 40,390 for Alternatives A/the Proposed RMP, B, C/E, and D (No Action), respectively. Therefore, Alternative B would be the most beneficial to riparian resources, and Alternative A/the Proposed RMP would be the least beneficial, as compared to Alternative D (No Action). The Proposed RMP fencing and water development projects would have beneficial impacts by improving conditions for timed livestock grazing and would have indirect beneficial impacts on riparian areas. There may be some trampling effects along fence lines, but water developments would provide water to upland range sites, keeping livestock and other ungulates out of riparian areas. Guzzlers, reservoirs, wells, and springs would attract livestock away from riparian areas and would decrease soil disturbance and sedimentation around riparian areas.

**4.13.2.8. IMPACTS OF RECREATION DECISIONS ON RIPARIAN RESOURCES****4.13.2.8.1. PROPOSED RMP**

The effects of recreation decisions on riparian resources would generally be long-term, indirect, and beneficial, by limiting OHV use to designated areas and by providing management for areas as SRMAs. Adverse effects would occur from increased visitor traffic, development of trails, and OHV use. Adverse impacts would include trampling of banks, compaction of soils, and spread of noxious weeds. Where limits are placed on OHV travel off designated routes for big-game retrieval, beneficial effects would occur.

The Proposed RMP would manage the 4 existing SRMAs: Browns Park (18,490 acres), Nine Mile Canyon (44,168 acres), Red Mountain-Dry Fork (24, 259 acres), and Pelican Lake (1,014 acres). The Proposed RMP would establish 3 new SRMAs: Blue Mountain (42,729 acres), White

River (2,831 acres), and Fantasy Canyon (69 acres). The Proposed RMP would have direct and indirect short- and long-term beneficial impacts to riparian resources (as compared to Alternative D, No Action) by designating the White River SRMA, which would be managed as VRM Class II, limiting surface disturbance within line of sight or up to 0.5 mile either side of the river. The designation of Blue Mountain and Fantasy Park would provide management of OHV use, which would not be managed in these areas under Alternative D (No Action). Under the Proposed RMP, non-WSA lands within SRMAs would be managed for non-motorized recreation, which would have long-term beneficial impacts to riparian areas by limiting the effects of motor vehicles.

Development of up to 400 miles of non-motorized trails would have long-term indirect adverse impacts due to increasing visitor traffic in riparian zones. This would be 345 more miles of trails developed than under Alternative D (No Action) and the same as under Alternative C. Not allowing OHV use for big-game retrieval off designated routes would have long-term indirect beneficial impacts to riparian resources by limiting trampling of riparian vegetation and spread of noxious weeds. OHV use off designated trails for big-game retrieval is unspecified under Alternative D (No Action).

#### **4.13.2.8.2. ALTERNATIVE A**

The effects of recreation decisions on riparian resources would generally be long-term indirect and beneficial, by limiting OHV use to designated areas and by providing management for areas as SRMAs. Adverse effects would occur from increased visitor traffic, development of trails, and OHV use. Adverse impacts would include trampling of banks, compaction of soils, and spread of noxious weeds. Where limits are placed on OHV travel off designated routes for big-game retrieval, beneficial effects would occur.

Alternative A would manage (and in some cases expand) the 4 existing SRMAs—Browns Park (52,720 acres), Nine Mile Canyon (81,168 acres), Red Mountain-Dry Fork (24,259 acres), and Pelican Lake (1, 014 acres). Alternative A would establish 3 new SRMAs: Blue Mountain (42,758 acres), Book Cliffs (273,486), and White River (24,183 acres). Alternative A would have direct and indirect short- and long-term beneficial impacts to riparian resources as compared to Alternative D (No Action) by designating the White River SRMA, which would be managed as VRM Class II, limiting surface disturbance within line of sight or up to 0.5 mile either side of the river. The designation of Blue Mountain and Fantasy Park would provide management of OHV use, which would not be managed in these areas under Alternative D (No Action). Long-term indirect adverse impacts would occur to these areas due to increase in visitor traffic.

Development of up to 400 miles of non-motorized trails would have long-term indirect adverse impacts due to increasing visitor traffic in riparian zones. This would be 345 more miles of trails developed than under Alternative D (No Action) and the same as under Alternative C. Not allowing OHV use for big-game retrieval off designated routes would have long-term indirect beneficial impacts to riparian resources by limiting trampling of riparian vegetation and spread of noxious weeds. OHV use off designated trails for big-game retrieval is unspecified under Alternative D (No Action).

**4.13.2.8.3. ALTERNATIVE B**

Alternative B would not designate any new nor expand current SRMAs (with SRMA designation the same as Alternative D, No Action). Long-term indirect adverse impacts would be the same as Alternative D (No Action), because the SRMA designations are the same. Alternative B and D (No Action) would have the least long-term, indirect, and beneficial impacts resulting from SRMA management and limiting OHV use to designated routes. Alternative B would have beneficial impacts as compared to Alternative D (No Action) as no miles of non-motorized trails would be developed and OHV use off route for big-game retrieval would not be allowed.

**4.13.2.8.4. ALTERNATIVE C**

In addition to the acreages listed under Alternative A, Alternative C would establish an SRMA for 273,486 acres in the Book Cliffs and would expand Brown's Park SRMA to 52,720 acres, White River SRMA to 47,130 acres and Nine Mile Canyon SRMA to 81,168 acres. Long-term, indirect, adverse impacts would occur to these areas due to increases in visitor traffic. In addition to the beneficial impacts listed in Alternative A, the expansion of Browns Park SRMA (52,720 versus 18,474 acres) would further protect riparian resources in this area, as compared to Alternative D (No Action), by managing parts of the SRMA as closed to OHV use; for VRM Class I landscape objectives; and for primitive, non-motorized, and undeveloped types of recreation. Additionally, under Alternative C, the Bitter Creek drainages and the head of Sweet Water Canyon would be closed to leasing.

**4.13.2.8.5. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would designate no new SRMAs, but would continue managing Browns Park (18,474 acres) and Nine Mile Canyon (44,181 acres). Long-term indirect adverse impacts due to increases in visitor traffic, trampling of bank and spread of noxious weeds would be lower than Alternatives A, C, and E. With fewer acres managed as an SRMA than the other alternatives (except for Alternative B, with the same acreage), Alternative D (No Action) would have fewer long-term indirect and beneficial impacts resulting from limiting OHV use to designated areas and by providing management for areas as SRMAs. Management regarding OHV use off designated routes for big-game retrieval is unspecified.

**4.13.2.8.6. ALTERNATIVE E**

The impacts would be the same as Alternative C because the recreation decisions are the same.

**4.13.2.9. IMPACTS OF RIPARIAN MANAGEMENT DECISIONS ON RIPARIAN RESOURCES****4.13.2.9.1. ALTERNATIVES A, C, AND THE PROPOSED RMP**

Alternatives A, C, and the Proposed RMP would offer the most protection for riparian resources, where key streamside herbaceous vegetation, non-streamside herbaceous vegetation, and woody riparian vegetation utilization would be managed. The Proposed RMP and these alternatives would have more long-term direct beneficial impacts to riparian resources than Alternative D

(No Action), which specifies lower stubble heights, does not specify about woody riparian vegetation, and has no utilization requirements.

#### **4.13.2.9.2. ALTERNATIVE B**

Alternative B would also protect key streamside herbaceous vegetation, but would graze key non-streambank, herbaceous and woody vegetation more than Alternatives A and C. This alternative would have more direct, long-term beneficial impacts to riparian resources than Alternative D (No Action), but fewer beneficial impacts than Alternatives A and C.

#### **4.13.2.9.3. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) offers the least protection to riparian resources, because the minimum stubble height is less (3 inches versus 4 inches in Alternatives A, B, and C) and percent utilization is not specified.

#### **4.13.2.9.4. ALTERNATIVE E**

The impacts would be the same as Alternatives A, C, and the Proposed RMP because the decisions are the same.

### **4.13.2.10. IMPACTS OF SOILS AND WATERSHED DECISIONS ON RIPARIAN RESOURCES**

#### **4.13.2.10.1. ALTERNATIVE A AND THE PROPOSED RMP**

Alternative A and the Proposed RMP would use oil and gas industry slope disturbance guidelines (Gold Book) to limit surface disturbances from oil and gas activities, which would provide indirect, long-term beneficial impacts to riparian resources by reducing soil erosion on steep hillsides, and thus reducing the potential for increased stream sedimentation. Under Alternative A and the Proposed RMP, surface disturbances on slopes between 21%–40% would require erosion control, GIS modeling, and surveying, and slopes greater than 40% would not be disturbed unless other proposed construction alternatives would cause unnecessary degradation. These actions would also provide indirect, long-term beneficial impacts to riparian and wetland areas by reducing surface disturbances that cause soil erosion and subsequent stream and wetland sedimentation. These management actions would provide more indirect long-term beneficial impacts to riparian and wetland resources than Alternative D (No Action). The Proposed RMP would be slightly more beneficial than Alternative A, because it would adopt UDEQ BMPs that would limit surface discharges into waters.

#### **4.13.2.10.2. ALTERNATIVE B**

Alternative B would use oil and gas industry slope disturbance guidelines (Gold Book) to limit surface disturbances from oil and gas activities, and would require erosion control, GIS modeling, and surveying on slopes greater than 20% for unavoidable surface disturbances, with similar indirect beneficial impacts to riparian and wetland areas as described for Alternative A

and the Proposed RMP, but slightly less beneficial because disturbance would not be limited on slopes greater than 40%.

#### **4.13.2.10.3. ALTERNATIVE C**

Alternative C would have greater indirect beneficial impacts on riparian and wetland resources than the other alternatives by applying the same management actions (with similar impacts as Alternative A) on 21%–40% slopes and by prohibiting surface disturbances, and thus reducing the risk of increased stream sedimentation, on slopes greater than 40%.

#### **4.13.2.10.4. ALTERNATIVE D (NO ACTION)**

Alternative D proposes restrictions on slopes greater than 40% for mineral production only, and actions on slopes less than 40% are unspecified. Allowing other activities with no restrictions for slopes over 40% and not specifying slope restrictions on slopes less than 40% would have more indirect long-term adverse impacts to riparian and wetland resources, as compared to other alternatives.

#### **4.13.2.10.5. ALTERNATIVE E**

The impacts would be the same as Alternative C because the management decisions would be the same.

### **4.13.2.11. IMPACTS OF SPECIAL DESIGNATION DECISIONS ON RIPARIAN RESOURCES**

#### **4.13.2.11.1. PROPOSED RMP**

The Proposed RMP would have the least beneficial impacts on riparian resources due to ACEC decisions of any alternative. A total of 131,700 acres of ACECs would be designated, 42,654 fewer acres than under Alternative D (No Action). The effects of WSR designations under the Proposed RMP would be the same as described for Alternative A and C, except that the Proposed RMP would be slightly less beneficial because the White River below Asphalt Wash would not be identified as suitable for WSR designation.

#### **4.13.2.11.2. ALTERNATIVES A AND C**

Alternative C would offer the greatest protection to riparian resources through ACEC designations, protecting approximately 481,182 acres more than Alternative D (No Action). Alternative A offers the next best level of protection to riparian resources with approximately 180,069 more acres than Alternative D (No Action). Alternative C has the most miles of riparian corridor recommended for designation as either wild or scenic. Alternatives A, B, and D (No Action) would recommend for designation less miles of wild and scenic rivers than Alternative C.

**4.13.2.11.3. ALTERNATIVES B AND D (NO ACTION)**

Alternatives B and D (No Action) far less protection to riparian resources than Alternatives A and C, and would protect only half of the area that Alternative A would protect. Alternatives B and D would recommend for designation only the Lower and Upper Green River as Wild and Scenic; other streams, such as the White River, middle Green River, Bitter Creek, Argyle Creek, and Evacuation Creek would not be recommended as suitable for Wild and Scenic designation. Alternatives B and D (No Action) would not recommend for designation any new ACECs or wild and scenic river segments.

**4.13.2.11.4. ALTERNATIVE E**

The impacts on riparian resources would be the same as Alternative C because the decisions are the same.

**4.13.2.12. IMPACTS OF SPECIAL STATUS SPECIES DECISIONS ON RIPARIAN RESOURCES****4.13.2.12.1. ALTERNATIVES A ,C, AND THE PROPOSED RMP**

Alternatives A, C, and the Proposed RMP offer the best protection to riparian resources when compared to Alternative D (No Action) and are similar with respect to raptors; however, Alternative C and the Proposed RMP offer slightly more protection (particularly with respect to sage-grouse) than Alternative A.

**4.13.2.12.2. ALTERNATIVE B**

Alternative B would offer more habitat protection than Alternative D (No Action), providing more direct riparian resource protection, though the level of protection would be less than Alternatives A and C.

**4.13.2.12.3. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) offers the least direct protection of riparian resources because raptor buffers for surface disturbance are unspecified in the Book Cliffs Resource Area.

**4.13.2.12.4. ALTERNATIVE E**

The impact would be the same as Alternative C because the management decisions are the same.

**4.13.2.12.5. IMPACTS OF TRAVEL DECISIONS ON RIPARIAN RESOURCES****4.13.2.12.6. ALTERNATIVE A AND THE PROPOSED RMP**

Alternative A and the Proposed RMP would obliterate and/or return roads to their original condition when they no longer serve their permitted purpose or public interest. Additionally, roads causing resource damage would be repaired or closed, and water crossings would be

designed and built to allow for the free passage of aquatic life. These actions would provide more long-term direct, and indirect beneficial impacts to riparian resources by limiting sediment input into riparian systems, as compared to Alternative D (No Action), which is unspecified about roads and trails. With respect to OHV use, the Proposed RMP and Alternative A would have 781,657 fewer acres open, 756,200 more acres limited, and 25,457 more acres closed, as compared to Alternative D (No Action). Under the Proposed RMP and Alternative A, 4,860 miles of routes would be designated to OHV travel, where none would be designated under Alternative D (No Action). Alternative A and the Proposed RMP are second to Alternatives C and E with respect to riparian protection and would have more acreage of limited OHV use areas than Alternative C.

#### **4.13.2.12.7. ALTERNATIVE B**

Alternative B would not obliterate roads or trails if they serve a public interest. Roads causing resource damage would be repaired, but not closed if they are causing resource damage. These actions would be similar to Alternative D (No Action), with direct and indirect, short- and long-term adverse impacts to riparian resources. With respect to OHV travel, this alternative would have 782,425 fewer acres open, 772,626 more acres limited, and 9,799 more acres closed, as compared to Alternative D (No Action). Under Alternative B, 4,861 miles of routes would be designated to OHV travel.

#### **4.13.2.12.8. ALTERNATIVE C**

Alternative C would have similar impacts to Alternative A and the Proposed RMP. With respect to OHV travel, this alternative would have 782,425 fewer acres open, 466,254 more acres limited, and 316,171 more acres closed, as compared to Alternative D (No Action). Under Alternative C, 4,707 miles of routes would be designated to OHV travel. Alternative C would provide the second most protection to riparian areas of any alternative, by having the least acreage accessible to OHV use after Alternative E.

#### **4.13.2.12.9. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would be unspecified about road and trail closure, obliteration, and repair. With respect to OHV travel, this alternative would have 787,859 acres open, 887,275 acres limited, and 50,388 acres closed. These actions would have direct and indirect, short- and long-term adverse impacts to riparian resources through increased sedimentation in riparian areas.

#### **4.13.2.12.10. ALTERNATIVE E**

Alternative E would have similar impacts to Alternative C. except that this alternative would manage 782,425 fewer acres as open to cross-country OHV travel, 438,749 more acres as limited to designated routes, and 342,430 more acres closed to OHV travel, when compared to Alternative D (No Action). Under Alternative E, 44,654 miles of routes would be designated to OHV travel (53 fewer miles of OHV routes than Alternative C in order to protect areas with non-WSA wilderness characteristics). Alternative E would provide the most protection to riparian

areas of any alternative, by having the least acreage accessible to OHV use and potential riparian surface disturbances.

#### **4.13.2.13. IMPACTS OF VEGETATION MANAGEMENT DECISIONS ON RIPARIAN RESOURCES**

Vegetation management decisions that affect riparian resources are a combination of fire management, forage allocation, livestock use, and range management. The direct and indirect impacts are discussed in the sections above.

##### **4.13.2.13.1. ALTERNATIVES A, B, C, D (NO ACTION), E, AND THE PROPOSED RMP**

Generally Alternatives A and the Proposed RMP provide more protection for riparian resources than does Alternative B and less protection than Alternatives C and E. Alternative D (No Action) provides less protection for riparian resources than any other alternative.

#### **4.13.2.14. IMPACTS OF VISUAL RESOURCE MANAGEMENT DECISIONS ON RIPARIAN RESOURCES**

##### **4.13.2.14.1. PROPOSED RMP**

The Proposed RMP would designate 57,776 and 231,911 acres as VRM Classes I and II respectively, which is 4,690 and 118,225 more acres with limits on surface disturbance than Alternative D (No Action). The Proposed RMP would provide more long-term indirect beneficial impacts, when compared to Alternative D (No Action), due lower levels of sedimentation and fragmentation of riparian areas.

##### **4.13.2.14.2. ALTERNATIVE A**

Alternative A would designate 63,136 and 294,773 acres as VRM Classes I and II respectively, which is 10,050 and 181,087 more acres with limits on surface disturbance than Alternative D (No Action). This alternative would provide more long-term indirect beneficial impacts, when compared to Alternative D (No Action), due lower levels of sedimentation and fragmentation of riparian areas.

##### **4.13.2.14.3. ALTERNATIVE B**

Alternative B would designate 52,764 and 114,030 acres as VRM Classes I and II, respectively, which is 322 fewer acres than Alternative D (No Action) under VRM Class I, and 344 more acres more under VRM Class II. This alternative would thus have similar impacts to riparian resources, as compared to Alternative D (No Action).

##### **4.13.2.14.4. ALTERNATIVE C**

Alternative C would designate 145,781 and 362,660 acres as VRM Classes I and II respectively, which is 95,695 and 248,974 more acres with limits on surface disturbance. This alternative would provide the second most long-term indirect beneficial impacts to riparian resources.

**4.13.2.14.5. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would designate 53,086 and 113,686 acres as VRM Classes I and II respectively. This alternative would have long-term indirect beneficial impacts to riparian resources by restricting surface disturbances under the class objectives.

**4.13.2.14.6. ALTERNATIVE E**

Alternative E would designate 334,516 and 259,694 acres as VRM Classes I and II respectively, which is 281,430 more acres of VRM Class I and 146,008 more acres of VRM Class II, when compared to Alternative D (No Action), with greater limitations on surface disturbance. This alternative would have the most long-term indirect beneficial impacts to riparian resources by managing the most acreage under the VRM Class I objectives that would impose the most restrictions on surface disturbances to riparian resources.

**4.13.2.15. IMPACTS OF WOODLANDS AND FOREST MANAGEMENT DECISIONS ON RIPARIAN RESOURCES****4.13.2.15.1. ALTERNATIVES A, B, AND C, AND THE PROPOSED RMP**

The Proposed RMP and Alternatives A, B, and C would respectively have 546,152; 552,663; 554,108; and 552,152 acres of woodlands treated or harvested. This would be more than 250,000 more acres of harvesting and/or treatments than Alternative D (No Action), which would have long-term adverse impacts on riparian resources caused by soil erosion. Ecologically sound treatments and harvesting would occur under Alternatives A and C to ensure adequate biodiversity and reintroduce the natural fire return interval. Treatments and harvesting under Alternative B would be conducted with wood products production in mind. The goals of treatments and harvesting are unspecified under Alternative D (No Action).

**4.13.2.15.2. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would have 288,300 acres of harvesting and/or treatments, with the least adverse impacts to riparian resources from soil erosion.

**4.13.2.15.3. ALTERNATIVE E**

Under Alternative E, there would be fewer impacts than those discussed under the Proposed RMP and Alternatives A, B, and C, but more impacts than under (Alternative D, No Action). Up to 421,133 acres would have treatments or be harvested. However, this would be partially offset by increased protection on 330,573 acres of non-WSA areas with wilderness characteristics that would be managed to prohibit woodland harvesting and wood gathering (primarily willow and cottonwood), with long-term, beneficial preservation-related impacts on riparian resources.

**4.13.2.16. SUMMARY**

In general, the greatest adverse impacts would be due to livestock and grazing, oil and gas leasing (which includes CBNG), and OHV use. Therefore the alternatives with higher open areas and fewer restrictions on activities would be least beneficial and most adverse to riparian areas. Alternative D (No Action) would have the greatest direct adverse impacts due to unmanaged OHV use and lack of limits on riparian grazing. Alternative B would have the greatest indirect adverse impacts due to oil and gas leasing (which includes CBNG). Alternative A and the Proposed RMP would have a moderate amount of direct and indirect adverse impacts, and Alternatives C and E would have the least direct and indirect adverse impacts of any alternative.

**4.13.3. MITIGATION MEASURES**

Riparian and wetland areas are protected under Section 404 of the Clean Water Act. Mitigation measures are required for development activities affecting these areas. Administrative actions can be undertaken where riparian resources are being degraded.

**4.13.4. UNAVOIDABLE ADVERSE IMPACTS**

Any proposed road water crossings would result in the loss of riparian habitat.

**4.13.5. SHORT-TERM USES VERSUS LONG-TERM PRODUCTIVITY**

Construction of well pad access roads would provide a short-term mineral use that would eventually result in long-term loss of riparian vegetation due to sedimentation, unless new roads are effectively maintained and restored after use.

**4.13.6. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS**

There would be no irreversible and irretrievable impacts to riparian habitat from RMP decisions.

## **4.14. SOCIOECONOMICS**

### **4.14.1. SUMMARY AND GENERAL ASSUMPTIONS**

This analysis of impacts to socioeconomics is based on BLM-related management changes that would occur under the Proposed RMP and each of the alternatives. If impacts to some aspect of the socioeconomic situation are not mentioned in this analysis, then a negligible effect should be assumed. This analysis focuses on the socioeconomic aspects of several key resources: lands and realty, minerals, recreation, livestock and grazing, paleontology, VRM, wild horses, wildlife and fisheries, and woodlands.

#### **4.14.1.1. PROPORTIONAL IMPACTS**

Based on the information presented in Chapter 3, certain counties rely more heavily on various market sectors of the economy. Counties with a higher proportion of oil, gas, and mineral leases on BLM-administered lands would experience impacts to minerals of proportionally greater magnitude than the rest of the VPA. Similarly, counties with a higher proportion of BLM-administered lands dedicated to recreation, and thus to tourism, would experience more impacts to recreation/tourism than other counties in that market sector. Based on this concept, the following is assumed about the counties within the study area:

- Effects of minerals management will be greater in Uintah and Duchesne Counties, where the economy is largely driven by this industry.
- Effects of recreation management will be greater in Daggett County, where recreation and tourism are the driving forces in the economy.

#### **4.14.1.2. QUALITATIVE VERSUS QUANTITATIVE DATA**

Economic impacts are considered with respect to each major sector of the economy in the VPA. Where quantitative data is available, a more detailed analysis is shown. Where quantitative data is not available, a qualitative analysis is performed based on the best available data.

Many human, community impacts cannot be measured in economic terms. Such impacts are analyzed here as social impacts and include detractions from existing lifestyles, quality of life, sense of place, community values, and unjust or unfair impacts or burdens on minority and low-income populations (i.e., environmental justice).

### **4.14.2. IMPACTS COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES**

The following sections discuss, by resource, the impacts common to the Proposed RMP and all alternatives that may have a measurable effect on socioeconomics.

#### 4.14.2.1. LIVESTOCK AND GRAZING MANAGEMENT

As noted in Section 3.8 in Chapter 3, demand for animal unit months (AUMs) for livestock grazing has never outpaced the allocation of AUMs. Within the VPA, 146,220 animal unit months (AUMs) are allocated for livestock, but active permitted use for the 160 allotments is currently 137,897 AUMs. The demand for forage resources by livestock (the total average actual use) for the past 10 years was only 78,500 AUMs. Comprehensive grazing allotment information is summarized in Appendix L. Because the Proposed RMP and each of the alternatives exceeds the recent demand for AUMs (except for Alternatives C and E which propose slightly less than the 78,500 AUMs average actual use with 77,294 proposed AUMs), the socioeconomic impact would be similar across alternatives and the Proposed RMP. See Section 4.14.3.1 for more details.

According to comments received during the scoping process and the Utah Public Lands Study conducted in 2007 by Utah State University (See Appendix J), Uintah and Duchesne Counties have expressed the desire to remain largely agricultural, specifically in the grazing industry. Preserving the agricultural lifestyle is made possible by the Proposed RMPs and each of the alternatives' forage decisions; the allocation of AUMs under the Proposed RMP and each of the alternatives would allow ranchers to maintain current practices and to maintain the agricultural lifestyle that characterizes the communities in Uintah and Duchesne Counties. Under the Proposed RMP and all alternatives, the ranching communities, which possess a rich culture and history in the planning area, would not be adversely impacted by livestock and grazing management decisions.

#### 4.14.2.2. LANDS AND REALTY

Under the Proposed RMP and all alternatives, actions involving acquisition, use, disposal, and adjustment of land resources, as well as land exchanges, have the potential to impact the planning area's social and economic conditions. Management decisions pertaining to lands and realty would result in a long-term, beneficial effect on the social and economic goals of the communities in the VPA because such decisions would be made in an attempt to maximize the use of the land in the vicinity of these communities. The growth and development of lands resulting from realty actions within the VPA would be in compliance with other goals and objectives in this RMP and other guiding documents (see Section 1.5 and Section 4.06). The BLM would continue to grant reasonable access to SITLA lands and other inholdings as required by law.

#### 4.14.2.3. MINERALS

The following analysis is based on the assumption that the demand for oil and gas resources will remain high over the next 20 years, and that private industry will continue to respond to demand. Should the demand for oil, gas and minerals subside, it is possible that the wells proposed in the Proposed RMP and each of the alternatives would not be developed. Based on the trend of well development outlined in the Mineral Potential Report, a maximum of 6,530 wells is predicted for development over the next 15-20 years (BLM, 2002). Given the amount of predicted wells to be developed over the life of the plan and the subsequent revenues, it is likely that minerals

development would have the greatest impact on local revenues when compared to other BLM management areas such as recreation or forage.

While minerals development would be restricted by the management actions under the Proposed RMP and each alternative, market demand, and industry trends, major development is still projected. Assuming the continuation of the trend in well development, the number of jobs available in this industry would increase, which in turn would increase overall prosperity in the region, because wages in this sector of the economy are typically higher than service or government-related jobs. Increasing jobs would also likely increase the population in the region and create an in-migration to the communities near these jobs. Increased population, in turn, increases the need for social services and infrastructure.

Throughout the VPA, the development of oil shale is speculative at this time and is not susceptible to analysis in this EIS/RMP. If such development should occur the actions would require site-specific NEPA analysis.

Developing alternative sources of energy (i.e., wind, solar, and geothermal energy) would have both short-term and long-term, beneficial effects on local economies. Short-term benefits would take the form of jobs necessary for the construction phases of these energy projects whereas long-term benefits would take the form of job necessary to for the maintenance and operation of the project facilities. Development of alternative sources of energy would further benefit local communities by augmenting the supply of electrical power in the area.

#### **4.14.2.4. RECREATION**

Expanding infrastructure for recreational activities would provide a long-term, beneficial impact by creating a better environment for recreation and drawing more visitors to the area, and consequently increasing traveler spending. Increasing recreational opportunities in the VPA would also increase jobs and potentially population, as the demand for retail services would likely increase with greater opportunities for recreation and tourism. In general, therefore, growth in the recreation industry would be a socioeconomic benefit, as it would contribute to the overall prosperity in the communities impacted by BLM management decisions. However, some of the recreation-based employment is not year round, as tourism rates decline in the winter months.

An increase in population resulting from recreation-based employment in the area would increase the need for infrastructure and social services in the communities of the VPA. Impacts resulting from an increase in recreation and the need for additional infrastructure would be minor and short-term.

Tourism generates tax revenue that is used to support the local community, which would potentially decrease if visitation decreases. If tourism and recreation decreased due to the loss of land to other uses (such as mineral development), the tax revenue from tourism in the local community would likely decrease. A decrease in recreation activities would cause a decrease in visitor spending in the region, thus decreasing the tourism economy and the number of dollars spent on local goods and services.

### **4.14.3. PROPOSED RMP AND ALTERNATIVES IMPACTS**

#### **4.14.3.1. IMPACTS OF LIVESTOCK AND GRAZING MANAGEMENT ON SOCIOECONOMICS**

##### **4.14.3.1.1. PROPOSED RMP**

Because the amount of AUMs under the Proposed RMP (138,402 AUMs) differ less than 5% from Alternative D (No Action) (146,220 AUMs) socioeconomic impacts would be similar to current conditions.

##### **4.14.3.1.2. ALTERNATIVE A**

Impacts to socioeconomic conditions would be nearly identical to the Proposed RMP and Alternative D (No Action) as the amount of available AUMs differs by less than 1% with 137,383 AUMs allocated for livestock grazing under Alternative A.

##### **4.14.3.1.3. ALTERNATIVE B**

Under Alternative B 139,163 AUMs would be available for permitted use. Because this is just a 5% decrease in AUMs from Alternative D (No Action), socioeconomic impacts to the ranching community would be similar to current conditions.

##### **4.14.3.1.4. ALTERNATIVES C AND E**

Under Alternatives C and E 77,294 AUMs would be available for permitted use. This is a 47% decrease in AUMs from Alternative D (No Action). However, a 47% decrease in AUMs is likely to have a negligible adverse impact on the social and economic conditions related to livestock grazing. As noted in Section 3.8 the total average actual use of the AUMs over the past 10 years has been around 78,500 in contrast to the 146,161 total AUMs currently allocated for livestock. Under Alternatives C and E the 77,294 AUMs fall just slightly below the total average actual use.

##### **4.14.3.1.5. ALTERNATIVE D (NO ACTION)**

Under Alternative D (No Action), 146,220 AUMs are available for permitted use. Under this alternative impacts to the social and economic conditions of the ranching communities in the VPA would be identical to current conditions. Because the demand for AUMs is not anticipated to exceed the supply under current conditions, a loss of income and decline in social well being is not anticipated for ranchers and their families resulting from a loss of available AUMs on public land.

#### **4.14.3.2. IMPACTS OF MINERALS DEVELOPMENT ON ECONOMIC CONDITIONS**

Because of undefined market and non-market factors, the following analysis is based on simplified assumptions used to quantify general estimates of development costs, employment, production, and production revenue. Where available, separate data is used for the development

and completion of oil wells, in contrast to natural gas wells. Otherwise, data from the Utah Energy Office (UEO) on the drilling of a natural gas well is used. The direct and indirect effects of the Proposed RMP and each alternative are based on the following assumptions (in addition to the assumptions described in the Minerals section of this chapter):

**Development Costs** – A single natural gas well in the Mesaverde Group would have a total drilling and completion cost of approximately \$2,035,891, according to the UEO (UEO 2004). Much of this cost is determined by how easily the commodity can be extracted from the geologic formation. In this case, the Mesaverde Group hosting the natural gas is several thousand feet thick and is composed of interbedded shales, sands, and coals. Throughout Uintah and Duchesne Counties, the subsurface top of the group ranges between 7,500 feet and 9,200 feet, and the base of the group ranges between 10,200 feet and 12,500 feet. A well depth of 12,000 feet was used by UEO to calculate well costs. Of the total drilling and completion costs, approximately \$1,647,000 (or 80% of the total cost of the well) is assumed to be spent in Uintah and Duchesne Counties, allocated to various local and regional industries and economic sectors, including retail and wholesale trade, construction, services, transportation, and public utilities.

**Employment** – Using recent data from the State of Utah, it is possible to project the numbers of jobs likely to be created by drilling and completing a well in the Uinta Basin. A study done by the Utah Energy Office (UEO, 2004) estimated the number of jobs in all sectors that drilling and completing a single well in the Basin would create, which UEO estimated at 14.8. The study cautions that the projection is for a single well; additional wells would likely use the most of these same employees. Table 4.14.1 confirms this likelihood. As of 2006, for example (the most recent year for which complete data is available), the number of employees per well in Uintah County was 0.67. For the five years prior to this, the ratio varied from a low of 0.463 to the 0.67 reported for 2006. Similarly, one can compute the number of additional employees in the industry in Uintah County in relationship to the number of new wells drilled. Although the numbers vary somewhat from year to year, Table 4.14.1 shows that the highest multiple was in 2006 at 1.267 additional employees per new producing well brought on-line; the average for all positive years was 1.03. This data is not inconsistent with the UEO study, which estimated that most of the new job creation would be in the services, retail and wholesale trades, with only 1.7 of the 14.8 projected new jobs in the oil and gas industry. The recent lower numbers are likely due to economies of scale resulting from large-scale development. If all wells, including dry holes, were included, the ratio would be less. These results should not be surprising, in that the industry can quickly relocate crews to new drilling platforms as wells are drilled and completed. Once completed, relatively few employees can oversee the operation of numerous wells and associated infrastructure.

As stated above, the UEO study projected an additional non-oil and gas jobs that a single well would create at 13.1 jobs (14.8 total minus 1.7 specific to oil and gas). The information from UEO assumes that employment for 14.8 individuals is required for one well and it would require 14.8 employees for each well thereafter. The numbers used from report do not take into account that one employee may be able to complete the tasks required for numerous wells, for example a clerk in a retail store could accommodate the needs of several oil and gas employees. In other words, one cannot assume a strictly multiplicative increase for additional wells. This is borne out

by a recent study done for the State of Utah by the University of Utah<sup>13</sup>. This study estimated total employment in the Uinta Basin at 19,852 employees. Of this total, the study estimates that 9,835 jobs were directly or indirectly related to the oil and gas industry, with direct employment of 3,959. This suggests a multiplier effect of 2.48 (9835/3959). Although a significant economic impact in itself, this is considerable less than the multiplier suggested by the earlier UEO study. Once again, this can be explained by the fact that the UEO study estimated the impact of a single well, which misses the economies of scale which result from large-scale development of the type currently experienced in the Uinta Basin. Given this recent State-provided data, subsequent analysis in this section will assume 1.26 direct and 2.48 indirect jobs created per additional well drilled over the life of the plan (2006 data). Wage data from the same study, average wages for employees in the oil and gas industry in the Uinta Basin were \$65,482 in 2006; average wages for all other jobs were \$30,607. Combining this data, the analysis which follows will assume that each new well could create 3.74 jobs, generating \$158,412 wage income annually. These numbers are based on producing wells, rather than wells drilled. Given that not all exploration efforts are successful, the actual economic impact per well drilled, based on the RFD, will probably be lower.

**Table 4.14.1. Producing Wells and Employment in the Oil and Gas Industry-Uintah County, 2001-2006**

Year	Producing Wells <sup>14</sup>	Employment <sup>15</sup>	Oil and Gas Employment per Well	Change in Well Numbers	Change in Employment	Ratio of Change in Employment to Change in Wells
2001	2650	1376	0.519			
2002	2867	1327	0.463	217	-49	-0.226
2003	3119	1564	0.501	252	237	0.940
2004	3471	1830	0.527	352	266	0.756
2005	3875	2254	0.582	404	424	1.050
2006	4452	2985	0.670	577	731	1.267

**Production** – The average value of oil, gas, and CBNG in the region is multiplied by that region's production (based on the potential for well development under the Proposed RMP and each alternative) to achieve a long-term sales figure for the region.

As stated in Chapter 3, the Geologic and Engineering Team in the BLM VFO estimated that 6,530 wells could be drilled in the VPA during the planning period. Of these wells, approximately 31% (or 2,055) would be oil, 67% (or 4,345) would be gas, and 2% (or 130) would be CBNG. Given the total number of wells under the Proposed RMP and each alternative,

<sup>13</sup> Source: The Structure and Economic Impact of Utah's Oil and Gas Exploration and Production Industry Phase I - The Uinta Basin, Bureau of Economic and Business Research, University of Utah, November, 2007)

<sup>14</sup> Source: State of Utah, Division of Oil, Gas and Mining

<sup>15</sup> Source: US Bureau of Labor Statistics, Quarterly Census of Employment and Wages (as reported in *The Structure and Economic Impact of Utah's Oil and Gas Exploration and Production Industry Phase I - The Uinta Basin*, Bureau of Economic and Business Research, University of Utah, November, 2007)

the percentages have been used to estimate the different types of wells that could be developed (Table 4.14.2).

**Table 4.14.2. Estimated Number of Wells under the Proposed RMP and Each Alternative, by Resource Type**

	Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D (No Action) <sup>16</sup>	Alternative E
Oil	1,655	1,655	2,015	1,979	1,858	1,957
Gas	4,216	4,216	4,250	4,130	3,886	4,037
CBNG	124	124	126	116	112	114
<b>Total</b>	<b>6,342</b>	<b>6,342</b>	<b>6,391</b>	<b>6,224</b>	<b>5,856</b>	<b>6,118</b>

According to the Energy Information Administration (EIA), the current-day oil price is \$60.78 per 42-gallon barrel of oil (EIA 2006). In 2004, the average yearly production per oil well in Utah was 7,141 barrels of oil. Therefore, assuming that 7,141 barrels are recovered, potential recovery value per oil well is \$434,030 ( $7,141 \times \$60.78$ ). The life of each well is estimated to be 15-20 years. The rate of production per oil well declines approximately 10% per year after the initial year. Therefore, recovery value per well would begin at \$434,030 and decrease 10% per year throughout the life of the well.

According to the EIA, the current-day natural gas price is \$7.28 per thousand cubic feet (Mcf) (EIA 2006). The UEO report assumes 200 million cubic feet of gas will be produced from a single well over a 1-year period. Therefore, assuming that 200 million cubic feet of natural gas is recovered, potential recovery value per natural gas well is \$1.46 million per year ( $200,000,000 \times \$7.28/1,000$ ). The life of each well is estimated to be 25 years. The rate of production declines approximately 10% per year after the initial year, according to the UEO. Therefore, the recovery value per well would begin at \$1.46 million and decline 10% per year throughout the life of the well.

The natural gas derived from CBNG development accounts for approximately 7% of total natural gas production in the U.S. (MSU 2003). In the VPA, the anticipated production of natural gas from CBNG is approximately 2% of all natural gas (Table 4.14.2). Given the low number of CBNG wells predicted for the area, a detailed socioeconomic analysis of the well production is not provided.

**Fiscal Impacts** - The drilling and completion of wells in the VPA would have an impact on local and state governments due to services provided and tax and other revenue received. According to the UEO report, the drilling and completion of a single well in the Uinta Basin would result in gross state revenue growth of \$74,134. Approximately 26% (or \$19,352) of the state revenue is estimated to come from general sales tax. Sales tax in Uintah, Duchesne, and Daggett Counties is 6.5, 6.0 and 6.0 respectively. Oil and gas development generates sales tax for local economies by

<sup>16</sup> Alternative D does not include the split-estate lands within the Hill Creek Extension. Therefore, less wells would be predicted for development when compared to the action alternatives. See Section 4.8.1.1 for more detail on split-estate lands.

purchasing local goods and services. The industry workers spend their earnings in local communities, thereby adding to the sales tax revenue. Other tax revenues contributing to the state and local economy would come from general sales tax, as well as individual income tax, education charges, motor fuel sales tax, and corporate income tax (UEO 2004).

Individual income tax and employee retirement are also large components of gross state revenues. Other charges and revenue, such as education charges, motor fuel sales tax, and corporate income tax, would contribute to smaller portions of gross state revenue. Local gross revenues would grow by \$45,974 per well including other charges and revenue, utility and liquor store revenue, and general sales tax. Local governments also receive property tax revenues (ad valorem tax) of \$3,216 per well (UEO 2004).

The estimated ad valorem taxes for each commodity type are based on productions, assessed values, and current tax rates. Ad valorem taxes assessed on property associated with oil and gas operations generate tax revenue for the counties in which production takes place; with respect to this RMP, the greater number of producing wells in the VPA, the greater the generation of property taxes associated with oil and gas extraction assets. The projected ad valorem tax revenue for the Proposed RMP and each alternative is provided in the sections below.

Tax and royalty revenue would be realized for the life of the well, with diminishing returns after maximum production is reached in the first year. The severance tax and royalty revenue generated from natural resource development depends on the amount of the commodity produced. Given the uncertainty of both the geology and the market, the quantification of revenue here is somewhat speculative.

The total revenue is allocated to the federal government (Minerals Management Service). Of the total 10% pays administrative fees, 45% is allocated to the federal government (into Reclamation and General Funds), 45% is paid to the state, and the state then redistributes 40% of the royalty back to the county of origin (BLM 2005). The majority of the balance is used to fund other local projects, such as water projects of recreation facilities.

Royalty revenue to the federal, state, and county governments equals approximately 12.5% of production revenue. Assuming the recovery value for one oil well is \$434,030 per year, royalty revenues would be \$54,253.75 per well at maximum production ( $\$434,030 \times 0.125$ ). If the recovery value for one natural gas well is \$1.46 million per year, royalty revenues would be \$182,500 per well at maximum production ( $\$1.46 \text{ million} \times 0.125$ ). Because the number of natural gas wells to be drilled in the planning area is more than double the amount of oil wells across all alternatives and the Proposed RMP, the following analysis will use recovery value of natural gas wells only. As the reader can see from the revenues listed above, natural gas revenues are higher per well than oil, thus suggesting that overall recovery and revenues would be lower if oil wells were substituted for gas wells. The analysis also assumes that all of the wells under the Proposed RMP and each alternative would be producing at maximum production and operating at the same time.

The severance taxes collected on minerals production are distributed within the state according to a formula published in the Utah State statutes. Severance tax revenues are distributed to a

variety of state and local entities, including the state's general fund, the state highway fund, counties, cities, and towns. Local government entities within the VPA would benefit from only a percentage of severance taxes collected on production within the VPA. However, these entities would also benefit from severance taxes collected on minerals production occurring in other parts of the state (BLM 2003).

In 2002, the severance tax rate for oil and gas development on Utah lands was 3% of the value, up to and including the first \$13 per barrel of oil and \$1.50 per MCF of natural gas, and 5% of the value above these prices. In Utah, it is estimated that two-thirds of the oil and gas severance tax is due to natural gas production (University of Utah 2003).

It is assumed that the greatest amount of oil and gas activity within the planning area would generate the greatest amount of sales tax revenue for counties and local communities. Because it not possible to accurately distinguish, in most cases, between sales tax revenue from oil and gas-related versus tourism the analysis of sales tax contributions is qualitative. Sales tax revenues are included in the analysis below under state and local revenues based on development costs.

#### **4.14.3.2.1. PROPOSED RMP**

Under the Proposed RMP, 1,916,936 acres would be open to CBNG, oil, and gas development under Standard Stipulations, Timing and Controlled Surface Use, and No Surface Occupancy categories of CBNG and oil and gas development. The total predicted number of wells developed would be 6,342. Of the 6,342 total predicted wells, 1,655 would be oil, 4,216 would be gas, and 124 would be CBNG.

Assuming that the drilling and completion of one well would create 3.74 jobs (see section 4.14.3.1), under the Proposed RMP, there would be 23,719 jobs resulting from 6,342 wells ( $14.8 \times 6,342$ ), or 1,185 jobs annually if distributed evenly over 20 years (assuming that all 6,342 wells were in operation at the same time). Increases in the number of potential wells that could be developed under the Proposed RMP would have a long-term direct, beneficial effect on jobs, with an increase of approximately 1,817 jobs throughout the life of the RMP in comparison to Alternative D (No Action). However, increasing jobs in this sector may increase the region's dependency on this industry, which consequently increases the risk of economic downturn due to a bust cycle in oil and gas development.

With an annual estimated wage income at \$158,412 per well (see section 4.14.3.1, Proposed RMP) would result in \$1 billion dollars in wage income over the life of the plan or approximately \$50.2 million annually.

Minerals decisions under the Proposed RMP would increase the costs of developing the total predicted oil and gas wells by \$0.1 billion, when compared to Alternative D (No Action). Such development would potentially create a total cost of development of \$12.9 billion over 20 years ( $2,035,891 \times 6,342$  wells), or approximately \$645.6 million over one year ( $(2,035,891 \times 6,342) \div 20$ ). Increases in the total number of potential wells from current management practices would have a long-term, beneficial effect on state and local revenues. Gross state revenue generated as a result of development costs is estimated to be \$470.2 million with the drilling and completion

of all wells under the Proposed RMP ( $\$74,134 \times 6,342$  wells). Local revenue is estimated to be \$291.6 million with the completion of all wells ( $\$45,974 \times 6,342$ ). Sales tax contributions from oil and gas developers and their employees would be slightly less (49 less predicted wells) than Alternative B, which has the greatest number of potential wells and greater than Alternative D (No Action), which has 486 less wells than the Proposed RMP. Ad valorem tax revenues for the Proposed RMP would total \$20,395, 872 ( $6,342 \times 3,216$ ).

In comparison to Alternative D (No Action), royalties paid to the state and counties from oil and gas sales on federal lands (including mineral lease revenue, and severance taxes) would increase in proportion to the increase in production, which would be a long-term beneficial effect on economics in the region. Royalty and tax revenue paid to the state and local governments resulting from oil and gas development would increase by 7.6% compared to Alternative D (No Action).

Annual recovery value for 6,342 wells under the Proposed RMP is 1.157 billion dollars ( $182,500 \times 6,342$ ), of this 45% or 520.8 million dollars ( $1,157,415,000 \times .45$ ) would be royalty revenue for the federal government and 40% or 462.9 million dollars ( $1,157,415,000 \times .40$ ) in royalty revenue would be distributed back to the counties. An increased number of wells could have a long-term direct adverse impact on the tourism sector of the economy by reducing contiguous areas available for outdoor recreation, and affecting the quality of recreational experiences from visual intrusion and fragmented areas and trails. Tourism generates tax revenue that is used to support the local community, which would decrease if visitation decreases. Reducing outdoor recreation opportunity and quality could also effect employment in this sector.

An additional potential impact to state revenues is the potential loss to SITLA from not being able to lease or develop lands bordered all or in part by non-WSA lands with wilderness characteristics. The value of these lands for oil and gas leasing and/or development may be reduced if all or portions of public lands bordering these state lands are closed to new oil and gas leasing. This in turn could reduce the monies collected by the state (through SITLA), including royalties and severance taxes. These impacts can be estimated using current data, and incorporating several assumptions. If one assumes that SITLA lands whose perimeter is more than 50% bounded by BLM acreage closed to new oil and gas leasing, as a result of implementing the Proposed RMP, would be unavailable for development, and using the projections of the RFD, one can project that less than one well (0.27) would not be drilled over the life of the plan. Using data provided by the State of Utah, royalty payments to wells on SITLA lands averaged \$57,065 as of early 2008. Severance taxes averaged \$9,335 for all wells, regardless of land ownership. Multiplying these figures by the wells assumed that would not be drilled, the fiscal loss to the state would total \$15,361 in royalties and \$2,513 in severance taxes in any one year that such wells were not in operation. The more years a well was in operation over the life of the plan, the economic impacts would be proportionately greater.

#### **4.14.3.2.2. ALTERNATIVE A**

Under Alternative A the amount of wells is identical to the Proposed RMP (6,342); therefore, impacts to socioeconomics would be the same as discussed above in Section 4.14.3.2.1 Proposed RMP.

**4.14.3.2.3. ALTERNATIVE B**

Alternative B would open 1,914,000 acres in the Standard Stipulations, Timing and Controlled Surface Use, and No Surface Occupancy categories for CBNG and oil and gas development. The total number of predicted wells would be 6,391. Of the 6,391 total predicted wells, 2,015 would be oil, 4,205 would be gas, and 126 would be CBNG.

Assuming that the drilling and completion of one well would create 3.74 jobs, under Alternative B, there would be 23,902 jobs resulting from 6,391 wells, or 1,195 jobs annually if distributed evenly over 20 years (assuming that all 6,391 wells were in operation at the same time). Increases in the number of potential wells under Alternative B would have a long-term direct beneficial effect on jobs. An increase of 369 potential wells over Alternative D (No Action) would result in an increase of approximately 2,000 jobs in this industry over 20 years, or approximately 100 jobs in one year. However, increasing jobs in this sector may increase the region's dependency on this industry, which consequently increases the risk of economic downturn due to a bust cycle in oil and gas development.

With an annual estimated wage income at \$158,412 per well, Alternative B would result in \$1.01 billion dollars in wage income over the life of the plan or approximately \$50.6 million annually.

Minerals decisions under Alternative B would increase the costs of developing the total predicted oil and gas wells by \$1.1 billion, compared to Alternative D (No Action). Such development would potentially create a total cost of development of \$13.0 billion over 20 years, or approximately \$650.9 million over one year.

An increase in the total number of potential wells from current management practices would have a long-term, beneficial effect on state and local revenue. Gross state revenue generated as a result of development costs is estimated to be \$473.8 million with the drilling and completion of 6,391 wells under Alternative B. Local revenue is estimated to be \$293.8 million with the completion of all wells under Alternative B. Ad valorem tax revenues for the Alternative B would total \$20,553,456. Sales tax contributions from oil and gas developers and their employees would be greatest under Alternative B because the greatest amount of wells and employees needed to operate these wells would be anticipated under this alternative.

In comparison to Alternative D (No Action), royalties paid to the state and counties from oil and gas sales on federal lands (including mineral lease revenue and severance taxes) would increase in proportion to the increase in production, which would be a long-term, beneficial effect on economics in the region. Royalty and tax revenue paid to the state and local governments resulting from oil and gas development would increase by 8.3% compared to Alternative D (No Action).

Annual recovery value for 6,391 wells under Alternative B would be \$1.166 billion, of this 45% or \$524.8 million would be royalty revenue for the federal government and 40% or \$466.5 million in royalty revenue would be distributed back to the counties. Federal and local royalty revenues would be greatest under Alternative B, thus having the most substantial beneficial impact on effected economies when compared to the other alternatives.

An increased number of wells could have a long-term direct adverse impact on the tourism sector of the economy by reducing contiguous areas available for outdoor recreation, and affecting the quality of recreational experiences from visual intrusion and fragmented areas and trails. Tourism generates tax revenue that is used to support the local community, which would decrease if visitation decreases. Reducing outdoor recreation opportunity and quality could also effect employment in this sector.

#### **4.14.3.2.4. ALTERNATIVE C**

Alternative C would open 1,914,000 acres in the Standard Stipulations, Timing and Controlled Surface Use, and No Surface Occupancy categories for CBNG and oil and gas development. The total number of predicted wells under Alternative C would be 6,225. Of the 6,225 total predicted wells, 1,979 would be oil, 4,130 would be gas, and 116 would be CBNG.

Assuming that the drilling and completion of one well would create 3.74 jobs, under Alternative C, there would be 23,277 jobs resulting from 6,225 wells, or 1,163 jobs annually if distributed evenly over 20 years (assuming that all 6,225 wells were in operation at the same time). Increases in the number of potential wells under Alternative C would have a long-term direct beneficial effect on jobs compared to Alternative D (No Action), as Alternative C would potentially increase the jobs in this industry by approximately 1,376 over 20 years, and approximately 68 jobs in one year. However, increasing jobs in this sector may increase the region's dependency on this industry, which consequently increases the risk of economic downturn due to a bust cycle in oil and gas development.

With an annual estimated wage income at \$158,412 per well, Alternative C would result in \$986 million dollars in wage income over the life of the plan or approximately \$49.3 million annually.

Minerals decisions under Alternative C would increase the costs of developing the total predicted oil and gas wells by \$0.8 billion, compared to Alternative D (No Action). Such development would potentially create a total cost of development of \$12.7 billion over 20 years, or approximately \$633.7 million over one year.

An increase in the total number of potential wells from current management practices would have a long-term, beneficial effect on state and local revenue. Gross state revenue generated as a result of development costs is estimated to be \$461.5 million with the drilling and completion of 6,225 wells under Alternative C. Local revenue is estimated to be \$286.2 million with the completion of all wells under Alternative C. Ad valorem tax revenues for the Alternative C would total \$20,016,384. Sales tax contributions from oil and gas developers and their employees would be slightly than Alternatives A and B because the total amount of predicted wells is 117 less than Proposed RMP and 166 less than Alternative B. With 369 more wells proposed than Alternative D (No Action), sales tax revenues would be greater under Alternative C.

In comparison to Alternative D (No Action), royalties paid to the state and counties from oil and gas sales on federal lands (including mineral lease revenue and severance taxes) would increase in proportion to the increase in production, which would be a long-term, beneficial effect on

economics in the region. Royalty and tax revenue paid to the state and local governments resulting from oil and gas development would increase by 5.9% compared to Alternative D (No Action).

Annual recovery value for 6,225 wells under the Proposed RMP is \$1.136 billion, of this 45% or \$511.2 million would be royalty revenue for the federal government and 40% or \$454.4 million in royalty revenue would be distributed back to the counties. The overall contributions from royalty revenues under Alternative C would be greater than Alternative D (No Action), but slightly less than Alternatives A and B.

#### **4.14.3.2.5. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would open 1,725,500 acres in the Standard Stipulations, Timing and Controlled Surface Use, and No Surface Occupancy categories for CBNG and oil and gas development.<sup>17</sup> A total of 5,856 wells is predicted under this alternative. The total number of newly created jobs would be approximately 19,910 over 20 years, or 995 if distributed evenly over a 20-year period (assuming that all 5,856 wells were in operation at the same time). With an annual estimated wage income at \$158,412 per well, Alternative D (No Action) would result in \$927.6 million dollars in wage income over the life of the plan or approximately \$46.4 million annually.

Of the 5,856 total predicted wells, 1,858 would be oil, 3,886 would be gas, and 112 would be CBNG. Total development costs under Alternative D (No Action) would be \$11.9 billion over a 20-year period, or approximately \$596.1 million over one year. Gross state revenue from oil and gas development costs would be estimated to be \$434.1 million with the drilling and completion of the 5,856 wells predicted under Alternative D (No Action), and local revenue is estimated to be \$269.2 million. Ad valorem tax revenues for the Alternative D (No Action) would total \$18,832,896. Sales tax contributions from oil and gas developers and their employees would be substantially less under Alternative D (No Action), compared to Alternative B (maximum amount of wells), because 535 less wells would require fewer employees and overall development costs within the planning area.

Annual recovery value for 5,856 wells under Alternative D (No Action) is \$1.068 billion, of this 45% or \$480.9 million would be royalty revenue for the federal government and 40% or \$427.4 million in royalty revenue would be distributed back to the counties. This alternative would generate the least amount of royalty revenues compared to all of the alternatives. Under Alternative D (No Action), royalties paid to the state and counties from oil and gas sales on federal lands (including mineral lease revenue and severance taxes) would be the least of the five alternatives (this is because the Hill Creek Extension [188,500 acres] is not included in the total acreage calculations of Alternative D, No Action).

**4.14.3.2.6. ALTERNATIVE E**

Alternative E would open 1,914,000 acres in the Standard Stipulations, Timing and Controlled Surface Use, and No Surface Occupancy categories for CBNG and oil and gas development. The total number of predicted wells under Alternative E would be 6,118. Of the 6,118 total predicted wells, 1,957 would be oil, 4,037 would be gas, and 114 would be CBNG.

Assuming that the drilling and completion of one well would create 3.74 jobs; under Alternative E, there would be 22,881 jobs resulting from 6,118 wells, or 1,144 jobs annually if distributed evenly over 20 years (assuming that all 6,118 wells were in operation at the same time). Increases in the number of potential wells under Alternative E would have a long-term direct beneficial effect on jobs compared to Alternative D (No Action), as Alternative E would potentially increase the jobs in this industry by approximately 979 over 20 years, and approximately 49 jobs in one year. However, increasing jobs in this sector may increase the region's dependency on this industry, which consequently increases the risk of economic downturn due to a bust cycle in oil and gas development.

With an annual estimated wage income at \$158,412 per well, Alternative E would result in \$969.1 million dollars in wage income over the life of the plan or approximately \$48.4 million annually.

Minerals decisions under Alternative E would increase the costs of developing the total predicted oil and gas wells by \$0.6 billion, compared to Alternative D (No Action). Such development would potentially create a total cost of development of \$12.5 billion over 20 years, or approximately \$623 million over one year.

An increase in the total number of potential wells from current management practices would have a long-term, beneficial effect on state and local revenue. Gross state revenue generated as a result of development costs is estimated to be \$453.6 million with the drilling and completion of 6,118 wells under Alternative E. Local revenue is estimated to be \$281.3 million with the completion of all wells under Alternative E. Ad valorem tax revenues for the Alternative E would total \$19,675,488. Sales tax contributions from oil and gas developers and their employees would be slightly less than Alternative C because the total amount of predicted wells is 106 less than Alternative C. With 262 more wells proposed than Alternative D (No Action), sales tax revenues would be greater under Alternative E.

In comparison to Alternative D (No Action), royalties paid to the state and counties from oil and gas sales on federal lands (including mineral lease revenue and severance taxes) would increase in proportion to the increase in production, which would be a long-term, beneficial effect on economics in the region. Royalty and tax revenue paid to the state and local governments resulting from oil and gas development would increase by 4.5% compared to Alternative (No Action).

Annual recovery value for 6,118 wells under Alternative E is \$1.116 billion, of this 45% or \$502.4 million would be royalty revenue for the federal government and 40% or \$446.6 million in royalty revenue would be distributed back to the counties. The overall contributions from

royalty revenues under Alternative E would be greater than Alternative D (No Action), but slightly less than Alternative C.

An additional potential impact to state revenues is the potential loss to SITLA from not being able to lease or develop lands bordered all or in part by non-WSA lands with wilderness characteristics. The value of these lands for oil and gas leasing and/or development may be reduced if all or portions of public lands bordering these state lands are closed to new oil and gas leasing. This in turn could reduce the monies collected by the state (through SITLA), including royalties and severance taxes. These impacts can be estimated using current data, and incorporating several assumptions. If one assumes that SITLA lands whose perimeter is more than 50% bounded by BLM acreage closed to new oil and gas leasing, as a result of implementing Alternative E, would be unavailable for development, and using the projections of the RFD, one can project that over twenty-four wells (24.49) would not be drilled over the life of the plan. Using data provided by the State of Utah, royalty payments to wells on SITLA lands averaged \$57,065 as of early 2008. Severance taxes averaged \$9,335 for all wells, regardless of land ownership. Multiplying these figures by the wells assumed that would not be drilled, the fiscal loss to the state would total \$1,425,379 in royalties and \$233,171 in severance taxes in any year in which all 24.49 wells would have been in operation. This amount could increase over the life of the plan, as it is likely that some fraction of these wells would be in operation in several (or even all) years of the plan.

The following table summarizes the effects of oil and gas development on the regional economy.

**Table 4.14.3. Summary of the Impacts of Oil and Gas Development in the VPA**

	<b>Proposed RMP</b>	<b>Alternative A</b>	<b>Alternative B</b>	<b>Alternative C</b>	<b>Alternative D (No Action)*</b>	<b>Alternative E</b>
<b>Predicted Wells</b>						
Total Acreage	1,916,936	1,914,000	1,914,000	1,914,000	1,725,500	1,914,000
Acreage Open	1,727,194	1,850,162	1,861,450	1,685,754	1,672,960	1,358,454
% of Total Acreage Open	90%	96%	97%	88%	97%	71%
Total Well Potential	6,342	6,342	6,391	6,224	5,856	6,118
<b>Jobs (Based on 3.74 jobs per Well)</b>						
Total Jobs over 20 Years	23,719	23,719	23,902	23,277	19,910	22,881
Jobs per Year (if distributed evenly over 20 years)	1,185	1,185	1,195	1,163	995	1,144
<b>Annual Wage Income (Based on \$158,412)</b>						
Total Income Over 20 Years	1.00 billion	1.00 billion	1.01 billion	986.0 million	969.1 million	969.1

**Table 4.14.3. Summary of the Impacts of Oil and Gas Development in the VPA**

	<b>Proposed RMP</b>	<b>Alternative A</b>	<b>Alternative B</b>	<b>Alternative C</b>	<b>Alternative D (No Action)*</b>	<b>Alternative E</b>
Total Income Per Year (if distributed evenly over 20 years; millions of dollars)	50.2	50.2	50.6	49.3	46.4	48.4
<b>Development Costs (Based on Average \$2,035,891 Development Cost per Well)**</b>						
Development Cost over 20 Years (billions of dollars)	12.9	12.9	13.0	12.7	11.9	12.5
Development Cost per Year (if distributed evenly over 20 years; millions of dollars)	645.6	645.6	650.6	633.7	596.1	623
<b>Ad Valorem Tax Revenue</b>						
Total Ad Valorem Tax per well over 20 years (millions of dollars)	20.4	20.4	20.5	20.0	18.8	19.6
<b>Total Recovery Value Annually***</b>						
Recovery Value based on wells per alternative and the Proposed RMP (billions)	1.157	1.157	1.166	1.136	1.068	1.116
<b>Gross Annual Royalty Revenue ***</b>						
Federal Revenue (millions of dollars)	520.8	520.8	524.8	511.2	480.9	502.4
County Revenue (millions of dollars)	462.9	462.9	466.5	454.4	427.4	446.6

\*The Hill Creek Extension (188,500 acres) was not leased in the Book Cliffs RMP and therefore is not included in the total acreage calculations of Alternative D (No Action).

\*\* Development costs do include a portion of the income effects from employment, as such this leads to some double-counting

\*\*\*Assuming wells are producing at maximum production.

Data for development costs, ad valorem taxes, and projected gross revenue from UEO 2004 Final Report.

**4.14.3.3. IMPACTS OF MINERALS DEVELOPMENT ON SOCIAL CONDITIONS**

Social well-being in communities is often disrupted during boom periods, characterized by extreme growth rates that can double population in a decade or less. Studies in natural resource driven communities—including in Utah—have found that disruptive social effects may not last once stability is re-established (Smith et al. 2001). The rapid population growth that can fuel these disruptive social effects, however, has not occurred to date in the planning area. State of Utah population estimates put the overall population growth for the three counties comprising the planning area at approximately 10% from 2000–2006. Conversely, the State of Utah as a whole grew 14.1% in the same period, a rate of growth 40% higher than the planning area. The rate of population growth in the planning area may be understated, as it does not include transient workers. Even if all employees in the minerals industry in Uinta Basin were transient (an unlikely scenario), population growth would still not approach the levels cited in the Smith et al study.

Another negative social impact often mentioned as a consequence of a boom environment is an increase in crime, presumably due to a more transient workforce which may not share many local values. This, however, has not occurred within the planning area. Table 4.14.4 shows crime indices as reported by the State of Utah for the State as a whole and for Uintah County and Vernal City, areas which presumably feel most of the impact from any increase in crime resulting from a boom in minerals development.

As Table 4.14.4 indicates, Uintah County as a whole has consistently reported lower crime than the State of Utah as a whole. Vernal City reported higher crime rates than both the state and the county up to 1985. Since 2000, however, Vernal City's reported crime rate has been very similar to the State of Utah, and lower from 2003-2005. This data suggests that an increase in crime, although not outside the realm of possibility in the future, has not yet occurred.

**Table 4.14.4. Reported Crime Indices for  
State of Utah, Uintah County and  
Vernal City, 1980-2005**

Year	State	Uintah	Vernal
1980	5,880.6	1,974.6	10,177.2
1985	5,317.3	1,843.4	8,505.8
1990	5,659.9	231.9	9,738.1
1995	6,090.8	2,523.3	8,383.7
2000	4,476.1	1,758.2	4,491.3
2001	4,243.0	1,832.8	5,561.2
2002	4,452.4	1,558.4	5,986.8
2003	6,640.4	1,527.3	5,113.1
2004	9,831.7	2,149.0	7,682.7
2005	6,054.9	2,070.5	3,984.4

Data sources:

<http://www.justice.utah.gov/Research/Crime/CrimeRate.pdf>;

<http://bci.utah.gov/Stats/StatsHome.html>

A major factor that could alleviate or even mask a decline in social well-being is the recognition that the area has come to depend more on oil and gas development over the recent past. The Smith et al study concludes that even communities which suffer social disruptions due to minerals booms tend to recover quickly once the boom has ended.

#### **4.14.3.4. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON SOCIOECONOMICS**

##### **4.14.3.4.1. PROPOSED RMP**

Under the Proposed RMP, 106,178 acres lands would be managed for the protection of non-WSA lands with wilderness characteristics. Managing the 106,178 acres (15 areas) to maintain their wilderness characteristics could have potential beneficial *or* adverse impacts on socioeconomics depending on the resource impacted. Impacts to resources as a result of management prescriptions for non-WSA lands with wilderness characteristics not listed in the sections below are anticipated to have negligible impacts to socioeconomics.

##### **4.14.3.4.1.1. Livestock Grazing**

Under the Proposed RMP livestock grazing would not be permitted in Desolation Canyon non-WSA lands with wilderness characteristics. The absence of grazing would likely improve riparian conditions and watershed values over time. Improving the natural condition of the area would sustain the setting necessary to support wilderness-related recreation opportunities (e.g., hiking, backpacking, river floating, hunting, and wildlife viewing). Improving the recreation opportunities (and overall quality of the visitor experience) within the Nine Mile area could lead to an increase in tourism and subsequent tourist related spending in the surrounding communities, thus having a beneficial impact on the local economies.

Because the amount of AUMs area identical under Alternative D (No Action) and the Proposed RMP, regardless of the designation of non-WSA lands with wilderness characteristics, adverse impacts to the ranching community would not be likely.

##### **4.14.3.4.1.2. Minerals**

All or parts (between 70% and 100%) of 13 non-WSA lands with wilderness characteristics, totaling up to 162,844 acres, would lose their natural characteristics and opportunities for solitude and primitive recreation due to surface disturbance and the presence and noise of people and equipment during exploration for and development of oil and gas resources in the VPA. See Section 4.10.2.5.1.1 for which areas would be impacted. Given the existing leases in the area, resource potential, and past production it is likely that all of these areas would lose their wilderness potential. This could have an adverse effect on visitors to the area who are seeking opportunities for solitude and primitive recreation activities.

Under the Proposed RMP 106,178 acres (15 areas) of lands non-WSA lands with wilderness characteristics would be managed to maintain their primitive nature. As such, these areas would

be closed to future mineral leasing and minerals disposal. Because the desired location of future oil and gas wells is not known, it is not possible to quantify the amount of wells and subsequent revenue that would not be generated as a result of the closure. However, with a total of 1,640,569 acres open to mineral development under the Proposed RMP only 6% would be closed to development as a result of the non-WSA lands with wilderness characteristics management restrictions. The loss of revenue based on a 6% decrease in the number of wells drilled over the life of the RMP would likely be negligible to the local economies.

#### **4.14.3.4.1.3. Lands and Realty**

Under the Proposed RMP, non-WSA lands with wilderness characteristics managed to protect their wilderness characteristics would be managed as ROW avoidance areas. Avoidance from future ROW development for pipelines and power lines would prevent surface disturbance and the placement of human-made structures on the land and protect the natural characteristics of the landscape. The protection and enhancement of opportunities to participate in unconfined and primitive recreation would likely contribute to a positive visitor experience, should the visitor be seeking these types of opportunities.

Section 4.9.2 states that lands and realty decisions would have minor to negligible impacts on mineral development (a potential revenue-generating resource for the VPA) regardless of alternative selected. Consequently, an adverse impact to socioeconomics from the management of non-WSA lands with wilderness characteristics is not anticipated.

#### **4.14.3.4.1.4. Recreation**

Under the Proposed RMP, 106,178 acres of non-WSA lands with wilderness characteristics would shift the focus of recreation to primitive and unconfined activities (e.g., hiking, backpacking, river floating, hunting, and wildlife viewing), opportunities for solitude, and the settings needed to achieve these opportunities. Coupled with the lands managed for their wilderness characteristics, SRMAs would generally retain the natural characteristics of the landscape, allowing minor development consistent with VRM Class II objectives. Retaining a natural setting would support opportunities for solitude and primitive forms of recreation. The long-term management of lands to retain their natural characteristics would likely have beneficial impacts on visitor experience, tourist-related revenues to local communities, and increase the likelihood that visitors would return to the area for a similar experience. See Section 4.12.2.6.1 for details on recreation management decisions.

Proposed management stipulations for non-WSA lands with wilderness characteristics would limit OHV use to designated routes, which would adversely reduce the recreational opportunities for motorized and mechanized recreation within these areas. Visitors to the area seeking motorized experiences would have fewer opportunities for these types of experiences as 75,845 acres would be closed to OHV use. However, with 6,202 acres designated as "open" for cross-country travel and 1,643,475 designated as "limited" to OHV travel, less than 4% of the VPA would be closed to OHV travel as a result of the non-WSA lands with wilderness characteristics management practices.

Managing lands for wilderness characteristics may have some positive economic benefits to the local economy, above and beyond recreation benefits to individual users of these areas. There is an extensive body of literature which argues that protecting lands as wilderness provides local, regional and national economic benefits. A paper prepared by the United State Forest Service (Bowker et al. 2005) summarizes some of the more relevant research on this topic. For example, some research suggests that private property located next to or near protected lands increases in value due to this proximity. Other research suggests that areas with protected lands are more likely to attract higher income individuals, as well as businesses, who value the types of recreation activities provided in protected areas. Still other research argues that certain types of high-dollar recreation, such as hunting, are enhanced by wilderness protection. Whereas most of these studies have focused on the benefits accruing to designated wilderness, it is possible that the same arguments may be applicable to non-WSA lands with wilderness characteristics.

#### **4.14.3.4.2. ALTERNATIVES A- D**

In these alternatives, it is not proposed to protect wilderness characteristics outside of designated WSAs. There would be a beneficial impact to socioeconomics by allowing a greater area to be developed for oil and gas and other resource extractions. This benefit would be somewhat offset by loss of recreational opportunities and the resulting economic benefits.

##### **4.14.3.4.2.1. Alternative E**

The impacts to socioeconomics from management of lands to maintain the wilderness characteristics of the non-WSA lands with wilderness characteristics would be the same as those described for the Proposed RMP, but it would affect more acres, including all of the non-WSA lands with wilderness characteristics. Under Alternative E, all 25 non-WSA lands with wilderness characteristics, totaling 277,596 acres would be managed to maintain their wilderness characteristics. See Section 4.01.2.14.3 for management prescription details.

Protecting wilderness characteristics limits activities that would impair them. Specifically, mineral development and extraction would be limited as a result of protecting wilderness characteristics. Oil and gas development would be limited to that which could be accomplished with no surface occupancy (i.e., directional drilling). The areas would also be closed to mineral material disposal, although locatable mineral entry and development would still be allowed.

Protection of wilderness characteristics would have minor to substantial, negative impacts upon extraction and development, as they would exclude lands from minerals development and lower the number of locations where potential wells could be drilled. The lower number of locations could indirectly lead to a lower yield and commercial supply of oil and natural gas and fewer royalties paid to the federal government and/or the State of Utah. An approximate monetary impact would be difficult to speculate because desired future locations of development in proposed non-WSA lands with wilderness characteristics is unknown. However, with a total 1,499,491 acres open for mineral development under Alternative E, 15% of the land in the VPA would be closed to mineral development. In general, and with specific regard to management of lands for wilderness characteristics, Alternative E would have the greatest potential for a

decrease in federal, state, and local revenues compared to the other Action Alternatives and the Proposed RMP.

#### **4.14.3.5. EFFECT OF PALEONTOLOGY ON SOCIOECONOMICS**

Management actions for paleontological resources would have negligible impacts on socioeconomic resources because the recreational and scientific collection of fossils, as well as the protection of these resources would be similar to current conditions and are the same for the Proposed RMP and across all alternatives. Personal collection of invertebrate and plant fossils would be allowed throughout the VPA. The recreational collection of vertebrate fossils, as well as of noteworthy invertebrate and plant fossils, is already prohibited within the VPA. Therefore, the recreational collection of fossils from BLM-administered lands would have minimal impacts on the local economy. The economic contributions, including sales and hotel tax revenue, from scientific collection would also be negligible under the Proposed RMP and all alternatives.

Additional information on fossils and collecting rules would be provided to the public through websites, publications, and personal contacts would occur under the Proposed RMP and all alternatives. Educational information regarding the paleontological resources could attract tourists to the local area.

Areas found rare and significant invertebrate and plant fossils would be closed to hobby collection under the Proposed RMP and all alternatives. This management decision could adversely impact those hobbyists currently allowed to pursue such collection.

#### **4.14.3.6. IMPACTS OF RECREATION ON SOCIOECONOMICS**

The relationship between changes in decisions pertaining to recreation use and the economic impacts associated with those changes is difficult to quantify. In this analysis, assumptions regarding this relationship include:

- Increasing recreation opportunities could positively affect visitation, which in turn could affect traveler spending at local businesses and overall spending in the region.
- Improving the recreation experience would have a beneficial effect on the social aspects of recreation and potentially increase visitation.
- From a social perspective, improving the quality of the recreation experience could also improve quality-of-life factors for local residents by providing greater recreational opportunity.
- A portion of the tourism related tax dollars, such as transient room tax and restaurant tax, comes from oil and gas development related services (lodging, food, and other services for mining sector employees). Although it is nearly impossible to extract whether a tourist dollar was generated from a tourist or a temporary mining employee, both are beneficial to the retail and service sectors of the local economy. A decrease in temporary oil and gas-related jobs may lead to a decrease in "tourism-related" revenue for the county. On the other hand, a decrease in oil and gas-related jobs could lead to an increase in actual tourism-related revenue.

- Special Recreation Management Areas (SRMAs) are also intended to reduce user conflict as the BLM manages them more broadly for a specific recreational experience in comparison to focus areas. Each SRMA has been previously identified as an area where recreation impacts or management concerns occur. SRMAs would still allow for other recreational uses within their boundaries but emphasize particular recreation opportunities that lie within the SRMA. See Section 4.12.2.6.1.2 for the focus of each SRMA.

#### **4.14.3.6.1. PROPOSED RMP**

Recreation decisions under the Proposed RMP would have long-term, indirect, beneficial effects to socioeconomics, as they would establish new recreational activities, expand and improve current recreational facilities, and limit other uses above and beyond recreation decisions under Alternative D (No Action). The effects would potentially include increased visitation, which would translate into an increase in overall tourist spending in surrounding communities.

The Proposed RMP is most likely to provide an increase in the demand for a range of recreation/tourism-associated goods and services and the number of jobs related to the tourism industry when compared to the all alternatives. Long-term, indirect beneficial effects to local residents would also occur: local residents would have the opportunity to enjoy a larger number of recreational sites, and they would have a higher quality recreational experience in those recreational areas.

##### **4.14.3.6.1.1. Backcountry Byways**

Under the Proposed RMP three existing roads would be proposed as backcountry byways. Seep Ridge, Book Cliff Divide, and Atachee Ridge would provide opportunities for backcountry sightseeing, scenic driving, and educational interpretation of the area. Expanding the range of recreation and educational opportunities for visitors to the area would likely contribute to an increase in positive visitor experience. A positive recreational experience could contribute to an increase in the amount of recreationists to the area, potential return visitors, and increases in tourism-related spending in the local communities. Thus, the designation of Backcountry Byways under the Proposed RMP could have beneficial impacts to the social and economic conditions.

##### **4.14.3.6.1.2. SRMAs**

The Proposed RMP would beneficially increase the combined acreage of SRMAs from 87,931 acres under current management to 133,560 acres. Each of the SRMAs would manage for the type and range of recreational activities and opportunities that lie within a given SRMA. Under the Proposed RMP seven SRMAs would be designated and a range of opportunities would be emphasized within the SRMAs. For example, the Blue Mountain SRMA (42,729 acres) would be managed with an emphasis on OHV use, special recreation activities, and competitive events. Fantasy Canyon (69 acres) would be managed to emphasize self-guided touring and hiking. See Section 4.12.2.6.1.2 for details on SRMAs management emphases. SRMAs in the VPA would emphasize recreation opportunities for a range of user groups. Because it is assumed that the SRMAs are managed to reduce user conflict, it is likely that the diverse range of recreationists

would have positive visitor experiences. The positive experiences could lead to an increase in tourism over the area in the short and long-term and therefore increased spending in the local communities. Also, local outfitters specializing to recreation activities could benefit from the designation of SRMAs as their services would be needed to serve the recreational visitor.

#### **4.14.3.6.1.3. Non-WSA Lands with Wilderness Characteristics**

The Proposed RMP would manage 15 areas totaling 106,178 acres to ensure their wilderness characteristics. The protection of these areas provides opportunities for primitive and unconfined recreation. These additional opportunities may produce both social benefits for the recreationists who desire such opportunities. An increase in recreationists seeking this type of experience or return recreationists to the area could have positive economic impacts on local economies with regard to tourist-generated sales and tax revenues. Local recreation outfitters may also benefit from recreationists seeking guided excursions in the 15 areas.

Conversely, those recreationists enjoying unlimited motorized access may suffer negative social impacts as they would not be able to recreate in the 15 areas with wilderness characteristics. This could have an adverse impact on local sales and tax revenues generated from tourists visiting the planning area.

#### **4.14.3.6.1.4. Trails**

Up to 400 miles of non-motorized trails used for hiking, horseback riding, and mountain biking would be signed, improved or developed under the Proposed RMP, compared to 50 miles under Alternative D (No Action). With a substantial increase in trails, compared to Alternative D (No Action), those seeking hiking, and/or riding opportunities would have numerous opportunities for recreation. Drawing more hiker, bikers, and horseback riders to the area could have positive impact on the local economy as more recreation-related spending would take place.

Under the Proposed RMP, up to 800 miles of motorized routes would be signed, improved, and/or developed. In contrast, Alternative D (No Action) does not specify the development of any new motorized trails and the Red Mountain Trail is currently the only designated motorized trail. The additional number of trail miles would reduce the density of OHV users, increase user safety, and reduce user conflicts. The designation would also alleviate strains on trails currently used for a variety of recreational activities and would potentially reduce overland OHV use. It is anticipated that the overall reduction on user conflicts and increased trail-riding opportunities for OHV users would lead to improved visitor experiences for OHV users as well as those individuals who choose non-motorized travel on existing trails. Positive visitor experiences for all groups could lead to an increase in tourist-related revenues for the local communities.

#### **4.14.3.6.2. ALTERNATIVE A**

Many recreation decisions under Alternative A closely resemble the recreational opportunities provided in the Proposed RMP. The amount of Backcountry Byways, trails, and cabins proposed under Alternative A are identical to the Proposed RMP, therefore impacts to socioeconomics would be identical.

Under Alternative A 499,588 acres would be designated as SRMAs. This is a 568% increase from Alternative D (No Action). The increase of 411,660 SRMA-managed acres within the VPA would be the result of expand the existing Browns Park and Nine Mile SRMAs by 71,233 acres (the 24,259-acre Red Mountain-Dry Fork SRMA would remain the same size), with the remaining acreage encompassing the proposed White River, Blue Mountain and Book Cliffs SRMAs. Special Recreation Management Area-designated acreage would comprise 29% of the 1,725,512 acres of BLM administered lands within the VPA. Each of the 6 SRMAs would be managed for range of recreational opportunities and activities. See Section 4.12.2.6 for recreation emphasis per SRMA.

In comparison to Alternative D (No Action), this alternative would have more beneficial impacts on recreational opportunities because more area would be managed under SRMAs to protect recreation resources and provide opportunities for a range of recreational activities. In addition, user conflict would likely be substantially reduced when compared to Alternative D (No Action). The reduction in user conflict would result in increases in visitor satisfaction. Increases in visitor satisfaction could lead to an increase in tourists seeking a specific recreation experiences and repeat visitors to the area. Tourist-related business and a range of recreation outfitters could experience long-term beneficial impacts under Alternative A.

#### **4.14.3.6.3. ALTERNATIVE B**

Recreation decisions under Alternative B closely match the recreational opportunities provided in Alternative D (No Action), the current trend in the economics associated with tourism would continue (described below under Alternative D). However, Alternative B would establish Backcountry Byways similar to the Proposed RMP. Alternative B would provide slightly fewer opportunities for recreation than the Proposed RMP, therefore having slightly less beneficial long-term direct and indirect social and economic impacts. Identical to Alternative D (No Action), four SRMAs would continue to be managed for their cultural, scenic, cultural, wildlife and/or recreational values. Alternative B, similar to Alternative D (No Action), would provide less of a demand for recreation/tourism associated goods and services in the local economies, compared to the Proposed RMP. Local residents would have less of an opportunity to enjoy the increased recreational sites and thus, possibly providing a lesser-quality recreational experience to the Proposed RMP.

Under Alternative B 400 miles of non-motorized trails would not be developed under this alternative. This could lead to increases in user conflicts between user groups and a decrease in visitor satisfaction which could, in turn, adversely impact tourist-spending at the local level.

#### **4.14.3.6.4. ALTERNATIVE C**

Recreation decisions under Alternative C are similar to the Proposed RMP and would have similar long-term, beneficial effects to socioeconomics. However, under Alternative C Backcountry Byways would not be designated, thus adversely limiting recreational scenic driving in the VPA. Alternative C would provide more potential for increased, tourism-related visitation and contribution to the economic conditions of the region than Alternatives B and D, but less than the Proposed RMP.

**4.14.3.6.5. ALTERNATIVE D (NO ACTION)**

The long-term direct effects of Alternative D (No Action) would be the continuation of current visitation patterns and trends and a continuation of the existing contribution of tourism to the local economy. Current recreation opportunities in the three counties support over 2.5 million visitors annually (based on regional visitation counts), total traveler spending of \$99.5 million annually, and a total tax benefit to the three counties of approximately \$2.08 million per year. A total of 2,580 jobs are attributable to the recreation/tourism sector within the three counties (Utah Department of Travel Development 2004).

Given the increase in OHV use in the VPA and across the state, conflicts between user groups would like increase over time. An increase in user conflicts would like result in a degradation of visitor experience. Dissatisfaction with recreation opportunities could lead to adverse long-term impacts to the tourism-based revenues generated in local communities.

**4.14.3.6.6. ALTERNATIVE E**

With 277,596 acres in 25 areas of non-WSA lands with wilderness characteristics to be managed to protect wilderness characteristics, Alternative E would provide the greatest amount of opportunities for primitive and unconfined recreation. These recreation opportunities would have the potential to produce the greatest amount of social benefits to those seeking solitude and quiet travel. In addition, under Alternative E local outfitters and local economies could benefit from recreation patrons visiting the planning area.

On the other hand, those enjoying unlimited motorized access would be most adversely impacted under Alternative E. The inability to access an additional 277,596 acres may negatively impact their recreation experience and discourage visitation to the area. Potential sales and tax revenues from motorized users in local communities could decrease under Alternative E.

Eight SRMAs focusing on a range of recreational opportunities would be designated under Alternative E. However, with an emphasis on 277,596 acres of non-WSA lands with wilderness characteristics the focus would shift to recreation to primitive and unconfined activities (e.g., hiking, backpacking, river floating, hunting, and wildlife viewing), opportunities for solitude, and the settings needed to achieve these opportunities.

Similar to the Proposed RMP, 400 miles of non-motorized trails would be signed, improved or developed. Providing additional opportunities for hiking, biking, and horseback riding would accommodate demand and reduce user densities on current trails. Increasing trail-usage opportunities has the potential to increase tourism-related spending by drawing additional and repeat trail-users to communities in or near the VPA.

Under Alternative E, no motorized trails would be improved or developed. The lack of trails produced under this alternative could lead in increases in user conflicts on existing trails, potentially decreasing visitor safety and satisfaction.

**4.14.3.7. IMPACTS OF SPECIAL DESIGNATIONS ON SOCIOECONOMICS****4.14.3.7.1. PROPOSED RMP AND ALTERNATIVES A–E****4.14.3.7.1.1. ACECs**

Protecting the specific, identified relevance and importance values of ACECs limits activities that are considered incompatible with specific values and resources of concern. Specifically, mineral development and extraction would be limited as a result of ACEC designations. It is important to note the ACEC designation does not completely restrict development. Standard stipulations, and controlled surface use is permitted in areas that do not compromise the values or resources of concern. Mineral development with no surface occupancy (i.e., directional drilling) is also permitted within ACECs. Table 4.14.4 shows the number of acres under NSO and Closed leasing categories within the proposed ACECs for the Proposed RMP and each alternative.

The designations of ACECs would have minor to substantial, negative impacts upon minerals resource extraction and development. The designation would exclude lands from minerals development and lower the number of locations where potential wells could be drilled, especially under Alternatives C and E which would designate 681,310 acres. Alternative A proposes 345,400 acres designated as ACECs. The Proposed RMP would have the least amount of acres(131,700) designated as ACECs and therefore greatest potential of minerals development.

The lower number of locations could indirectly lead to a lower yield and commercial supply of oil and natural gas and fewer royalties paid to the federal government and/or the State of Utah. An approximate monetary impact would be difficult to estimate because desired future locations of development in proposed ACECs sites are unknown.

**Table 4.14.5. Minerals Leasing Restrictions Acreages within Proposed ACECs, for the Proposed RMP and each Alternative**

	<b>Proposed RMP</b>	<b>Alternative A</b>	<b>Alternative B</b>	<b>Alternative C</b>	<b>Alternative D (No Action)</b>	<b>Alternative E</b>
<b>Total</b>	83,539	83,539	23,390	257,006	47,167	261,602

Under the Proposed RMP and Alternatives A–D OHV use would be allowed in ACECs on designated routes. Alternative E would close OHV use in those portions of ACECs in which wilderness characteristics would be protected. Allowing OHV access within ACEC designations would be beneficial in the long-term for socioeconomics because opportunities would remain available for recreational access. Revenue generated in local communities by OHV users would be similar to current conditions.

When compared to Alternatives A–E, visitors to the area seeking opportunities for primitive travel and solitude would have fewest opportunities under the Proposed RMP. Fewer opportunities for primitive travel may mean visitors would choose not to visit the area and patronize local businesses. Local outfitters who specialize in backcountry, non-motorized travel

could be adversely impacted with the designation of fewer ACECs. See Section 4.16.1 for areas and acres of ACECs designated by the Proposed RMP and all alternatives.

#### **4.14.3.7.1.2. Wild and Scenic River Designation**

The Proposed RMP recommends 52 river miles of Wild and Scenic River (WSR) designations. Alternative B and D also recommend 52 miles to be designated as WSR. Alternative A recommends 86 total river miles and Alternatives C and E recommends 216 river miles be designated as WSRs. See Section 4.16.2 for locations of proposed WSR designations.

Management prescriptions for mineral activities in riparian and floodplains within WSR designations do not allow surface occupancy. Therefore, Alternative E would most adversely impact mineral resource extraction and development, as it proposes the greatest amount of river miles as WSR and lower number of locations where wells could be drilled. This lower number of locations could potentially lead to a lower yield of oil and natural gas and fewer royalties paid to the federal government and/or the State of Utah.

The designation of WSRs under the Proposed RMP and all alternatives could potentially lead to an increase in tourism revenue to the BLM and local communities, thus having long-term beneficial impact on the local economies. The designation of rivers and/or river segments could attract more people to the area who enjoy the type of recreation that often accompanies these designations (including high scenic qualities and opportunities for solitude). The increase in tourism based on river recreation could lead to increased revenue to local river running companies, increased permit revenue, and increase in tourist dollars spent within nearby communities. Alternatives A, C, and E would have the greatest potential to increase tourism revenue for river-based recreation based on the amount of river miles determined suitable for WSR designation.

Under the Proposed RMP and Alternatives A, B, C, and E all eligible river segments would be in a limited or closed OHV category, with most of the segments limited. River corridors would largely be protected from disturbance related to OHV activity. Under Alternative D (No Action) river corridors remain in an open category for OHV use, which could exacerbate user conflicts and decrease wilderness experience for river runners and other who prefer non-motorized recreation along river corridors. Alternative D would provide OHV users with the greatest amount of access to river corridors.

#### **4.14.3.8. IMPACTS OF TRAVEL DECISIONS ON SOCIOECONOMICS**

##### **4.14.3.8.1. PROPOSED RMP**

Under the Proposed RMP, areas within the VPA designated as Open to OHV cross-country travel would be limited to approximately 6,202 acres (a decrease of approximately 781,657 acres when compared to Alternative D, No Action). The impacts of limiting the number of open-designated acres would be long-term direct and indirect, adverse and beneficial on recreation. Long-term direct adverse effects would include the reduction in opportunities for OHV cross-country recreation-related travel. However, this loss would be offset by the 800 miles of trails

proposed for OHV use in the Proposed RMP. The decrease in acres designated as "open" leads to fewer opportunities for OHV travel, as such these recreationists may reduce their visitation to the area.

Areas designated as Limited to Designated Routes for OHV travel would be increased to 1,643,475 acres (an increase of 756,200 acres compared to current management in Alternative D, No Action), which would have direct long-term beneficial impacts on recreation by increasing the level of OHV management within the VPA. This would have direct beneficial impacts on recreation by reducing recreational resource-use conflicts. Under the Proposed RMP, OHV travel limited to designated routes would include the 106,178 acres of non-WSA lands with wilderness characteristics. Reducing user conflicts will likely result in more positive visitor experiences in the long and short-term.

Designating areas as Closed to OHV travel would be increased from 50,388 acres (under Alternative D) to 75,845 acres (an increase of 25,457 acres) and the miles of designated routes would increase from zero miles under existing conditions (Alternative D, No Action) to 4,860 miles. This increase in designated closed OHV routes would have direct long-term beneficial impacts on other non-motorized recreational opportunities activities by reducing recreation resource-use conflicts, and by reducing the OHV-related disturbances to soil, water, and wildlife habitat resources. Visitation by recreationists preferring non-motorized travel may increase within the VPA under the Proposed RMP.

#### **4.14.3.8.2. ALTERNATIVE A**

Impacts under Alternative A would be identical to the Proposed RMP as the designation of routes and closed areas are the same.

#### **4.14.3.8.3. ALTERNATIVE B**

The effects of Alternative B would be similar to those described under the Proposed RMP, for areas open to OHV travel. Areas closed to OHV travel would increase to a total of 60,187 acres (an increase of 9,799 acres compared to Alternative D, No Action). However, it is the least amount of all the action alternatives which would give OHV users the greatest opportunity for OHV travel on designated routes. Alternative B would have long-term beneficial impacts on other recreation resources similar to those described under the Proposed RMP.

#### **4.14.3.8.4. ALTERNATIVE C**

Alternative C would be the most restrictive to OHV use and provide the greatest amount of opportunities for non-motorized recreation. Areas closed to OHV travel would be increased from 50,388 acres (under Alternative D, No Action) to 366,559 acres. Areas designated as limited to designated routes for OHV travel would be increased to 1,353,529 acres, allowing for increased use in a more managed setting, and potentially sustaining the existing levels of OHV use.

A decrease in the number of acres available for OHV use would have long-term beneficial impacts on other non-motorized forms of recreation by reducing resource-user conflicts and by

enhancing and/or protecting recreation resources as described under the Proposed RMP. However, those recreationists who enjoy the OHV experience would have fewer opportunities for recreation and may reduce their visitation and patronization to the area.

#### **4.14.3.8.5. ALTERNATIVE D (NO ACTION)**

Current management practices designate a total of 787,859 acres as open to cross-country OHV travel, 887,275 acres as limited to designated routes, and 50,388 acres as closed to OHV use. No OHV routes would be designated under this alternative. Travel management under current conditions would be less restrictive to OHV users when compared to the action alternatives, but would maintain the current adverse impacts to natural and cultural resources and to non-motorized users, as discussed above. Continued adverse impacts to non-motorized users, as well as the natural and cultural resources could have long-term adverse impacts to tourism and tourist-related spending the area.

#### **4.14.3.8.6. ALTERNATIVE E**

Under Alternative E, 5,434 acres would be open to cross-country OHV travel, the same as under Alternatives B and C and a reduction of 782,425 acres from Alternative D (No Action). Under this alternative, motorized travel would be focused on designated routes, not cross-country. Although the experience of cross-country driving would be limited to 5,434 acres, motorized travel for access and recreation would still be available on 4,654 miles of road and trails.

There are 228 miles of routes that exist in the non-WSA lands with wilderness characteristics. Under this alternative, these routes would be closed to motorized travel, foreclosing the opportunity for backcountry driving, vehicle-supported camping, and other motorized forms of recreation.

OHV users would be most adversely impacted by the travel limitations of Alternative E. Although they may reduce visitation to the area, recreationists who enjoy non-motorized travel may increase visitation to the area over the short and long-term.

#### **4.14.3.9. IMPACTS OF VISUAL RESOURCE MANAGEMENT DECISIONS ON SOCIOECONOMICS**

The demand for a range of recreation opportunities would not be limited as a result of VRM (Visual Resource Management) classifications; therefore, impacts to socioeconomics from recreational visitation would be minor under the Proposed RMP and all alternatives. Opportunities for recreation with high levels of scenic quality (VRM Class I and Class II) would remain throughout Wilderness Study Areas (WSAs), Areas of Critical Environmental Concern (ACECs), Special Recreation Management Areas (SRMAs), and along eligible Wild and Scenic river segments. See Section 4.14.3.6 for more details on recreation impacts to socioeconomics.

The proposed designation of VRM Class acreages for the Proposed RMP and each of the alternatives are tabulated below in Table 4.14.6. Alternatives C and E provide the most benefit to tourists to the area who value scenic vistas. These alternatives could lead to a greater potential for increased and repeat tourists to the area who enjoy high levels of scenic quality. The large

amounts of VRM Class I and II could have adverse impacts to local industries that would have to spend more money mitigating for scenic quality disturbances.

Under the Proposed RMP, approximately 106,178 acres of non-WSA lands with wilderness characteristics would be managed under VRM Class II objectives in order to preserve their wilderness characteristics and values, which would have long term, preservation-related, beneficial impacts on scenic quality and visual resources.

Alternatives B and D would provide the least amount of VRM Class I and II acreages. Tourists enjoying high levels of visual quality would be most adversely impacted by these alternatives. Adverse impacts to industries resulting from visual mitigation would be least under these Alternatives.

Under Alternative E, approximately 277,596 acres of non-WSA lands with wilderness characteristics would be managed under VRM Class I objectives in order to preserve their wilderness characteristics and values (see Table 4.19.3). Based on these visual management objectives, Alternative E would provide the highest degree of protection to scenic quality under VRM I and II, followed by Alternative C, then Alternatives A and the Proposed RMP. Alternatives B and Alternative D (No Action) would provide the least protection to scenic quality under combined VRM I and II acreages.

**Table 4.14.6. VRM Class Acreages for the Proposed RMP and all Alternatives**

<b>VRM Class</b>	<b>Proposed RMP</b>	<b>Alternative A</b>	<b>Alternative B</b>	<b>Alternative C</b>	<b>Alternative D (No Action)</b>	<b>Alternative E</b>
VRM I and	57,776	63,136	52,764	145,781	53,086	334,516
VRM II	231,911	294,773	114,030	362,660	113,686	259,694
VRM III	786,612	716,186	199,179	580,846	199,192	535,586
VRM IV	643,641	645,845	1,353,967	630,653	1,353,976	590,144
Total	1,719,940	1,719,940	1,719,940	1,719,940	1,719,940	1,719,940
VRM I and II	289,687	357,909	166,794	508,441	166,772	594,210
VRM III and IV	1,430,253	1,362,031	1,553,146	1,211,499	1,553,168	1,125,730

#### **4.14.3.10. IMPACTS OF WILD HORSES ON SOCIOECONOMICS**

##### **4.14.3.10.1. PROPOSED RMP AND ALTERNATIVE B**

No wild horses would be maintained within the VPA under the Proposed RMP and Alternative B. The national constituency for the wild horse and burro program would be adversely impacted under the Proposed RMP and Alternative B. It is possible that the group's sense of "well-being" will be harmed by this decision. In addition, those who enjoy the sight of these animals may be less likely to visit the planning area.

**4.14.3.10.2. ALTERNATIVES A, C, AND E**

Those who enjoy the presence of the wild horse and burros in the VPA would benefit most under these alternatives. The greatest amount of protection to their habitat would be protected under these alternatives. Those who enjoy the sight of the animals may be more likely to visit the planning area and contribute to the local economy.

**4.14.3.10.3. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would maintain current levels of adverse indirect, long-term impacts on wild horses in the HA and HMAs. Sense of well-being to those who support the animals would be maintained at current levels. Current contributions to the local economy from related tourists would remain the same.

**4.14.3.11. IMPACTS OF WILDLIFE AND FISHERIES ON SOCIOECONOMICS**

To the extent that habitat and forage would be protected for the emigration and/or reintroduction of Rocky Mountain Bighorn Sheep and moose populations, those who enjoy hunting and wildlife viewing would be beneficially impacted. Alternatives A, C, and E that implement the greatest amount of habitat and forage protection would be the most beneficial to hunting guides and outfitters in the VPA.

**4.14.3.12. IMPACTS OF WOODLAND AND FORESTS ON SOCIOECONOMICS**

Woodland management actions common to the Proposed RMP and all alternatives would have negligible impacts on the social and economic conditions of communities in Uintah, Duchesne, and Daggett counties, because the private and commercial use of woodland products is not a substantial contributor to the local economy. However, the forest and woodland could have potential beneficial impacts to public health and safety as the risk of catastrophic fire would be reduced. Also, to the extent the woodland and timber harvesting contributes to the overall health of local forests, benefits to wildlife and corresponding benefits to those who enjoy viewing or hunting could benefit.

**4.14.4. SUMMARY****4.14.4.1. PROPOSED RMP**

The Proposed RMP provides the second greatest opportunities for minerals development and the subsequent generation of royalties and revenues when compared to the alternatives. Although the potential increase in revenues related to minerals development would have beneficial impacts on the local economy, adverse impacts to recreation may occur with user conflicts and a decrease in visitor satisfaction.

However, with 15 areas of non-WSA lands with wilderness characteristics (106,178 acres) to be managed to preserve wilderness qualities, recreationists seeking solitude and opportunities for primitive recreation would have areas available to meet their needs. In addition, the increase in SRMA acreage would also recreationists focused recreation areas. The increase in SRMAs and

management of non-WSA lands with wilderness characteristics would have long-term beneficial impacts on socioeconomics as SRMA and non-WSA lands with wilderness characteristics would likely reduce user conflicts and increase visitor satisfaction.

A decrease in areas designated as "open" to OHV travel and an increase in the areas designated as "closed," compared to Alternative D (No Action), could have adverse impacts on motorized recreationists. Decreases in opportunities for "cross-country" travel and increase in closed areas may result in decreases in visitor satisfaction for the user group and a potential loss of revenue generated by this group.

Impacts to socioeconomics from other resources including livestock, wood harvest, paleontology, visual resource management, lands and realty would likely have negligible impacts to socioeconomic conditions under the Proposed RMP as well as the other alternatives given that the resource is not a substantial contributor to the local economy or changes resulting from the Proposed RMP or any of the alternatives would not likely have measurable beneficial or adverse impacts.

#### **4.14.4.2. ALTERNATIVE B**

This alternative would permit the most acres within the VPA for minerals development which would provide the greatest potential related revenue and royalties. This alternative would have the most adverse impacts to recreation resources due to the large number of acres available for oil and gas leasing. For visitors seeking opportunities for primitive travel and solitude, this alternative would have the greatest amount of long-term adverse effects. This could result in long-term decreases in tourist-based revenue for local communities. Impacts to OHV users would be similar to those under the Proposed RMP.

#### **4.14.4.3. ALTERNATIVE C**

Alternative C would have the least amount of acreage open for mineral development among the action alternatives. Consequently, the amount of revenues and royalties would be less under Alternative C. Limits of OHV travel would be greatest under this alternative, producing adverse impacts on mechanized recreational opportunities.

This alternative would have the most beneficial impacts on recreation. Designation of additional ACECs and eligibility designations of Wild and Scenic River segments would have beneficial impacts on recreation. Designation of the most acreage for SRMA management (522,604) would have major beneficial impacts on all forms of recreation. Long-term positive impacts on recreation users would likely result in increases to the local economy in terms of tourist-related spending.

#### **4.14.4.4. ALTERNATIVE D (NO ACTION)**

Because Alternative (No Action) does not include the Hill Creek Extension (more than 180,000 acres), the total amount of wells to be developed over the life of the plan, and subsequent revenue generated from the wells, would be the least of all the alternatives. Resource decisions

regarding minerals development would be less restrictive than those made for Alternatives C and E, more restrictive than Alternative A, and only slightly more restrictive than Alternative B.

Recreation decisions under Alternative B closely match the recreational opportunities provided in Alternative D (No Action), the current trend in the economics associated with tourism would continue. However, it is likely the due to an increase in OHV use, user conflicts will escalate and visitor experiences would be degraded. Thus, a reduction in tourist-related spending could decrease.

#### **4.14.4.5. ALTERNATIVE E**

The focus of this alternative would be the protection of non-WSA lands with wilderness characteristics. That protection would have substantial beneficial impacts on primitive and non-mechanized recreation activities, but it would exclude OHV use on 228 miles of routes and activities dependent on developed sites (e.g., campground and interpretive facilities). Recreationists seeking primitive recreation activities would benefit most from this alternative, which may result in long-term increases in visitor spending as overall visitation would increase and visitors would return to the area for similar experiences. Conversely, those seeking motorized recreation opportunities would have fewer opportunities for recreation. A potential for a decrease in revenues from this group would be greatest under Alternative E.

Minerals development and the revenue generated from them would be most adversely impacted under this alternative as the percentage of land open for development is nearly 30% less.

#### **4.14.5. UNAVOIDABLE ADVERSE IMPACTS**

There would be no unavoidable, adverse impacts to socioeconomics.

#### **4.14.6. SHORT-TERM USES VERSUS LONG-TERM PRODUCTIVITY**

There are no foreseeable impacts for short-term use versus long-term productivity.

#### **4.14.7. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS**

There are no foreseeable irreversible or irretrievable impacts to socioeconomics.

## 4.15. SOIL AND WATER RESOURCES

All of the alternatives and the Proposed RMP would impact soil and water resources within the VPA, as all of them contain plans for surface disturbance of some kind. Activities involving surface disturbance would disturb soils and water resources to varying degrees, due to the amount, placement, and type of surface disturbance; the disturbed soil's characteristics; and the surface hydrology.

The BLM manages 1,725,522 acres within the VPA. Many of the soils are derived from shale formations and are, therefore, highly erodible. Many of the soils also have limitations on rehabilitation after disturbance, which is one of the primary factors in evaluating the effects of other resource management decisions on soil and water resources. Table 4.15.1 displays acreage of soils with chemical or physical limitations and their percentage of the VPA. Some soil limitation areas overlap; therefore, the numbers listed in this table add up to a higher number than the total number of acres in the VPA.

For the purposes of this programmatic-level analysis, the acreages disclosed in Table 4.15.1 are assumed to be evenly distributed across the smallest nominal geographic area represented in each table. The analyses are done for all of the VPA, but Table 4.15.1 lists limiting soils by RFD area so specific analysis can be done for future projects. Limiting soils have specific chemical or physical properties that affect normal use and management. These limiting features (as defined by NRCS in soil interpretation tables) include but are not limited to high sodium or gypsum content, high erosion hazard, steep slopes, high rock content, high water table, high wind erosion hazard. The limitations of this type of broad scale analysis are best seen in cases when surface disturbance is concentrated in areas that are either highly erodible or highly non-erodible. Fortunately, limitations in analysis have been anticipated and will be compensated for by the surface stipulations found in Appendix K and site-specific analyses of water quality and soil stability. Approximate soil loss from water erosion due to oil and gas leasing (which includes CBNG) was analyzed by RFD area based on soil erosion potential (k-factor) and percent slope. Soils with a k-factor of  $\geq 0.32$  and a slope of greater than 10% were classified as erodible.

**Table 4.15.1. Vernal Soils with Limitations by RFD Area**

Limitation	Altamont-Bluebell	East Tavaputs Plateau	Manila-Clay Basin	Monument Butte-Red Wash	Tabiona-Ashley Valley	West Tavaputs Plateau	Total	% of VPA
Water Erodible	513	27,947	4,144	45,612	66,959	17,640	<b>162,815</b>	<b>9%</b>
Wind Erodible	15,997	410,494	34,760	560,157	267,055	73,191	<b>1,361,654</b>	<b>79%</b>
Sodic (sodium rich)	35	11,719	133	130,047	6,318	13,093	<b>161,345</b>	<b>9%</b>
Saline (high salt content)	6,679	40,006	1,816	219,781	83,096	14,473	<b>365,851</b>	<b>21%</b>
Gypsic (gypsum rich)	0	41,877	0	89,358	1,471	0	<b>132,706</b>	<b>8%</b>

#### **4.15.1. IMPACTS COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES**

Surface-disturbing activities that are currently occurring and are expected to continue include grazing, access to and maintenance of existing oil and gas wells and access roads, recreation and OHV use, and woodland harvest/vegetation removal. As a result of surface-disturbing activities in areas having soils with limitations, impacts common to the Proposed RMP and all alternatives include soil erosion, sedimentation, and impacts to surface and ground water quantity and quality. Surface disturbance can result in loss of vegetation or prevention of revegetation, increased soil erosion and sedimentation, and increased salinity in surface waters. Erosion control practices for slopes greater than 20% would be the same for the Proposed RMP and all alternatives, as per Utah's Non-Point Source Management Plan (UDEQ 2000). Careful planning of development to ensure impacts to soil and water are limited is important in protecting water quality and soil productivity. BLM will work towards compliance with water quality standards currently not in compliance at Pariette Draw Creek [TDS, selenium, and boron for 54.1 stream miles], Willow Creek, excluding Hill Creek, [TDS for 57.2 stream miles] and Nine Mile Creek [stream temperature on the VFO portion of 119.1 miles] where the BLM-administered lands make up a large percentage of the total acreage at these sub-basins. Efforts towards compliance can include limiting the concentrations of sediments. In general, TDS levels can often be proportional to sediment levels.

The Utah BLM Standards for Rangeland Health (Appendix F) apply to soil resources in the VPA. The Proposed RMP and all alternatives must adhere to Standards 1 and 4:

- Upland soils [must] exhibit permeability and infiltration rates that sustain or improve site productivity, considering the soil type, climate, and landform.
- BLM will apply and comply with water quality standards established by the state of Utah (R317.2) and the federal clean water and safe drinking water acts. Activities on BLM lands will fully support the designated beneficial uses described in the Utah Water Quality Standards (R317.2) for surface and groundwater.
- Site-specific conditions would need to be documented before modifying any prescriptions. Activities that would not comply with Standards 1 and 4 in the short term would require reclamation and rehabilitation to ensure water quality, soil productivity and sustainability. Additionally, the BLM would take measures to protect water quality, ensure soil productivity and sustainability in the event of wildland fire, drought, or other natural disasters, by reducing or eliminating livestock, wild horses, and/or wildlife forage allocations, recreational activities (e.g., camping and campfires, OHV use, etc.), and mineral exploration and acquisition until soils are stabilized. Monitoring would be used to determine the condition of water and soils and determine if water quality or soil productivity trends tended upward, downward, or static (considering the soil type, climate, and landform).

##### **4.15.1.1. IMPACTS COMMON TO ALL FIRE MANAGEMENT DECISIONS**

Fire management would have short-term, adverse impacts to soils and water via prescribed burning or fuels reduction, which would increase erosion rates. Some areas would be difficult to reclaim because of the soil's physical and chemical limitations (e.g., soils with high sodium, salt, or gypsum content). Additional post-fire erosion (i.e., a short-term, direct, adverse impact) would

occur from fire suppression activities such as the digging of fire lines and the bulldozing of roads.

However, in the long term, these fire management activities would reintroduce the natural fire return interval, thereby decreasing or eliminating the occurrence of catastrophic rangeland fires and promoting more productive rangelands with less water and soil degradation. The reduction of catastrophic fires would limit the aggressive fire suppression activities necessary for wildfire control, thereby minimizing indirect impacts to soil and water resources. As well, proper oversight for fire suppression activities would further reduce the potential for adverse impacts.

#### **4.15.1.2. IMPACTS COMMON TO ALL LANDS AND REALTY MANAGEMENT DECISIONS**

Lands and realty management decisions would have beneficial, long-term impacts to soils and water resources by pursuing locatable mineral withdrawals in specified areas within the VPA. Mineral withdrawals would provide indirect, long-term benefits to water quality by reducing soil erosion and sedimentation in streams.

On the other hand, pursuing public access under the Proposed RMP and various action alternatives would open specified areas up to recreation, potentially resulting in soil degradation along proposed travel routes and water quality degradation in stream corridors. Long-term direct adverse impacts would also occur where new ROWs are designated for development of roads or utility corridors.

#### **4.15.1.3. IMPACTS COMMON TO ALL LIVESTOCK AND GRAZING, FORAGE, AND WILD HORSE MANAGEMENT DECISIONS**

The effects of livestock and grazing, forage and wild horse decisions on soils would generally be short-term and direct. Through monitoring and changes in range use, soils should not become degraded to the point where they lose productivity; therefore no long-term impacts should occur. Management decisions for livestock and grazing, forage, and wild horse resources could potentially result in loss of vegetative cover and subsequent wind and water erosion, and loss of biological soil crusts, where they occur. However, these potentially adverse impacts on soils would depend on a number of factors, such as grazing season of use, timing, and grazing intensity.

Forage and wild horse management decisions would affect soils and water resources when AUMs for livestock, wild horses, and/or wildlife are adjusted in response to evidence from monitoring that water quality or soil degradation is eminent or occurring. Depending on season of use and duration, adjusting AUMs would be a short-term, direct, and potentially beneficial impact, as it would slow the loss of ground cover. On the other hand, greater forage utilization and more AUMs in a given area put greater stress on the soils via trampling and loss of cover. The loss of vegetation would have direct, long-term, adverse impacts to water quality and soil productivity, especially in areas with soil limitations.

With respect to livestock grazing, the Proposed RMP and all alternatives vary between season of use and duration of use. Due to growing seasons, effects on vegetation (and subsequently, on

water and soils) vary depending on the season of use. For example, limiting grazing before periods of high runoff (generally due to spring runoff and late summer thunderstorms) reduces adverse impacts: banks that retain their vegetation are protected from erosion caused by high flows. A longer duration of use would result in greater impacts to vegetation, soils, and water in a given area.

The Proposed RMP and all alternatives contain restrictions to livestock grazing during seasons of use as well. If all areas are grazed equally, the Proposed RMP and all alternatives should help retain watershed health and provide indirect, long-term benefits to water quality by reducing soil disturbance during critical periods of vegetation establishment and soil vulnerability.

#### **4.15.1.4. IMPACTS COMMON TO ALL MINERALS MANAGEMENT DECISIONS**

The Proposed RMP and all alternatives would result in surface disturbance, minerals exploration and development, and road building. With more land available for leasing and higher levels of development, the risk of adverse impacts to soil and water resources (both surface and groundwater) would increase. Under the Proposed RMP and all alternatives, the effects of minerals decisions on water and soils would be direct, short- and long-term, and adverse.

General impacts to soil and water resources would be erosion, loss of soil productivity, increased runoff, landslides, flooding, and water quality degradation.

Direct, long-term, adverse impacts to surface water quality, in the form of increased sediment levels due to erosion and increased flows from runoff, would increase as the number of well sites increases.

Water quality may be affected by hazardous materials leaks or disposal of wastewater from wells.

Groundwater may become contaminated if drilling fluids and chemicals from the well bore escape into underground reserves or if minerals migrate between geological formations during drilling.

Groundwater impacts may also take the form of changes in total dissolved solids (TDS) or salinity; pollution from pipeline or storage tank leaks; leaks from mud pits; and disposal of water by injection wells.

If streambeds are altered during development, changes in volume or location of flows that feed streams would result from alterations.

Water channelization and runoff could result from improper road building and maintenance.

Due to the explosives used and the digging, leveling, and scraping required, mixing of soils and loss of vegetative cover may occur during exploration activities; construction of roads and well pads; and installation of pipelines.

Soils would be compacted due to the use of trucks and other heavy equipment.

Oil and gas leasing (which includes CBNG) under No Surface Occupancy or Closed to Leasing categories would result in no surface disturbance, and would have no impact on surface water quality. However, No Surface Occupancy areas could still impact groundwater quality. The CBNG development process removes large amounts of groundwater and, in the VPA, reinjects it into the ground via injection wells. This can create changes in groundwater movement and has the potential to adversely affect groundwater. This results in a consumptive use of water, where wastewater is injected into deep areas to minimize adverse effects on water quality.

Gilsonite, phosphate, and disposal of mineral materials, all with Standard Lease Terms, would result in indirect, long-term, adverse impacts to water quality in the form of increased soil erosion and sedimentation in streams (see Table 2.1.9 in Chapter 2, Minerals and Energy Resources).

Reclamation and restoration of oil and gas, locatable minerals, surface minerals, and alternative energy sites would be required upon abandonment of sites to reduce long-term impacts.

#### **4.15.1.5. IMPACTS COMMON TO ALL RANGELAND IMPROVEMENT DECISIONS**

The effects of rangeland improvements on soils and water would be generally beneficial, long-term, and direct.

Vegetation treatments, in the form of increased vegetative cover, would ultimately improve soil quality and would have indirect, long-term benefits to water quality and soil productivity through reduced soil erosion and sedimentation in streams.

Fencing of riparian areas would improve soil conditions within exclosures and protect water quality.

Water developments would provide water to upland range sites and keep livestock and other ungulates from seeking out water in sensitive riparian areas; riparian water quality would thus receive indirect, long-term benefits.

On the other hand, localized soils around the guzzlers, reservoirs, wells, and springs would be increasingly disturbed, as the water sources would attract ungulate traffic. Short-term adverse impacts would also occur due to surface disturbance during the building of guzzlers/reservoirs and pipelines and the improvement of wells/springs. These adverse impacts could be mitigated through proper placement and limitations on surface disturbance in areas with fragile soils or in floodplains. Fragile soils have a high erosion hazard, are difficult to reclaim or restore due to physical and chemical properties e.g. high salt concentration, high rock content, or low available water, or soils that are more susceptible to impacts and damage due to high water tables (hydric or wetland/riparian soils).

**4.15.1.6. IMPACTS COMMON TO ALL RECREATION MANAGEMENT DECISIONS**

Recreational activities would have limitations in place that would reduce adverse impacts to soils. Limiting OHV use to designated trails would provide short- and long-term, beneficial impacts to soils and water resources. "Sacrifice" areas would be designated for OHV users in areas that are not ecologically sensitive and present little or no risk to soils, watersheds, and other components identified in the Utah BLM Standards for Rangeland Health (Appendix F). Some areas may need to be entirely closed to OHV use and planned travel routes.

Increasing visitor access to certain areas would have long-term, adverse impacts to soils and water; stream banks would be increasingly trampled, and more trails would likely be developed.

Proper management and public education would reduce adverse impacts to soils and water resources. The Tread Lightly Program is invaluable for encouraging OHV users to stay on existing trails, thereby decreasing impacts to soil.

**4.15.1.7. IMPACTS COMMON TO ALL RIPARIAN MANAGEMENT DECISIONS**

Proper functioning condition (PFC) is the minimum acceptable goal for riparian areas. Riparian-wetland areas would be maintained, restored, and managed to achieve PFC with respect to soils, vegetation, and hydrology/water quality. Thus, riparian management would have short- and long-term direct beneficial impacts to soils and water where use of streamside vegetation is reduced.

Maintaining plant stubble along the banks traps sediment and reduces stream bank erosion. Managing key riparian woody vegetation maintains bank stability by providing root structure, holding banks together, and reducing sediment transport. Maintaining riparian vegetation would also attenuate floodwaters and, therefore, lower runoff amounts and flooding levels.

**4.15.1.8. IMPACTS COMMON TO ALL SOIL AND WATER MANAGEMENT DECISIONS**

Soil and watershed decisions would reduce or eliminate the discharge of pollutants and sediment into surface waters, providing protection for fish, amphibians, wildlife, and water recreation. Decisions to limit development on steep slopes would have short- and long-term direct beneficial impacts to soils and water resources. Oil and gas well pads would not be permitted in active floodplains, protecting watersheds from sedimentation. With respect to biological soil crusts, the BLM would take measures to protect or restore soil crust functions and avoid soil crust areas where possible. The BLM would examine the effects of prescribed fire, post fire management, invasive weed control, energy development, grazing, OHV use, and range improvement projects prior to taking action.

Erodible soils on slopes between 20% and 40% are required to have an erosion control plan, as outlined in Appendix K. These stipulations would limit the soil loss from these areas and thus limit adverse impacts to soils and water resources in the VPA. Slopes less than 20% are not required to have an erosion control plan and would likely experience more soil loss than areas in the high and very high erodibility categories. This analysis did not take into account road densities, which are a factor in soil loss. Erosion from roads that do not have an all-weather

surface also would likely contribute sediment to total soil loss, but proper engineering design would limit or reduce these losses.

#### **4.15.1.9. IMPACTS COMMON TO ALL SPECIAL DESIGNATIONS**

Designating new ACECs and expanding current ACECs would have long-term direct and indirect, beneficial impacts to soils and water by protecting relevant and important values and limiting OHV travel to designated routes (although designation would not preclude oil and gas development within these areas). Specific management guidelines would be created for each ACEC and would require further analysis of impacts to soils and water resources. Special designations of ACECs would continue in Browns Park, Red Mountain-Dry Fork, Lears Canyon, Pariette Wetlands, Nine Mile Canyon, and Red Creek Watershed; therefore, these designations will not be analyzed by individual alternative.

The designation of segments of the Upper and Lower Green River as Wild and Scenic Rivers also provides long-term direct and indirect beneficial impacts to soils and water, as it limits development along the river segments.

WSAs would limit development in these areas resulting in short- and long-term direct and indirect, beneficial impacts to soils and water.

#### **4.15.1.10. IMPACTS COMMON TO ALL SPECIAL STATUS SPECIES MANAGEMENT DECISIONS**

The effects of special status species decisions on water and soils would be beneficial, long-term, and direct, as they would limit development. The Proposed RMP and all alternatives are similar: implementation of spatial and seasonal, no-disturbance buffers around critical habitat (e.g., raptor nests) would likely result in less development and surface disturbance and would thus cause indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams and fewer salinity increases. Inventories of these plant and animal resources would provide well-defined protection areas.

#### **4.15.1.11. IMPACTS COMMON TO ALL TRAVEL MANAGEMENT DECISIONS**

The effects of travel decisions on water and soils generally would be beneficial, long-term, and direct, primarily by limiting OHV activities to open areas and restricted travel routes. Soil and water resources are greatly affected by runoff from roads and trails; therefore, these travel limits would have indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams, and thus, fewer salinity increases.

Leaving newly permitted roads open would have an indirect, long-term, adverse impact on water quality, manifest as increased soil disturbance. Under the Proposed RMP and all action alternatives, roads and trails currently causing resource damage would be maintained, upgraded and/or realigned. Roads and trails would be designed and built with water crossings that would allow for free passage of aquatic life. All action alternatives (A, B, C, and E) would have fewer long-term direct adverse impacts to soils and water resources than Alternative D (No Action), which is unspecified with respect to roads and trails causing resource damage.

**4.15.1.12. IMPACTS COMMON TO ALL VEGETATION MANAGEMENT DECISIONS**

Vegetation management including prescribed burns, mechanical and chemical treatments, and rangeland improvements would have short-term direct adverse impacts to soils and water resources by increasing surface disturbance. Long-term indirect impacts would be beneficial due to increased ground cover. The impacts due to these management decisions are discussed under fire management and rangeland improvements.

**4.15.1.13. IMPACTS COMMON TO ALL VISUAL RESOURCE MANAGEMENT DECISIONS**

Visual resource management (VRM) decisions would be beneficial and long term. They would directly affect water and soil resources by precluding some areas from surface disturbance due to their proximity to highways, scenic areas, and special designation areas. However, adverse, short-term, indirect impacts would occur if vegetation treatments were not implemented in VRM-sensitive areas.

**4.15.1.14. IMPACTS COMMON TO ALL WILDLIFE MANAGEMENT DECISIONS**

The effects of wildlife management decisions on water and soils would be beneficial, long-term, and indirect, by limiting surface development. Most of the wildlife and fisheries management decisions involve seasonal constraints but would not necessarily preclude surface-disturbing activities.

The only impacts of wildlife and fisheries management decisions upon water and soils that can be measured are the preservation of crucial deer winter range and the reclamation of disturbance within sagebrush habitat. Reclamation of disturbance within sagebrush habitat would stabilize soils and increase vegetation, thereby benefiting soil productivity by reducing soil erosion and sedimentation in streams. The allowance of new surface disturbance within crucial winter range would result in indirect, long-term, adverse impacts to water quality and soil productivity. The BLM would provide habitat for a diversity of wildlife and fish species by limiting fragmentation, thereby keeping soils intact and sediment out of streams.

**4.15.1.15. IMPACTS COMMON TO ALL WOODLANDS AND FOREST MANAGEMENT DECISIONS**

Salvage operations and permitted use of certain vegetation products in specified areas would result in indirect, short-term, adverse impacts to water quality and soil productivity in the form of increased soil erosion and sedimentation in streams. Adverse, short-term, direct impacts to water and soils would occur as soil erosion during treatments and harvesting.

However, in the long term, treatments and harvesting have the potential to reintroduce the natural fire return interval, indirectly reducing soil erosion through fewer catastrophic fires.

The effects of woodlands and forest management on soils and water would be reduced by following National BLM Forest Health and Forest Management Standards and Guidelines (BLM 2004) to achieve desired future conditions and minimize impacts to water and soils while providing for multiple uses of forest products.

#### **4.15.2. PROPOSED RMP AND ALTERNATIVES IMPACTS**

Surface disturbance activities for the Proposed RMP and all alternatives and all effects would generally increase risks of adverse effects on water and soil resources by increasing erosion potential, sedimentation, soil compaction, loss of soil productivity, and impacts to biological soil crusts. Water quality would be impacted due to rises in salinity, sediment load, and increases in Selenium and Boron concentrations. The duration of these impacts would depend on the action. Mitigation outlined in Appendix K contains stipulations on surface disturbance that could be implemented to reduce impacts to soils and water resources; therefore some of the impacts discussed below would be reduced or eliminated.

##### **4.15.2.1. IMPACTS OF FIRE MANAGEMENT DECISIONS ON WATER AND SOILS**

###### **4.15.2.1.1. PROPOSED RMP AND ALTERNATIVES A, B, C, AND E**

Under the Proposed RMP and Alternatives A, B, C and E, prescribed burns on 156,425 acres of the VPA would result in 3 times more surface disturbance than Alternative D (No Action). In the short term, 13% (20,335 acres) of the burned area would occur on water erodible soils, 79% (123,575 acres) would occur on wind erodible soils, 9% (14,078 acres) would occur on sodic soils, 20% (31,285 acres) would occur on saline soils, and 7% (10,949 acres) would occur on gypsic soils. Proper location of prescribed burns would limit adverse effects due to fire management.

###### **4.15.2.1.2. ALTERNATIVE D (NO ACTION)**

Continuing current management would have fewer short-term adverse impacts and long-term benefits to water and soils from prescribed fire. Surface disturbance would be 3 times less under Alternative D (No Action) than under Alternatives A, B, and C.

##### **4.15.2.2. IMPACTS OF FORAGE MANAGEMENT DECISIONS ON WATER AND SOILS**

###### **4.15.2.2.1. PROPOSED RMP AND ALTERNATIVE A**

Utilization under the Proposed RMP and Alternative A would be 50%, which would provide more beneficial impacts to soils and water by limiting utilization, than Alternative D (No Action), which does not specify forage utilization. Approximately 245,607 and 245,649 AUMs are allocated under the Proposed RMP and Alternative A, respectively.

###### **4.15.2.2.2. ALTERNATIVE B**

Utilization under Alternative B is 60%, which provides more beneficial impacts to soils and water by limiting utilization, than Alternative D (No Action). Approximately 244,034 AUMs are allocated under this alternative.

**4.15.2.2.3. ALTERNATIVES C AND E**

Utilization under Alternatives C and E is the same as the Proposed RMP and Alternative A. Approximately 187,450 AUMs are allocated under these alternatives, which is 58,678 fewer than Alternative D (No Action). These alternatives would cause the fewest adverse impacts from forage utilization.

**4.15.2.2.4. ALTERNATIVE D (NO ACTION)**

Forage utilization under Alternative D (No Action) is not specified, which would result in long-term, adverse impacts to soils and water due to overutilization of forage and loss of cover. Approximately 245,108 AUMs are allocated under this alternative.

**4.15.2.3. IMPACTS OF LANDS AND REALTY DECISIONS ON WATER AND SOILS****4.15.2.3.1. PROPOSED RMP AND ALTERNATIVES A, C, AND E**

The Proposed RMP and Alternatives A, C, and E would pursue public access to the White River and acquisition of Indian Trust Lands in Bitter Creek, Willow Creek, and near the confluence of South and Sweetwater Canyons. The Proposed RMP and these alternatives would result in increased, adverse impacts to soil and water resources, due to increased public access as compared to Alternative D (No Action), where increased access would not specifically be pursued and agricultural entry would be precluded in withdrawal areas.

**4.15.2.3.2. ALTERNATIVE B**

Alternative B would not pursue access to the White River and would only pursue administrative access across Indian Trust Lands in Bitter Creek and near the confluence of South and Sweetwater Canyons. With respect to access, this alternative would have similar effects to soils and water as Alternative D (No Action).

**4.15.2.3.3. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) precludes agricultural entry on 35,900 acres of land. Mineral and agricultural withdrawals under Alternative D (No Action) would provide fewer indirect, long-term adverse impacts to water quality and soil productivity than the Proposed RMP and other alternatives by reducing soil erosion and sedimentation in streams. Alternative D (No Action) would not pursue public access to any new land.

**4.15.2.4. IMPACTS OF MINERALS DECISIONS ON WATER AND SOILS**

Table 4.15.2 shows the acreages of erodible soils by RFD area for oil and gas leasing (which includes CBNG). The areas with No Surface Occupancy or No Leasing were removed from the acreages analyzed. The largest source of sediment input to waters is expected from slopes 0-20%, with  $\geq 0.32$  k-factor. These acreages have been highlighted in the table. Impacts to soils

would have indirect, short- and long-term adverse impacts to water quality through subsequent sedimentation and salinity rises.

The RFD area with the highest amount of water erodible soils not subject to surface stipulations is Monument Butte-Red Wash. This area also has the greatest number of potential wells, with 1,700 oil and 3,100 gas wells identified for reasonably foreseeable development. The location of wells within the RFD areas may or may not be on BLM lands; therefore, the analysis may overstate the amount of water erodible areas that would be impacted on BLM lands.

<b>Total Projected Wells<sup>3</sup></b>	<b>3,665</b>	<b>3,688</b>	<b>3,712</b>	<b>3,637</b>	<b>3,488</b>	<b>3,285</b>

<sup>1</sup>Gilsonite data are represented in miles / acres.<sup>2</sup>The decrease in leasing in Alternative D (No Action) is due to the closure to leasing of the 188,500-acre Hill Creek Extension.<sup>3</sup>Total Projected Wells data are represented in numbers of wells. All other data is represented in acres.**4.15.2.4.1. PROPOSED RMP**

The Proposed RMP would have more direct and indirect adverse impacts to water quality and soil productivity due to oil and gas leasing (which includes CBNG), as compared to Alternative C and Alternative D (No Action). Approximately 1,640,535 acres would be administratively available for oil and gas leasing (which includes CBNG) subject to Standard Lease Terms or Controlled Surface Use, which is approximately 104,560 acres more than Alternative D (No Action). Total disturbance from oil and gas development would occur on 18,826 acres of soils, with adverse impacts to soils, which is 759 more acres more than for Alternative D (No Action).

Total wells under the Proposed RMP would be approximately 3,665 which are approximately 177 more than Alternative D (No Action); therefore more direct, long-term impacts to water due to drawdown would be expected for water resources. With respect to hydrocarbon leasing, and mineral materials, the Proposed RMP impacts more acreage than Alternatives C and D, and therefore would have greater direct adverse impacts to soil and water resources.

**4.15.2.4.2. ALTERNATIVE A**

Alternative A would have more direct and indirect adverse impacts to water quality and soil productivity due to oil and gas leasing (which includes CBNG), as compared to Alternative C and Alternative D (No Action). Approximately 1,780,879 acres would be administratively available for oil and gas leasing (which includes CBNG) subject to Standard Lease Terms or

Controlled Surface Use, which is approximately 244,905 acres more than Alternative D (No Action). Total disturbance from oil and gas development would occur on 18,945 acres of soils, with adverse impacts to soils, which is 732 more acres more than for Alternative D (No Action).

Total wells under this alternative would be approximately 3,688 which are approximately 200 more than Alternative D (No Action), therefore more direct, long-term impacts to water due to drawdown would be expected for water resources. With respect to hydrocarbon leasing, and mineral materials, Alternative A impacts more acreage than Alternatives C and D (No Action), and therefore would have greater direct adverse impacts to soil and water resources.

#### **4.15.2.4.3. ALTERNATIVE B**

Alternative B would have the greatest adverse impacts to water quality and soil productivity due to oil and gas leasing (which includes CBNG), as compared to the Proposed RMP and Alternative D (No Action). Approximately 1,819,397 acres would be administratively available for oil and gas leasing (which includes CBNG) subject to Standard Lease Terms or Controlled Surface Use, which is approximately 283,367 acres more than Alternative D (No Action). Total disturbance would occur on 19,033 acres, causing direct adverse impacts to soils, and affecting 821 more acres than Alternative D (No Action).

Total wells under this alternative would be approximately 3,712, which is approximately 224 more than alternative D (No Action), therefore more direct, long-term impacts to water due to drawdown would be expected for water resources. With respect to hydrocarbon leasing, and mineral materials, Alternative B impacts more acreage than Alternatives A, C, D and E, and therefore would have greater direct adverse impacts to soil and water resources.

#### **4.15.2.4.4. ALTERNATIVE C**

Alternative C would have the second least adverse impacts to water quality and soil productivity, as compared to other action alternatives and Alternative D (No Action). Approximately 1,627,085 acres would be administratively available for oil and gas leasing (which includes CBNG) subject to Standard Lease Terms or Controlled Surface Use, which is approximately 91,055 acres more than Alternative D (No Action). Total disturbance from oil and gas development would adversely affect 18,757 acres of soils, which is 545 acres more than Alternative D (No Action). This alternative also designates the second largest number of acres classified as no surface occupancy or as closed to leasing.

Total wells under this alternative would be approximately 3,637, which is approximately 149 more wells than Alternative D (No Action); therefore greater direct, long-term impacts to water due to drawdown would be expected for water resources. With respect to hydrocarbon leasing, and mineral material disposal Alternative C would adversely impact fewer acres than Alternatives A and B, but more than Alternatives D (No Action) and E.

**4.15.2.4.5. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would have approximately 1,536,030 acres administratively available for oil and gas leasing (which includes CBNG) subject to Standard Lease Terms or Controlled Surface Use. Total disturbance from oil and gas development would occur on 18,212 acres. The number of wells projected under this alternative would be approximately 3,488.

**4.15.2.4.6. ALTERNATIVE E**

Alternative E would have the least adverse impacts to water quality and soil productivity, as compared to other action alternatives and Alternative D (No Action). Approximately 1,499,461 acres would be administratively available for oil and gas leasing (which includes CBNG) subject to Standard Lease Terms or Controlled Surface Use, which is approximately 36,569 fewer acres than under Alternative D (No Action). Total disturbance from oil and gas development would adversely affect 17,468 acres of soils, which is 744 fewer acres than (No Action). This alternative also designates the largest number of acres classified as no surface occupancy or as closed to leasing.

Total wells under this alternative would be approximately 3,285, which is approximately 203 fewer wells than Alternative D (No Action); therefore the least direct, long-term impacts to water due to drawdown would be expected for water resources. With respect to hydrocarbon leasing and mineral material disposal, Alternative E would adversely impact fewer acres than any other alternative.

**4.15.2.5. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS ON WATER AND SOILS****4.15.2.5.1. PROPOSED RMP**

Under the Proposed RMP, 106,178 acres of non-WSA lands would be managed with special protections to maintain their wilderness characteristics. This area would be managed as VRM Class II, closed to mineral disposal, managed for avoidance of new ROWs, closed to road construction, closed to wood cutting and seed collecting, and retained for federal ownership. This management would result in less surface disturbance and would therefore have the beneficial impacts to water and soils, as described elsewhere in this section (4.15). Compared to Alternative A–D, the Proposed RMP would have indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation and salinity in streams.

**4.15.2.5.2. ALTERNATIVES A–D**

Under these alternatives, lands with wilderness characteristics outside of designated WSAs would not be subject to protective management to maintain those characteristics. Depending on management decision for other resources, there would be varying levels of development and surface disturbance within these areas, which would have indirect, long-term, adverse impacts to water quality and soil productivity.

**4.15.2.5.3. ALTERNATIVE E**

Under Alternative E, 277,596 acres of non-WSA lands would be managed with special protections to maintain their wilderness characteristics. This area would be managed as VRM Class I, closed to OHV use, closed to mineral disposal, managed for avoidance of new ROWs, closed to road construction, closed to wood cutting and seed collecting, and retained for federal ownership. This management would result in less surface disturbance than under any other alternative and would therefore have the greatest beneficial impacts to water and soils, as described elsewhere in this section (4.13). Compared to the Proposed RMP and Alternatives A-D, Alternative E would have indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation and salinity in streams.

**4.15.2.6. IMPACTS OF RANGELAND IMPROVEMENT DECISIONS ON WATER AND SOILS****4.15.2.6.1. PROPOSED RMP AND ALTERNATIVE A**

The Proposed RMP and Alternative A would provide 34,640 acres of vegetation treatment, which would be 5,750 fewer acres than Alternative D (No Action). Thus, Alternative A would result in fewer indirect, long-term, beneficial impacts to soil and water resources. The miles of fencing, number of guzzlers/reservoirs, number of wells/springs, and miles of pipeline planned under Alternative A would have similar impacts to Alternative D (No Action).

**4.15.2.6.2. ALTERNATIVE B**

Alternative B would provide 50,900 acres of vegetation treatments, 368.5 miles of fencing, 1,165 guzzlers/reservoirs, and 51 miles of pipelines. Compared to Alternative D (No Action), this alternative would have 10,510 more acres of vegetation treatment and 303.5 more miles of fencing, which would result in more indirect, long-term, beneficial impacts to soil and water resources.

Compared to Alternative D (No Action), this alternative would also implement 390 more guzzlers/reservoirs and 16 more miles of pipeline, which would result in more direct, short-term adverse impacts to soil and water than Alternative D (No Action).

Development of wells/springs and the associated impacts would be similar to Alternative D (No Action).

**4.15.2.6.3. ALTERNATIVES C AND E**

Alternatives C and E would provide 45,860 acres of vegetation treatments and 129 miles of fencing would be developed. Compared to Alternative D (No Action), these alternatives would have 5,470 more acres and 64 more miles of fencing, thereby providing more long-term beneficial impacts to soil and water resources. Water developments would have similar impacts to Alternative D (No Action).

**4.15.2.6.4. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would result in 40,390 acres of vegetation treatments, 65 miles of fencing, 775 guzzlers/reservoirs, 74 wells/springs, and 35 miles of pipeline.

**4.15.2.7. IMPACTS OF RECREATION DECISIONS ON WATER AND SOILS****4.15.2.7.1. PROPOSED RMP AND ALTERNATIVE A**

Designating Seep Ridge, Book Cliff Divide, and Atchee Ridge Roads as BLM Backcountry Byways would have more long-term, indirect, adverse impacts to soil and water resources compared to Alternative D (No Action) in the form of increased public visitation and use of these roads. Alternative D (No Action) does not specify these Backcountry Byways.

Management of the White River area as an SRMA under Alternative A would provide more long-term, beneficial impacts to water and soil than Alternative D (No Action).

Management of the Blue Mountain, Fantasy Canyon (Proposed RMP only, not Alternative A), Browns Park, Red Mountain-Dry Fork, and Nine Mile Canyon areas as SRMAs would limit OHV use to trails and therefore provide greater direct long-term beneficial impacts to soils and water, as compared to Alternative D (No Action). Although increased public visitation would have greater indirect, long-term adverse impacts to water quality and soil productivity than Alternative D (No Action).

Under Alternative A, development or improvement of up to 400 miles of trails for non-motorized use and up to 800 miles of motorized trails would result in increased public visitation and would have indirect, long-term adverse impacts to water quality and soil productivity. Proper placement of trails would reduce the adverse impacts to soils and water resources.

Not allowing OHV use off designated trails for big game retrieval would limit adverse impacts to soils and water resources, compared to Alternative D (No Action), which places far fewer restrictions on OHV travel.

Cabin improvement and construction proposed under Alternative A would result in surface disturbance (a more indirect, long-term, adverse impact to water quality and soil productivity) compared to Alternative D (No Action), which does not specify cabin improvements.

**4.15.2.7.2. ALTERNATIVE B**

Designation of Backcountry Byways and improvement of up to 800 miles of motorized trails would have essentially the same impacts as Alternative A and the Proposed RMP.

Providing minimal or no management of the White River, Blue Mountain, Fantasy Canyon, Book Cliffs, Browns Park, Red Mountain-Dry Fork, and Nine Mile Canyon would have no beneficial impacts to soils and water resources due to minimal management of OHV use, which would be the same as Alternative D (No Action).

OHV travel off of designated trails for big-game retrieval would be allowed under this alternative, which would result in long-term, adverse impacts to soil and water resources.

#### **4.15.2.7.3. ALTERNATIVES C AND E**

Alternatives C and E would have the same impacts as Alternative A for SRMA designation, except that Fantasy Canyon (69 acres) would be designated as an SRMA and the White River SRMA would increase in size from 24,183 acres to 47,130 acres. Backcountry Byways, motorized trails and cabins would not be developed under these alternatives. Therefore, these alternatives would generally have less adverse impacts and greater beneficial impacts than under other alternatives, including Alternative D (No Action).

#### **4.15.2.7.4. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would result in more direct and indirect, short- and long-term, adverse impacts than any other alternative due to lack of limits on OHV use. Other impacts from Alternative D (No Action) are similar to those under Alternative B.

### **4.15.2.8. IMPACTS OF RIPARIAN MANAGEMENT DECISIONS ON WATER AND SOILS**

#### **4.15.2.8.1. PROPOSED RMP AND ALTERNATIVES A, C, AND E**

The Proposed RMP, along with Alternatives A, C, and E, would implement the same management of riparian resources. The Proposed RMP and these alternatives propose stubble heights of 4 inches (30% utilization) where conditions are to be maintained and 6 inches (less than 20% utilization) if conditions are to be improved. Compared with Alternative D (No Action), the Proposed RMP and Alternatives A, C, and E would foster improved riparian conditions and more beneficial impacts on water quality and soil productivity. Key herbaceous riparian species would provide more trapping and retention of sediment during high water events than Alternative D (No Action) provides. Key riparian woody vegetation would be managed more under the Proposed RMP and Alternatives A, C, and E, providing both direct and indirect, long-term benefits to water quality and soil productivity via reduced soil erosion and sedimentation in streams. By contrast, no management of woody species is specified under Alternative D (No Action).

#### **4.15.2.8.2. ALTERNATIVE B**

Key herbaceous riparian vegetation, other than the stream banks, under Alternative B would not be grazed more than 50% during the growing season and not more than 60% during the dormant season. In this respect, Alternative B provides more beneficial impacts than Alternative D (No Action), which does not specify percent utilization. Key riparian woody vegetation would not be used more than 50%. Thus, Alternative B provides more protection to woody vegetation than Alternative D (No Action), which has no parameters specified for woody vegetation. Alternative B would implement the same management of key streamside herbaceous vegetation as Alternatives A and C.

**4.15.2.8.3. ALTERNATIVE D (No Action)**

Alternative D (No Action) has fewer beneficial impacts to soils and water than any other alternative, as it has a lower minimum stubble height after livestock grazing (Diamond Mountain: 3 inches, Book Cliffs: unspecified) and unspecified percent utilization. As well, key riparian woody vegetation use is not specified under Alternative D (No Action).

**4.15.2.9. IMPACTS OF SOILS AND WATER RESOURCES DECISIONS ON WATER AND SOILS****4.15.2.9.1. PROPOSED RMP AND ALTERNATIVE A**

The Proposed RMP and Alternative A would use oil and gas industry slope disturbance guidelines (Gold Book) to limit surface disturbances from oil and gas activities, which would provide indirect, long-term beneficial impacts to soil and water quality by reducing soil erosion on steep hillsides, and thus reducing the potential for increased stream sedimentation. Under the Proposed RMP and Alternative A, surface disturbances on slopes between 21%–40% would require erosion control, GIS modeling, and surveying, and slopes greater than 40% would not be disturbed unless other proposed construction alternatives would cause unnecessary degradation. These actions would also provide indirect, long-term beneficial impacts to soils and water by reducing surface disturbances that cause soil erosion and subsequent stream sedimentation. The Proposed RMP would be slightly more protective of water quality than Alternative A because UDEQ BMPs would be implemented to prevent surface runoff.

**4.15.2.9.2. ALTERNATIVE B**

Similar to the Proposed RMP, Alternative B would use oil and gas industry slope disturbance guidelines (Gold Book) to limit surface disturbances from oil and gas activities, and would require erosion control, GIS modeling, and surveying on slopes greater than 20% for unavoidable surface disturbances, with similar indirect beneficial impacts to soils and water quality as described for the Proposed RMP. This alternative would not restrict surface disturbances to slopes greater than 40%, and thus would not provide indirect beneficial impacts to soils and water quality, and would not protect steep slopes from surface-disturbance-caused erosion.

**4.15.2.9.3. ALTERNATIVES C AND E**

Alternatives C and E would have greater indirect beneficial impacts on soils and water quality than the other alternatives by applying the same management actions (with similar impacts) on 21%–40% slopes as the Proposed RMP and by prohibiting surface disturbances (and thus reducing the risk of increased stream sedimentation) on slopes greater than 40%.

**4.15.2.9.4. ALTERNATIVE D (No Action)**

Alternative D (No Action) proposes restrictions on slopes greater than 40% for mineral production only. Allowing other activities with no restrictions for slopes over 40% and not

specifying slope restrictions on slopes less than 40% would have more indirect long-term adverse impacts to water quality and soil productivity, as compared to other alternatives.

#### **4.15.2.10. IMPACTS OF SPECIAL DESIGNATION DECISIONS ON WATER AND SOILS**

##### **4.15.2.10.1. PROPOSED RMP**

Under the Proposed RMP, Lears Canyon (1,375 acres), Pariette (10,437 acres), Red Mountain-Dry Fork (24,285 acres), Red Creek (24,475 acres), Nine Mile Canyon (44,168 acres), Lower Green River (8,470 acres), and Browns Park (18,490 acres) would continue to be managed as ACECs. These actions would have indirect long-term benefits to water quality and soil productivity, in the form of reduced soil erosion and sedimentation in streams.

The Proposed RMP would manage for continued recommendation for designation of river segments on the Upper and Lower Green River. This action may increase visitation but would prevent surface disturbance in the immediate vicinity and would overall have indirect, long-term benefits to water quality and soil productivity.

##### **4.15.2.10.2. ALTERNATIVE A**

In addition to existing ACECs, Alternative A proposes ACEC designation of Bitter Creek (68,834 acres), Coyote Basin (87,743 acres), and the White River corridor (17,810 acres), as well as slight expansion of Nine Mile Canyon (48,000 acres) ACEC. This alternative would result in less surface disturbance and would have indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams. By contrast, Alternative D (No Action) does not designate any of these ACECs except the Lower Green River, Browns Park, and Nine Mile Canyon.

Alternative A recommends designation of new river segments on the White River (44 miles), as Wild and Scenic Rivers. This action may increase visitation, but would prevent surface disturbance in the immediate vicinity and would overall have more direct and indirect, long-term benefits to water quality and soil productivity, as compared to Alternative D (No Action).

##### **4.15.2.10.3. ALTERNATIVE B**

Alternative B would propose designation of 47,659 acres in Coyote Basin as a new ACEC, which would provide more beneficial impacts to soils and water resources than Alternative D (No Action), which would not designate this area. This alternative would not designate any other new ACECs nor Wild and Scenic Rivers and therefore would have similar impacts to soil and water resources, as compared to Alternative D (No Action).

##### **4.15.2.10.4. ALTERNATIVES C AND E**

Alternatives C and E would offer the greatest protection to soil and water resources through proposed ACEC designations. In addition to existing ACECs, Alternatives C and E propose ACEC designation of Bitter Creek (147,425 acres), Coyote Basin, which would include Kennedy

Wash, Snake John, Shiner, and Myton Bench (124,161 acres), Middle Green River (6,768 acres), White River corridor (47,130 acres), Four Mile Wash (50,280 acres), and Main Canyon (100,915 acres) and expansion of the lower Green River (10,170 acres) and Nine Mile Canyon (81,168 acres) as ACECs. These alternatives would result in less surface disturbance and would have indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams. By contrast, Alternative D (No Action) does not designate any of these ACECs except the Lower Green River and Nine Mile Canyon.

Alternatives C and E recommend designation of new river segments on the White River (44 miles), Nine Mile Creek (2 segments: 19 miles), middle Green River (36 miles), Evacuation Creek (21 miles), Bitter Creek (22 miles), and Argyle Creek (22 miles) as Wild and Scenic Rivers. This action may increase visitation, but would prevent surface disturbance in the immediate vicinity and would overall have more direct and indirect long-term benefits to water quality and soil productivity, as compared to Alternative D (No Action).

#### **4.15.2.10.5. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) proposes no new designation of ACECs or WSRs. This alternative would result in the greatest amount of surface disturbance, and would have indirect, long-term, adverse impacts to water quality and soil productivity.

#### **4.15.2.11. IMPACTS OF SPECIAL STATUS SPECIES DECISIONS ON WATER AND SOILS**

The Proposed RMP and Alternatives A and C would result in the most beneficial, indirect impacts to water and soils and are similar with respect to raptors; however, the Proposed RMP offers the most protection and Alternative C offers slightly more protection than Alternative A. Alternative B would offer some habitat protection (and thus, soil protection), but the level of protection would be less than Alternatives A and C and the Proposed RMP. Alternative D (No Action) offers the least indirect protection of water and soil resources because raptor buffers for surface disturbance are unspecified in the Book Cliffs area.

Improvement and maintenance of stream habitat in Bitter, Upper Willow, Beaver, Sears, Crouse, Tolivers, Davenport, Jackson, and Sweetwater Creeks, or others as found applicable, including tributaries, would have direct, long-term benefits to water quality and soil productivity by stabilizing stream banks and reducing erosion and subsequent stream sedimentation and salinity increases.

#### **4.15.2.12. IMPACTS OF TRAVEL DECISIONS ON WATER AND SOILS**

##### **4.15.2.12.1. PROPOSED RMP AND ALTERNATIVE A**

Under the Proposed RMP and Alternative A, newly permitted roads or trails would be obliterated and/or returned to their original condition when they no longer serve their permitted purpose or public interest. Roads causing resource damage would be closed if maintenance, upgrade or realignment is not feasible. In contrast, Alternative D (No Action) is unspecified with respect to roads and trails.

With respect to OHV travel, the Proposed RMP and Alternative A would allow open travel on 6,202 acres, limited travel on 1,643,475 acres and no travel on 75,845 acres and would designate 4,860 miles of routes. Compared to Alternative D (No Action), the Proposed RMP and Alternative A would allow unlimited travel on 781,657 fewer acres, would allow limited travel on 756,200 more acres, and would allow no travel on 25,457 more acres, and would designate 4,860 more miles of routes for OHV travel. Alternative A would cause fewer adverse and more beneficial impacts to soils and water by limiting OHV use; thus, it would likely reduce soil erosion and sedimentation in streams.

#### **4.15.2.12.2. ALTERNATIVE B**

Under Alternative B, newly permitted roads or trails and roads adversely impacting water and soils would not be obliterated if the road or trail serves a public interest. This alternative would have the same impacts as Alternative D (No Action), with respect to obliteration and closing roads and trails.

With respect to OHV travel, Alternative B would allow unlimited travel on 5,434 acres, limited travel on 1,659,901 acres and no travel on 60,187 acres and would designate 4,861 miles of routes. Compared to Alternative D (No Action), Alternative B would allow unlimited travel on 782,425 fewer acres, would allow limited travel on 772,626 more acres, would allow no travel on 9,799 more acres, and would designate 4,861 more miles of routes for OHV travel.

#### **4.15.2.12.3. ALTERNATIVE C**

Under Alternative C, newly permitted roads or trails would be obliterated, and roads and trails causing resource damage would be closed if maintenance, upgrade or realignment would not protect resources.

With respect to OHV travel, Alternative C would allow unlimited travel on 5,434 acres, limited travel on 1,353,529 acres and no travel on 366,559 acres and would designate 4,707 miles of routes. Compared to Alternative D (No Action), Alternative C would allow unlimited travel on 782,425 fewer acres, allow limited travel on 466,254 more acres, allow no travel on 316,171 more acres, and would designate 4,707 more miles of routes for OHV travel. This alternative would result in more beneficial and less adverse impacts to soils and water resources than all other alternatives except Alternative E.

#### **4.15.2.12.4. ALTERNATIVE D (NO ACTION)**

Under Alternative D (No Action), actions related to resource damage and newly created roads and trails are unspecified. With respect to OHV travel, Alternative D (No Action) would allow unlimited travel on 787,859 acres, would allow limited travel on 887,275 acres, and would allow no travel on 50,388 acres. Alternative D (No Action) provides relatively unrestricted OHV access, which would have an indirect long-term, adverse impact to water quality and soil productivity in the form of increased soil erosion and sedimentation in streams, which, in turn, would cause increases of salinity and loss of soil productivity.

**4.15.2.12.5. ALTERNATIVE E**

Under Alternative E, newly permitted roads or trails would be obliterated, and roads and trails causing resource damage would be closed if maintenance, upgrade or realignment would not protect resources.

With respect to OHV travel, Alternative E would allow unlimited travel on 5,434 acres, limited travel on 1,326,024 acres and no travel on 392,818 acres and would designate 4,654 miles of routes. Compared to Alternative D (No Action), Alternative E would allow unlimited travel on 782,425 fewer acres, allow limited travel on 438,749 more acres, allow no travel on 342,430 more acres, and would designate 4,654 more miles of routes for OHV travel. This alternative would provide the most beneficial and least adverse impacts to soils and water resources compared to all other alternatives.

**4.15.2.13. IMPACTS OF VISUAL RESOURCE MANAGEMENT DECISIONS ON WATER AND SOILS****4.15.2.13.1. PROPOSED RMP**

The Proposed RMP would designate approximately 289,687 acres as VRM Class I and II. This designation would generally result in less development and surface disturbance than Alternative D (No Action) and, thus, would result in fewer indirect, long-term adverse impacts to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.

**4.15.2.13.2. ALTERNATIVE A**

This alternative would designate 357,909 acres for management under VRM Class I and Class II. This designation would generally result in less development and surface disturbance than Alternative D (No Action) and, thus, would result in fewer indirect, long-term adverse impacts to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.

**4.15.2.13.3. ALTERNATIVES B AND D**

Alternatives B and D propose designation of approximately 166,794 and 166,772 acres respectively as VRM Class I and II. This designation would result in the lowest limitations of development and surface disturbance and, thus, would result in fewer indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams.

**4.15.2.13.4. ALTERNATIVE C**

Alternative C proposes designation of approximately 508,441 acres as VRM Class I and II. This designation would generally result in less development and surface disturbance than Alternative D (No Action) and would result in the second most indirect, long-term benefits to water quality and soil productivity in the form of reduced soil erosion and sedimentation in streams (following Alternative E).

**4.15.2.13.5. ALTERNATIVE E**

Alternative E proposes designation of approximately 594,210 acres as VRM Class I and II. This designation would generally result in less development and surface disturbance than Alternative D (No Action) and would result in the most indirect long-term benefits to water quality and soil productivity (following Alternative C) in the form of reduced soil erosion and sedimentation in streams.

**4.15.2.14. IMPACTS OF WILDLIFE AND FISHERIES MANAGEMENT DECISIONS ON WATER AND SOILS****4.15.2.14.1. THE PROPOSED RMP AND ALTERNATIVES A, B, C AND E**

The Proposed RMP and Alternatives A, B, C, and E propose restriction of surface-disturbing activities. Qualitatively, the Proposed RMP and these alternatives would likely result in less development and surface disturbance and would have indirect, long-term benefits to water quality and soil productivity by reducing soil erosion and sedimentation in streams.

**4.15.2.14.2. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) proposes restriction of surface-disturbing activities to mineral exploration. This alternative would have more indirect, long-term adverse impacts to water quality and soil productivity than any action alternative by reducing soil erosion and sedimentation in streams.

**4.15.2.15. IMPACTS OF WOODLANDS AND FOREST MANAGEMENT DECISIONS ON WATER AND SOILS****4.15.2.15.1. THE PROPOSED RMP ALTERNATIVE A**

The Proposed RMP would manage up to 552,152 acres for treatments or be harvested to reduce fuel loadings and to provide salvage of products that are dying due to fire, disease, insect-kill, and/or other disturbance, with the management intent of promoting healthy forest and woodlands. In addition, no vegetation removal would occur in WSAs. These management actions would have short-term, indirect adverse impacts on soil and water quality by increasing soil erosion and increasing stream sedimentation from surface disturbances during harvesting or treatments. The long-term impacts would be beneficial to soils and water by reducing the risks of wildland fire, and thus, reducing the risks of large-scale soil erosion and subsequent degradation of stream water quality. In comparison, management actions are unspecified under Alternative D (No Action) and would have more adverse impacts to water quality than under the Proposed RMP, due to increased erosion and stream sedimentation.

**4.15.2.15.2. ALTERNATIVE BA**

Alternative A would manage up to 552,152 acres for treatments or be harvested to reduce fuel loadings and to provide salvage of products that are dying due to fire, disease, insect-kill, and/or

other disturbance, with the management intent of promoting healthy forest and woodlands. In addition, no vegetation removal would occur on 13,606 acres within WSAs. These management actions would have short-term, indirect adverse impacts on soil and water quality by increasing soil erosion and increasing stream sedimentation from surface disturbances during harvesting or treatments. The long-term impacts would be beneficial to soils and water by reducing the risks of wildland fire, and thus, reducing the risks of large-scale soil erosion and subsequent degradation of stream water quality. In comparison, management actions are unspecified under Alternative D (No Action) and would have more adverse impacts to water quality than under the Alternative A, due to increased erosion and stream sedimentation.

#### **4.15.2.15.3. ALTERNATIVE B**

The impacts of Alternative B would be similar to those described under Alternative A, except that 554,108 acres would be treated or harvested.

#### **4.15.2.15.4. ALTERNATIVE C**

The impacts under this alternative would have the same number of acres managed for treatments and harvesting as Alternative A (552,152), with similar impacts to soils and water as described for Alternative A. Woodland and forest species salvaging, under Alternative C, would not be allowed except when woodland, forest, or other resources are threatened in proposed ACECs, which would result in fewer indirect, long-term adverse impacts to soil and water resources through reduced surface disturbance; thus limiting soil erosion and sedimentation in streams.

#### **4.15.2.15.5. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) provides for treatment or harvesting of up to 88,200 acres of forest and 200,100 acres of woodlands. This alternative would likely reduce the risk of catastrophic wildfire, providing indirect, long-term benefits to water quality and soil productivity. Depending on management restrictions, treatment and harvest activities would also result in short-term and long-term, indirect, adverse impacts to water quality and soil productivity due to soil erosion and sedimentation.

#### **4.15.2.15.6. ALTERNATIVE E**

Under this alternative 421,133 acres would be managed for treatments and harvesting, with similar impacts to soils and water as described for Alternative C. Woodland and forest species salvaging, under Alternative E, would not be allowed in areas proposed for protection of wilderness characteristics, which would result in fewer indirect, long-term adverse impacts to soil and water resources through reduced surface disturbance; thus limiting soil erosion and sedimentation in streams.

#### **4.15.2.16. SUMMARY**

The primary impacts to soil and water resources from the proposed alternatives are surface disturbance and vegetation loss, which would affect soil erosion, stream salinity, and

sedimentation. Other impacts are loss of soil productivity, increased road-bank erosion, localized headcutting in drainage channels from adjacent streams, and increased bank erosion from development within active channels of drainages. These processes have major impact on surface water quality and soil productivity. For this reason, almost all resource management decisions have some effect on soil and water resources.

#### **4.15.2.16.1. THE PROPOSED RMP AND ALTERNATIVE A**

Under the Proposed RMP and Alternative A, fire management, vegetation treatment, oil and gas leasing, and land withdrawals have the greatest impact on soil and water resources because they encompass large areas of land. These activities result in long-term indirect impacts to surface and ground water quality and long-term direct impacts to soil productivity. Riparian management will have the most direct benefit to water quality, though it encompasses a smaller area. Mineral extraction also has adverse effects, including direct impacts to soil productivity and surface water quality, indirect impacts through surface disturbance, as well as potential impacts to groundwater quality.

Overall, for the Proposed RMP and Alternative A, compared to current management conditions there will be direct and indirect benefits to soil productivity, watershed health, and water quality. Because the Proposed RMP designated more areas as ACECs and has somewhat more protective management restrictions for Special Status Species, it would have slightly greater beneficial effects on water and soils than Alternative A.

#### **4.15.2.16.2. ALTERNATIVE B**

Alternative B will generally result in more surface disturbance and indirect, long-term adverse impacts to soil productivity and surface water quality as compared to Alternative A. However, compared to current conditions, there will likely be little overall improvement or decline in soil productivity, watershed health, and water quality.

#### **4.15.2.16.3. ALTERNATIVE C**

Alternative C will generally result in slightly less surface disturbance than the Proposed RMP, and will result in slightly greater benefit to soil and watershed health and water quality. Compared to current conditions, there will be an overall benefit to soil productivity, watershed health, and water quality from Alternative C.

#### **4.15.2.16.4. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) will result in no improvement or decline in soil productivity, watershed health, or surface water quality compared to current conditions.

#### **4.15.2.16.5. ALTERNATIVE E**

Alternative E would generally result in less surface disturbance than the Proposed RMP and Alternatives A, B, C, and D. It would, thus result in the greatest benefits to soil and watershed

health and water quality. Compared to current conditions, there would be an overall benefit to soil productivity, watershed health, and water quality from Alternative E.

#### **4.15.3. MITIGATION MEASURES**

Mitigation for impacts to water and soil resources would generally take the form of avoidance of activities likely to cause major resource degradation. Under standard Non-Point Source Management policies (UDEQ 2000), activities within the VPA are required to take into account storm-water runoff controls. Best Management Practices would be used in areas where runoff, erosion, or range management could affect water quality and soil productivity. Reduction of surface-disturbing activities in and near streams and rivers would also mitigate adverse effects. Administrative actions such as halting surface-disturbing activities, changes in grazing management, and increased enforcement of travel restrictions can be taken where water and soil resources are being degraded.

#### **4.15.4. UNAVOIDABLE ADVERSE IMPACTS**

Unavoidable adverse impacts from the Proposed RMP include short-term, increased erosion and sedimentation and short-term nutrient release to surface waters due to prescribed burning and vegetation management; increases to surface water temperature due to vegetation treatment and woodland harvesting immediately adjacent to streams; and loss of soil productivity and water quality degradation due to proposed oil and gas facilities and infrastructure.

#### **4.15.5. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY**

Construction of oil and gas facilities and infrastructure would provide a short-term mineral use that would eventually result in long-term loss of soil productivity unless well pads are effectively restored. Long-term impacts to surface water quality and soil productivity are primarily the result of vegetation removal or prevention of revegetation, which allows continued erosion of soil and its resulting impact on surface waters. All activities described are surface-disturbing in nature and can result in long-term impacts due to short-term land uses. Impacts will persist as long as surface disturbance and vegetation loss continue. As oil and gas areas increase towards full field development, water quality degradation would shift from a short-term impact to one that is more long-term.

#### **4.15.6. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS**

All activities discussed result in short-term or long-term changes to soil productivity and surface water quality due to surface disturbance or loss of vegetation. However, almost all activities discussed are reversible with respect to surface water quality with appropriate revegetative or mitigation measures.

Soil is a finite resource, and soil productivity would experience localized irreversible impacts if excessive erosion were to occur without mitigative control structures or practices. These irreversible impacts would be applicable to all activities described above. Sedimentation in

surface waters resulting from excessive soil erosion and loss would also be an irreversible impact.

Impacts to groundwater quality resulting from improper well construction and accidental releases of contaminated production water during oil and gas drilling would be considered to be irreversible on a reasonable time scale.

## 4.16. SPECIAL DESIGNATIONS

In general, management of specially designated areas (such as ACECs, WSRs, and WSAs) is focused on protection of their special values, while allowing those uses and activities that are considered compatible with the specific, special resources of concern, and restricting those uses and activities that would impact those identified value(s). In the case of ACECs, the management focuses on protecting and preventing irreparable damage to specific, identified relevant and important values. For river segments that are eligible / suitable for congressional designation into the National Wild and Scenic River System, the management focuses on protecting the identified, outstandingly remarkable values, free-flowing water, and tentative classifications for eligible river segments. For WSAs, the management focuses on maintaining the wilderness setting, characteristics and experience.

Some of the actions proposed in this plan would have no adverse impacts on existing or potential ACECs, eligible river segments, or wilderness characteristics regardless of the alternative chosen. Only decisions that may affect the values of these areas are analyzed further.

### 4.16.1. ACECs

#### 4.16.1.1. IMPACTS COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES

With the Proposed RMP and all alternatives, seven currently designated ACECs (Browns Park, Nine Mile Canyon, Lears Canyon, Lower Green River Corridor, Red Mountain-Dry Fork, Red Creek Watershed, and Pariette Wetlands) would be designated and continue to be managed as ACECs, and their relevant and important values, including historic, cultural, scenic, and fish and wildlife resources, would continue to be protected, subject to valid existing rights. See Table 4.16.1 that follows for acreages under the Proposed RMP and each alternative.

With the Proposed RMP and all alternatives, relevant and important values of existing and potential ACECs would benefit from the special management attention they would receive if designated, including development of comprehensive, integrated activity plans in some cases. The plans would address the maintenance and development of OHV or non-motorized trails, minimal facilities necessary for human health and safety, and other surface-disturbing activities that would be complementary to the goals and objectives of each ACEC.

In the Proposed RMP and alternatives where some potential ACECs would not be designated or where surface disturbance would occur, the relevance and importance of these areas may be at some risk of irreparable damage during the life of the plan, depending upon the specific resource use or other actions proposed by the Proposed RMP or alternative.

Decisions that would generally have a positive impact on existing and potential ACECs, regardless of whether the Proposed RMP or other alternative are chosen, include those involving fire management, soil and watershed, and vegetation (including riparian and upland vegetation) management. Vegetation treatments would, in the long-term, restore vegetative communities to

resemble more natural ecosystems, which are important to protecting the identified relevant and important values in some of the ACECs.

In general, the more acres where mineral development is likely within existing and potential ACECs, the fewer acres there would be that would retain relevant and important values. In cases where mineral development would be allowed, the likelihood of surface disturbance affecting relevant and important values would be much greater in areas where standard stipulations or timing and controlled surface use stipulations would be applied. Also, some areas are at risk where cross country OHV travel ("open" areas) would continue under the Alternative D (No Action).

#### 4.16.1.2. ALTERNATIVES IMPACTS

The following table summarizes the acres proposed for ACEC designation by the Proposed RMP and alternatives.

**Table 4.16.1. Areas and Acres of ACECs That Would Be Designated by Alternative**

Area	Proposed RMP (acres)	Alternative A (acres)	Alternative B (acres)	Alternative C (acres)	Alternative D (No Action) (acres)	Alternative E (acres)
Bitter Creek	0	68,834	0	68,834	0	68,834
Bitter Creek – P.R. Spring	0	0	0	78,591	0	78,591

**Table 4.16.1. Areas and Acres of ACECs That Would Be Designated by Alternative**

<b>Area</b>	<b>Proposed RMP (acres)</b>	<b>Alternative A (acres)</b>	<b>Alternative B (acres)</b>	<b>Alternative C (acres)</b>	<b>Alternative D (No Action) (acres)</b>	<b>Alternative E (acres)</b>
Red Creek Watershed	24,475	24,475	24,475	24,475	24,475	24,475
Red Mountain-Dry Fork	24,285	24,285	24,285	24,285	24,285	24,285
Pariette Wetlands	10,437	10,437	10,437	10,437	10,437	10,437
White River Corridor	0	17,810	0	47,130	0	47,130
<b>Totals</b>	<b>131,700</b>	<b>345,850</b>	<b>179,356</b>	<b>681,310</b>	<b>165,944</b>	<b>681,310</b>

**4.16.1.2.1. BITTER CREEK AND BITTER CREEK-P.R. SPRING ACECS**

The Proposed RMP and Alternatives B and D (No Action) would not designate Bitter Creek or Bitter Creek-P.R. Springs as ACECs and would not afford special management protection. However, other resource decisions would continue to protect some of the relevance and importance values. Leasing for oil and gas development would be limited to NSO for the old growth pinyon pine area (160 acres). These management actions would preserve pinyon pine habitat, with indirect positive benefits to wildlife that use that type of habitat (See Wildlife Section). These management actions would also result in decreased fire risk and improved water quality in streams in the Bitter Creek Watershed.

Under Alternative A, 68,834 acres would be designated as the Bitter Creek ACEC/Research Natural Area to protect high-value old-growth pinyon pine, cultural resources, historic features, and watersheds. Special management actions would include establishing a research/monitoring program, enhancing habitat using forest treatments, and restricting wood-cutting around the old growth pinyon. Leasing for oil and gas development would be limited to NSO for the old growth pinyon pine area (160 acres). These management actions would preserve pinyon pine habitat, with indirect positive benefits to wildlife that use that type of habitat (See Wildlife Section). These management actions would also result in decreased fire risk and improved water quality in streams in the Bitter Creek Watershed.

Under Alternatives C and E, 68,834 acres would be designated as the Bitter Creek ACEC and 78,591 acres would be designated as the Bitter Creek/P.R. Spring ACEC. The ACECs are adjoining, and together would be managed as a contiguous polygon of 147,425 acres. For either alternative the management would be the same. The area would be managed to protect old-growth pinyon pine, cultural resources, historical features, and watersheds. Special management actions would include the following: establishing a research/monitoring program, enhancing habitat through forest manipulation, and restricting wood cutting around old-growth pinyon forests. These management actions would preserve pinyon pine habitat, with indirect positive benefits to wildlife that use that type of habitat. These management actions would also result in decreased fire risk and improved water quality in streams in the Bitter Creek Watershed.

Alternatives C and E would designate both ACECs, and there would be more than double the acreage protected, compared with Alternative A. This would result in roughly twice the protection to existing habitat and watershed health in the area.

Alternatives C and E would also place similar restrictions on OHV use and mineral development in the area. These two alternatives would require somewhat more area to be closed to leasing or leased with an NSO stipulation. Based on the acres designated under each alternative and these increased restrictions, Alternative C and E would result in greater restrictions to mineral development in the ACEC, followed by Alternatives A and the Proposed RMP and Alternatives B and D (No Action), respectively.

Under Alternative E, parts of the ACECs would be managed to protect non-WSA lands with wilderness characteristics, including Bitter Creek (33,488 acres), Rat Hole Ridge (11,367 acres), Cripple Cowboy (13,603 acres), and Sweet Water Canyon (6,994 acres). To protect those values, management of the non-WSA lands with wilderness characteristics would limit surface disturbance, including avoidance from rights-of-way location; management to VRM Class I objectives; and closure to OHV use, oil and gas leasing, fire wood cutting, mineral material sales, and road construction (see Table 2.1.10). These measures would limit the vegetation manipulation needed to enhance the relevant and important watershed values of the ACEC to the use of prescribed fire. On the other hand, limitations on surface disturbance would protect the relevant and important old growth pinyon, cultural resources, and historic values of the ACEC.

#### **4.16.1.2.2. COYOTE BASIN ACEC AND THE COYOTE BASIN COMPLEX ACEC<sup>18</sup>**

Under the Proposed RMP and Alternative D (No Action), Coyote Basin would not be designated as an ACEC, affording no special management attention or protection to the identified relevant and important values. However, other resource decisions would continue to protect some of the relevance and importance values. The VRM Class II objectives, limiting OHV travel to designated routes, and oil and gas leasing with controlled surface use would limit surface disturbance that would protect habitat for the white-tailed prairie dogs.

Alternative A would designate 87,743 acres as a Research Natural Area ACEC for protection of critical ecosystem for the white-tailed prairie dog and other special status species associated with the ecosystem. Under Alternative B, the Coyote Basin ACEC would include 47,659 acres of critical ecosystem for the black-footed ferret. Under Alternatives C and E, the Coyote Basin Complex ACEC would include the sub-complexes of Coyote Basin, Snake John, Shiner, Kennedy Wash, and Myton Bench for a total of 124,161 acres. These areas are proposed as ACECs because they contain populations of white-tailed prairie dogs and/or habitat. Plague has resulted in adverse impacts to white-tailed prairie dog in Utah. Designation of the Coyote Basin ACEC and the Coyote Basin Complex ACEC would not prevent the continued adverse impacts from the plague, but it would preserve essential habitat for remaining prairie dog populations in the planning area.

<sup>18</sup> There are two different polygons under the title Coyote Basin ACEC. One is proposed in Alternatives A and B and comprises 87,743 acres and 47,659 acres, respectively. In addition, there is a Coyote Basin sub-complex called Coyote Basin under Alternatives C and E that comprises 26,590 acres. They are all somewhat inclusive of one another regarding geographic location. Refer to Figures 29–32.

Alternatives C and E would provide the greatest amount of habitat and, therefore, the greatest potential protection to prairie dogs. Alternative A would provide the next greatest benefit followed by Alternative B. The Proposed RMP and Alternative D (No Action) would not designate either ACEC, offering no additional protection of the white-tailed prairie dog or black-footed ferret.

Each of the areas under Alternatives A, B, C, and E would be designated as a Research Natural Area, which would provide additional opportunities for research to identify the potential vectors for transmission of plague. This, in turn, could provide some long-term information for the treatment of this disease. However, designation of these ACECs does not guarantee the continued population viability of the white-tailed prairie dog in view of the potential mortality from continued spread of the disease.

Designation of the Coyote Basin ACEC or the Coyote Basin Complex ACEC would impact other resources found within the ACECs. These ACECs would provide essential habitat for the potential reintroduction of black-footed ferret. The white-tailed prairie dog provides forage for the black-footed ferret and is considered necessary for its successful recovery in the project area.

Accordingly, Alternatives C and E would provide the greatest potential positive benefit to the black-footed ferret, followed by Alternatives A and B. Under Alternatives A, B, C, and E, habitat in the ACEC would also be managed to protect critical habitat for other wildlife species that use the Coyote Basin ACEC. These species include the pronghorn, and sensitive species such as Bobolink, Ferruginous Hawk, Peregrine Falcon, Sage Grouse, Long-billed Curlew, Grasshopper Sparrow, Short-eared Owl, big free-tailed bat, black-footed ferret, ringtail cat, and dwarf shrew. Accordingly, Alternatives C and E would have the greatest potential benefits to these species and their habitat, followed by Alternatives A and B.

Under Alternatives C and E, the area would be subject primarily to standard lease terms, but would include areas managed with timing and controlled surface use and NSO for oil and gas leasing. Alternatives A and B would be subject primarily to standard lease terms and timing and controlled surface use. OHV use would be limited to designated routes and closed under all alternatives. These stipulations, combined with the size of the proposed Coyote Basin ACEC or Coyote Basin Complex ACEC, would manage oil and gas development and OHV use to ensure protection of the species and their habitat under Alternatives A, B, C, and E. These surface management stipulations would also apply to the development of other solid mineral resources in the ACEC.

#### **4.16.1.2.3. FOUR MILE WASH ACEC**

Under the Proposed RMP and Alternatives A, B, and D, Four Mile Wash would not be designated as an ACEC. Alternatives C and E would designate 50,280 acres in the Four Mile Wash area as an Outstanding Natural Area ACEC to protect high-value scenery, riparian ecosystems, and special status fish species. Management actions include closing the area to oil and gas leasing. Visual resources would be managed as Class II, III, and IV. OHV use would be limited to designated routes. However, under the Proposed RMP, other resource decisions would continue to protect some of the relevance and importance values. The VRM Class II objectives,

limiting OHV travel to designated routes, and oil and gas leasing with NSO in the river corridor and controlled surface use would limit surface disturbance that impact T&E species in the Green River.

Under Alternative E, much of the ACEC would be managed to preserve the wilderness characteristics on 43,013 acres of the Desolation Canyon non-WSA lands with wilderness characteristics that lie within the ACEC. Protection of wilderness characteristics would limit surface disturbance in the ACEC by closing the non-WSA lands with wilderness characteristics to OHV use and oil and gas leasing and by managing for little or no change to the landscape under VRM Class I objectives. Alternative E would limit surface disturbances, offering more protection to the relevant and important scenery, riparian ecosystem, and fisheries than offered by Alternative C. These limits on surface disturbance and motorized vehicle use would emphasize primitive and non-motorized recreation activities and experiences by preserving a natural setting and prohibiting motorized recreation that intrudes upon primitive activities.

Accordingly, Alternatives C and E would provide the greatest protection to wildlife and their habitat, scenery, and recreation opportunities in the area. The Proposed RMP and Alternatives A, B, and D (No Action) would have greater impacts to these resources, as they would impose the fewest restrictions to oil and gas development.

#### **4.16.1.2.4. MIDDLE GREEN RIVER ACEC**

The Proposed RMP and Alternatives A, B, and D would not designate this area as an ACEC. Currently, this section of the river is used for recreational use (hunting and fishing), as well as some OHV use. However, other resource decisions would continue to protect some of the relevance and importance values. The VRM Class II objectives, limiting OHV travel to designated routes, and oil and gas leasing with controlled surface use would limit surface disturbance that would protect riparian resources, water quality, as well as T&E species.

Under Alternatives C and E, 6,768 acres of the Middle Green River (line of sight from the centerline of the river up to one-half mile along both sides) between Dinosaur National Monument and the boundary of the Ouray National Wildlife Refuge would be designated as an ACEC to protect the riparian ecosystem. Special management attention would include permitting only surface-disturbing activities found complimentary to the goals and objectives of the ACEC. The area would be open to oil and gas leasing subject mostly to standard lease terms and managed with timing and controlled surface use stipulations. Visual resources would be managed as Class II (115 acres), III (3,492 acres) or IV (3,161 acres). OHV use would be limited to designated routes.

ACEC designation would result in some protection to riparian resources. Impacts to riparian resources under Alternative C would be protective in the form of reduced potential disturbance to riparian resources with associated improvements in riparian wildlife habitat and water quality. This section of the Green River provides habitat for Colorado pikeminnow and razorback sucker. Accordingly, designation of this section as an ACEC would have some positive impact on these species. However, the management actions associated with this ACEC would not extensively change the use of the area, therefore, these benefits are unlikely to be substantial in relation to

the other existing threats to these species (i.e., exotic fish introductions and existing dams on the Green River). This section of the Green River is used for recreational boaters. Limiting development along this corridor to activities complimentary to maintaining the riparian area would improve the recreational experience for these users.

#### **4.16.1.2.5. LOWER GREEN RIVER CORRIDOR AND EXPANSION ACECS**

The Proposed RMP and Alternatives B and D (No Action) would designate 8,470 acres of the Lower Green River Corridor as an ACEC to provide special management attention to scenery and the riparian ecosystem, extending only west from the centerline of the river. Oil and gas leases would be issued primarily with an NSO stipulation. Visual resources would be managed as Class II. OHV would be limited to designated routes. These restrictions would limit surface disturbance and protect both riparian and upland habitat along the corridor. This would have a protective effect on resident and migrating birds and other wildlife. It would also protect critical habitat for such sensitive species as the American White Pelican, Bald Eagle, Long-billed Curlew, Black Tern, Mountain Plover, Caspian Tern, Common Yellow Throat, Ferruginous Hawk, Osprey, Peregrine Falcon, Grasshopper Sparrow, Lewis' Woodpecker, Short-eared Owl, black-footed ferret, Townsend's big-eared bat, Utah milk snake, Colorado pikeminnow, razorback sucker, roundtail chub, and the Uinta Basin hookless cactus. The river corridor is a prime location for prehistoric and historical cultural sites as well. Therefore, this alternative would result in reduced potential surface disturbance and impacts to these resources, and enhance recreational opportunities. The Proposed RMP as well as Alternatives B and D would not designate 1,700 acres of the Lower Green River Expansion as an ACEC. However, other resource decisions would continue to protect some of the relevance and importance values. The VRM Class II objectives, limiting OHV travel to designated routes, and oil and gas leasing (NSO) would limit surface disturbance that would protect riparian resources, water quality, as well as T&E species. Alternatives A, C, and E would designate 10,170 acres of the Lower Green River between the Ouray National Wildlife Refuge and the Carbon County line as an ACEC. This is an expansion of the existing Lower Green River ACEC as described in the Proposed RMP and Alternatives B and D (No Action). The 1,700-acre increase adds the eastern portion of the river (line of sight from the center line of the river up to 0.5 mile). The impacts of ACEC management on other resource values and uses under Alternatives A, C, and E would be similar to those under the Proposed RMP and Alternatives B and D (No Action), affecting a larger area of land.

The Proposed RMP and Alternatives B and D (No Action) would have benefits similar to those described above for Alternatives A, C, and E but to a lesser degree because fewer acres would be designated for special management protection. Alternative E would have the same impacts of ACEC designation and management as Alternatives A and C, except that under Alternative E a portion of the ACEC would be managed to preserve the wilderness characteristics on 5,329 acres of the Desolation Canyon non-WSA lands with wilderness characteristics that lie within the ACEC. Protection of wilderness characteristics would limit surface disturbance in a portion of the ACEC by closing the area to OHV use and to oil and gas leasing and by managing the landscape under VRM Class I objectives. This prescription would limit surface disturbances, offering protection to the relevant and important scenery and riparian ecosystem.

**4.16.1.2.6. WHITE RIVER ACEC**

The Proposed RMP and Alternatives B and D (No Action) would not designate the White River as an ACEC. Accordingly, the Proposed RMP and these alternatives would not afford special management attention to the relevant and important geologic formations, scenery, and riparian ecosystems, and result in greater adverse impacts to these values from other resource uses along the river corridor. However, other resource decisions would limit surface disturbance and continue to protect some of the relevance and importance values. The central portion of the river canyon would be managed with emphasis on protection of its wilderness characteristics. Most of the public lands along the river canyon would be closed to oil and gas leasing or would be available for leasing with an NSO stipulations. The river downstream of the non-WSA lands with wilderness characteristics would be managed as a special recreation management area (SMRA) providing primitive recreation activities such as floating, primitive camping, fishing, hiking, and wildlife viewing. Much of the river corridor would be closed to disposal of sand, gravel, and building stone. Most of the river canyon would be managed VRM Class II for retention of the characteristic landscape. Surface disturbance would be prohibited within floodplains and 100 meters of riparian zones. OHV use would be limited to designated routes. Furthermore, compliance with endangered species and cultural resource protection laws would continue to afford protection of those elements of the ACEC relevant and important values.

Under Alternatives C and E, 47,130 acres along the White River would be managed as an ACEC to protect unique geologic formations with spectacular vistas and the high-value river riparian ecosystem. The ACEC would be managed as VRM Class I, II, III, and IV and would be closed and limited to designated routes for OHV use to meet the management objectives of the ACEC. Oil and gas leasing would be permitted with an NSO stipulation within line of sight from the centerline, up to one-half mile either side of the river. Areas beyond the 0.5-mile buffer would be open to oil and gas leasing subject to standard lease terms and timing and controlled surface use stipulations, or closed to leasing. This larger ACEC would result in an associated increase in the protections to geological formations, riparian and upland habitat, and the recreational experience.

A portion of the ACEC under Alternative E would include the White River non-WSA lands with wilderness characteristics (21,167 acres) and would be managed to preserve those characteristics. Protection of wilderness characteristics would limit surface disturbance by closing the area to OHV use and oil and gas leasing and by managing the landscape for little or no change according to VRM Class I objectives. Protection of wilderness characteristics in part of the ACEC would offer further protection to the relevant and important geology, scenery, and riparian values.

The White River provides critical habitat for the endangered Colorado pikeminnow, as well as habitat for other threatened, endangered, and sensitive species, including the razorback sucker, flannel mouth sucker, roundtail chub, Yellow-billed Cuckoo, Peregrine Falcon, and Bald Eagle.

Alternatives C and E would benefit these species through the preservation of riparian habitat and the associated improvements to water quality. These alternatives, in particular, close OHV use in the western portion of the ACEC. This management prescription would limit surface disturbance and provide have additional benefits for the species.

Alternative A would designate 17,810 acres of the river corridor as an ACEC to provide special management attention to the identified values of the area. The management prescription would be very similar to that described for Alternatives C and E, but applicable to a smaller area. The resultant impacts, thus, would be similar on a smaller portion of the river corridor.

#### **4.16.1.2.7. NINE MILE CANYON ACEC**

The Proposed RMP and Alternative A would designate an ACEC to provide special management attention to the relevant and important values, to 44,168 acres and 48,000 acres, respectively. The management prescription under the Proposed RMP and Alternative A would be very similar to that of Alternatives B, C, D, and E, and thus so would the resultant impacts to the relevant and important values of the ACEC. The designation of 44,168 acres from upper rim to upper rim of the canyon as an ACEC would protect identified relevant and important values. See the analysis of Alternatives of B, C, D and E below. This designation is consistent with the ACEC designation in the Price Field Office Proposed RMP. The relevant and important values of historic properties would be protected through cultural laws, rules and regulations.

Alternatives C and E would designate 81,168 acres in Nine Mile Canyon as an ACEC. Each alternative would require the development and implementation of a comprehensive integrated activity plan. Under these alternatives, the ACEC would be open to oil and gas leasing subject to standard lease terms, timing and controlled surface use, and NSO stipulations. Visual resources would be managed, in part, as Class II and III to meet different management objectives in different parts of the ACEC. OHV use would be limited to designated routes or closed. These actions would manage surface disturbance to ensure the protection of relevant and important values.

These alternatives would provide protection to existing cultural resources in Nine Mile Canyon, including nationally significant Fremont, Ute, and Archaic rock art and structures. Additionally, this ACEC would protect wildlife habitat, vegetation (including special status species), and visual resources. Protection of the cultural resources and wildlife values would enhance recreational opportunities in the ACEC.

Alternative E would have the same impacts as those described for Alternative C except that 20,963 acres of the Desolation Canyon non-WSA lands with wilderness characteristics located in the ACEC would be managed to preserve the area's wilderness values. In the non-WSA lands with wilderness characteristics, the area would be closed to oil and gas leasing and OHV use, and an avoidance area for ROWs. The landscape would be managed for little to no change according to VRM Class I objectives. This prescription for the non-WSA lands with wilderness characteristics is more restrictive than the prescription for the remainder of the ACEC and would allow little surface disturbance or intrusion by motorized vehicles. These limitations would protect cultural resources in place, preserve the natural landscapes (scenery), protect sensitive plants, and limit disturbance to wildlife utilizing the area, all relevant and important ACEC values.

Alternatives B, and D would designate 44,181 acres in Nine Mile Canyon as an ACEC, with effects on the relevant and important values similar to those described under Alternatives C and E, but affecting a smaller ACEC.

Based on the acres that would be designated and the management prescriptions, Alternatives C and E would provide the greatest protection to relevant and important ACEC values, followed by Alternatives A, B, and D (No Action), then the Proposed RMP.

#### **4.16.1.2.8. MAIN CANYON ACEC**

The Proposed RMP and Alternatives A, B, and D (No Action) would not designate the Main Canyon ACEC or prescribe special management attention to protect the relevant and important values of the area. However, other resource decisions would continue to protect some of the relevant and important values. Nearly half of the Main Canyon acreage is within the Winter Ridge WSA. This area would be protected under the IMP with VRM Class I objectives, closed to oil and gas leasing, and closed to OHV travel. Lands outside of the Winter Ridge WSA would be limited to OHV travel; open to oil and gas leasing with moderate constraints; avoidance of steep slopes; timing limitations for crucial deer and elk winter range; habitat improvement with vegetation treatment; and protection of historic properties through cultural laws, rules and regulations.

Alternative C would designate 100,915 acres in Main Canyon as an ACEC to protect relevant and important cultural and historic resources and natural systems. Special management attention would include permitting only surface-disturbing activities found to be complementary or compatible with the goals and objectives of the ACEC. The area would be closed and managed with timing and controlled surface use for oil and gas leasing. Visual resources would be managed as VRM Class I and Class II. OHV use would be closed and limited to designated routes. These management actions would limit surface disturbance and protect numerous cultural sites, including sites associated with the historical Northern Ute migration route along Main Canyon. Management of the visual resources according to Class I and II objectives would limit landscape modifications, preserve the visual aesthetics of the area, and enhance the recreational experience.

Alternative E would also designate a 100,915-acre ACEC with impacts similar to those described for Alternative C. However, under this alternative, the ACEC includes portions of the Wolf Point non-WSA lands with wilderness characteristics (11,802 acres within the ACEC), which would be managed to preserve its wilderness characteristics. To protect the wilderness characteristics of the non-WSA lands with wilderness characteristics, Wolf Point would be closed to OHV use and oil and gas leasing, and a ROW avoidance area. To preserve the natural characteristics of the area, the landscape would be managed according to VRM Class I objectives. This prescription would limit or prohibit surface disturbance, protecting the relevant and important cultural, historic, and natural system values of the ACEC.

**4.16.1.2.9. BROWNS PARK ACEC**

The Proposed RMP would designate an 18,490-acre ACEC for the same values, following a very similar management prescription to Alternative B. Under Alternative B, 18,475 acres would be designated as an ACEC to provide special management attention to the protection of scenery, wildlife habitat, and cultural resources. The area would be open to oil and gas leasing subject to standard lease terms, timing and controlled surface use, and NSO; and some parts of the ACEC would be closed to leasing. OHV use would be closed and limited to designated routes. The effect on the relevant and important scenery, wildlife habitat, and cultural resources would be the same as described for Alternative B. Under the Proposed RMP, Lower Flaming Gorge, Cold Spring Mountain and Mountain Home would also be managed to protect their wilderness characteristics, with a similar management prescription to Alternative E. The resultant impacts on ACEC values in Brown's Park would be similar to Alternative E.

The remaining 34,231 that would not be designated as an ACEC under the Proposed RMP would continue to protect the relevant and important values through VRM Class II objectives, OHVs limited to designated roads, and oil and gas leasing would be opened with moderate and major constraints such as timing limitations for crucial deer and elk winter range and NSO.

Alternatives A, C, and E would designate 52,721 acres in Browns Park as an ACEC. Under these alternatives, the BLM would develop a comprehensive integrated activity plan that would address protection of the relevant and important scenery, wildlife habitat, and cultural and historic resources.

The area would be closed to oil and gas leasing or leased primarily with NSO or timing and controlled surface use stipulations. Visual resources would be managed as according to VRM Class I or Class II objectives under Alternative E. OHV use would be closed or limited to designated routes. This prescription would limit surface disturbance and preserve wildlife habitat and cultural resources. It would also afford protection to visual resources and would consequently improve the recreational setting and experience in the area. Closing the area to OHV use and restricting OHV use to existing routes would decrease surface disturbance.

Because the ACEC would be larger and would have greater restrictions on minerals development and landscape modification under Alternatives A, C and E, there would be greater protection of wildlife habitat, cultural resources, and recreation opportunities, in comparison with the effects under Alternatives B.

Under Alternative E portions of Lower Flaming Gorge (11,274 acres), Dead Horse Pass (1,665 acres), Cold Spring Mountain (8,649 acres), and Mountain Home (2,089 acres) non-WSA lands with wilderness characteristics are located in the ACEC, and they would be managed to protect their wilderness characteristics. To protect their wilderness characteristics, these non-WSA lands with wilderness characteristics would be closed to OHV use, oil and gas leasing, mineral material sales, wood cutting, and road construction. The non-WSA lands with wilderness characteristics would also be managed for avoidance from location of ROWs. The landscape would be managed according to VRM Class I objectives to preserve its undeveloped character. This prescription would limit activities that disturb the landform and vegetation, protecting scenery, wildlife habitat, and cultural and historic resources values of the ACEC.

Under Alternative D (No Action), 52,721 acres of Browns Park would continue to be managed as an ACEC. The area would have similar restriction on oil and gas development. OHV use would be open, closed, and limited to designated routes in different parts of the ACEC. The effects on the relevant and important scenery, wildlife habitat, and cultural resources would be similar to Alternatives A, C, and E.

#### **4.16.1.3. UNAVOIDABLE ADVERSE IMPACTS**

Unavoidable adverse impacts to relevant and important ACEC values would occur from surface disturbance associated with mineral development and OHV activity, depending upon the ACEC values and Proposed RMP or alternative.

#### **4.16.1.4. SHORT-TERM USES VERSUS LONG-TERM PRODUCTIVITY**

Any loss of ACEC values due to surface disturbances would remain throughout the life of the plan.

#### **4.16.1.5. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS**

In those potential ACECs, not proposed for management of their relevant and important values under any of the alternatives, any loss of identified ACEC values that would result from surface disturbance caused by mineral development, OHV use, or other development, would be irretrievable. It is not anticipated that any impacts would be irreversible.

### **4.16.2. WILD AND SCENIC RIVERS**

#### **4.16.2.1. IMPACTS COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES**

Under the Proposed RMP and all of the alternatives, segments of the Upper Green and Lower Green River would continue to be recommended to Congress as suitable and managed to protect the outstandingly remarkable values, free-flowing water, and tentative classifications of these segments, subject to valid existing rights.

In the Proposed RMP and all alternatives where eligible rivers would be determined suitable, the BLM would protect the outstandingly remarkable values, tentative classification, and free-flowing water of these rivers to the extent of its authority, which is limited to those portions of the segment where BLM manages the shoreline or other lands within the corridor, and is subject to valid existing rights. The free-flowing character of eligible river segments would be protected to the extent that modifications such as stream impoundments, channelization, and/or rip-rapping would not be permitted along BLM shorelines. However, depending upon the alternative, values may be at risk from potential mineral development, OHV activity, or other surface-disturbing activities. Unless public land is somehow involved in a proposed land use, BLM has no control of potential modifications of the shoreline or other development (including development related to the perfection of water rights) on non-public lands. Because of this factor, there would be no affect on the Colorado River Compact from protective management of eligible/suitable segments.

Under the Alternative D (No Action), a suitability determination would not be made, and BLM would continue to manage some of the eligible river segments to protect their outstandingly remarkable values, free-flowing water, and tentative classification to the extent of its authority as identified above, consistent with existing land use plan decisions and subject to valid existing rights. In the case of those river segments that were reviewed and determined unsuitable in the Diamond Mountain RMP, that decision would remain in effect.

For those river segments that would not be recommended suitable for wild and scenic river designation under the Proposed RMP and all alternatives, many other prescriptions of the Proposed RMP and alternatives would still afford protection to the river corridor, free-flowing water, and river values. For example, surface disturbance restrictions in riparian zones and floodplains would protect river shoreline and water quality. Actions proposed to protect riparian obligate and aquatic wildlife species and their habitat would protect river values. Vegetation treatments implemented to restore riparian and upland vegetation communities would enhance watershed health, water quality and quantity, wildlife habitat, and recreation settings and experiences. However, varying degrees of construction, development, and use would be allowed in these river corridors, including recreation development, motorized travel, and placement of utility lines and facilities. These actions would result in some level of surface disturbance and development that could alter "wild" or "scenic" classifications.

Refer to Table 4.16.2 for a listing of river segments and total river miles that would be determined suitable by alternative.

**Table 4.16.2. River Segments That Would Be Determined Suitable and Total River Miles by Alternative**

River/River Segment	Proposed RMP (river miles)	Alternative A (river miles)	Alternative B (river miles)	Alternative C (river miles)	Alternative D (No Action) (river miles) <sup>1</sup>	Alternative E (river miles)
White River "scenic" between the state line and its confluence with Asphalt Wash (Segment 1)	0	24	0	24	0	2
White River "wild" between Asphalt Wash to where the river leaves Section 18 T10S R23E SLBM (Segment 2)	0	10	0	10	0	10

**Table 4.16.2. River Segments That Would Be Determined Suitable and Total River Miles by Alternative**

River/River Segment	Proposed RMP (river miles)	Alternative A (river miles)	Alternative B (river miles)	Alternative C (river miles)	Alternative D (No Action) (river miles) <sup>1</sup>	Alternative E (river miles)
White River "scenic" from where the river leaves Section 18 T10S R23E SLBM, and the Indian Trust land boundary (Segment 3)	0	0	0	10	0	10
Nine Mile Creek "scenic" within Duchesne County between the Green River and the Duchesne County Line (Segment A)	0	0	0	13	0	13
Nine Mile Creek "recreational" within Duchesne County, between the Carbon county line and its confluence with Gate Canyon (Segment B)	0	0	0	6	0	6
Upper Green River	22	22	22	22	22	22
Lower Green River	30	30	30	30	30	30
Middle Green River	0	0	0	36	0	36
Evacuation Creek	0	0	0	21	0	21
Bitter Creek	0	0	0	22	0	22
Argyle Creek	0	0	0	22	0	22
<b>Total River Miles</b>	<b>52</b>	<b>86</b>	<b>52</b>	<b>216</b>	<b>52</b>	<b>192</b>
<b>Total BLM Shoreline Miles</b>	<b>39</b>	<b>57</b>	<b>39</b>	<b>112</b>	<b>39</b>	<b>104</b>

**Table 4.16.2. River Segments That Would Be Determined Suitable and Total River Miles by Alternative**

River/River Segment	Proposed RMP (river miles)	Alternative A (river miles)	Alternative B (river miles)	Alternative C (river miles)	Alternative D (No Action) (river miles) <sup>1</sup>	Alternative E (river miles)
---------------------	----------------------------	-----------------------------	-----------------------------	-----------------------------	--	-----------------------------

<sup>1</sup> In addition, 87 miles of river involving the White River (Segments 1, 2, and 3), Evacuation Creek, and Bitter Creek would remain eligible with this alternative.

<sup>2</sup> Alternative E would not recommend Segment A suitable, but would manage and protect the segment as eligible pending completion of a review of the permit for dam construction.

Note: Mileage is approximate.

#### 4.16.2.2. ALTERNATIVE IMPACTS

##### 4.16.2.2.1. PROPOSED RMP AND ALTERNATIVE B

Under the Proposed RMP and Alternative B, 52 river miles (39 miles of BLM shoreline) would be recommended suitable for designation into the National Wild and Scenic River System. The Green River (Upper and Lower Segments) would be determined suitable for designation into the National Wild and Scenic River System (see Table 4.16.2) with a tentative classification of "Scenic" for both river segments. Where BLM manages the shoreline or other lands within the river corridors, BLM would protect the outstandingly remarkable values (unique natural, scenic, recreational, fish and wildlife and cultural values), tentative classification, and free-flowing nature of these rivers. Because other resource allocations would be consistent with management of the rivers' suitability, the Proposed RMP and Alternative B would provide greater protection to outstanding remarkable values than would the Alternative D (No Action). Under the Proposed RMP and Alternative B, a mineral withdrawal would be pursued to prevent mineral entry and related surface disturbance, and therefore protect the outstandingly remarkable values and tentative classification of the Upper Green River and the Lower Green River.

The Upper and Lower Green River would largely be protected from disturbance related to mineral development by either being closed to mineral leasing or by no surface occupancy stipulations.

Both suitable river segments would be in a limited or closed OHV category, with most of the segments limited to designated routes. River corridors would largely be protected from disturbance related to OHV activity. No loss of outstandingly remarkable values from OHV use would be anticipated during the life of the plan.

##### 4.16.2.2.2. ALTERNATIVE C

With Alternative C, 216 river miles (112 miles of BLM shoreline) including all 11 eligible river segments would be recommended suitable for designation into the National Wild and Scenic River System (see Table 4.16.2). Where BLM manages the shoreline or other lands within the river corridors, BLM would protect the outstandingly remarkable values (unique natural, scenic, recreational, fish and wildlife and cultural values), tentative classification, and free-flowing

nature of these rivers. Overall, this alternative would provide the greatest protection to the outstandingly remarkable values, free-flowing nature and tentative classification of these segments. However, where mineral development would be allowed (on valid existing leases) with standard stipulations or timing and controlled surface use, or where other mineral development would be allowed within the corridor of Evacuation Creek, White River (Segments 1 and 3), Middle Green River, and Nine Mile Creek, segment B (on valid existing leases), the outstandingly remarkable values of these rivers would be at risk. The White River and Evacuation Creek segments are most at risk as they are within an area of foreseeable mineral development.

The proposed locatable mineral withdrawals would also be protective of the outstandingly remarkable values of the Upper Green River, the White River (Segment 2), and the Lower Green River. With this alternative, public access (which may involve easement or exchange and improvement of existing routes) would be pursued for Segment 1 of the White River at the mouth of Cowboy Canyon, Bonanza Bridge, and Wagon Hound Road. This would enhance access to the river corridor and this segment's recreational values, and would not affect the other outstandingly remarkable values. It would not affect the free-flowing nature of the river, and would be in keeping with the tentative classification of scenic.

The suitability recommendation for Segment 1 of the White River would result in the discontinuance of the existing permit for the dam site. Accordingly, the free-flowing nature of Segment 1 would be maintained.

Not grazing the lands acquired along Nine Mile Creek would limit surface disturbance caused by livestock grazing and protect the outstandingly remarkable cultural and scenic values, and would enhance water quality of the segment.

Overall, this alternative would provide the greatest protection to the outstandingly remarkable values, free-flowing nature of the rivers, and tentative classification of all the suitable segments. The Upper and Lower Green River, the White River (Segments 1 and 2), Nine Mile Creek (Segment A), and Bitter Creek, would largely be protected from surface disturbance related to mineral development by either being closed to mineral leasing or by no surface occupancy stipulations. However, where mineral development would be allowed (on valid existing leases) with standard stipulations or timing and controlled surface use, or where other mineral development would be allowed within the corridor of Evacuation Creek, White River (Segments 1 and 3), and Nine Mile Creek, segment B (on valid existing leases), the outstandingly remarkable values of these rivers would be at risk. The White River and Evacuation Creek segments are most at risk as they are within an area of foreseeable mineral development.

All suitable river segments would be in a limited or closed OHV category, with most of the segments closed. This alternative would best protect these river corridors from surface disturbance and the presence and noise related to OHV activity. No loss of outstandingly remarkable values from OHV use would be anticipated during the life of the plan. The closed category for Segment 2 of the White River would be consistent with the tentative classification of wild.

**4.16.2.2.3. ALTERNATIVE A**

With Alternative A, 86 river miles (57 miles of BLM shoreline) involving four eligible river segments would be recommended suitable for inclusion into the National Wild and Scenic River System (see Table 4.16.2). Under this alternative, the Upper and Lower Green Rivers and segments 1 and 2 of the White River would be recommended suitable for designation as wild and scenic rivers. The alternative would result in the same management prescription and resultant impacts to the outstandingly remarkable values, free-flowing water, and tentative classification of these four river segments as described for these segments under Alternative C above.

**4.16.2.2.4. ALTERNATIVE D (NO ACTION)**

With Alternative D, the recommended suitable Upper and Lower Green River (see Table 4.16.2) segments, involving 52 river miles (39 miles of BLM shoreline), would remain suitable, and be managed so as to protect their outstandingly remarkable values, tentative classification, and free-flowing nature. Although suitability recommendations would not be made for the other eligible rivers under this alternative, non-suitable recommendations made for Nine Mile Creek, Argyle Creek, and Middle Green River in the Diamond Mountain RMP would continue with this alternative. However, in keeping with BLM Manual 8351, Sections .32C and .33C, the White River (Segments 1, 2, and 3) Evacuation Creek, and Bitter Creek would remain eligible with this alternative and, where BLM manages the shoreline or other lands within the river corridors, they would be managed in a manner that would protect their outstandingly remarkable values, tentative classification, and free-flowing water until such time as suitability findings are made. Approximately 87 river miles (34 miles of BLM shoreline) would be involved.

However, protective management would be restricted by other decisions made in the Diamond Mountain RMP. Where mineral development would be allowed on valid existing leases with standard stipulations or timing and controlled surface use, or where other mineral development would be allowed in the corridors of the Middle Green River, Bitter Creek, Nine Mile Creek, White River Segments 1 and 3, Argyle Creek, and Evacuation Creek (on valid existing leases), the outstandingly remarkable values of these rivers would be at risk. Segments 1 and 3 of the White River Corridor would be most at risk because they are in an area of foreseeable mineral development, and Segment 1 has been identified for a potential dam site. Also, river corridors which would remain in an open category for OHV use would also be at risk from increased surface disturbance.

A locatable mineral withdrawal or other protective measures would be pursued that would preclude mineral entry and agricultural entry within the corridors of the Upper Green River, and the lower Green River. This withdrawal would prevent surface disturbance that would degrade the outstandingly remarkable values, free-flowing nature of the rivers, and eligible classification of these river segments.

Under this alternative, the continued eligibility decision for Segment 1 of the White River would be incompatible with the existing permit for the dam site. Because this permit would continue under this alternative, the free-flowing nature of Segment 1 would not be maintained and this segment would no longer be eligible for designation as a Wild and Scenic River.

#### **4.16.2.2.5. ALTERNATIVE E**

Under Alternative E, 192 river miles (104 miles of BLM shoreline) including all 11 eligible river segments would be recommended suitable for designation as wild and scenic rivers. (see Table 4.16.2 above). The only difference between this alternative and Alternative C is the exclusion of White River segment 1. This segment of the White River would not be recommended suitable for designation, pending completion of a review of the permit for dam construction. In the interim, the segment would remain eligible and managed to protect its river values. Thus the management prescription and resultant impact to wild and scenic river values would be the same for all 11 rivers as described under Alternative C above.

In addition, under this alternative, non-WSA lands with wilderness characteristics in the river corridors would be managed to protect those characteristics, and, where suitable wild and scenic river segments include portions of non-WSA lands with wilderness characteristics, additional protections would result from the protective management prescriptions. Portions of the White River non-WSA lands with wilderness characteristics are located in the White River wild and scenic river corridor. Portions of Desolation Canyon non-WSA lands with wilderness characteristics are in the Nine Mile Creek corridor. Parts of the Bitter Creek, Rat Hole Ridge, Cripple Cowboy, and Hell's Hole Canyon non-WSA lands with wilderness characteristics are located in the Bitter Creek corridor. Parts of Lower Flaming Gorge non-WSA lands with wilderness characteristics are in the Upper Green River corridor, and portions of Desolation Canyon non-WSA lands with wilderness characteristics are located in the Lower Green River corridor.

To protect their wilderness characteristics, the non-WSA lands with wilderness characteristics would be closed to OHV use, oil and gas leasing, mineral material sales, wood cutting, and road construction. The non-WSA lands with wilderness characteristics would be ROW avoidance areas. VRM Class I objectives would protect the natural characteristics from change in each of the non-WSA lands with wilderness characteristics. For those portions of the non-WSA lands with wilderness characteristics located in suitable wild and scenic river corridors, this prescription would prevent surface disturbances that would have adverse impacts on the outstanding natural, scenic, recreational, fish and wildlife, and cultural values; tentative classification; and free-flowing nature of these rivers.

#### **4.16.2.3. UNAVOIDABLE ADVERSE IMPACTS**

Unavoidable adverse impacts to outstandingly remarkable river values, the free-flowing condition of the rivers, and their tentative classification would occur from mineral development and OHV activity, depending upon the river segment and Proposed RMP or alternative.

#### **4.16.2.4. SHORT-TERM USES VERSUS LONG-TERM PRODUCTIVITY**

Any loss of river values due to surface disturbances or alteration of the free-flowing nature of the rivers would remain throughout the life of the plan.

#### 4.16.2.5. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

Any loss of outstandingly remarkable values of eligible or recommended suitable river segments that would result from mineral development would be irretrievable. No irreversible impacts are anticipated under the Proposed RMP or any alternative.

#### 4.16.3. WILDERNESS STUDY AREAS (WSAs)

Wilderness study areas (WSAs) are managed under the Interim Management Policy and Guidelines for Lands Under Wilderness Review (IMP) (BLM 1995) which directs the BLM to manage the areas so as not to impair their suitability for preservation as wilderness. This management policy applies to all uses and activities in WSAs but acknowledges those uses specifically exempted from this standard by FLPMA (such as grandfathered uses) and valid existing rights. Because of this protective standard, there would be no impacts to the wilderness characteristics of the WSAs from implementation of the Proposed RMP or any alternative except in areas with existing valid rights. The only area where valid existing rights are expected to impact the wilderness values is in the Winter Ridge WSA.

The Winter Ridge WSA (42,462 acres) is located in an area high oil and gas development potential (Mineral Potential Report, BLM 2002), with a demonstrated exploration and production history. About 25% of the lands in the WSA are currently under lease. Although, WSAs are closed to leasing, the IMP does recognize valid existing rights. Under the Proposed RMP and all alternatives, it is anticipated that the leaseholder(s) would exercise their rights under these leases to explore and develop oil and gas resources. The resulting surface disturbance (i.e., roads, well pads, pipelines) would degrade the natural characteristics on as much as 33% of the WSA. The presence and noise of people, vehicles, and equipment would also diminish opportunities for solitude and conflict with primitive recreational activities. Through the exercise of valid existing rights, it is anticipated that approximately 13,832 acres of the WSA would lose its wilderness characteristics.

Under the Proposed RMP and Alternatives A, B, C, and E, each WSA would be managed under VRM Class I objectives. This objective provides for preservation of the characteristic landscape and would preserve the natural characteristics of the WSAs. Preservation of an undeveloped landscape (the natural values) would also provide the setting needed to support outstanding opportunities for solitude and primitive recreational activities.

Under the Proposed RMP and alternatives motorized use is either limited to designated "ways" or closed to all motorized use, depending on the WSA and alternative, and consistent with the IMP. In WSAs where motorized travel is permitted on designated routes, there would be no additional surface disturbance to the natural characteristics of the WSAs. However, the presence and noise of vehicles would temporarily disrupt opportunities for solitude and conflict with primitive forms of recreation. In WSAs where existing "ways" would be closed to motorized travel, there would be no added surface disturbance that would degrade the natural characteristics of the WSA and no conflicts with opportunities for solitude or primitive recreation activities.

**4.16.3.1. UNAVOIDABLE ADVERSE IMPACTS**

Because of the anticipated exercise of valid existing rights on existing oil and gas leases in the Winter Ridge WSA, 13,832 acres of the WSA would lose its wilderness characteristics resulting from surface disturbance created by exploration and development. While mitigation measures would be employed to reduce the effects on the wilderness values of the WSA, the leaseholder(s) have the right to develop the lease(s), and that development would degrade the wilderness values of the WSA. That impact cannot be avoided.

**4.16.3.2. SHORT-TERM USES VERSUS LONG-TERM PRODUCTIVITY**

The loss of wilderness values of Winter Ridge WSA is expected to remain for 25–30 years, the average life of a producing well, plus time for reclamation.

**4.16.3.3. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS**

Any loss of wilderness characteristics that would result from mineral development would be irretrievable, but not irreversible. At the end of the production life of the well, the site would be reclaimed, and the natural characteristics of the land would return.

## 4.17. SPECIAL STATUS SPECIES

Federally listed and sensitive species are updated per Instruction Memorandum No. UT 2007-078 dated September 26, 2007 (Expires: 09/30/2008). The Updated Utah BLM State Director's Sensitive Plant and Animal Species Lists states the following:

**"1. Sensitive Animal Species List.** By this Instruction Memorandum, Utah BLM adopts the existing Utah Division of Wildlife Resources (DWR) *Utah Sensitive Species List*. This means that BLM will now use the official DWR list that is in place at the time of a given action. DWR updates this list on a regular basis so it will be important to consult the DWR web site at <http://www.wildlife.utah.gov> to ensure that you are using the latest list. Only those species or their habitat that occur on BLM administered public lands should be considered.

**2. Sensitive Plant Species List.** The existing state director's sensitive plant species list contained in IM No. UT 2003-027 is currently undergoing extensive peer review both inside and outside of BLM. That review has not yet been completed; therefore, the existing list (see IM No. UT 2003-027) will continue to be used until a new list has been developed. However, due to recent changes in the legal status of *Penstemon grahamii*, this species is now included on the existing plant list."

As of July 1, 2008, there are 13 federally listed, 2 candidate, and 32 sensitive species within the VPA, which includes mammals, birds, reptiles, fishes and plants. Each of these species has different habitats, different ranges of distribution, and different susceptibilities to management activities. In contrast to other resources, special status species have limited distributions and key habitat requirements that might not be located or unable to be relocated elsewhere within the VPA. For this reason, total acres of surface disturbance under individual alternatives are difficult to interpret in the context of a special status species, without being placed in a context of the factors most important in managing individual species for either recovery or to prevent listing as threatened or endangered.

The methods used to analyze the impacts to special status species were to first list the overall species threats, as defined in individual species' Federal Register listing packages (for federally listed species), or according to data provided by the BLM for sensitive species. How the management decisions in the RMP would contribute to a change in individual species' threats (either positively or negatively) was then identified. Finally, the risks of individual resource decisions contributing to species threats were evaluated, using both qualitative analysis and a selected subset of acreage data that would pertain to individual key special status species limiting factors. Table 4.17.1 below summarizes the overall threats and potential impacts of RMP alternatives' management actions on listed species. The remainder of this section describes how the specific management actions under the Proposed RMP and each alternative would affect key factors affecting species, as listed in Table 4.17.1. Because, there is less information on sensitive species than listed species, most sensitive species are discussed in conjunction with those federally listed species sharing similar habitat and limiting factors. Sensitive species for which

the RMP includes specific management prescriptions are individually discussed. These include the Ferruginous Hawk, Burrowing Owl, Sage-grouse, and Colorado River cutthroat trout.

Impacts to listed species would occur if any of the resource decisions were to result in direct impacts to a listed or candidate species through "take," defined by the Endangered Species Act as "harm, hunting, wounding, killing, or harassment." Harassment includes activities resulting in increased stress during critical life history stages such as nesting, migration or wintering, loss or degradation of designated critical habitat, loss or degradation of occupied or potential listed species' habitat, or activities precluding or reducing the effectiveness of recovery goals or measures. Although other special status species are not regulated under the Endangered Species Act, impacts to these species were identified if they fell within one of the above categories.

Some decisions regarding resources would not affect special status species because they would neither change the status of current species threats nor affect recovery potential. The impacts from decisions concerning Cultural Resources, Lands and Realty, Paleontological Resources, Visual Resource Management, Wild Horse Management, and Wildlife and Fisheries Management would be negligible on special status plant and animal species in the Vernal Planning Area (VPA) and therefore will not be discussed further in this analysis.

Impacts from other resource decisions would affect special status species. Individual resource decisions that would have a combined potential effect on special status species and could not be separated were addressed jointly. Impacts from other resource decisions that would affect Special Status species include: Fire Management/Woodland and Forest Management, Forage Allocation/Livestock Grazing, Mineral Resources, Recreation and Travel, Riparian Resources, Special Designations, Special Status Species, and Soils and Watershed. Decisions relating to these resources and resource uses would have a either a direct or indirect impact on special status plant and animal species in the VPA and be long term or short term in nature.

#### **4.17.1. IMPACTS COMMON TO THE PROPOSED RMP AND ALL ALTERNATIVES**

##### **4.17.1.1. FIRE AND WOODLAND MANAGEMENT**

Under the Proposed RMP and all of the alternatives, prescribed burning and public harvest of forest products would occur. These impacts would occur in woodland, forest and desert shrub habitats, but not grassland or riparian habitats. As a result, fire would not be used in black-footed ferret, Yellow-billed Cuckoo, endangered Colorado River fish, or Ute ladies'-tresses habitat. Fire would occur in vegetation types occupied by the listed plant species other than the Ute ladies'-tresses (hereafter referred to as the Book Cliffs soil endemics, referring to the general restriction of these plant species to specific soil types in the Book Cliffs area). In general, the Book Cliffs soil endemics occur in sparsely vegetated habitats within the larger mapped vegetation types. Controlled prescribed fire would not likely carry in these habitats unless they had been invaded by cheatgrass or other annual weedy species or if prescribed fires spread beyond their intended dense woodland target. As a result, carefully controlled prescribed fire would not have a major adverse impact on the Book Cliffs soil endemics, and would have long-term beneficial impacts by preventing larger fires in adjacent woodlands that could spread through sensitive species habitat. If prescribed fires were to spread beyond their intended dense woodland target these fires

would have adverse impacts on special status species by directly destroying individual plants of special status plant species or by indirectly contributing to the risk of cheatgrass invasion, which is higher following a fire. Associated activities, such as fire line construction and off-road travel by necessary fire maintenance vehicles could also result in direct adverse impacts to the Book Cliff soil endemics via uprooting and or trampling.

Both fire and woodland harvest would likely occur in habitat used by the Mexican Spotted Owl, Canada lynx and sensitive bird species. The short-term effects of prescribed fire on the Mexican Spotted Owl and Ferruginous Hawk would be direct and adverse by removing the conifers used by these species. As long as some mature patches of trees were left in the vicinity, the long-term impacts of fire decisions on these species would be beneficial, by reducing the chance of catastrophic wildland fire. Catastrophic wildland fire is a key threat to the Mexican Spotted Owl. Use of prescribed burning, thinning treatments and any other activities that would result in a mix of age classes is supported by the FWS as being beneficial for the Mexican Spotted Owl (USFWS 2001). Fire would have mixed effects on the Canada lynx, as this species requires an abundance of downed woody debris for denning, which would be removed by prescribed burning and would take decades to redevelop. Conversely, fire in decadent forest stands would restore habitat for the snowshoe hare, which is the main food for the lynx.

#### **4.17.1.2. FORAGE ALLOCATION/LIVESTOCK GRAZING**

Livestock grazing in both upland and riparian habitats would occur under the Proposed RMP and all alternatives. Livestock grazing may have a direct and/or indirect impact on special status plant and animal species. Historically, livestock grazing has had an impact on public lands by modifying vegetation, introduction of foreign plant species, and an increase in soil erosion.

Livestock may impact special status plant species through trampling and removal of above-ground portions, preventing flowering and seed set necessary for species survival. Livestock may also impact special status animal species through direct "take" and "harassment."

Proper management of livestock would reduce or eliminate the impacts to special status species from livestock grazing. Proper management would be attained through the implementation of the appropriate number of livestock, season of use, utilization, and monitoring to meet, exceed or make progress toward meeting the Rangeland Health Standards.

#### **4.17.1.3. MINERAL AND ENERGY DEVELOPMENT**

The Proposed RMP and all alternatives allow some level of mineral and energy development. Oil and gas development is identified as a key threat to the Book Cliffs soil endemics and was a major factor in their listing. Potential adverse direct effects of oil and gas developments include placement of facilities or roads within either occupied habitat or potential habitat necessary for the recovery of the species, resulting in an overall reduction in habitat and an increase in habitat fragmentation. This threat is particularly high for the shrubby reed-mustard as this species is restricted to geologic formations containing oil shale. Indirect adverse impacts of oil and gas development within the listed plant species habitat include damage to plants from travel outside of designated roads, increases in road densities, and fugitive dust production. The clay soils on

which these plants grow are highly susceptible to wind erosion, and surface disturbance increases the soil erosion potential. Deposition of wind-blown dust on the listed plant species currently is a problem, potentially affecting plant reproduction, in the existing oil and gas fields (Whittington, USFWS [personal communication] 2003). Pollination vectors are not known for many special status plant species in the VPA. Studies on Ute ladies'-tresses (Sipes and Tepedino 1995) have shown that ground-nesting bees are important for pollination of this species, whereas other species' pollination vectors are not known within the VPA. Seed dispersal vectors are also unknown for most special status species within the VPA, but could be affected by habitat fragmentation due to road development. Other indirect adverse impacts include the potential for introduction and spread of noxious and invasive weeds that would compete with the special status plants. The spatial layout of oil and gas facilities would disturb a large proportion of vegetation, when in the context of the landscape. Each area disturbed for the construction of a well pad or road increases the opportunity for weed invasions and disrupts the spatial continuity of vegetation communities. Also, activities such as road building would increase the access to sensitive areas on which special status species are dependent for survival.

Oil and gas development would have both direct and indirect adverse effects on the Pariette cactus, Uinta Basin hookless cactus, White River beardtongue, Ute ladies'-tresses, the Yellow-billed Cuckoo, the four Colorado River fishes and the Colorado River cutthroat trout. Although most of the riparian zone is listed as NSO, this stipulation could be allowed an exception (a one-time exemption from a stipulation) if necessary for transmission lines, roads and surface occupancy. Any development within riparian zones could adversely affect the Yellow-billed Cuckoo and Ute ladies'-tresses through removal of riparian vegetation. Development of oil and gas wells requires water for both well drilling and extraction. Approximately 0.75 acre-feet of water would be required for each well. The source of this water is unknown, and each contracting company would identify its own water source and disposal methods for waste products. One of the main factors in the listing of the Colorado River fishes was the cumulative effect of water depletion within the Colorado River system, which includes the Green, White, and Duchesne Rivers and their associated critical habitat. New depletions from these rivers or changes in the amount of water returned to the rivers would constitute an additional impact on the Colorado River fishes. Depending on where the depletions occur, riparian habitat supporting the Ute ladies'-tresses would also be adversely impacted by changes in hydrologic support. Loss of riparian habitat through streamflow changes is a key threat to the Ute ladies'-tresses. Wastewater disposal methods would be determined by each individual contracting company and are currently unknown. Any discharges of petroleum wastes into water bodies would negatively affect the special status fish. Boron and selenium are high in the local soils; the degree to which sediments containing these contaminants would enter water bodies is unknown. The potential for mineral development to increase sedimentation is discussed in Section 4.15 Soil and Water Resources. Increases in sediments containing boron or selenium would adversely affect all of the special status fishes.

Under the Proposed RMP and all alternatives, large areas associated with Ferruginous Hawk nesting sites, Mexican Spotted Owl habitat and Greater Sage-grouse habitat would be open for oil and gas and mineral development. General adverse impacts to these species (and others, including white-tailed prairie dog and black-footed ferret) would include reduction in habitat, habitat fragmentation, and increases in noise and other human disturbances.

#### 4.17.1.4. RANGELAND IMPROVEMENT

Construction of new rangeland improvement projects could have short- and long-term direct adverse impacts on some special status species from trampling by livestock due to trailing and construction of range developments. Short- and long-term indirect adverse impacts could also occur on some special status species if the projects result in moving livestock and wildlife into areas that had previously received little use. Conversely, special status species would benefit from rangeland improvements by improved dispersion of livestock and wildlife if animals are prevented from concentrating in their habitat, although dispersal of weeds into previously undisturbed areas would adversely impact some special status species. Direct impacts would depend on exact project locations, but in general, adverse impacts are projected to be minimal, because site examinations would be conducted prior to project approval.

Vegetation treatments, including Utah juniper (*Juniperus osteosperma*) control, prescribed burning, and seedings, would impact special status species, depending on the species, the number of exotic species within the area, overall ecological condition, and the likelihood that exotics would colonize the sites following treatment. Site examinations, to the extent feasible, would be conducted prior to treatments; however, due to the generally large size of such treatments, species might be overlooked and adverse impacts would result if species are uprooted during the physical procedures. Where canopies are opened and exotics are displaced in or near special status species habitat, beneficial impacts could result, as sites would be improved for establishment or recolonization by certain species.

#### 4.17.1.5. RECREATION AND TRAVEL

The Proposed RMP and all alternatives would encourage recreation in the Book Cliffs area and allow a degree of OHV use. Identification of special recreation management areas (SRMAs) would provide beneficial impacts to special status species by providing focused recreation management on these lands and reducing impacts associated with dispersed recreation with minimal management. Continued use of OHVs and development of trails would have adverse impacts on special status species by providing access to habitats where trampling, habitat fragmentation and illegal plant collecting could occur. Increased visitor use of recreational areas would adversely affect special status species through increased human disturbance.

#### 4.17.1.6. SPECIAL STATUS SPECIES

Raptors would be managed under the auspices of Best Management Practices (BMPs), which would include implementation of spatial and seasonal buffers to disturbances in the vicinity of nesting raptors that would be tailored to the individual raptor species involved, and based on factors such as line of sight distance between nest and disturbance, type and duration of disturbance, nest structure security, sensitivity of the species to disturbance, observed responses to related disturbances, and the amount of other disturbances already occurring in the vicinity to reduce adverse impacts of minerals development on raptors. These buffers would implement "Best Management Practices for Raptors and Their Associated Habitats in Utah" (Utah BLM, 2006, Appendix A) with modifications allowed as long as protection of the raptors is ensured. The BLM would also pursue a partnership between industries, local governments, the USFWS, UDWR, USFS, and NRCS and others as appropriate to establish a raptor management fund to be

utilized for raptor population monitoring and habitat enhancement. The BLM would also cooperate with utility companies, UDWR, and the USFWS to prevent electrocution of raptors.

Additionally, under the Proposed RMP and all alternatives:

- Cottonwood bottoms for Bald Eagle winter habitat along the Green and White Rivers, at Pelican Lake, and at the Cliff Creek Bald Eagle roost site would be protected.
- In cooperation with UDWR the BLM would maintain nesting habitat and maintain/enhance prey-base habitat for burrowing and Short-eared Owls.
- To provide primary food sources for the Ferruginous Hawk, the BLM would cooperate with UDWR to maintain and enhance white-tailed prairie dog and prey base habitat.
- The BLM would establish Protected Activity Centers (PACs) at all known Mexican Spotted Owl nest sites; maintain habitat to support small mammal populations as a prey base for Mexican Spotted Owls in occupied and suitable owl habitats; and retain large down logs, large trees, and snags as prey habitats in occupied and suitable Mexican Spotted Owl habitats.
- For Peregrine Falcons the BLM would protect and enhance riparian habitat in Pariette Draw, as well as along the Green River, White River, Bitter Creek, and other drainages.
- The BLM would manage the black-footed ferret consistent with the 1999 Black-footed Ferret Reintroduction Plan Amendment.

**Table 4.17.1. Comparison of Potential Resource Decision Impacts within the VPA to Overall Species Threat for Federally Listed and BLM Sensitive Species**

Common Name	Overall Species Threats	Potential Impacts Associated with Resource Decisions in the VPA
Black-footed ferret	Loss of prairie dog colonies on which they depend due to habitat loss and fragmentation, poisoning, agricultural conversion, and disease.	Changes in the prairie dog prey base within the Coyote Basin experimental population through conversion of open, sparse grassland to a different habitat type.
Canada lynx	Inadequate regulatory mechanisms to protect the species coniferous forest habitat which is important for denning (needs large woody debris), its snowshoe hare prey base (needs dense understory), and corridors for dispersal.	Forest practices that would remove large woody debris, dense understories, or fragment the Diamond Mountain coniferous forest dispersal corridor through roads, trails, or other barriers; forest practices that would provide for long-term maintenance of different-aged forest stands.
Mexican Spotted Owl	Forested habitat loss due to even-aged stands, catastrophic wildland fires.	Forest practices that would develop even-aged stands of trees, catastrophic wildland fires, and loss of forested habitat within the steep canyons of the Book Cliffs area; forest practices that would provide for long-term maintenance of different-aged forest stands.
Yellow-billed Cuckoo	Loss of multilayered riparian habitat.	Any loss of multilayered riparian habitat; activities that could prevent future development of dense riparian habitat.
Bonytail Colorado pikeminnow Humpback chub Razorback sucker	Cumulative effects of streamflow regulation and depletion, changes in temperature regimes, loss of connected floodplain habitat, competition with and predation by nonnative fish, hybridization, increased concentration of salts and contaminants.	Any river depletion or change in Duchesne River, White River, or Green River stream flows that would add to the cumulative impacts of all existing depletions, particularly in the designated critical habitat reaches; changes in tributary flows that could affect mainstem flows; increased salt or contaminant concentrations associated with flow depletion and/or increased sediments entering the two rivers.
White River beardtongue Barneby ridge-cress <sup>1</sup>	Cumulative effects of restriction to unique formations, with oil and natural gas development, and sheep and cattle grazing.  Energy/mineral developments, livestock grazing, and off-road vehicle use.	Direct placement of facility footprints or associated infrastructure on existing individuals or colonies, placement of facilities on potential habitat needed for the species' recoveries, grazing within the restricted habitat areas that tramples plants or prevents them from flowering, unrestricted off-road travel, wind erosion from high road densities and facilities in the highly erodible clay soils on which these species depend, potential loss of long-term reproduction capabilities due to habitat fragmentation.  Indirect effects include invasion of habitat by noxious weeds and other undesirable plant species resulting from surface disturbance in and adjacent to occupied and/or potentially suitable Barneby ridge-cress habitat.
Clay reed-mustard Shrubby reed-mustard	Cumulative effects of restriction to unique formations, with oil and natural gas development.	Potential impacts for shrubby reed-mustard are the same as described above plus the additional risk that the oil shale underlying the mustard's habitat leaves a strong possibility for future oil and gas development within the population centers. Clay reed-mustard grows in silty loam without a trace of oil shale.
Uinta Basin hookless cactus Pariette cactus	Energy/mineral developments, livestock grazing, stone collecting, and off-road vehicle use.	Direct placement of facility footprints or associated infrastructure on existing individuals or colonies, placement of facilities on potential habitat needed for the species' recoveries, grazing within the restricted habitat areas that tramples plants, unrestricted off-road travel.
Ute ladies'-tresses	Loss of riparian habitat through streamflow alteration, streamflow depletion, and invasion by noxious weeds overgrazing; changes in stream dynamics allowing repeated new habitat creation.	Additional changes in streamflow through new consumptive use, increases or decreases in noxious weeds increases or decreases in totals grazing allowed within riparian zones, discretionary authority to allow infrastructure within NSO designated riparian zones.

<sup>1</sup>Found on tribal and private land. Not yet found on BLM land (personal communication with Clayton Newberry, BLM VFO, May 14, 2008).

#### **4.17.2. PROPOSED RMP AND ALTERNATIVES IMPACTS**

##### **4.17.2.1. IMPACTS OF FIRE MANAGEMENT DECISIONS ON SPECIAL STATUS SPECIES**

###### **4.17.2.1.1. PROPOSED RMP AND ALTERNATIVES A, B, C, AND E**

The Proposed RMP and Alternatives A, B, C, and E would have direct beneficial and adverse effects on special status species as described under Impacts Common to All Alternatives, although the impacts would generally be positive for species status over the long term. The greatest beneficial impact of prescribed fire on 156,425 acres per decade would be to restore habitat for the Mexican Spotted Owl and over the long term reduce the potential for catastrophic wildland fires in other sensitive species habitats. Adverse impacts would include mortality, and short-term loss of habitat. The Proposed RMP and these four action alternatives would provide for prescribed burning on 104,525 more acres per decade than Alternative D (No Action). As a result, the Proposed RMP and the action alternatives would provide substantially more long-term beneficial impacts to special status wildlife species than Alternative D (No Action) due to a greater acreage of prescribed fire under the Proposed RMP and all action alternatives.

###### **4.17.2.1.2. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) allows for prescribed fire on 50,900 acres per decade (27,950 and 22,950 acres under the Book Cliffs and Diamond Mountain RMPs, respectively). The impacts of this alternative on special status species would be similar to those described above for the action alternatives, except that the impacts would be on a smaller scale.

##### **4.17.2.2. IMPACTS OF FORAGE ALLOCATION AND LIVESTOCK GRAZING DECISIONS ON SPECIAL STATUS SPECIES**

###### **4.17.2.2.1. PROPOSED RMP**

Under the Proposed RMP, up to 50% of upland forage would be utilized by livestock, wild horses, and big-game species. The total number of AUMs (including livestock, wild horses and big game) would be 245,607. Approximately 2,340 of these AUMs would only be temporarily allocated for wild horses because wild horses would be gathered and removed under the Proposed RMP. However, these AUMs would still be utilized through allocation in later planning processes. In riparian areas, stubble height would be initially identified as 4 inches, with 30% key herbaceous riparian species utilization unless bank stabilization goals were not met. In that case, minimum stubble height would be increased to six inches with a maximum of 20% key herbaceous riparian species utilization. The riparian grazing standards under the Proposed RMP differ from Alternative D (No Action) in that stubble heights are set at 3 inches (1 to 3 inches lower than the Proposed RMP) and that Alternative D (No Action) has no riparian key herbaceous riparian species utilization standards.

In general, grazing is a threat to all listed and most sensitive species, as described under Impacts Common to the Proposed RMP and All Alternatives (4.17.1). Under the Proposed RMP, the risk

of grazing impacts to the Book Cliffs soil endemics would be slightly less than those of Alternative D (No Action) as grazing utilization would be monitored; however substantial grazing impacts to these species would still occur as there little difference in AUMs (less than 1%) between the Proposed RMP and Alternative D (No Action). Also, under the Proposed RMP, even 50% upland forage utilization would provide a threat to special status plant species, although this is less than Alternative D (No Action) which would not explicitly limit forage utilization. The risk of adverse grazing impacts to the Ute ladies'-tresses would remain unchanged from Alternative D (No Action), as both the Proposed RMP and Alternative D (No Action) would allow grazing to the extent that flowering parts could be removed.

The largest difference in grazing management between the Proposed RMP and Alternative D (No Action) would be that the Proposed RMP would restrict woody riparian species utilization whereas Alternative D (No Action) would have no such restrictions. Over the long term, restrictions on woody species utilization would provide beneficial impacts to riparian-dependent wildlife such as the Yellow-billed Cuckoo over Alternative D (No Action), although it should be noted that grazing impacts would occur to these species as long as grazing was allowed in the riparian zone.

The increased grazing restrictions in the riparian zone to increase stream bank stability would have beneficial impacts on the Colorado River cutthroat trout and potentially the Colorado River endangered fishes by reducing sediment input into streams.

#### **4.17.2.2.2. ALTERNATIVE A**

Under Alternative A, up to 50% of upland forage would be utilized by livestock, wild horses, and big-game species. The total number of AUMs (including livestock, wild horses and big game) would be 245,649. In riparian areas, stubble height would be initially identified as 4 inches, with 30% key herbaceous riparian species utilization unless bank stabilization goals were not met. In that case, minimum stubble height would be increased to six inches with a maximum of 20% key herbaceous riparian species utilization. The riparian grazing standards under Alternative A differ from Alternative D (No Action) in that stubble heights are set at 3 inches (1 to 3 inches lower than Alternative A) and that Alternative D (No Action) has no riparian key herbaceous riparian species utilization standards.

In general, grazing is a threat to all listed and most sensitive species, as described under Impacts Common to the Proposed RMP and All Alternatives (4.17.1). Under Alternative A, the risk of grazing impacts to the Book Cliffs soil endemics would be slightly less than those of Alternative D (No Action) as grazing utilization would be monitored; however substantial grazing impacts to these species would still occur as there is little difference in AUMs between Alternative A and Alternative D (No Action). Also, under Alternative A, even 50% upland forage utilization would provide a threat to special status plant species, although this is less than Alternative D (No Action), which would not explicitly limit forage utilization. The risk of adverse grazing impacts to the Ute ladies'-tresses would remain unchanged from Alternative D (No Action), as both alternatives would allow grazing to the extent that flowering parts could be removed.

The largest difference in grazing management between Alternatives A and D (No Action) would be that Alternative A would restrict woody riparian species utilization whereas Alternative D (No Action) would have no such restrictions. Over the long term, restrictions on woody species utilization would provide beneficial impacts to riparian-dependent wildlife such as the Yellow-billed Cuckoo over Alternative D (No Action), although it should be noted that grazing impacts would occur to these species as long as grazing was allowed in the riparian zone.

The increased grazing restrictions in the riparian zone to increase stream bank stability would have beneficial impacts on the Colorado River cutthroat trout and potentially the Colorado River endangered fishes by reducing sediment input into streams.

#### **4.17.2.2.3. ALTERNATIVE B**

Under Alternative B, up to 60% of upland forage would be utilized by livestock, wild horses, and big-game species. The total number of AUMs (including livestock and big game; wild horses would not be allocated AUMs under this alternative) would be 244,034 or 2,094 AUMs (approximately 0.8%) less than under Alternative D (No Action). The riparian zone would be managed in a similar manner to the Proposed RMP and Alternative A except that key herbaceous riparian vegetation in riparian areas, other than the stream banks, would not be grazed more than 50% during the growing season, or 60% during the dormant season. The impacts of grazing, forage allocation and riparian grazing management decisions under Alternative B would be similar to those described for the Proposed RMP and Alternative A.

#### **4.17.2.2.4. ALTERNATIVES C AND E**

Under Alternatives C and E, up to 50% of upland forage would be utilized by livestock, wild horses, and big-game species. The total number of AUMs (including livestock, wild horses and big game) would be 187,450 or 58,678 AUMs (approximately 24%) less than under Alternative D (No Action). The riparian zone would be managed the same as described for the Proposed RMP and Alternative A.

Although grazing is a threat to all listed and most sensitive species, the 24% reduction in AUMs would provide a substantial benefit to all species compared to Alternative D (No Action), and particularly reduce the risk of grazing impacts to the Book Cliffs soil endemics as compared to Alternative D (No Action). Other impacts would be the same as described for the Proposed RMP and Alternative A.

#### **4.17.2.2.5. ALTERNATIVE D (NO ACTION)**

Under Alternative D (No Action), upland forage utilization levels are unspecified. The total number of AUMs (including livestock, wild horses, and big game) would be 246,128. In riparian areas, stubble height would be initially identified as 3 inches, with an unspecified amount of woody species utilization. Alternative D (No Action) would continue the existing grazing risk for all special status species and not provide benefits for any of them.

**4.17.2.3. IMPACTS OF MINERAL DEVELOPMENT DECISIONS ON SPECIAL STATUS SPECIES**

Table 4.17.2 presents a summary of the changes in acres open for mineral and energy development. The table displays differences in total acres as well as a percentage change in acres available for mineral and energy development (Standard Stipulations and Timing and Controlled Surface Use) as compared to Alternative D (No Action). As depicted in Table 4.17.2 there are large differences in total acreages available for mineral/energy development among the alternatives as compared to Alternative D (No Action) (ranging from an 11% decrease under Alternative E to an 18% increase under Alternative B), and that the largest changes occur in the areas available for oil, gas, and mineral leasing. However, acres of development alone can be misleading unless placed in geographic context. Most of the increased oil and gas mineral development within BLM administered lands in the VPA would occur primarily in the Monument Butte – Red Wash Area, and secondarily in the East Tavaputs Plateau area. It is also important to note that the Hill Creek Extension (188,500 acres) was not leased in the Book Cliffs RMP and therefore it is not included in the acreage totals for Alternative D (No Action). These areas are population centers for the Book Cliffs soil endemics and the Mexican Spotted Owl. Concentration of increased mineral and energy development within habitats of sensitive species whose major threat is oil and gas development would result in substantial adverse effects through direct take, potential harassment and by preventing recovery by development in unoccupied but suitable habitat.

**Table 4.17.2. Differences in Acreages Available for Mineral and Energy Development under Each the Proposed RMP and Action Alternative as Compared to Alternative D (No Action)**

Activity	Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative E
Oil and Gas	+104,351 acres (+7%)	244,830 acres (+16%)	+283,367 acres (+18%)	+91,055 acres (+6%)	-36,569 (-2%)
Open Minerals	+2,088 acres (+1%)	27,695 acres (7%)	+45,253 acres (+12%)	999 acres (0.3%)	-43,018 (-11%)

**4.17.2.3.1. PROPOSED RMP****4.17.2.3.1.1. Special Status Plant Species**

Under the Proposed RMP, areas open for mineral and energy development would increase by 7% in areas open for oil and gas leasing, and 1% in areas open for mineral development as compared to Alternative D (No Action). The number of acres open to oil and gas leasing on BLM administered lands within the VPA would be 1,640,381, and mineral materials 389,788 acres. As described in Impacts Common to the Proposed RMP and All Alternatives, the increased minerals development would have multiple short-term and long-term direct and indirect adverse impacts on special status plant populations within the VPA. These impacts include categorizing a large majority of special status plant habitat as open to mineral development. These designations would likely lead to an increase in road densities, a reduction in habitat through the installation

of mineral development infrastructure, and an increase in habitat fragmentation. Increased road densities would also make access to remote areas easier for OHVs and could increase illegal collection of rare plants. Long-term adverse impacts would primarily be in the form of loss of habitat and direct destruction of individuals and populations, with the extent of impacts generally determined by the amount of activity. Other impacts that could occur would be genetic isolation of special populations and biodiversity loss. Impacts to seed dispersal and pollinators could occur, but studies of these impacts within the VPA are limited and few conclusions can be drawn.

Locatable mining activities, including mineral exploration, development, and collection of building stone would continue to have a long-term adverse impact on certain special status plant species, particularly Uinta Basin hookless cactus, Pariette cactus, and shrubby reed-mustard (*Schoenocrambe suffrutescens*). Impacts from mineral mining are projected to be most severe within the areas in and near Wrinkles Road, Little Pack Mountain, and Big Pack Mountain that are currently mined and in areas where high potential has been identified for mineral occurrence. Impacts of increased oil and gas leasing are projected to be most severe within the areas in and near the Book Cliffs, on alluvial river terraces near the confluence of the Green, White, and Duchesne Rivers, and in Pariette Draw. The potential impacts to Uinta Basin hookless cactus, Pariette cactus, clay reed mustard, shrubby reed mustard, Barneby ridge-cress, and White River beardtongue are expected to be high with oil, gas, and CBNG development.

Adverse impacts would be highest for special status plants where future development would occur in pinyon-juniper, sagebrush, and desert shrub communities. For comparative purposes, the alternatives are analyzed with an assumption of 20-acre to 40-acre well spacing. Under the Proposed RMP, 470,731 acres of desert shrub, 489,679 acres of sagebrush, and 483,249 acres of pinyon-juniper would be subject to surface disturbance from oil, gas, and CBNG development. The Proposed RMP proposes 12% more disturbance to desert shrub, 14% more to sagebrush, and 17% more to pinyon-juniper than does Alternative D (No Action).

#### 4.17.2.3.1.2. Special Status Animal Species

##### Ferruginous Hawk

The minerals development land categorization proposed under the Proposed RMP would have multiple short-term and long-term direct and indirect adverse impacts on Ferruginous Hawk populations in the VPA. These impacts would include categorizing a majority of areas associated with Ferruginous Hawk nesting sites as open for mineral development. These designations would likely lead to an increase in road densities, a reduction in habitat from the installation of mineral development infrastructure, and an increase in habitat fragmentation.

The Proposed RMP would increase the proportion of areas surrounding Ferruginous Hawk nesting sites open to oil and gas development by approximately 4% when compared to Alternative D (No Action). The Proposed RMP and Alternative D (No Action) would also decrease the proportion of areas surrounding Ferruginous Hawk nesting sites subject to special stipulations (other than those prescribed specifically for Ferruginous Hawk) by 9% and 10%, respectively.

### Mexican Spotted Owl

The minerals development land categorization proposed in the Proposed RMP would likely have multiple short-term and long-term direct and indirect adverse impacts on Mexican Spotted Owl populations in the VPA. These impacts include categorizing a majority of important Mexican Spotted Owl canyon and forest habitat as open for minerals development. These designations would likely have impacts similar to those described for Ferruginous Hawks.

The Proposed RMP would decrease the proportion of Mexican Spotted Owl canyon and forest habitat open to oil and gas development by approximately 22% and 15%, respectively, when compared to Alternative D (No Action). The Proposed RMP would decrease the proportion of Mexican Spotted Owl canyon and forest habitat subject to special stipulations by approximately 19% and 18%, respectively when compared to Alternative D (No Action). Most of the increased oil and gas development, as well as the reduction in special stipulation designations, would occur in the canyon habitat immediately adjacent to designated critical habitat and in an area in which substantial suitable habitat for the Mexican Spotted Owl occurs.

### Greater Sage-grouse

The minerals development land categorization proposed in the Proposed RMP would have multiple short-term and long-term direct and indirect adverse impacts on Greater Sage-grouse populations in the VPA. These impacts include categorizing a large majority of important Greater Sage-grouse winter and brooding habitat as open to minerals development.

The Proposed RMP would increase the proportion of Greater Sage-grouse brooding habitat open to oil and gas development by approximately 5% while decreasing the proportion of Greater Sage-grouse winter habitat open to oil and gas development by approximately 12% when compared to Alternative D (No Action). This alternative would also increase the proportion of Greater Sage-grouse winter and brooding habitat subject to special stipulations by approximately 23% and 29%, respectively when compared to Alternative D (No Action) (see Sage-grouse Tables 14 and 15 in Appendix H, Wildlife).

Outright losses, degradation and fragmentation of sagebrush habitats are suspected as the primary causes of Sage-grouse population declines throughout Utah (UDWR 2005). Although there are several factors that contribute to habitat loss (such as drought), development of oil and gas resources includes direct loss of habitat for well pads, roads, and pipelines. Vehicle traffic and noise disturbance on roads and at well sites during the drilling phase can have a negative effect (Connelly et al. 2004). Disturbances within 200 meters of lek sites resulted in loss of attendance at Sage-grouse leks (Braun et al. 2002). Sage-grouse continued to use highly fragmented habitats in some oil fields and reclaimed areas, but population levels were below numbers prior to disturbance (Braun et al. 2002).

Stipulations regulate timing and distance from lek sites of construction activities and are largely directed to avoid disturbance to Sage-grouse near leks during breeding or nesting periods. However, effects on habitats from roads, power lines, compressor stations, and pipelines remain following construction. Female Sage-grouse moved greater distances from leks and had lower

rates of nest initiation in areas disturbed by vehicle traffic (1-12 vehicles/day) (Lyon and Anderson 2003). Surface disturbance created by roads also facilitates spread of exotic plant species (Forman and Alexander 1998; Trombulak and Frissell 2000; Gelbard and Belnap 2003). The soil surface of disturbed areas is prepared and reseeded. The primary objectives of the reclamation are to control soil erosion, establish desirable vegetation and prepare for natural processes to restore the site. Although Sage-grouse may repopulate reclaimed areas, their numbers may not return to levels prior to disturbance (Braun et al. 2002).

#### White-tailed Prairie Dog and Black-footed Ferret

The minerals development proposed in the Proposed RMP would have multiple short-term and long-term direct and indirect adverse impacts on white-tailed prairie dog and black-footed ferret populations in the VPA. For this analysis it was assumed that black-footed ferrets are completely dependent upon white-tailed prairie dog towns for survival in those areas where they have been reintroduced into the VPA. Therefore, the impacts of minerals development on white-tailed prairie dog populations would be similar to the impacts on black-footed ferret populations. Minerals development would likely lead to an increase in road densities, a reduction in habitat from the installation of mineral development infrastructure, and an increase in habitat fragmentation.

The Proposed RMP would increase the proportion of white-tailed prairie dog habitat open to oil and gas development by approximately 5% when compared to Alternative D (No Action). This alternative would decrease the proportion of white-tailed prairie dog habitat subject to special stipulations by approximately 61% when compared to Alternative D (No Action) (see Table 16 in Appendix H, Wildlife).

#### Yellow-billed Cuckoo

Yellow-billed Cuckoo are generally associated with lowland riparian and cottonwood forest areas. A stipulation common to the Proposed RMP and all alternatives is that surface-disturbing activities would not be allowed within 100 meters of riparian areas. This stipulation would protect these lowland riparian and cottonwood forest habitats from activities such as mineral development. However, an exception would be authorized if 1) there are no practical alternatives, or 2) all long-term impacts would be fully mitigated or 3) the activity would benefit and enhance the riparian area. Any exception that would allow development or construction in the riparian zone would have adverse effects on listed or sensitive riparian species.

#### Bonytail, Colorado Pikeminnow, Humpback Chub, Razorback Sucker, Roundtail Chub, Flannelmouth sucker, Bluehead sucker and Colorado River Cutthroat Trout

The minerals development proposed in the Proposed RMP would have long-term and short-term, direct and indirect adverse impacts on bonytail, Colorado pikeminnow, humpback chub, razorback sucker, roundtail chub, flannelmouth sucker, bluehead sucker and Colorado River cutthroat trout. The Soils and Water Quality Section (Section 4.17.2) concludes that although stipulations would mitigate the negative impacts of minerals development on water quality, the mineral development outlined for the Proposed RMP and each alternative would result in indirect, long-term adverse impacts to water quality through soil erosion, sedimentation, and the

potential for petroleum discharges into surface water and would therefore adversely impact these fisheries. It is also currently unknown how minerals development would increase surface disturbances in selenium and boron-rich soils, which could indirectly increase these contaminants in waters supporting these fisheries.

The greatest impact to the Colorado River fishes would be that most of the new energy and mineral development would occur in the southern part of the VPA, in the proximity of the Green and White Rivers or their tributaries. Oil and gas development would change clean water discharge patterns into the rivers. Any new depletion from the Green River, particularly in a critical habitat reach would constitute a substantial impact.

#### **4.17.2.3.2. ALTERNATIVE A**

##### **4.17.2.3.2.1. Special Status Plant Species**

Under Alternative A, areas open for mineral and energy development would increase by 16% in areas open for oil and gas leasing, and 7% in areas open for mineral development as compared to Alternative D (No Action). The number of acres open to oil and gas leasing on BLM administered lands within the VPA would be 1,780,860, and mineral materials 415,395 acres. As described in the Impacts Common to All Alternatives, the increased minerals development would have multiple short-term and long-term direct and indirect adverse impacts on special status plant populations within the VPA. These impacts include categorizing a large majority of special status plant habitat as open to mineral development. These designations would likely lead to an increase in road densities, a reduction in habitat through the installation of mineral development infrastructure, and an increase in habitat fragmentation. Increased road densities would also make access to remote areas easier for OHVs and could increase illegal collection of rare plants. Long-term adverse impacts would primarily be in the form of loss of habitat and direct destruction of individuals and populations, with the extent of impacts generally determined by the amount of activity. Other impacts that could occur would be genetic isolation of special populations and biodiversity loss. Impacts to seed dispersal and pollinators could occur, but studies of these impacts within the VPA are limited and few conclusions can be drawn.

Locatable mining activities, including mineral exploration, development, and collection of building stone would continue to have a long-term adverse impact on certain special status plant species, particularly Uinta Basin hookless cactus, Pariette cactus and shrubby reed-mustard that occur in areas used for collecting building stone. Impacts from mineral mining are projected to be most severe within the areas in and near Wrinkles Road, Little Pack Mountain, and Big Pack Mountain that are currently mined and in areas where high potential has been identified for mineral occurrence. Impacts of increased oil and gas leasing are projected to be most severe within the areas in and near the Book Cliffs, on alluvial river terraces near the confluence of the Green, White, and Duchesne Rivers, and in Pariette Draw. The potential impacts to Uinta Basin hookless cactus, Pariette cactus, clay reed mustard, shrubby reed mustard, Barneby ridge-crest and White River beardtongue are expected to be high with oil, gas, and CBNG development.

Adverse impacts would be highest for special status plants where future development would occur in pinyon-juniper, sagebrush, and desert shrub communities. For comparative purposes,

the alternatives are analyzed with an assumption of a 40-acre well spacing. Under Alternative A, 438,230 acres of desert shrub, 442,502 acres of sagebrush, and 429,882 acres of pinyon-juniper would be subject to surface disturbance from oil, gas, and CBNG development. Alternative A proposes 4% more disturbance to desert shrub, 4% more to sagebrush, and 3% more to pinyon-juniper than does Alternative D (No Action).

#### **4.17.2.3.2.2. Special Status Animal Species**

##### Ferruginous Hawk

The minerals development land categorization proposed under Alternative A would have multiple short-term and long-term direct and indirect adverse impacts on Ferruginous Hawk populations in the VPA. These impacts would include categorizing a majority of areas associated with Ferruginous Hawk nesting sites as open for mineral development. These designations would likely lead to an increase in road densities, a reduction in habitat from the installation of mineral development infrastructure, and an increase in habitat fragmentation.

Alternative A would increase the proportion of areas surrounding Ferruginous Hawk nesting sites open to oil and gas development by approximately 2% when compared to Alternative D (No Action). This alternative would also decrease the proportion of areas surrounding Ferruginous Hawk nesting sites subject to special stipulations other than those prescribed for Ferruginous Hawk by 9% and 10%, respectively.

##### Mexican Spotted Owl

The minerals development land categorization proposed in Alternative A would likely have multiple short-term and long-term direct and indirect adverse impacts on Mexican Spotted Owl populations in the VPA. These impacts include categorizing a majority of important Mexican Spotted Owl canyon and forest habitat as open for minerals development. These designations would likely have impacts similar to those described for Ferruginous Hawks.

Alternative A would increase the proportion of Mexican Spotted Owl canyon and forest habitat open to oil and gas development by approximately 9% and 10%, respectively, when compared to Alternative D (No Action). Alternative A would decrease the proportion of Mexican Spotted Owl canyon habitat subject to special stipulations by approximately 12% but would increase Mexican Spotted Owl forest habitat subject to special stipulations by approximately 10%, when compared to Alternative D (No Action). Most of the increased oil and gas development, as well as the reduction in special stipulation designations, would occur in the canyon habitat immediately adjacent to designated critical habitat and in an area in which substantial suitable habitat for the Mexican Spotted Owl occurs.

##### Greater Sage-grouse

The minerals development land categorization proposed in Alternative A would have multiple short-term and long-term direct and indirect adverse impacts on Greater Sage-grouse populations in the VPA. These impacts include categorizing a large majority of important Greater Sage-grouse winter and brooding habitat as open to minerals development.

Alternative A would increase the proportion of Greater Sage-grouse winter and brooding habitat open to oil and gas development by approximately 3% when compared to Alternative D (No Action). This alternative would also decrease the proportion of Greater Sage-grouse winter and brooding habitat subject to special stipulations by approximately 2% when compared to Alternative D (No Action) (see Sage-grouse Tables 14 and 15 in Appendix H, Wildlife).

Outright losses, degradation and fragmentation of sagebrush habitats are suspected as the primary causes of Sage-grouse population declines throughout Utah (UDWR 2005). Although there are several factors that contribute to habitat loss (such as drought), development of oil and gas resources includes direct loss of habitat for well pads, roads, and pipelines. Vehicle traffic and noise disturbance on roads and at well sites during the drilling phase can have a negative effect (Connelly et al. 2004). Disturbances within 200 meters of lek sites resulted in loss of attendance at Sage-grouse leks (Braun et al. 2002). Sage-grouse continued to use highly fragmented habitats in some oil fields and reclaimed areas, but population levels were below numbers prior to disturbance (Braun et al. 2002).

Stipulations regulate timing and distance from lek sites of construction activities and are largely directed to avoid disturbance to Sage-grouse near leks during breeding or nesting periods. However, effects on habitats from roads, power lines, compressor stations, and pipelines remain following construction. Female Sage-grouse moved greater distances from leks and had lower rates of nest initiation in areas disturbed by vehicle traffic (1 to 12 vehicles per day) (Lyon and Anderson 2003). Surface disturbance created by roads also facilitates spread of exotic plant species (Forman and Alexander 1998; Trombulak and Frissell 2000; Gelbard and Belnap 2003). The soil surface of disturbed areas is prepared and reseeded. The primary objectives of the reclamation are to control soil erosion, establish desirable vegetation and prepare for natural processes to restore the site. Although Sage-grouse may repopulate reclaimed areas, their numbers may not return to levels prior to disturbance (Braun et al. 2002).

#### White-tailed Prairie Dog and Black-footed Ferret

The minerals development proposed in Alternative A would have multiple short-term and long-term direct and indirect adverse impacts on white-tailed prairie dog and black-footed ferret populations in the VPA. For this analysis it was assumed that black-footed ferrets are completely dependent upon white-tailed prairie dog towns for survival in those areas where they have been reintroduced into the VPA. Therefore, the impacts of minerals development on white-tailed prairie dog populations would be similar to the impacts on black-footed ferret populations.

Alternative A would increase the proportion of white-tailed prairie dog habitat open to oil and gas development by approximately 3% when compared to Alternative D (No Action). This alternative would decrease the proportion of white-tailed prairie dog habitat subject to special stipulations by approximately 30% when compared to Alternative D (No Action) (see Table 16 in Appendix H, Wildlife).

Yellow-billed Cuckoo

Yellow-billed Cuckoo are generally associated with lowland riparian and cottonwood forest areas. A stipulation common to the Proposed RMP and all alternatives is that surface-disturbing activities would not be allowed within 100 meters of riparian areas. This stipulation would protect these lowland riparian and cottonwood forest habitats from activities such as mineral development. However, an exception would be authorized if 1) there are no practical alternatives, or 2) all long-term impacts would be fully mitigated or 3) the activity would benefit and enhance the riparian area. Any exception that would allow development or construction in the riparian zone would have adverse effects on listed or sensitive riparian species.

Bonytail, Colorado Pikeminnow, Humpback Chub, Razorback Sucker, Roundtail Chub, Flannemouth Sucker, Bluehead Sucker and Colorado River Cutthroat Trout

The minerals development proposed in Alternative A would have long-term and short-term, direct and indirect adverse impacts on bonytail, Colorado pikeminnow, humpback chub, razorback sucker, roundtail chub, flannemouth sucker, bluehead sucker and Colorado River cutthroat trout. The Soils and Water Quality Section (Section 4.17.2) concludes that although stipulations would mitigate the negative impacts of minerals development on water quality, the mineral development outlined for the Proposed RMP and each alternative would result in indirect, long-term adverse impacts to water quality through soil erosion, sedimentation, and the potential for petroleum discharges into surface water and would therefore adversely impact these fisheries. It is also currently unknown how minerals development would increase surface disturbances in selenium and boron-rich soils, which could indirectly increase these contaminants in waters supporting these fisheries.

The greatest impact to the Colorado River fishes would be that most of the new energy and mineral development would occur in the southern part of the VPA, in the proximity of the Green and White Rivers or their tributaries. Oil and gas development would change clean water discharge patterns into the rivers. Any new depletion from the Green River, particularly in a critical habitat reach would constitute a substantial impact.

**4.17.2.3.3. ALTERNATIVE B****4.17.2.3.3.1. Special Status Plant Species**

Under Alternative B, areas open for mineral and energy development would increase 18% in areas open for oil and gas leasing and 12% in areas open for mineral development. The number of acres open to oil and gas leasing on BLM administered lands within the VPA would be 1,819,397 and mineral materials 432,953 acres. Additionally, 463,510 acres of desert shrub, 464,549 acres of sagebrush, and 443,217 acres of pinyon-juniper would be subject to surface disturbance from oil, gas, and CBNG development. Alternative B proposes 10% more disturbance to desert shrub, 8% more to sagebrush, and 7% more to pinyon-juniper than does Alternative D (No Action). Impacts of mineral and energy development under Alternative B are generally similar to those described for the Proposed RMP and Alternative A, except that the increase in mineral and energy development is concentrated in the southern part of the VPA,

which would place the Book Cliffs soil endemics at substantial risk and potentially result in jeopardy to listed species and/or the listing of previously candidate or sensitive species as threatened or endangered. The risks would be especially high for the listed and candidate penstemons and reed mustards.

#### **4.17.2.3.3.2. Special Status Animal Species**

Impacts to the Ferruginous Hawk, Greater Sage-grouse, white tailed prairie dog, black-footed ferret, and Yellow-billed Cuckoo under Alternative B would be similar to those described for the Proposed RMP and Alternative A.

Most of the increased oil and gas development, as well as the reduction in special stipulation designations, would occur in the canyon habitat immediately adjacent to designated critical habitat and in an area in which substantial suitable habitat for the Mexican Spotted Owl occurs. Alternative B would increase the proportion of Mexican Spotted Owl canyon and forest habitat open to oil and gas development by approximately 9% and 1%, respectively, when compared to Alternative D (No Action). Alternative B would decrease the proportion of Mexican Spotted Owl canyon and forest habitat subject to special stipulations by approximately 22% and 12%, respectively, versus Alternative D (No Action). The combination of both increased oil and gas development and a reduction in protective measures within canyons providing substantial suitable habitat potentially necessary for the species recovery would provide a substantial impact when compared to Alternative D (No Action).

Impacts to the Colorado River fishes would be similar to those described for the Proposed RMP.

#### **4.17.2.3.4. ALTERNATIVE C**

##### **4.17.2.3.4.1. Special Status Plant Species**

Under Alternative C, areas open for mineral and energy development would increase by 6% in areas open for oil and gas leasing, and 0.3% in areas open for mineral development when compared to Alternative D (No Action). The number of acres open to oil and gas leasing on BLM administered lands within the VPA would be 1,627,085, and mineral materials 388,699 acres. Under Alternative C, 445,945 acres of desert shrub, 424,043 acres of sagebrush, and 404,772 acres of pinyon-juniper would be subject to surface disturbance from oil, gas, and CBNG development. Alternative C proposes 6% more disturbance to desert shrub, 1% less to sagebrush, and 2% less to pinyon-juniper than does Alternative D (No Action). Impacts of mineral and energy development under Alternative C are generally similar to those described for Alternative D (No Action); although, there are slight increases in acreage available for mineral and energy development. The overall effect of Alternative C would be to maintain the current condition that is one of continued risk for endemics.

#### 4.17.2.3.4.2. Special Status Animal Species

Alternative C would decrease the proportion of Greater Sage-grouse winter and brooding habitat open to oil and gas development by approximately 2% when compared to Alternative D (No Action). This alternative would also increase the proportion of Greater Sage-grouse winter and brooding habitat subject to special stipulations by approximately 11% when compared to Alternative D (No Action). This would have a beneficial impact when compared to Alternative D (No Action).

Alternative C would increase the proportion of white-tailed prairie dog habitat open to oil and gas development by approximately 3% when compared to Alternative D (No Action). This alternative would also decrease the proportion of white-tailed prairie dog habitat subject to special stipulations by approximately 17% when compared to Alternative D (No Action). This would result in impacts similar to the other action alternatives.

Alternative C would decrease the proportion of Mexican Spotted Owl canyon and forest habitat open to oil and gas development by approximately 1% and 3%, respectively, when compared to Alternative D (No Action). This alternative would also decrease the proportion of Mexican Spotted Owl canyon and forest habitat subject to special stipulations by approximately 23% when compared to Alternative D (No Action) (see Tables 17 and 18 in Appendix H, Wildlife). The combination of a slight decrease in oil and gas development within the Mexican Spotted Owl canyon habitat (1%) with a 23% reduction in protective measures within canyons providing substantial suitable habitat potentially necessary for the species recovery would provide a substantial impact when compared to Alternative D (No Action).

Impacts to the Colorado River fishes would be similar to those described for the Proposed RMP.

#### 4.17.2.3.5. ALTERNATIVE D (NO ACTION)

Under Alternative D (No Action), substantial mineral and energy development would still occur. There would be 1,536,030 acres of land open for oil and gas leasing, 387,700 acres open for mineral materials, totaling 1,923,730 acres. Impacts under Alternative D (No Action) would be the same as described under Impacts Common to the Proposed RMP and All Alternatives.

#### 4.17.2.3.6. ALTERNATIVE E

##### 4.17.2.3.6.1. Special Status Plant Species

Under Alternative E, there would be a 2% decrease in the area open for oil and gas leasing, and an 11% decrease in the area open for mineral development when compared to Alternative D (No Action). The number of acres open to oil and gas leasing on BLM administered lands within the VPA would be 1,499,461, and mineral materials 344,682 acres. Under Alternative E, 418,869 acres of desert shrub, 371,960 acres of sagebrush, and 327,451 acres of pinyon-juniper would be subject to surface disturbance from oil, gas, and CBNG development. Alternative E proposes 0.4% less disturbance to desert shrub, 11% less to sagebrush, and 17% less to pinyon-juniper than does Alternative D (No Action). Impacts of mineral and energy development under

Alternative E are generally similar to those described for Alternative D (No Action); although, there are slight decreases in acreage available for mineral and energy development. The overall effect of Alternative E would be to slightly reduce the risk to endemics.

#### **4.17.2.3.6.2. Special Status Animal Species**

Alternative E would decrease the proportion of Greater Sage-grouse winter habitat open to oil and gas development by approximately 17% while increasing the proportion of Greater Sage-grouse brooding habitat open to oil and gas development by approximately 1% when compared to Alternative D (No Action). This alternative would also increase the proportion of Greater Sage-grouse winter and brooding habitat subject to special stipulations by approximately 12% and 21%, respectively when compared to Alternative D (No Action). This would have a beneficial impact when compared to Alternative D (No Action).

Alternative E would increase the proportion of white-tailed prairie dog habitat open to oil and gas development by approximately 1% when compared to Alternative D (No Action). This alternative would also decrease the proportion of white-tailed prairie dog habitat subject to special stipulations by approximately 52% when compared to Alternative D (No Action). This would result in impacts similar to the other action alternatives.

Alternative E would decrease the proportion of Mexican Spotted Owl canyon and forest habitat open to oil and gas development by approximately 17% and 2%, respectively when compared to Alternative D (No Action). This alternative would also increase the proportion of Mexican Spotted Owl canyon habitat subject to special stipulations by approximately 106% while decreasing the proportion of Mexican Spotted Owl forest habitat subject to special stipulations by approximately 10% when compared to Alternative D (No Action) (see Tables 17 and 18 in Appendix H, Wildlife). The combination of a decrease in oil and gas development within the Mexican Spotted Owl canyon habitat and an increase in protective measures within canyons would provide a substantial beneficial impact when compared to Alternative D (No Action).

Impacts to the Colorado River fishes would be similar to those described for the Proposed RMP.

#### **4.17.2.4. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON SPECIAL STATUS SPECIES**

##### **4.17.2.4.1. PROPOSED RMP AND ALTERNATIVES A, B, C, D (NO ACTION), AND E**

Protecting wilderness characteristics outside designated WSAs would provide direct and indirect beneficial impacts to special status species by precluding surface disturbance in these areas. Reducing surface disturbance limits erosion and decreases habitat fragmentation, noise, and traffic that can have adverse impacts on special status species. The Proposed RMP and Alternative E would manage approximately 106,178 acres and 277,596 acres, respectively, to maintain their wilderness characteristics. The Proposed RMP and Alternative E propose to manage these lands for their wilderness characteristics. Alternative E would be more beneficial to wildlife than the Proposed RMP primarily because Alternative E would include more acreage

and because Alternative E would manage these areas as VRM Class I (compared to VRM Class II under the Proposed RMP) and closed to oil and gas leasing.

#### 4.17.2.5. IMPACTS OF RANGELAND IMPROVEMENT DECISIONS ON SPECIAL STATUS SPECIES

General impacts associated with all of the alternatives would be the same as described in the Impacts Common to the Proposed RMP and All Alternatives section. Such impacts would be either beneficial or adverse, depending on whether the improvements made for livestock grazing resulted in moving livestock out of special status species habitat or concentrating them in new habitats. The exact locations of the rangeland treatments are presently unknown. Therefore, the discussion below focuses only on how rangeland improvement decisions would affect special status plants as compared to Alternative D (No Action). Table 4.17.3 below describes the range improvement management actions for each alternative.

**Table 4.17.3. Rangeland Improvements for the Proposed RMP and all Alternatives**

Activity	Proposed RMP	Alternative A	Alternative B	Alternative C	Alternative D (No Action)	Alternative E
Vegetation treatment (acres)	34,640	34,640	50,900	45,860	40,390	45,860
Fencing (miles)	68.5	68.5	368.5	129.0	65.0	129.0
Guzzlers/reservoirs	812	812	1,165	811	775	811
Wells/springs	51	51	78	87	74	87
Water pipeline (miles)	37.5	37.5	51.0	29.5	35.0	29.5

##### 4.17.2.5.1. PROPOSED RMP AND ALTERNATIVE A

This alternative would decrease the amount of vegetation treatment and wells/springs, but increase the length of fencing and the number of wells/springs that would be developed in the VPA. The slightly less surface disturbance caused by vegetation treatments, when compared to Alternative D (No Action), would produce slightly less adverse impacts on special status plant habitat.

##### 4.17.2.5.2. ALTERNATIVE B

Alternative B would propose more vegetation treatments, fencing, and guzzlers/reservoirs than Alternative D (No Action). The greater amount of disturbance under this alternative from vegetation treatments, when compared to Alternative D (No Action), would result in potentially greater adverse impacts to special status plant species.

**4.17.2.5.3. ALTERNATIVES C AND E**

Alternatives C and E propose slightly more vegetation treatments and rangeland improvements than Alternative D (No Action). Impacts to special status plants would be similar to those described under alternative B.

**4.17.2.5.4. ALTERNATIVE D (NO ACTION)**

Vegetation disturbance for rangeland improvements would occur under this alternative and result in both beneficial and adverse impacts as described under Impacts Common to All Alternatives.

**4.17.2.6. IMPACTS OF RECREATION AND TRAVEL DECISIONS ON SPECIAL STATUS SPECIES****4.17.2.6.1. PROPOSED RMP AND ALTERNATIVES A, B, C, D (NO ACTION), AND E**

Assignment and designation of Back Country Byways and SRMAs would have both beneficial and adverse impacts on special status species. Beneficial impacts would result from focused management of recreation in these areas. However adverse impacts would also result because of the increased visitor use—and associated disturbance from human presence, trampling of vegetation, etc.—that would likely occur following designation. The nature of long-term beneficial and adverse impacts on special status species in these areas would be the same among the alternatives as described in Impacts Common to the Proposed RMP and all Alternatives. However, the magnitude of these impacts would differ among the alternatives.

The Proposed RMP and Alternatives A and B would designate Seep Ridge, Book Cliff Divide, and Atchee Ridge Roads as BLM Back Country Byways. Alternatives C and E would not designate these roads as BLM Back Country Byways. This action is not specified under Alternative D (No Action). The Proposed RMP and all alternatives would manage Pelican Lake (1,014 acres) and Red Mountain – Dry Fork (24,259 acres) as SRMAs. Lands in Browns Park and Nine Mile Canyon would also be managed as SRMAs under all alternatives but the acreage would differ between some alternatives (Browns Park: 18,490 acres under the Proposed RMP; 17,000 acres under Alternatives B and D; 52,720 acres under Alternatives A, C and E; Nine Mile Canyon: 44,168 acres under the Proposed RMP; 44,181 acres under Alternatives B, and D; 81,168 acres under Alternatives A, C and E). Lands in Blue Mountain, the Book Cliffs, Fantasy Canyon, and the White River would be managed as SRMAs under some alternatives and not under others. Acreages would differ as well. Lands in Blue Mountain (42,758 acres), Fantasy Canyon (69 acres), and the White River (2,831 acres under the Proposed RMP and 47,130 acres under Alternatives C and E) would be managed as SRMAs under the Proposed RMP and Alternatives C and E. Alternative A would managed all of these lands as SRMAs except Fantasy Canyon and the White River would consist of 24,183 acres. Under Alternatives B and D these lands would not be managed as SRMAs. Lands in the Book Cliffs (273,486 acres) would be managed as SRMA under Alternatives A, C and E but not under the Proposed RMP and Alternatives B and D. The Proposed RMP and Alternatives A, C, and E would improve, develop, and/or sign up to 400 miles of non-motorized trails. Up to 800 miles of motorized routes would be improved, developed, and/or signed under the Proposed RMP and Alternatives A, B, and D.

With respect to travel management, the main difference between the Proposed RMP and the action alternatives and Alternative D (No Action) is in the amount of land available for Open and Limited OHV use. Total acreages available for OHV Open use under the Proposed RMP and Alternatives A, B, C, and E are similar, ranging from 6,202 acres under the Proposed RMP and Alternative A to 5,434 acres under Alternatives B, C, and E. In comparison, Alternative D (No Action) would allow 787,859 acres to be Open to unrestricted OHV use. Under the Proposed RMP and Alternatives A, B, C, and E, the number of acres designated as the more restrictive Limited category of OHV use are roughly similar, ranging from 1,326,024 under Alternative E to 1,659,901 under Alternative E. The Proposed RMP and Alternative A would designate 1,643,475 acres as Limited to designated routes while Alternative C would designate 1,353,529 acres as Limited to designated routes. In comparison, Alternative D (No Action) would designate 887,275 acres as Limited OHV use. Generally adverse OHV effects, such as trampling of either occupied or potential special status species habitat, noise, habitat fragmentation, increased wind erosion in sensitive habitats would still occur but the risks of these impacts on special status species would be substantially reduced under the Proposed RMP and Alternatives A, B, C, and E, when compared to Alternative D (No Action). The minimal management of OHV use would lead to declines of special status species and habitats as areas in the VPA become more popular for OHV recreation.

Although recreational hunting is carefully managed by the UDWR, impacts to species such as the Greater Sage-grouse and the White-tailed prairie dog could be exacerbated by recreational and travel activity.

#### **4.17.2.7. IMPACTS OF SPECIAL STATUS SPECIES DECISIONS ON SPECIAL STATUS SPECIES**

The RMP provides special status species designations for Sage-grouse and the Colorado River cutthroat trout. Therefore, only special status species decisions for these two species are addressed in this section.

##### **4.17.2.7.1. PROPOSED RMP AND ALTERNATIVES C AND E**

###### **4.17.2.7.1.1. Greater Sage-grouse**

Under the Proposed RMP and Alternatives C and E no surface-disturbing activities would be allowed year round within 0.25 miles of active Sage-grouse leks. From March 1 through June 15 (the brooding period) no surface-disturbing activities would be allowed within two miles of active Sage-grouse leks and no permanent facilities or structures would be allowed when possible. Finally, within 0.5 miles of known active Sage-grouse leks, the best available technology would be used to reduce noise. These measures would provide more benefits to Sage-grouse than Alternative D (No Action) which would only require buffers of 300 feet (Book Cliffs area) and 1,000 feet (Diamond Mountain area) and would not require noise reduction devices for operations occurring within 0.5 miles of known active leks.

#### 4.17.2.7.1.2. Colorado River Cutthroat Trout

The Proposed RMP and Alternatives C and E would provide, maintain, and/or enhance habitat for the reintroduction of Colorado River cutthroat trout to Bitter Creek, Upper Willow Creek, Beaver Creek, Sears Creek, Crouse Creek, Tolivers Creek, Davenport Creek, Jackson Creek, and Sweetwater Creek and their tributaries. In comparison, Alternative D (No Action) would provide and maintain suitable habitat for the reintroduction of Colorado River cutthroat trout to the same creeks mentioned above with the exception of Sweetwater, Bitter, and Upper Willow Creeks. Under Alternative D (No Action), Argyle Creek would also be included in this list. There would be no essential difference between the Proposed RMP and Alternatives C and E and Alternative D (No Action), except in the number and location of creeks available for the reintroduction of Colorado River Cutthroat Trout. The Proposed RMP and Alternatives C and E would be more beneficial to Colorado River cutthroat trout than Alternative D (No Action) because there would be more creeks available for reintroduction under the Proposed RMP and Alternatives C and E.

#### 4.17.2.7.2. ALTERNATIVE A

##### 4.17.2.7.2.1. Greater Sage-grouse

Alternative A would implement the *Strategic Management Plan for Sage-Grouse* (UDWR 2002) as follows: Human disturbances within 0.6 mile (3,168 feet) of a Sage-grouse lek would be avoided during the Sage-grouse breeding season (March 1 through May 31) from 1 hour before sunrise to 3 hours after sunrise. Roads, fences, poles, and utility lines would not be constructed within 1,300 feet of a lek. Noise reduction according to best available technology would be used within 0.5 miles of a lek. The main differences between Alternative A and Alternative D (No Action) would be that (1) Alternative A would provide a greater human protective buffer (3,168 feet) as compared to only 300 feet in the Book Cliffs and 1,000 feet in the Diamond Mountain area and (2) noise reduction devices would be used on machinery under Alternative A, whereas there would be none under Alternative D (No Action).

##### 4.17.2.7.2.2. Colorado River Cutthroat Trout

Impacts to the Colorado River cutthroat trout would be as described for the Proposed RMP and Alternatives C and E because the decisions are the same.

#### 4.17.2.7.3. ALTERNATIVE B

##### 4.17.2.7.3.1. Greater Sage-grouse

Sage-grouse management would be as described for Alternative A, with the exception that restrictions would apply only to "significant human disturbance," developments may occur within 1,300 feet of a lek and there would be no measures undertaken to reduce noise. In general, Alternative B would provide much greater protection for Sage-grouse than Alternative D (No Action), although the lack of definition of "significant human disturbance" and the option for development within 1,300 feet of a lek leaves the possibility open that there would be no difference in Sage-grouse management between Alternative B and Alternative D (No Action).

**4.17.2.7.3.2. Colorado River Cutthroat Trout**

Impacts to the Colorado River cutthroat trout would be as described for the Proposed RMP and Alternatives C and E because the decisions are the same.

**4.17.2.7.4. ALTERNATIVE D (No ACTION)****4.17.2.7.4.1. Greater Sage-grouse**

Alternative D (No Action) would limit surface disturbance, exploration, drilling, and other minerals development activities from March 15 to June 15 and no drilling or storage facilities would be allowed within 300 feet of a lek in the Book Cliffs area. No surface-disturbing activities would be allowed in Sage-grouse nesting areas (a 2-mile radius of sagebrush vegetation type surrounding a lek) from March 1 through June 30 or within 1,000 feet of a lek in the Diamond Mountain area.

**4.17.2.7.4.2. Colorado River Cutthroat Trout**

Under Alternative D (No Action) suitable habitat would be provided and maintained to reintroduce Colorado River cutthroat trout in Upper Willow (Brown's Park), Beaver, Sears, Crouse, Tolivers, Davenport, Jackson, and Argyle Creeks as found applicable.

**4.17.2.8. IMPACTS OF SOILS AND WATERSHEDS DECISIONS ON SPECIAL STATUS SPECIES****4.17.2.8.1. PROPOSED RMP AND ALTERNATIVES A, B, C, D (No ACTION), AND E**

Alternatives that incorporate decisions to protect water quality and reduce soil erosion would benefit special status plants and animals. The Proposed RMP and Alternative A would provide beneficial protection for soils and watersheds by limiting surface disturbance on slopes greater than 40% and requiring an approved erosion control strategy and design for activities on slopes of 21%–40%.

Alternative B would have beneficial impacts on special status species by limiting surface-disturbing activities on slopes greater than 20% by requiring an approved erosion control strategy and design.

Alternatives C and E would provide beneficial protection by preventing disturbance to slopes above 40%, and requiring an approved erosion control strategy and design for activities on slopes of 21%–40%.

Alternative D (No Action) restricts surface disturbance for mineral activities only on slopes greater than 40%.

Protection of water quality, reduction of sedimentation in streams, and limits on surface disturbance would be beneficial to special status species; therefore the Proposed RMP and all of the action alternatives would provide more protection than Alternative D (No Action).

Alternatives C and E would provide the most protection for water quality and surface disturbance and therefore provide the greatest amount of indirect protection for special status species.

#### **4.17.2.9. IMPACTS OF SPECIAL DESIGNATION DECISIONS ON SPECIAL STATUS SPECIES**

ACECs, Wild and Scenic Rivers, and Wilderness would provide direct and indirect beneficial impacts to special status species. ACECs provide direct beneficial impacts through management prescriptions when they are focused on protecting wildlife, riparian resources, and special status species. They also provide indirect beneficial impacts if they preclude surface disturbance within portions of the ACEC by limiting erosion and decreasing habitat fragmentation, noise, and traffic. Wild and Scenic River recommended designations protect river corridors from mineral development and most other surface-disturbing activities within 0.5 mile line of sight from centerline of the river thereby providing direct protection to special status species within the river corridor. Wilderness Study Areas are closed to leasing unless they have prior valid existing rights and thereby provide direct beneficial impacts to special status species. The acreage and prescriptions for WSAs are the same for the Proposed RMP and all alternatives so these are not discussed below. The acreage and prescriptions for these areas would only change if these areas were released by congress.

##### **4.17.2.9.1. ACECs**

###### **4.17.2.9.1.1. Proposed RMP**

Under the Proposed RMP, Brown's Park (18,490 acres), the Lower Green River Corridor (8,470 acres), Nine Mile Canyon (44,168 acres), the Red Mountain – Dry Fork Complex (24,285 acres), Lears Canyon (1,375 acres), Red Creek Watershed (24,475 acres), and the Pariette Wetlands (10,437 acres) would be designated as ACECs (131,700 total acres). The benefits of ACEC designation, as described above, to special status species would be reduced under the Proposed RMP compared to Alternative D (No Action). The Proposed RMP would designate 20% less area as ACECs than Alternative D (No Action) (165,944 acres).

###### **4.17.2.9.1.2. Alternative A**

Under Alternative A, Bitter Creek (68,834 acres), Brown's Park (52,721 acres), Coyote Basin (87,743 acres), the Lower Green River Corridor and Lower Green River Expansion (10,170 acres), Nine Mile Canyon (48,000 acres), the Red Mountain – Dry Fork Complex (24,285 acres), White River (17,810 acres), Lears Canyon (1,375 acres), Red Creek Watershed (24,475 acres), and the Pariette Wetlands (10,437 acres) would be designated as ACECs (345,850 total acres). The benefits of ACEC designation, as described above, to special status species would be increased under Alternative A compared to Alternative D (No Action). Alternative A would designate 108% more area as ACECs than Alternative D (No Action) (165,944 acres).

**4.17.2.9.1.3. Alternative B**

Under Alternative B, Browns Park (18,474 acres), Coyote Basin (47,659 acres), the Lower Green River Corridor (8,470 acres), Nine Mile Canyon (44,181 acres), the Red Mountain – Dry Fork Complex (24,285 acres), Lears Canyon (1,375 acres), Red Creek Watershed (24,475 acres), and the Pariette Wetlands (10,437 acres) would be designated as ACECs (179,356 total acres). The total acreage of ACECs under Alternative B would be about 8% greater than under Alternative D (No Action) resulting in more beneficial impacts to special status species than Alternative D (No Action).

**4.17.2.9.1.4. Alternative C**

Under Alternative C, Bitter Creek (147,425 acres), Browns Park (52,721 acres), Coyote Basin (124,161 acres), Four Mile Wash (50,280 acres), the Lower Green River Corridor and Lower Green River Expansion (10,170 acres), Main Canyon (100,915 acres), Middle Green River (6,768 acres), Nine Mile Canyon (81,168 acres), the Red Mountain – Dry Fork Complex (24,285 acres), the White River (47,130 acres), Lears Canyon (1,375 acres), Red Creek Watershed (24,475 acres), and the Pariette Wetlands (10,437 acres) would be designated as ACECs (681,310 total acres). The total acreage of ACECs under Alternative B would be nearly four times greater than under Alternative D (No Action) resulting in more beneficial impacts to special status species than Alternative D (No Action).

**4.17.2.9.1.5. Alternative D (No Action)**

Under Alternative D (No Action), Browns Park (52,721 acres), the Lower Green River Corridor (8,407 acres), Nine Mile Canyon (44,181 acres), the Red Mountain – Dry Fork Complex (24,285 acres), Lears Canyon (1,375 acres), Red Creek Watershed (24,475 acres), and the Pariette Wetlands (10,437 acres) would be designated as ACECs (165,944 total acres).

**4.17.2.9.1.6. Alternative E**

The impacts of special designation decisions on special status species would be the same as discussed above for Alternative C because the management actions are the same, except that Bitter Creek would not be designated as an ACEC under Alternative E and that the non-WSA areas with wilderness characteristics would be managed for the protection of their wilderness values. Under this alternative, approximately 197,171 acres within the proposed ACECs would be managed under VRM I objectives, closed to mineral leasing and mineral materials disposal, excluded from ROW consideration, closed to commercial and private woodcutting, and closed to cross-country OHV travel. These management decisions would have long-term, beneficial impacts on special status species by either reducing or prohibiting surface disturbances within the non-WSA wilderness characteristics areas. This alternative would have more beneficial impacts on special status species than all other alternatives because it would manage potential special status species habitat with more protective prescriptions. However, it would manage fewer acres overall (681,310 total acres) for their wilderness characteristics than Alternative C.

**4.17.2.9.2. WILD AND SCENIC RIVERS****4.17.2.9.2.1. Proposed RMP and Alternative B**

Under the Proposed RMP and Alternative B, two river segments on the Upper Green River (22 miles) and Lower Green River (30 miles) with a tentative classification of scenic for both river segments would be considered for Wild and Scenic River designation. Though Alternative D (No Action) would also not identify any segments of the aforementioned rivers as suitable for Wild and Scenic River designation it would manage portions of Bitter Creek, Evacuation Creek, and the White River to protect the free flowing nature, outstandingly remarkable values, and tentative classification of the river. As a result, Alternative D (No Action) would have more beneficial impacts for special status species than the Proposed RMP and Alternative B.

**4.17.2.9.2.2. Alternative A**

Under Alternative A, the portion of the White River between the Colorado state line and the trust land boundary (44 miles) would be tentatively classified as "Scenic" (Segment A) and "Wild" (Segment B). Though Alternative D (No Action) would not identify any river segments as suitable for Wild and Scenic River designation it would manage portions of Bitter Creek, Evacuation Creek, and the White River to protect the free flowing nature, outstandingly remarkable values, and tentative classification of the river. As a result, Alternative D (No Action) would have more beneficial impacts for special status species than Alternative A.

**4.17.2.9.2.3. Alternatives C and E**

Under Alternatives C and E all segments of the aforementioned rivers would be considered suitable for Wild and Scenic River designation. This would result in reduced surface disturbance and adverse impacts to special status species along approximately 158 miles of river in the VPA. Long-term beneficial impacts to riparian dependent special status species would be greater under Alternatives C and E compared to Alternative D (No Action) due to the greater river mileage considered suitable for Wild and Scenic River designation. These alternatives would identify segments along the White River, Nine Mile Creek, the Middle Green River, Evacuation Creek, Bitter Creek, and Argyle Creek as suitable for designation into the Wild and Scenic River System. These management actions would have greater beneficial impacts on special status species than any of the other alternatives.

**4.17.2.9.2.4. Alternatives D (No Action)**

This alternative would not identify any river segments within the VPA as suitable for Wild and Scenic River designation. However, segments of Bitter Creek, Evacuation Creek, and the White River would be managed to protect the free flowing nature, outstandingly remarkable values, and tentative classification of the rivers.

**4.17.2.10. IMPACTS OF WOODLANDS AND FOREST MANAGEMENT DECISIONS ON SPECIAL STATUS SPECIES****4.17.2.10.1. PROPOSED RMP AND ALTERNATIVES A, B, C AND E**

The Proposed RMP and Alternatives A, B, C, and E would allow public utilization of forest and woodland products as one tool for conducting vegetative treatments to achieve desired future conditions in these forest and woodland habitats. The Proposed RMP would treat/harvest up to 546,152 acres of forest and woodland habitat. Alternatives A and C would treat/harvest up to 552,152 acres of forest and woodland habitat. Alternative B would treat/harvest 554,108 acres of forest and woodland habitat.

The Proposed RMP and Alternatives A, C, and E would manage forests and woodlands to maintain and restore ecosystems to a condition in which biodiversity is preserved and occurrences of fire, insects, disease, and other disturbances do not exceed levels normally expected in healthy forests and woodlands. The Proposed RMP and these alternatives would maintain relict stands of vegetation for biological and genetic diversity. Forests and woodlands would be managed under the principles of multiple use and sustained yield without permanent impairment of the productivity of the land and the quality of the environment; allow use of forest, woodland products, biomass, and certain vegetation products in areas specified for this use to meet RMP goals. The Proposed RMP and each of these alternatives would implement the National Healthy Forest Initiative and the National Fire Plan by conducting treatments to reduce fuel loadings, fire severity, and restoring historical disturbance regimes.

The Proposed RMP and Alternatives A and B would initiate a proactive program of woodland management that would be implemented for the salvage of forest and woodland products that are dead and/or dying due to, fire, disease, insect-kill or other disturbance with the management intent of promoting healthy forest and woodlands. Alternative C would allow for the salvage of forest and woodland products within proposed ACECs (242,760 acres) only when there is a threat to forest and woodlands or other resources in the ACEC. Alternative C would also allow for salvage of forests and woodlands for other resources on up to 343,110 acres outside of proposed ACECs. Alternative E would allow for the salvage of forest and woodland products outside proposed ACECs (242,602 acres) but would not allow these activities within proposed ACECs. Alternative E would also prohibit forest and woodland salvage on non-WSA lands with wilderness characteristics. Alternative B would allow harvesting forest and woodland stands that have reached culmination of mean annual increment (growth begins to decrease). Stands would thereafter be grown and thinned to approximately 80% to 90% of "normal (maximum) basal area" until the culmination of mean annual increment, at which time the stand(s) would be cut again.

**4.17.2.10.2. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would allow up to 88,200 acres of forest and 200,100 acres of woodlands to have treatments or be harvested.

These woodland and fire management treatments would have a varying degree of beneficial to adverse impacts on special status plant and animal species. Treatments would be conducted to manage structure, composition, and function of vegetation, and consideration of how these attributes relate to the landscape. Fire suppression activities such as line construction would avoid plant sites as much as possible, resulting in slight to moderately adverse impacts depending on location and successful avoidance of sites. Maintaining forest and woodland habitats in a mosaic of seral stages would have beneficial impacts on most special status species by providing a diversity of habitats to meet the life history needs of those species that use these areas.

#### **4.17.3. MITIGATION MEASURES**

The following mitigation measures would be implemented under the Proposed RMP and all alternatives:

Mineral and energy development in areas directly associated with Ferruginous Hawk nesting areas would be subject to special stipulations including buffers outlined in "Best Management Practices for Raptors and Their Associated Habitats in Utah" (Utah BLM, 2006, Appendix A) with modifications allowed as long as protection of the raptors is ensured.

Notices for oil and gas development and BLM-committed conservation measures would be applied to Utah's T&E species (see Appendix L).

The Proposed RMP and all alternatives would have stipulations and mitigation measures meant to protect and/or enhance existing Greater Sage-grouse habitat. The Proposed RMP and Alternatives C and E would not allow surface-disturbing activities year round within 0.25 miles of active Sage-grouse leks. From March 1 through June 15 (the brooding period) no surface-disturbing activities would be allowed within two miles of active Sage-grouse leks and no permanent facilities or structures would be allowed when possible. Finally, within 0.5 miles of known active Sage-grouse leks, the best available technology would be used to reduce noise. Alternative A would implement the *Strategic Management Plan for Sage-Grouse* (State of Utah, June 11, 2002) as the baseline threshold. Alternatives A and B would result in the avoidance of all human disturbances within 0.6 miles of a Sage-grouse lek during the Sage-grouse breeding season (March 1 to May 31) from 1 hour before sunrise to 3 hours after sunrise. Under Alternative A, roads, fences, poles, and utility lines would not be developed within 1,300 feet of a lek. Alternative B would allow development within 1,300 feet of a lek but would be designed to minimize, to the extent possible, bird collision and to minimize raptor perching within 2 miles of a lek. Alternative D (No Action) would limit surface disturbance, exploration, drilling, and other minerals development activities from March 15 to June 15 and no drilling or storage facilities would be allowed within 300 feet of a lek in the Book Cliffs area. No surface-disturbing activities would be allowed in Sage-grouse nesting areas (a 2-mile radius of sagebrush vegetation type surrounding a lek) from March 1 through June 30 or within 1,000 feet of a lek in the Diamond Mountain area.

Construction and development around any Bald Eagle nests would be managed under the authority of the Eagle Protection Act, and under the auspices of Best Management Practices as

outlined in "Best Management Practices for Raptors and Their Associated Habitats in Utah" (Utah BLM, 2006, Appendix A) with modifications allowed as long as protection of nests is insured.

No surface occupancy would be allowed in the riparian zone under the Proposed RMP or any of the action alternatives unless 1) there are no practical alternatives; 2) all long term impacts would be fully mitigated; or 3) the activity would benefit or enhance the riparian areas.

Roads, buried pipelines, facilities and well pads should be designed and constructed down slope of populations, or suitable habitat, of special status species to eliminate effects of changes to water flows that can create erosion and/or sedimentation. In addition, roads, buried pipelines, facilities and well pads should be located outside of the 100-year floodplain, wherever feasible.

Where construction of roads and pads due to landscape constraints, or other resource impacts such as archeological sites, need to be upslope of habitat; site specific designs of buffers utilizing the landscape, berms, and engineered roads and pads construction measures will be initiated to eliminate concentrated water flows and sediment into habitats.

When buffers are utilized to protect habitat, the buffers need to be of sufficient width to allow road or facility maintenance and weed controls without jeopardizing the habitat.

Where habitat for special status species occurs adjacent to planned construction areas, temporary fencing will be used to prevent equipment from disturbing habitat.

Surface pipelines should be placed a minimum of ten feet from special status plants and habitat. Where resource impacts conflict and pipelines need to go through habitat, the pipelines will be placed ten feet from occurring plants and staked to prevent snaking in the habitat areas.

Small area closures using permanent fencing, signing, barriers, or other protective measures should be utilized to protect special status species habitat from off road travel or OHV use. Monitoring of off road travel and OHV use will determine the level of protection needed.

BLM would initiate the avoidance of key habitats with allotment permittees to protect special status species habitat during livestock herding and trailing activities or use of habitat areas for bedding or camp sites. (Key habitats are those that are deemed necessary for the conservation of the species, including, but not necessarily limited to Designated Critical Habitat, and other occupied or unoccupied habitat considered important for the species).

Supplements for livestock and range improvement projects, such as water developments and fences, would be planned to avoid concentrating livestock use on special status species habitat.

Where season of use by livestock is proven detrimental to special status species populations, BLM would initiate grazing plans using herding, deferment or rest rotation or other management activities, to lessen or deter impacts.

**4.17.4. UNAVOIDABLE ADVERSE IMPACTS**

The specified mitigation measures would reduce impacts to special status species but would also still result in adverse impacts to the Book Cliffs soil endemics, Ferruginous Hawk, Mexican Spotted Owl and the threatened and endangered Colorado River fishes. Depending on the degree of restriction applied to riparian zone exemptions, unavoidable adverse impacts could also occur to the Yellow-billed Cuckoo and the Ute ladies'-tresses.

**4.17.5. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY**

Construction of roads and well pads associated with mineral development would potentially provide a short-term use that would eventually result in long-term loss and fragmentation of special status species habitat. These activities would also increase the occurrence of noxious weed infestations competing for water and space with special status plants. Off highway vehicle use in the short-term would cause long-term loss of special status species through habitat disturbance, illegal collection of plants, and the indirect spread of noxious weeds.

**4.17.6. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS**

Irreversible impacts (species loss) to special status species (plants and animals) within the VPA would not occur due to planning level decisions described in this document. Irretrievable impacts to special status species would occur due to minerals development and other surface-disturbing activities that would remove and fragment habitat. In particular, there could be irretrievable impacts to the Ferruginous Hawk population because Ferruginous Hawks appear to be more susceptible to disturbance because of their preference for solitude when nesting and their high dependence on primary prey species such as rabbits and/or ground squirrels (Bechard et al. 1990; White and Thurow 1985; Holmes et al. 1993; Olendorff 1993). Similar irretrievable impacts could also occur to other special status species that are sensitive to noise and disturbance, such as Sage-grouse, and/or of limited distribution such as narrow soil endemic plant species (e.g., Book Cliffs soil endemics).

## 4.18. VEGETATION

Vegetation resources across the VPA would be affected by the management decisions of several resources. Direct adverse effects would primarily occur in the form of surface disturbance associated with development activities, vegetation manipulation treatments, and forage utilization. Oil and gas exploration and development requires the construction of roads, pipelines, wells, well pads, and compressors. Construction of recreation facilities, such as campgrounds and trails, and off-road vehicle travel would also disturb vegetated areas. Forage use by livestock, wildlife, and wild horses affect plant productivity and plant community structure and composition, having both beneficial and adverse impacts. Vegetation manipulation treatments and range improvement projects result in both beneficial effects in the long-term and adverse effects in the short-term due to surface disturbance. These activities alter plant communities and could eventually change the community's successional trajectory. Indirect impacts to vegetation associated with surface disturbance activities would also occur through processes such as soil loss and compaction, and noxious weed invasions. Indirect effects would also be beneficial through special designations such as ACECs.

This section describes the programmatic-level analysis of the potential effects to vegetation resources of the VPA as a result of land management decisions. Short-term direct and indirect impacts include acreage of surface disturbance, when possible, while long-term direct and indirect effects depend on the potential for a site to be revegetated or improved following surface disturbance.

### 4.18.1. IMPACTS COMMON TO ALL

The Utah BLM Standards for Rangeland Health would apply under the Proposed RMP and all of the alternatives. Summarized in Chapter 2, these management objective guidelines would ensure good site productivity, properly functioning riparian and wetland areas, vegetation communities composed of desired species, including native, and special status species when applicable, and compliance with state and federal water quality standards. Site-specific monitoring and evaluation strategies would be implemented to measure the success of following the Standards for Rangeland Health. Approved activities that would result in short-term adverse impacts contrary to these objectives would require rehabilitation and reclamation.

In addition to the Utah BLM Standards for Rangeland Health, vegetation would benefit from specific management guidelines, constraints or stipulations on use (see Chapter 2). Considerations would include monitoring to ensure compliance with permit conditions of approval and successful site reclamation. Proper livestock grazing timing and intensity would maintain or improve rangeland health. Special considerations during periods of drought would be made regarding livestock, wildlife, wild horses, recreation, and OHV use.

All management prescriptions would consider climatic conditions relative to an activity's effect on long-term rangeland productivity. The effect of management activities combined with wildland fire, drought, and natural disasters would also be considered. Resource degradation

would be minimized through adaptive-management actions such as temporary livestock reductions or recreation limitations, as necessary.

Several resources incorporate management goals and objectives and resource-specific actions common to the Proposed RMP and all alternatives that would beneficially affect the vegetation resource by either reducing surface disturbance, rehabilitating or restoring areas following surface disturbance, or protecting areas from consumptive use, thereby minimizing impacts to vegetation. These resources consist of cultural, fire management, forage, lands and realty, livestock and grazing, riparian, soil and watershed, wilderness, ACEC and Wild and Scenic Rivers special designations, special status species, visuals, wildlife, and woodlands and forests. Actions common to all are summarized by resource in Chapter 2.

The Proposed RMP and all of the alternatives allow for utilization increases in the event that rangeland health was being sustained or significant progress was being made towards rangeland health improvements. This increase in grazing would potentially cause adverse impacts to vegetation if not carefully managed and monitored. Impacts related to forage utilization are further analyzed in Section 4.8, Livestock and Grazing.

Land withdrawals would benefit vegetation in both the short- and long-term by reducing the potential for surface disturbance by mineral extraction activities. The Proposed RMP and Alternatives A and B would pursue locatable mineral withdrawal in the Book Cliffs Natural Area (401 acres), Green River Scenic Corridor in Browns Park (8,208 acres), relict vegetation areas in Lears Canyon (1,375 acres), the White River (9,218 acres), and developed and potential recreation sites (5,000 acres), for a total of 24,202 acres. Alternatives C and E would pursue locatable mineral withdrawal in all of the aforementioned locations (except developed and potential recreation sites) in addition to the Lower Green River ACEC for a total of 36,265 acres. Alternative D (No Action) would pursue mineral withdrawals in the above areas, but with different acreages designated for withdrawal in some cases: in Browns Park (19,400 acres), Lears Canyon (3,600 acres), the Lower Green River ACEC (7,900 acres), and developed and potential recreation sites (5,000 acres). A total of approximately 35,900 acres of mineral withdrawals would be pursued under Alternative D (No Action).

Special Designations that are currently managed would be maintained under the Proposed RMP and all alternatives. These include ACEC designation in Browns Park, Lears Canyon, Nine Mile Canyon, Red Mountain - Dry Fork, Pariette Wetlands, and Red Creek. These areas are also discussed under alternative impacts along with other impacts of special designations (Wild and Scenic Rivers, WSAs) on vegetation.

The Proposed RMP and all of the alternatives would allow harvesting of forest and woodland products. Impacts common to the Proposed RMP and all of the alternatives would include the long-term beneficial impacts that would result from the reduction of excessive fuel loads within the treated areas, which would reduce the potential for catastrophic, stand-destroying wildland fire; allow public use of woodland products; make improvements to woodland habitat; and make improvements in woodland productivity by restoring woodland and forest health. Prescribed fire or other treatments that would reduce the number of diseased and/or insect-infested trees in the resource area would also have long-term beneficial impacts to woodland health.

The Proposed RMP and all of the alternatives would restore or rehabilitate up to 200,000 acres of sagebrush-steppe habitat over the life of the plan. These vegetation treatments would consider the Western Association of Fish and Wildlife Agencies (WAFWA) Guidelines for Management of Sage Grouse Populations and Habitats and State and Local Conservation Plans. These Sage-grouse habitat protection measures would directly benefit vegetation by curtailing surface disturbance and increasing the acreage of stable sagebrush-steppe habitat.

Any decisions involving spatial and seasonal buffers for raptor protection would generally benefit any surrounding vegetation. Long-term benefits to vegetation would occur, as nesting sites would be protected from surface disturbance associated with oil and gas leasing activities. Impacts due to paleontological and cultural decisions would not be different under the alternatives and the Proposed RMP and are discussed under management common to all in Chapter 2.

#### **4.18.2. PROPOSED RMP AND ALTERNATIVE IMPACTS**

Management decisions that would affect vegetation are discussed below for the Proposed RMP and each alternative.

##### **4.18.2.1. IMPACTS OF FIRE MANAGEMENT DECISIONS ON VEGETATION RESOURCES**

###### **4.18.2.1.1. PROPOSED RMP AND ALTERNATIVES A, B, C AND E**

All prescribed fire activities are preceded by a burn plan. The Proposed RMP and Alternatives A, B, C and E would allow for 156,425 acres of prescribed fire per decade in the VPA. Target vegetation communities include pinyon-juniper, oak, aspen, and conifer. Prescription fires would reduce plant material initially, resulting in an adverse, short-term impact on vegetation. There would be an increased risk of noxious weed and invasive species establishment on fire-exposed and disturbed ground surfaces. However, as vegetation recovers and plant communities return to a natural fire regime, long-term, beneficial effects on the vegetation resource would occur, except where invasive annuals such as cheatgrass have invaded and become established. Plant communities could return to a more native mix of species. In some situations, seeding may be required in conjunction with prescribed fire to help prevent the establishment of non-native, invasive, and noxious species. The reduction in hazardous fuels from the use of prescribed fire would also benefit vegetation in the long-term by reducing the risks of wildland fire. These beneficial impacts would be greater than those that would occur under Alternative D (No Action) because these action alternatives and the Proposed RMP would propose more acreage for prescribed fire treatments than Alternative D (No Action).

###### **4.18.2.1.2. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) would allow up to 27,950 acres of prescribed burn treatments in the Book Cliffs RMP area and 22,950 acres of treatments, including prescribed burns, in the Diamond Mountain RMP area. As under the other alternatives and the Proposed RMP, direct impacts on vegetation would be adverse immediately following treatment, but long-term impacts

would be beneficial. However, the smaller amount of prescribed fire allowed under this alternative would produce less short-term adverse effects and less beneficial long-term effects than would the other alternatives or the Proposed RMP.

Impacts to vegetation would also occur with fire suppression activities (e.g., surface disturbance caused by heavy equipment, the digging of fire lines, etc.). Invasive species could spread to these disturbed areas, resulting in adverse impacts to vegetation community composition.

#### **4.18.2.2. IMPACTS OF FORAGE DECISIONS ON VEGETATION RESOURCES**

Forage utilization decisions would directly impact vegetation in both the short- and the long-term. Short-term direct adverse impacts include loss of vegetative cover and biomass, and trampling, while long-term adverse impacts would include reductions in plant productivity and regenerative ability, and increases in noxious weeds. The severity of adverse impacts also depends on grazing management (i.e., season of use) and climatic conditions (see Section 4.8 Livestock and Grazing). As explained in Chapter 2, the BLM Standards for Rangeland Health and Guidelines for Grazing Management would apply to forage utilization decisions.

##### **4.18.2.2.1. PROPOSED RMP AND ALTERNATIVES A, B, C AND E**

Though forage utilization would generally lead to short- and long-term adverse impacts to vegetation as described above, under the Proposed RMP and Alternatives A, B, C and E season of use changes, reduced livestock use, and improved livestock management strategies would all lead to improved vegetation conditions compared to Alternative D (No Action). Areas already meeting standards for rangeland health would be maintained; no other impacts would be present or no other improvements would be needed.

The Proposed RMP and each action alternative would allow for reductions in AUMs in the event that rangeland conditions are not being sustained or improved. This adaptive management strategy would generally benefit vegetation in the long-term compared to Alternative D (No Action) by allowing it to recover from grazing pressure. The Proposed RMP and Alternatives A, B, C and E would reduce utilization only after all other viable management options were considered, such as timing of use.

The Proposed RMP and Alternatives A, B, C and E would limit percent forage utilization on uplands—under the Proposed RMP and Alternatives A, C and E forage utilization would be limited to 50%, while under Alternative B forage utilization would be limited to 60%—and would, therefore, result in less adverse impacts to vegetation as compared to Alternative D (No Action), which would not limit percent forage utilization (Table 4.18.1).

**Table 4.18.1. Forage Utilization and AUM Allocations for the Proposed RMP and each Alternative**

Alternative / Proposed RMP	Forage Utilization Limit (%)	AUM Allocations		
		Livestock	Wildlife	Wild Horses
Proposed RMP	50	138,402	104,865	2,340
A	50	137,838	104,871	2,940
B	60	139,163	104,871	0
C	50	77,294	106,196	3,960
D	NA	146,161	96,607	3,360
E	50	77,294	106,196	3,960

<sup>1</sup>AUM Allocations for wild horses under the Proposed RMP would be temporary, until wild horses have been gathered and removed.

#### **4.18.2.2.2. ALTERNATIVE D (NO ACTION)**

In addition to the AUM allocations shown in Table 4.18.1, Alternative D (No Action) also includes the following allocations. The Book Cliffs RMP allocates 1,123 AUMs for antelope in the Bonanza-Rainbow area. These AUMs are split among the Bonanza Wild Horse Herd area, which includes 239 AUMs inside the area and 502 outside the area. Some allotments have shown an upward trend in forage availability and changes made to other allotments would result in an upward trend under Alternative D (No Action).

As mentioned above, each action alternative and the Proposed RMP would allow for reductions in AUMs in the event that rangeland conditions are not being sustained or improved. This adaptive management strategy would generally benefit vegetation in the long-term by allowing it to recover from grazing pressure. Alternative D (No Action) does not specify a utilization reduction, which would potentially result in greater impacts to vegetation than the action alternatives and the Proposed RMP. Rangeland health complications such as noxious weed infestations could result from the inability to limit forage use. This would have indirect, adverse impacts on vegetation as noxious weeds would outcompete native vegetation for space and resources.

#### **4.18.2.3. IMPACTS OF LANDS AND REALTY DECISIONS ON VEGETATION RESOURCES**

##### **4.18.2.3.1. PROPOSED RMP AND ALTERNATIVES A, B, AND C**

Decisions regarding land acquisitions to improve access would potentially increase impacts to vegetation in some areas, while reducing potential impacts in other areas. The Proposed RMP and Alternatives A and C could result in impacts to vegetation along the White River near the mouth of Cowboy Canyon if access was acquired, resulting in more adverse impacts than under Alternative D (No Action). Adverse impacts from damage to vegetation and from the establishment of noxious weeds could occur through the subsequent increase in traffic through

this area. This activity would not occur under Alternative B and it is not specified under Alternative D (No Action).

Acquisition of lands in Bitter Creek and near the confluence of South and Sweetwater Canyons would occur under the Proposed RMP and Alternatives A and C, with potentially adverse impacts to vegetation in these areas. Under Alternative B administrative access only would be pursued in these areas. These activities are not specified under Alternative D (No Action), so the potential for adverse impacts from these management actions would be less than those under the Proposed RMP and Alternatives A, B, and C.

Decisions regarding locatable mineral withdrawal or other protective measures that would preclude mineral entry would have beneficial impacts on vegetation by reducing the acreage of surface disturbance that would result from mineral withdrawal activities. A total of 24,202 acres would be withdrawn from mineral entry or subject to other protective measures under the Proposed RMP and Alternatives A and B. This is approximately two-thirds (67%) as much as would be withdrawn or subject to other protective measures under Alternative D (No Action) (35,900 acres upon which mineral and agricultural entry would be precluded). The Proposed RMP and Alternatives A and B, therefore, would be less beneficial to vegetation because these alternatives and the Proposed RMP would protect less acreage from mineral withdrawal activities than Alternative D (No Action). Under Alternative C a total of 36,265 acres would be withdrawn from mineral entry or subject to other protective measures. This is about 365 more acres subject to these measures than under Alternative D (No Action). Alternative C, therefore, would be more beneficial to vegetation because this alternative would protect more acreage from mineral withdrawal activities than Alternative D (No Action).

#### **4.18.2.3.2. ALTERNATIVE D (NO ACTION)**

Under Alternative D (No Action) management decisions related to land access are unspecified. However, locatable mineral withdrawal or other protective measures that would preclude mineral and agricultural entry would occur on a total of approximately 35,900 acres. The preclusion of mineral and agricultural entry on this acreage would decrease the potential for adverse impacts to vegetation in these acres, as compared to the Proposed RMP and the action alternatives.

#### **4.18.2.3.3. ALTERNATIVE E**

The impacts of lands and realty decisions on vegetation would be similar to those discussed above for Alternative C because the decisions are similar, except that approximately 277,597 acres of non-WSA lands with wilderness characteristics within the VPA would be managed as ROW exclusion areas. The management decisions for these areas, in order to protect their wilderness values, would have long-term, beneficial impacts on vegetation resources because surface disturbance impacts would be restricted. Compared to Alternative D (No Action), this alternative would have more beneficial impacts on vegetation resources because more protection would be afforded vegetation, reducing the potential for invasive species establishment and maintaining vegetation communities.

#### **4.18.2.4. IMPACTS OF LIVESTOCK AND GRAZING DECISIONS ON VEGETATION RESOURCES**

Impacts to vegetation from livestock grazing depend partly on the seasonality and locality of the grazing activity. Seasons-of-use decisions incorporate these factors and differ across the Proposed RMP and each alternative under the broad grazing management strategies of: Phenology (Proposed RMP and Alternative A), Billed Use (Alternative B), Adjudicated (Alternatives C and E), and Permitted (Alternative D, No Action). In general, impacts to vegetation are reduced when grazing occurs in the fall and winter, because plants are dormant and are not using energy for growth or reproduction. In contrast, grazing during the spring would have adverse indirect impacts on native plants by inhibiting productivity and reproduction, and increasing the likelihood of noxious weed expansion or establishment. Other direct, adverse impacts from livestock grazing include trampling, soil compaction, and soil erosion.

##### **4.18.2.4.1. PROPOSED RMP AND ALTERNATIVE A**

The Proposed RMP and Alternative A would employ a phenology-based grazing system in all areas except Area 1 which would allow vegetation to recover by coupling forage use with dormancy and avoiding the growth periods of plants. Grazing would occur in Area 1 (Special Resources) only at the discretion of the VFO. Under the Proposed RMP grazing would be allowed in the Nine Mile Acquired Area provided that grazing is controlled, of short duration, does not detract from recreation and/or riparian values along the river, and is in accordance with the Green River Allotment Management Plan administered by the Price Field Office. With respect to the Nine Mile Acquired Area, to enhance riparian and watershed values Alternative A would not allow grazing. In the Nine Mile Acquired Area, therefore, Alternative A would have more beneficial impacts to vegetation than the Proposed RMP. In general, the Proposed RMP and Alternative A would result in fewer adverse impacts to vegetation due to livestock grazing than Alternative D (No Action) because the Proposed RMP and Alternative A would only allow grazing during the dormancy period of the forage plants, whereas Alternative D (No Action) would allow grazing during the growth period of forage plants.

##### **4.18.2.4.2. ALTERNATIVE B**

Alternative B would have the highest potential for adverse impacts to vegetation of all alternatives and the Proposed RMP. This alternative would be based on dates taken from permittee billing receipts and would reflect the actual allotment use times, not necessarily the permitted use periods or the best time, biologically, with respect to vegetation growth periods. Combined with a 60% forage allocation (see Section 4.18.2.2, Forage Decisions), this alternative would result in the greatest impacts to vegetation compared to all other alternatives and the Proposed RMP. Grazing use under Alternative B would often exceed the permitted timeframes, or overlap grazing start or end dates, increasing the risk of adverse impacts to vegetation.

Livestock grazing use in Area 1 and in the Nine Mile Acquired Area would be the same under Alternative B as under Alternative A.

**4.18.2.4.3. ALTERNATIVES C AND E**

Alternatives C and E would incorporate the negotiation between permitted use periods and vegetation phenology, narrowing the time period of actual use as it occurs under permitting, to the most sound vegetation phenological period. In general, forage use would be limited to the fall and winter, except in Areas 2 and 3, reducing the potentially adverse impacts that could occur during crucial growth periods. These alternatives would result in fewer adverse impacts to vegetation when compared to Alternative D (No Action) (Permitted Use) because Alternative D would allow more use during the growth period of forage plants than Alternatives C or E.

Under Alternatives C and E livestock grazing in Area 1 would be allowed at the discretion of the VFO (same as Alternatives A, B, and D), though these alternatives would not allow lands in the Nine Mile Acquired Area to be grazed. Alternative E would include additional protections for vegetation because conversions would not be allowed in non-WSA lands with wilderness characteristics if fencing or other structural improvements would be required or if conversions would result in significant resource conflicts. In general, Alternative E would be the most protective of vegetation resources with respect to livestock grazing decisions.

**4.18.2.4.4. ALTERNATIVE D (NO ACTION)**

Alternative D (No Action) reflects current livestock grazing activities, as assigned on grazing permits. Potential impacts of this alternative would be similar to those under Alternative B, but would differ (for most areas) by the length of time grazing may occur in each area. Management prescriptions for the Nine Mile Acquired Area are unspecified under Alternative D (No Action).

**4.18.2.5. IMPACTS OF MINERALS DECISIONS ON VEGETATION RESOURCES**

The potential direct impacts from oil, gas, and CBNG production; Gilsonite and phosphate (non-energy leasable minerals) mining; and mineral materials mining would occur as various forms of surface disturbance. Initial loss of vegetation would be followed by a greater potential for invasive and noxious weed establishment.

Of the six oil and gas development areas within the VPA (see Figure 24, RFD Areas), vegetation in the three most southern RFD areas is expected to be the most impacted by minerals decisions. It is anticipated that these three areas (East and West Tavaputs Plateau, and Monument Butte-Red Wash) would have the highest levels of oil and gas well development.

Surface disturbance associated with well construction would produce both short- and long-term adverse impacts to vegetation, potentially beyond the average well-life of 25 years. In the short term, surface disturbance would remove vegetation and increase the potential for noxious weed invasions. Other surface-disturbing activities associated with well development, such as road and pipeline construction, would produce additional impacts to vegetation. Following the initial short-term impacts, surface disturbance associated with oil and gas development would produce long-term impacts to vegetation. Successful reclamation is estimated to take at least 10 years, allowing time for site degradation and noxious weed infestations to continue. Revegetation is especially difficult within the desert shrub type, as soils are shallow and highly saline, and

moisture availability is relatively low. Noxious weed invasions, notably cheatgrass, are likely in the sagebrush/perennial grass types, as these areas are often grazed by domestic livestock. Pinyon-juniper areas that have been chained and/or burned in the past are also highly susceptible to noxious weed invasions, and further disturbance would only increase the possibility of weed infestation. Russian knapweed is already a problem in the Diamond Mountain and Blue Mountain areas. Surface disturbance near noxious weed populations in these areas would likely allow for the weeds to spread. Other areas of concern include the Uinta Basin, Clay Basin, and Browns Park, where large populations of Russian thistle, halogeton, and cheatgrass are known to occur.

Acres of each vegetation type by leasing category are shown for the Proposed RMP and each alternative in Table 4.18.2. Note that acreage figures may differ slightly due to discrepancies between vegetation data and leasing data used in the minerals potential report. Also, GAP vegetation type categories listed below do not include values for Urban and Agricultural areas. Acreage figures under the categories Standard Stipulations and Timing and Controlled Surface Use reflect the total BLM administered areas within the VPA open to surface-disturbing activities. These are not estimates of the total area disturbed within the VPA, but a comparison by alternative and the Proposed RMP of the amount of area open to potential development within BLM administered areas within the VPA.

**Table 4.18.2. Acreage of Each Vegetation Cover Type by Minerals Leasing Category under the Proposed RMP and Each Alternative**

Alternative / Proposed RMP	Vegetation Type	Standard Stipulations	Timing and Controlled Surface Use	No Surface Occupancy	No Leasing
<b>Proposed RMP</b>	Aspen	125	0	0	14

<sup>1</sup>The differences in total BLM vegetation acreages for each leasing category and total BLM acreages for oil and gas leasing are accounted for by those areas lacking vegetation (e.g., rocky areas, urban/developed areas).

#### 4.18.2.5.1. PROPOSED RMP

As shown in Table 4.18.2, the potential for impacts to vegetation associated with the total area open to potential development would be greater under the Proposed RMP compared to Alternative D (No Action). Under the Proposed RMP, combined acreages totaling approximately 1,467,684 acres would be categorized as Standard Stipulations or Timing and Controlled Surface Use in the vegetation types listed in Table 4.18.2, a 1% decrease over Alternative D (No Action). Estimated surface disturbance by individual well development would total 18,860 acres; 5,045 acres of which would be reclaimed within one year of completion of operations (as per stipulations in the Minerals Potential Report). This represents a 4% increase in potential acres disturbed by oil and gas development compared to Alternative D (No Action).

Under the Proposed RMP approximately 223,873 acres of No Surface Occupancy and No Leasing BLM lands would not be impacted by oil and gas development, representing a 19% increase in the total acres that would not be impacted by oil and gas development compared to Alternative D (No Action).

Under the Proposed RMP impacts associated with prospecting, leasing, and development of phosphate would potentially occur on 76,208 acres open to leasing within the phosphate occurrence areas. Approximately 4% fewer acres are available for this activity under the Proposed RMP compared to Alternative D (No Action), which would potentially result in fewer adverse impacts to vegetation from this activity under the Proposed RMP. Gilsonite prospecting, leasing, and development would potentially occur on 172 miles (36,846 acres) of Gilsonite veins and on all BLM lands classified as open that contain additional veins. This area is 2% more than the area available under Alternative D (No Action), which would result in more adverse impacts to vegetation under the Proposed RMP.

Mineral material disposal could occur on 389,788 acres, less than a 1% increase compared to Alternative D (No Action). Therefore, adverse impacts to vegetation under Alternative A would be greater when compared to Alternative D (No Action), but only slightly.

**4.18.2.5.2. ALTERNATIVE A**

As shown in Table 4.18.2, the potential for impacts to vegetation associated with the total area open to potential development would be greater under Alternative A compared to Alternative D (No Action). Under Alternative A, combined acreages totaling approximately 1,537,250 acres would be categorized as Standard Stipulations or Timing and Controlled Surface Use in the vegetation types listed above, a 14% increase over Alternative D (No Action). Estimated surface disturbance by individual well development would total 18,971 acres; 5,071 acres of which would be reclaimed within one year of completion of operations (as per stipulations in the Minerals Potential Report). This represents a 4% increase in potential acres disturbed by oil and gas development compared to Alternative D (No Action).

Approximately 133,141 acres of No Surface Occupancy and No Leasing BLM lands would not be impacted by oil and gas development, representing a 30% decrease in the total acres that would not be impacted by oil and gas development compared to Alternative D (No Action).

Alternative A impacts associated with prospecting, leasing, and development of phosphate would potentially occur on 87,724 acres open to leasing within the phosphate occurrence areas. Approximately 4% fewer acres are available for this activity under Alternative A compared to Alternative D (No Action), which would potentially result in fewer adverse impacts to vegetation from this activity under Alternative A. Gilsonite prospecting, leasing, and development would potentially occur on 172 miles (36,846 acres) of Gilsonite veins and on all BLM lands classified as open that contain additional veins. This area is 2% more than the area available under Alternative D (No Action), which would result in more adverse impacts to vegetation under Alternative A.

Mineral material disposal could occur on 415,395 acres, a 7% increase compared to Alternative D (No Action). Therefore, adverse impacts to vegetation under Alternative A would be greater when compared to Alternative D (No Action).

**4.18.2.5.3. ALTERNATIVE B**

As shown in Table 4.18.2, Alternative B would designate approximately 1,579,372 acres as Standard Stipulations or Timing and Controlled Surface Use within the vegetation types listed above; a 7% increase over Alternative D (No Action). Surface disturbance associated with oil and gas activity on BLM administered land within the VPA would equal 19,033 acres, with 5,088 acres to be reclaimed within one year of completion of operations (as per stipulations in Minerals Potential Report). This represents a 5% increase in surface disturbance over Alternative D (No Action). Potential oil and gas related impacts to vegetation under Alternative B would be greater than what would occur under Alternative D (No Action).

Approximately 94,603 acres of No Surface Occupancy and No Leasing BLM lands would not be impacted by oil and gas development, representing a 50% decrease in total acres not available compared to Alternative D (No Action). Thus, the area available for development is greater under Alternative B compared to Alternative D (No Action), allowing for a greater potential for adverse impacts to vegetation.

Under Alternative B, 87,724 acres would be open for prospecting, leasing, and development of phosphate within the phosphate occurrence areas, representing a 4% increase over Alternative D (No Action). Gilsonite prospecting, leasing, and development would potentially occur on 172 miles (36,846 acres) of Gilsonite veins and on all BLM lands classified as open that contain additional veins, representing a 2% increase as compared to Alternative D (No Action). Impacts associated with phosphate and Gilsonite prospecting activities would be greater under Alternative B, as compared to Alternative D (No Action).

Mineral material disposal could occur on 432,953 acres under Alternative B, a 12% increase as compared to Alternative D (No Action). Potentially adverse impacts to vegetation associated with mineral material disposal would be greater under Alternative B when compared to Alternative D (No Action).

#### **4.18.2.5.4. ALTERNATIVE C**

As shown in Table 4.18.2, Alternative C would designate approximately 1,393,048 acres as Standard Stipulations or Timing and Controlled Surface Use, representing a 6% decrease as compared to Alternative D (No Action). Oil and gas development would impact 18,757 acres, 5,020 of which would be reclaimed within one year of completion of operations (as per stipulations in Minerals Potential Report). This represents a 3% increase under Alternative C in potential disturbances related to oil and gas production compared to Alternative D (No Action).

Approximately 286,916 acres of No Surface Occupancy and No Leasing BLM lands would not be impacted by oil and gas development, representing a 51% increase in total acres that would not be impacted by oil and gas development compared to Alternative D (No Action). Thus, the potential for impacts would be less under Alternative C when compared to Alternative D (No Action).

Under this alternative, 63,571 acres would be open for prospecting, leasing, and development of phosphate with standard and special stipulations within the phosphate occurrence areas. This represents a 25% decrease over Alternative D (No Action), resulting in a lower potential for adverse impacts to vegetation under Alternative C. Gilsonite prospecting, leasing, and development would potentially occur on 172 miles (36,846 acres) of Gilsonite veins and on all BLM lands classified as open that contain additional veins. This equates to a 2% increase in area available for Gilsonite activities across the BLM administered areas within the VPA as compared to Alternative D (No Action). Thus, greater adverse impacts to vegetation would be expected.

Mineral material disposal could occur on 388,699 acres, an increase of 0.3% in potentially adverse impacts to vegetation when compared to Alternative D (No Action).

#### **4.18.2.5.5. ALTERNATIVE D (NO ACTION)**

As shown in Table 4.18.2, Alternative D (No Action) would classify approximately 1,478,977 acres in the vegetation types listed above as Standard Stipulations and Timing and Controlled Surface Use. Oil and gas development would potentially impact 18,212 acres, 4,886 of which would be reclaimed within one year. Approximately 189,470 acres of No Surface Occupancy

and No Leasing BLM lands would not be impacted by oil and gas development under Alternative D (No Action).

Under Alternative D (No Action), 84,600 acres would be open for prospecting, leasing, and development of phosphate with standard and special stipulations within the phosphate occurrence areas. Gilsonite prospecting, leasing, and development would potentially occur on 168 miles (36,009 acres) of Gilsonite veins, and on all BLM lands classified as open that contain additional veins. Additional mitigation actions would be required in critical deer and elk winter range to reduce short and long-term impacts to habitat. Mineral material disposal could occur on 387,700 acres.

#### **4.18.2.5.6. ALTERNATIVE E**

As shown in Table 4.18.2, Alternative E would designate approximately 1,268,737 acres as Standard Stipulations or Timing and Controlled Surface Use within the vegetation types listed above, representing a 14% decrease as compared to Alternative D (No Action). Oil and gas development would impact 17,469 acres, 4,703 of which would be reclaimed within one year of completion of operations (as per stipulations in Minerals Potential Report). This represents a 4% decrease under Alternative E in potential disturbances related to oil and gas production compared to Alternative D (No Action).

Approximately 414,666 acres of No Surface Occupancy and No Leasing BLM lands would not be impacted by oil and gas development, representing a 119% increase in total acres that would not be impacted by oil and gas development compared to Alternative D (No Action). Thus, the potential for impacts would be less under Alternative E when compared to Alternative D (No Action).

Under this alternative, 52,063 acres would be open for prospecting, leasing, and development of phosphate with standard and special stipulations within the phosphate occurrence areas. This represents a 38% decrease compared to Alternative D (No Action), resulting in a lower potential for adverse impacts to vegetation under Alternative E. Gilsonite prospecting, leasing, and development would potentially occur on 163 miles (34,967 acres) of Gilsonite veins and on all BLM lands classified as open that contain additional veins. This equates to a 3% decrease in area available for Gilsonite activities within the VPA as compared to Alternative D (No Action). Thus, fewer adverse impacts to vegetation would be expected.

Mineral material disposal could occur on 344,682 acres, a decrease of 11% in potentially adverse impacts to vegetation when compared to Alternative D (No Action).

#### **4.18.2.6. IMPACTS OF MINERALS DECISIONS BY RFD AREA**

Surface disturbances (acres) by RFD area within the BLM administered areas of the VPA are shown in Table 4.18.4 below.

**Table 4.18.4. Short- and Long-term Minerals Impacts under the Proposed RMP and Each Alternative by RFD Area within BLM-administered Land (acres)**

RFD Area	Proposed RMP		Alternative A		Alternative B		Alternative C		Alternative D (No Action)		Alternative E	
	Short	Long	Short	Long	Short	Long	Short	Long	Short	Long	Short	Long
East Tavaputs Plateau	599	1,627	612	1,670	613	1,672	599	1,627	613	1,672	474	1,245

<b>TOTAL</b>	<b>18,860</b>		<b>18,971</b>		<b>19,035</b>		<b>18,758</b>		<b>18,212</b>		<b>17,469</b>	

Source: Vernal Draft EIS Calculations 10 August 2004.

**4.18.2.6.1. PROPOSED RMP**

Total short-term and long-term impacts from oil and gas surface disturbances to vegetation would be greater under the Proposed RMP than under Alternative D (No Action). Under the Proposed RMP surface disturbance from oil and gas development would be 4% greater than under Alternative D (No Action).

**4.18.2.6.2. ALTERNATIVES A, B, AND C**

Total short-term and long-term impacts from oil and gas surface disturbances to vegetation would be greater under Alternatives A, B, and C when compared to Alternative D (No Action) because surface disturbance would be greater (ranging from 3% to 5%) under these alternatives than under Alternative D (No Action).

**4.18.2.6.3. ALTERNATIVE D (NO ACTION)**

Total short-term and long-term impacts from oil and gas surface disturbances to vegetation would be about 18,212 acres under Alternative D (No Action).

**4.18.2.6.4. ALTERNATIVE E**

Under Alternative E the potentially adverse impacts to vegetation caused by oil and gas surface disturbances would be the least of all the alternatives (4% less than Alternative D, No Action) because the acres of impact would be the least.

**4.18.2.7. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON VEGETATION RESOURCES**

Where non-WSA lands with wilderness characteristics would be managed to maintain these characteristics vegetation resources would generally benefit by the elimination or curtailment of surface-disturbing activities such as energy and minerals development, woodland harvest, and OHV use. Where these lands would not be managed to maintain their wilderness values these prescriptions would not apply and vegetation resources would potentially be subject to increased adverse impacts in the form of surface disturbance from these activities.

**4.18.2.7.1. PROPOSED RMP**

Under the Proposed RMP approximately 106,178 acres of non-WSA lands with wilderness characteristics would be managed to maintain their wilderness values. Management prescriptions would include VRM II; closed to oil and gas leasing; closed to woodland product harvest; right-of-way avoidance; and OHV use limited to designated routes. Vegetation resources located on these lands would benefit from the protection provided under the listed prescriptions. Because of these protective prescriptions the Proposed RMP would be more beneficial to vegetation resources than Alternative D (No Action), because Alternative D (No Action) would not include the aforementioned protective measures.

**4.18.2.7.2. ALTERNATIVES A, B, C, AND D (NO ACTION)**

Under Alternatives A, B, C, and D (No Action), no non-WSA lands with wilderness characteristics would be managed to maintain their wilderness characteristics. The management prescriptions described for non-WSA lands with wilderness characteristics under the Proposed RMP and Alternative E would not apply and, as a result, vegetation resources in these areas would potentially be subject to adverse impacts from surface-disturbing activities such as energy and mineral development, OHV use, and woodland harvest.

**4.18.2.7.3. ALTERNATIVE E**

Alternative E would provide the most benefit to vegetation resources by restricting surface disturbance within approximately 277,596 acres of non-WSA lands with wilderness characteristics. The impacts on vegetation resources would be similar to the discussion under Alternative E, Woodlands above.

**4.18.2.8. IMPACTS OF RANGELAND IMPROVEMENTS DECISIONS ON VEGETATION RESOURCES**

Habitat enhancement projects include vegetation treatments, fencing, and water developments. Treatments may include mechanical, chemical, biological, and prescribed fire. While these activities produce short-term adverse impacts to vegetation associated with initial treatment or construction surface disturbance, long-term benefits to vegetation would also occur. Restoring natural vegetation communities, eliminating weeds, and fencing areas to control animal movement would enhance the vegetation resource and help achieve the desired mix of seral stages (see Chapter 2). However, additional guzzlers and pipelines would not enhance vegetation in the long-term. Table 4.18.5 provides information on rangeland improvements for the Proposed RMP and each of the alternatives.

**Table 4.18.5. Comparison of Rangeland Improvements for the Proposed RMP and Ea Alternative**

<b>Alternative / Proposed RMP</b>	<b>Treatment acres (+/- impacted compared to Alternative D, No Action)</b>	<b>Fencing miles (acres disturbed)</b>	<b>Guzzlers/reservoirs (acres disturbed)</b>	<b>Pipeline miles</b>
<b>Proposed RMP</b>	34,640 (- 5,750)	68.5 (34)	812	37.5
<b>A</b>	34,640 (- 5,750)	68.5 (34)	812	37.5
<b>B</b>	50,900 (+10,510)	368.5 (184)	1,165	51
<b>C</b>	45,860 (+5,470)	129.0 (65)	811	29.5
<b>D</b>	40,390	65.0 (33)	775	35
<b>E</b>	45,860 (+5,470)	129.0 (65)	811	29.5

**4.18.2.8.1. PROPOSED RMP AND ALTERNATIVE A**

The Proposed RMP and Alternative A would result in fewer short-term impacts associated with vegetation treatments compared to Alternative D (No Action), but the long-term benefits would also be less. Potentially adverse impacts associated with fencing and pipeline projects would be similar to Alternative D (No Action), but new guzzlers and reservoirs would result in greater long-term adverse impacts to vegetation compared to Alternative D (No Action).

**4.18.2.8.2. ALTERNATIVE B**

All rangeland improvements under Alternative B would result in greater short-term impacts to vegetation, but vegetation treatments and fencing would have beneficial impacts on vegetation in the long-term when compared to Alternative D (No Action).

**4.18.2.8.3. ALTERNATIVES C AND E**

Management decisions for vegetation treatments, fencing, and guzzlers/reservoirs would be the same for Alternatives C and E, and would result in greater short-term impacts to vegetation compared to Alternative D (No Action). On the other hand, short-term impacts associated with

new pipelines would be slightly less under Alternatives C and E than under Alternative D (No Action).

#### **4.18.2.8.4. ALTERNATIVE D (NO ACTION)**

Rangeland improvements that include vegetation treatments and fencing would have short-term adverse impacts on vegetation caused by construction, but would have long-term beneficial impacts on vegetation by improving the distribution of grazing animals; restoring natural vegetation communities, and eliminating weeds. Guzzlers and reservoir development would tend to have long-term adverse impacts on vegetation by concentrating livestock and attracting wildlife and wild horses in those areas, with subsequent disturbance and degradation of vegetation communities.

#### **4.18.2.9. IMPACTS OF RECREATION DECISIONS ON VEGETATION RESOURCES**

The alternative recreation management decisions focus primarily on whether to designate areas as SRMAs. In providing for focused management of recreation activities, in general SRMAs would benefit the vegetation resource by reducing or limiting surface-disturbance related to recreation. However, long-term adverse impacts would still occur with increases in access and visitors. As more people recreate in an area, trampling of the vegetation would occur and the chance for invasive, noxious weed introduction would increase.

##### **4.18.2.9.1. PROPOSED RMP**

Under the Proposed RMP, Pelican Lake (1,014 acres), Red Mountain – Dry Fork (24,259 acres), Blue Mountain (42,729 acres), Browns Park (18,490 acres), Fantasy Canyon (69 acres), Nine Mile Canyon (44,168 acres), and a portion of the White River (2,831 acres) would be managed as SRMAs (133,560 total acres). Management actions within each SRMA would vary but in general recreational activities would be allowed and managed in designated areas. By focusing management activities on specified areas and/or uses managed recreational use as in SRMAs would reduce impacts to vegetation compared to dispersed recreational use with limited management. Under the Proposed RMP the total acreage of land (133,592 acres) managed as SRMAs would be about 113% greater than that under Alternative D (No Action) (62,655 total acres managed as SRMAs). This would reduce the potential for impacts to vegetation when compared to Alternative D (No Action).

The Proposed RMP would develop up to 400 miles of non-motorized trails, disturbing/removing approximately 150 acres of vegetation (assuming an average 3-foot trail width along 400 miles). Short-term impacts would consist of vegetation loss and noxious weed invasion of disturbed areas. This activity would disturb approximately 130 more acres than Alternative D (No Action), adversely impacting a greater amount of vegetation. This alternative would also develop, improve, and/or sign up to 800 miles of motorized trails. Assuming an average motorized trail width of 6 feet, approximately 580 acres would potentially be disturbed or removed by this action, with impacts to vegetation similar to those described for non-motorized trails. No similar action would occur under Alternative D (No Action) thus impacts from the improvement,

development, and/or signage of motorized routes would be greater under the Proposed RMP than under Alternative D (No Action).

The Proposed RMP would eliminate OHV use off designated routes for big game retrieval. This activity is unspecified in Alternative D (No Action); therefore, the Proposed RMP would result in less OHV-related adverse impacts to vegetation.

The Proposed RMP would assess the placement of additional cabins for permitted/administrative use at or near the existing Chipeta, Trujillo, Moonshine, Rat Hole, and Wolf Den cabins and at Westwater Point, Dick Canyon, and other locations. Short-term impacts to vegetation would occur as new cabins were constructed. Long-term impacts would include increased potential for noxious weed invasions in disturbed areas and the loss of vegetation equal to the size of the cabin footprint. Adverse impacts to vegetation would be greater than what would occur under Alternative D (No Action) because no similar management action is proposed under Alternative D (No Action).

#### **4.18.2.9.2. ALTERNATIVE A**
