## STATE FOOD STAM P PARTICIPATION RATES IN 1998

The Food Stamp Program is a central component of A merican policy to reduce hunger and poverty. The program's main purpose is "to permit low-income households to obtain a more nutritious diet ... by increasing their purchasing power" (Food Stamp Act of 1977, as amended). The Food Stamp Program is the largest of the domestic food and nutrition assistance programs administered by the U.S. D epartment of A griculture's Food and Nutrition Service. D uring fiscal year 2000, the program served just over 17 million people in an average month at a total annual cost of nearly $\$ 15$ billion in benefits. The average monthly food stamp benefit was about $\$ 170$ per household.

Although the costs of the Food Stamp Program and other assistance programs are scrutinized during federal budget debates, the G overnment Performance and Results Act calls for policymakers to pay close attention to the effects of programs, not just total dollars spent. One important measure of a program's performance is its ability to reach its target population. The national food stamp participation rate - the percentage of eligible people in the United States who actually participate in the program - has been a standard for assessing performance for over 15 years. Recent studies have also examined participation rates for socioeconomic and demographic subgroups of the national population (C astner 2000) and rates for States (Schirm 2000). T he Food and N utrition Service's Strategic

Plan for 2000 to 2005 calls for continued monitoring and includes a performance target to "increase the rate of . . . program participation among eligible people."

This document presents estimates of food stamp participation rates for States as of September 1998 and estimates of how rates changed between September 1994 and September 1998. These estimates

can be used to assess recent program performance, determine whether performance has been improving or deteriorating, and focus efforts to improve performance. T he estimates can also be used to help understand the effects of the strong economy and expanding job opportunities for low-income families and the early consequences of the Personal Responsibility and W ork O pportunity Reconciliation Act of 1996 (P.L. 104-193). This law ended the entitlement to welfare and replaced the A id to Families with D ependent Children program with the workoriented Temporary A ssistance for N eedy Families block grant. The law also included important changes to Food Stamp Program rules, limiting participation by legal noncitizens and
unemployed, able-bodied adults without dependent children.

## Participation R ates in 1998

In September 1998, about 59 percent of eligible people in the United States received food stamps. Participation rates varied widely from State to State, however, with some rates under 50 percent and some over 80 percent. Sixteen States had rates that were significantly higher (in a statistical sense) than the national rate, and 12 States had rates that were significantly lower. A mong the regions, the M id-A tlantic had the highest participation rate. Its 67 percent rate was significantly higher than the rates for all of the other regions. The W estern and Southwest Regions had the lowest rates, at 56 percent. H owever, their rates were not significantly lower than the 59 percent rates for the Southeast, N ortheast, and M ountain Plains Regions. (See the last page for a map showing regional boundaries.)

## C hanges Since 1994

$N$ ationwide, the food stamp participation rate fell by 11 percentage points between September 1994 and September 1998. R ates fell in every region of the country and most States. For 35 States, the 1998 rate was significantly lower than the 1994 rate, and the decline in each

| Participation R ates |  |  |  |  |  |

| United States | 71\% | 70\% | 66\% | 64\% | 59\% |

There is substantial uncertainty associated with most of these estimates. C onfidence intervals that measure the uncertainty in the estimates for 1994 to 1997 are presented in Schirm (forthcoming). Those confidence intervals are generally about as wide as the confidence intervals that are presented in this document for the 1998 estimates.

State's rate was at least seven percentage points. O nly in the D istrict of Columbia and H awaii were the rates significantly higher in 1998 than in 1994. For every region, the participation rate fell significantly. TheW estern Region had the smallest decline, at six percentage points. T he decreases in rates for all of the other regions except the M id-A tlantic were significantly larger, at least 13 percentage points over the four-year period. D uring the period, the variation in regional participation rates diminished, and the variation in State rates grew, suggesting that differences among States within regions generally became larger.

## State C omparisons

All of the estimated participation rates presented here are based on fairly small samples of households in each State. Although there is substantial uncertainty associated with the estimates for some States and with comparisons of estimates from different States, the estimates for 1998 show whether aState's participation rate was probably at the top, at the bottom, or in the middle of the distribution. H awaii, W est Virginia, the District of Columbia, M aine, and A laska were very likely at the top, with higher rates than most other States. In contrast, New H ampshire, N evada, and A rizona almost surely had lower rates than most other States. W isconsin, Idaho, M assachusetts, North C arolina, and Texas probably fell in the bottom half of the distribution, whileM ichigan, R hode I sland, Tennessee, K entucky, Pennsylvania, and Louisiana were probably in the top half.

The estimates of changes in participation rates between two years are less precise than the estimates of rates for a single year. A lthough there is enough uncertainty that even some fairly big differences among States are not statistically significant, the D istrict of C olumbia, H awaii, and A laska probably had about the largest increases in participation rates between 1994 and 1998. A rizona, M ississippi, O hio, New H ampshire, and Texas probably had among the largest decreases.

H ow a State compares with other States may fluctuate over time due to statistical variability in estimated rates and true changes in rates. The statistical variability is sufficiently great that a large change in a State's rate from the prior year should be interpreted cautiously, as should differences between the rates of that State and other States. It may be incorrect to conclude that program performance in the State has improved or deteriorated dramatically. D espite this uncertainty, the estimated participation rates suggest that some States have fairly consistently been in the top or bottom of the distribution of rates. In at least four of the five years from 1994 to 1998, H awaii, M aine, Vermont, and W est Virginia have had significantly higher participation rates than two-thirds of the States, and M ichigan and Pennsylvania have had significantly higher rates than half of the States. A rizona, Idaho, $M$ assachusetts, and $N$ evada have had significantly lower rates than half of the States in at least four of the five years.

## H ow M any W ere E ligible in September 1998? W hat Percentage Participated?

A confidence interval expresses our uncertainty about the true value of a participation rate. Each interval displayed here is a 90 percent confidence interval. One interpretation of such an interval is that there is a 90 percent chance that the true participation rate falls within the estimated bounds. For example, while our best estimate is that Iowa's participation rate was 57 percent in September 1998, the true rate may have been higher or lower. However, the chances are 90 in 100 that the true rate was between 50 and 64 percent.

## H ow D id Participation R ates C hange B etween September 1994 and September 1998?

Participation
Rates
19941998

Changes in Participation Rates and Confidence Intervals for Changes
(Change in Participation Rate $=1998$ Participation Rate - 1994 Participation Rate)
(Estimated changes in participation rates are in red; estimated bounds of confidence intervals are in black.)

Each interval displayed here is a 90 percent confidence interval. One interpretation of such an interval is that there is a 90 percent chance that the true change in the participation rate falls within the estimated bounds. Differences between the estimated changes in red and the values obtained by subtracting the 1994 rates at the left of the page from the adjacent 1998 rates are due to rounding.

## H ow D id Your State C ompare with 0 ther States in September 1998?

Whether one State has a significantly higher participation rate than a second State can be determined from this figure by finding the row for the first State at the left of the figure and the column for the second State at the top of the figure. If the box where the row and column intersect is red, there is at least a 90 percent chance that the first State (the row State) has a higher true participation rate. If the box is blue, there is at least a 90 percent chance that the second State (the column State) has a higher true participation rate. Equivalently, there is less than a 10 percent chance that the first State has a higher rate. If the box is tan, there is more than a 10 percent chance but less than a 90 percent chance that the first State has a higher rate; thus, we conclude that neither estimated rate is significantly higher.

Taking Connecticut, the State in the middle of the distribution, as an example, we see that it has a significantly lower participation rate than 11 other States (Hawaii,West Virginia, the District of Columbia, Maine, Alaska, Michigan, Rhode Island, Tennessee, Kentucky, Pennsylvania, and Louisiana) and a significantly higher rate than 8 other States (Texas, North Carolina, Massachusetts, Idaho, Wisconsin, Arizona, Nevada, and New Hampshire). Its rate is neither significantly higher nor significantly lower than the rates for the other 31 States, suggesting that Connecticut is probably in the broad center of the distribution, unlike, for example, Hawaii and New Hampshire, which are surely at or near the top and bottom of the distribution, respectively. Although we use the statistical definition of "significance" here, most of the significant differences are at least ten percentage points, and all of them are at least five percentage points, a difference that seems important as well as significant.

## E stimation M ethod

The U.S. Department of A griculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, sexual orientation, or marital or family status. (N ot all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA'sTARGET Center at (202) 720-2600 (voice and TD D).

To file a complaint of discrimination, write USDA, Director, O ffice of Civil Rights, R oom 326-W, W hitten Building, 1400 Independence A venue, S.W ., Washington, DC 20250-9410 or call (202) 720-5964 (voice and TDD).USDA is an equal opportunity provider and employer.

The estimates presented here were derived using shrinkage estimation methods (Schirm, forthcoming). D rawing on data from the C urrent Population Survey, the decennial census, and administrative records, the shrinkage estimator averaged sample estimates of participation rates with predictions from a regression model. T he predictions were based on observed indicators of socioeconomic conditions, such as per capita income and the percentage of the total State population receiving food stamps. Shrinkage estimates are substantially more precise than direct sample estimates from the C urrent Population Survey or the Survey of Income and Program Participation, the leading sources of current data on household incomes and program eligibility. Because these surveys do not collect data on participation in the Food

Distribution Program on Indian Reservations, the estimates presented here are not adjusted to reflect the fact that participants in that program are not eligible to receive food stamps at the same time (C astner 2000). T he effects of such adjustments would generally be negligible.

The shrinkage estimates of participation rates for 1994 and 1997 presented here differ from the estimates in Schirm (2000). The differences are due to improvements in data and methods, which are described in C astner (2000) and Schirm (forthcoming). One improvement is that data for 1998 were available and were used with

previously available data to derive estimates for the earlier years. The 1998 data were used because socioeconomic conditions in one year are related to conditions in other years - both earlier and later. Thus, the shrinkage estimator uses data for all of the years for which estimates are sought to obtain the most accurate estimates for each year and for changes between years. Before 1998 data became available, 1997 data were the most recent data used in deriving estimates for 1994 to 1997. W hen 1998 data became available, they were used to derive the first estimates for 1998 and revised estimates for 1994 to 1997. In the future, the estimates for 1994 to 1998 will be revised - and improved - when data for 1999 and subsequent years become available.
