STRATIGRAPHIC SECTIONS OF THE PHOSPHORIA FORMATION  
IN MONTANA, 1948

By M. R. Klepper, F. S. Honkala, O. A. Payne, and E. T. Ruppel

This report concerns work done partly  
on behalf of the U. S. Bureau of Recla-  
mation and partly on behalf of the U. S.  
Atomic Energy Commission, and is  
published with the permission of the  
Commission.

## INTRODUCTION

The U. S. Geological Survey has measured and sampled the Phosphoria formation at many localities in Montana and other western states. These data will not be fully synthesized and analyzed for several years, but segments of the data, accompanied by little or no interpretation, are published as preliminary reports as they are assembled. This report, which contains abstracts of many of the sections in southwestern Montana (fig. 1), is one of this series and is the second report of data gathered in Montana during 1948. The field and laboratory procedures adopted in these investigations are described rather fully in a companion report (McKelvey and others, 1953).

Many people have taken part in this investigation. The program of which this work is a part was organized by V. E. McKelvey. D. A. Bostwick, E. R. Cressman, J. E. Joyce, J. A. Kelleher, R. L. Konizeski, R. L. Parker, L. A. Thomas, and W. H. Wilson participated in the description of strata and collection of samples referred to in this report. The laboratory preparation of samples for chemical analysis was done in Denver, Colo., under the direction of W. P. Huleatt.

All the  $P_2O_5$ , F,  $V_2O_5$ , and acid-insoluble analyses and some of the  $Al_2O_3$ ,  $Fe_2O_3$ , and loss-on-

ignition analyses were made for the Survey by the U. S. Bureau of Mines at the Northwest Electrodevelopment Laboratory, Albany, Oreg., under the supervision of S. M. Shelton and M. L. Wright. The spectrographic analyses were made by D. M. Mortimer, also in this laboratory. Most of the  $Al_2O_3$ ,  $Fe_2O_3$ , and loss-on-ignition analyses were made in the Trace Elements Section laboratory of the Survey in Washington, D. C., under the direction of J. C. Rabbitt, by chemists I. Barlow, A. B. Caemmerer, J. L. Greene, and N. Guttag.

Compilation of the data has been largely by R. P. Sheldon and F. D. Frieske under the supervision of R. W. Swanson. Organization of the tabular data has been largely by Anita Cozzetto.

## ACKNOWLEDGMENTS

Special thanks are due A. E. Weissenborn, who gave much advice and help in carrying out the field program. The cost of the field and laboratory investigations has been borne partly by the Missouri River Basin Division of the Bureau of Reclamation and the Division of Raw Materials of the Atomic Energy Commission.

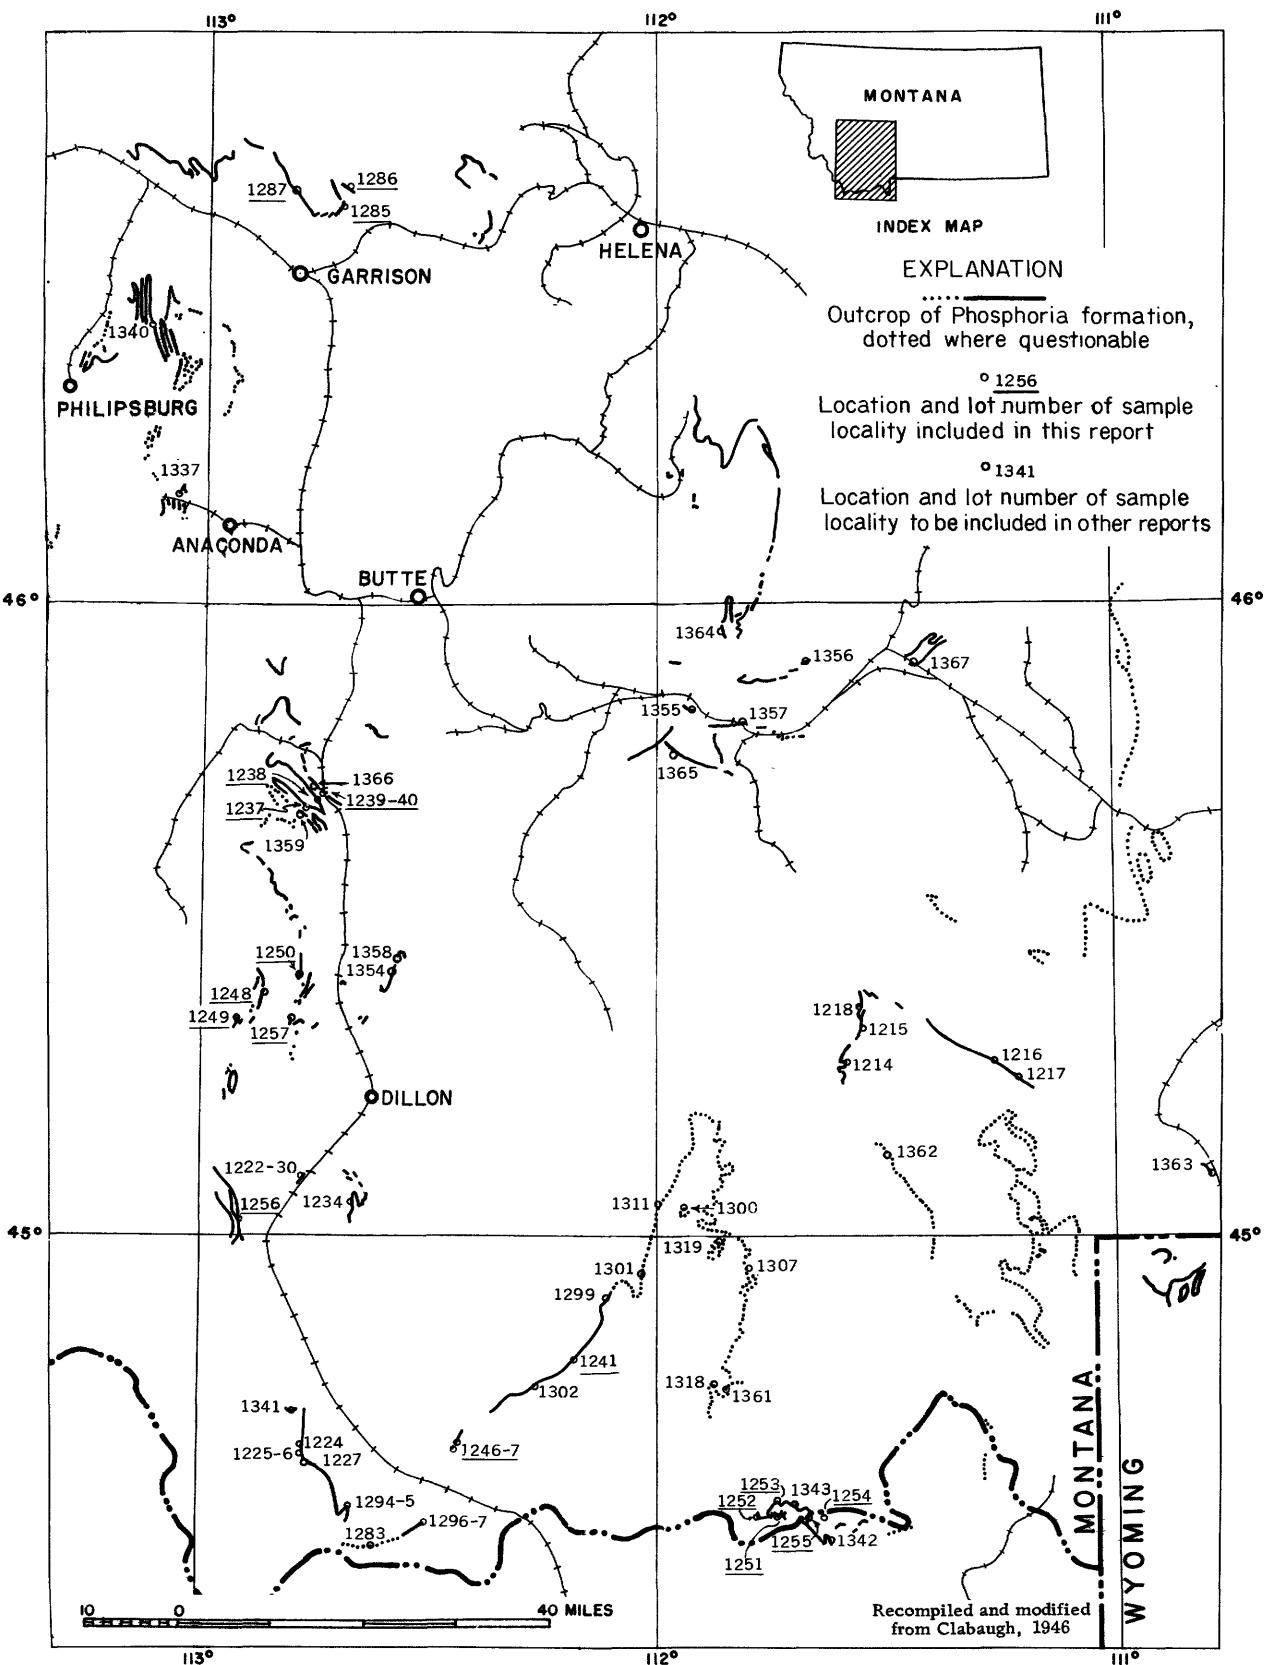

Figure 1.—Outcrop of the Phosphoria formation in Montana and localities sampled.

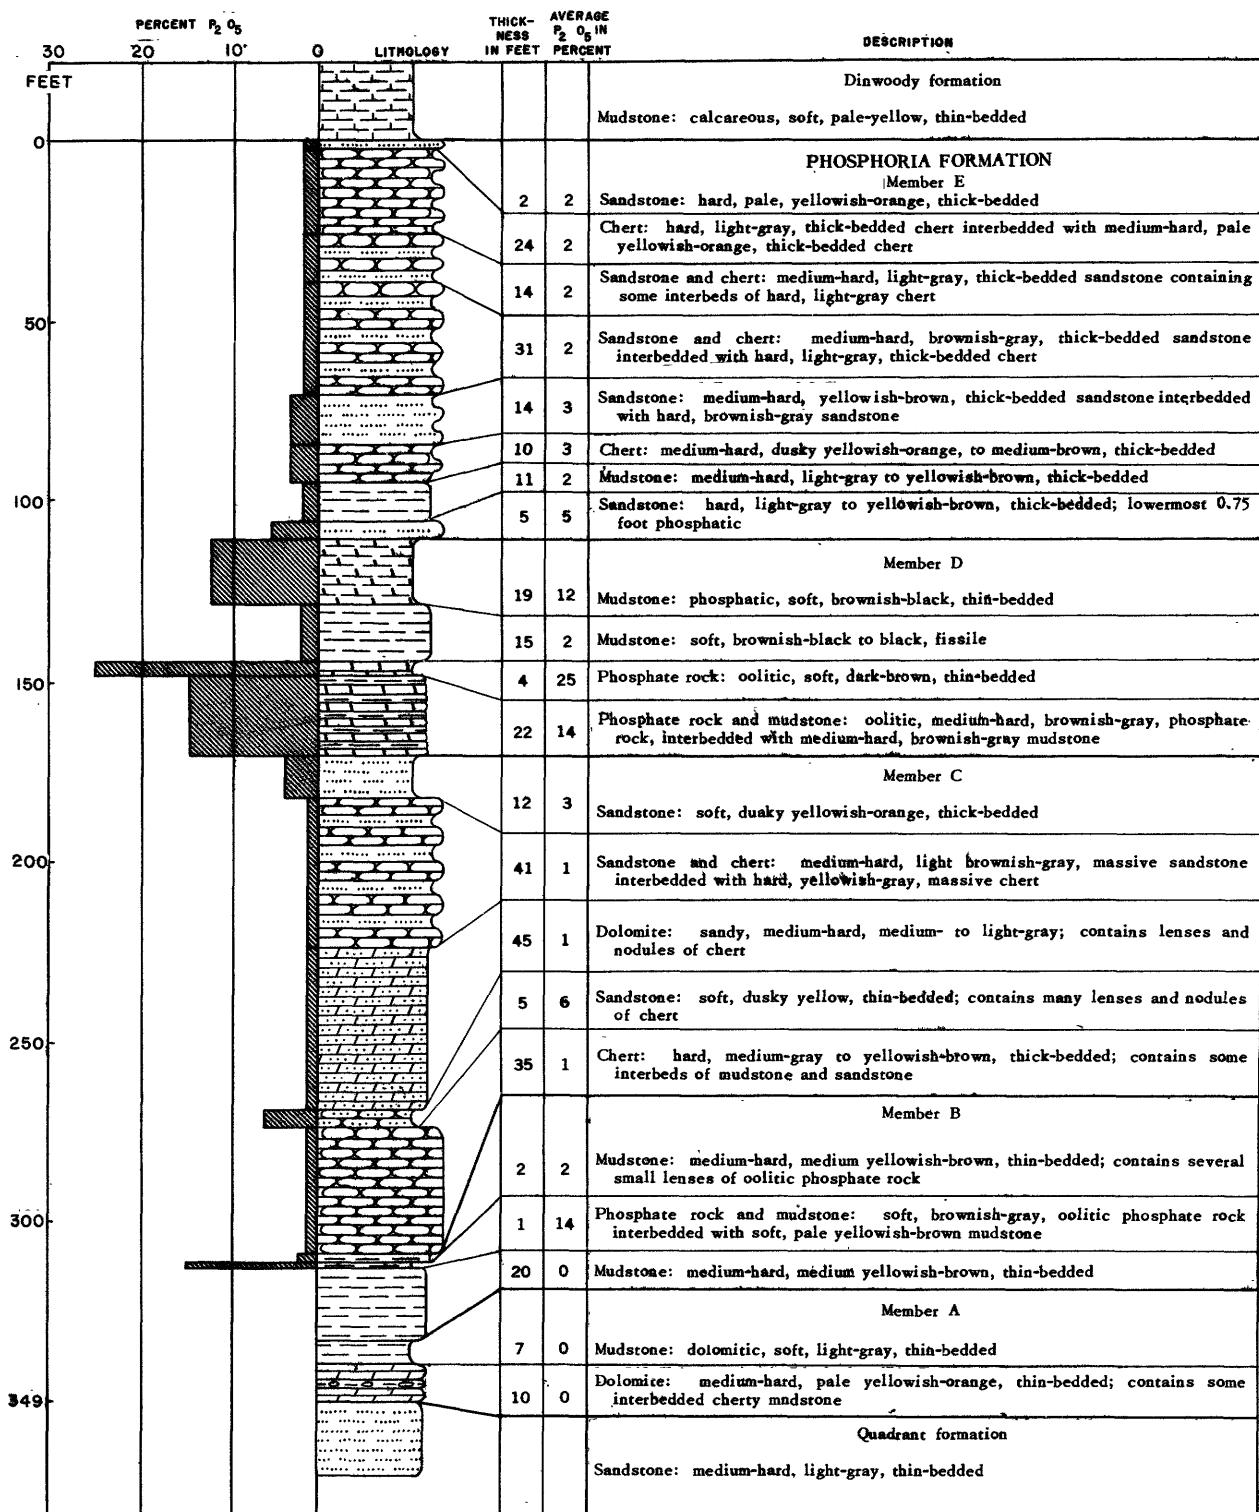

Figure 2.—Generalized section of the Phosphoria formation at Sheep Creek (lot no. 1234).

It is a pleasure to acknowledge the fine cooperation extended to the field parties by the local residents, property owners, and operating companies who furnished information and services and gave access to property. These include principally R. B. Shelledy, R. J. Armstrong, and J. J. McKay, of the Montana Phosphate Products Co., and William Anderson and the Martin brothers who developed the Melrose and Canyon Creek properties.

#### STRATIGRAPHY OF THE PHOSPHORIA FORMATION IN MONTANA

The Phosphoria formation in southwestern Montana consists in general of five members, two phosphatic shale members and three hard members (fig. 2). The lower two hard members are dominated by limestone, the top member by chert and sandstone or quartzite. Most of the members can be identified over a large part of the area of outcrop, although correlation toward the east and northeast is difficult. The formation ranges in thickness from less than 100 feet to more than 800 feet.

The lowermost, or A, member is thickest toward the west and southwest—with a maximum thickness of nearly 350 feet—and consists of limestone or dolomite, sandstone, mudstone, and chert. It overlies the Quadrant formation of Pennsylvanian age and is probably equivalent to the upper member of the Wells formation of southeastern Idaho and adjacent Wyoming and Utah (McKelvey, 1949).

The lower phosphatic shale member, or B, is about 50 feet thick near the southwest corner of the state but thins markedly to the north and east, where

#### REFERENCES

- Clabaugh, P. S., 1946, Permian phosphate deposits of Montana, Idaho, Wyoming, and Utah: U. S. Geol. Survey, Strategic Minerals Inv. Preliminary Map 3-198.  
 McKelvey, V. E., 1949, Geological studies of the western phosphate field: Am. Inst. Min. Met. Eng. Mining Trans., v. 184, p. 270-279.

in some areas it cannot be recognized. It contains a rich bed of minable phosphate in the Centennial Range.

The middle, or C, member consists of as much as 200 feet of limestone with some chert and sandstone. The upper phosphatic shale, or D, member is rather similar to and much more uniform and widespread than the B member, though minable phosphate is present only toward the north end of the area (plate 1), where the full thickness of the phosphatic zone may consist of a single 3- to 5-foot bed of high-grade phosphate rock.

The uppermost, or E, member is the most widespread and uniform, averaging about 100 feet in thickness and consisting chiefly of siliceous rocks—siltstone, chert, and quartzitic sandstone. It is overlain by the Dinwoody formation of Triassic age in the greater part of the area and by the Ellis group of Jurassic age toward the north and northeast.

#### STRATIGRAPHIC SECTIONS

Analytical data and abstracts of stratigraphic sections measured at 20 localities follow. Their locations as well as those of other sections previously reported (Swanson and others, 1953) and sections to be reported later are shown on figure 1.

The semiquantitative spectrographic analyses are based upon comparisons with a standard plate representing known quantities of the elements tested for and made at the same exposure. Greater sensitivities for many elements can be obtained by additional exposures. The standard sensitivities for the elements noted in this report are as follows:

ANDERSON MINE, MONTANA. LOT NO. 1287.

D member of Phosphoria formation sampled at 4,800 level of Anderson mine of Montana Phosphate Products Company, secs. 2 and 3, T. 10 N., R. 10 W., Powell County, Montana, on southwest flank of Garrison anticline, samples 308-313, locality A, from 100 feet south of north heading and sample 314, locality B, from 150 feet south of crosscut. Beds strike about N. 30° W., and dip 30° SW. Section measured and sampled by M. R. Klepper in October 1948. Samples analyzed by U. S. Bureau of Mines Laboratory, Albany, Oregon.

SPECTROGRAPHIC ANALYSES—MELROSE ADIT NO. 2, MONTANA. LOT NO. 1239.

Semi-quantitative analyses of samples of the D member of Phosphoria formation, Melrose adit no. 2, Montana (see immediately preceding page for location of section, thickness and description of strata, and chemical analyses of samples), made by U. S. Bureau of Mines Laboratory, Albany, Oregon. In addition to the elements listed in the table below, Sb, As, Ba, Be, Bi, Cd, Co, Cr, Ga, Ge, Au, In, Pb, Li, Hg, Pt, Ta, Sn, and W were looked for in all samples but were not detected.

Explanation of symbols

A = more than 10 percent      E = 0.01-0.1 percent  
 B = 5-10 percent      F = 0.001-0.01 percent  
 C = 1-5 percent      G = less than 0.001 percent

## SOUTH GREENSTONE GULCH, MONTANA. LOT NO. 1250.

D member of Phosphoria formation sampled in south bulldozer trench at Greenstone Gulch, SE $\frac{1}{4}$  sec. 11, T. 5 S., R. 10 W., Beaverhead County, Montana. Beds strike N. 10° W. and dip 50° NE. The stratigraphic sequence of the units is questionable for, because of a large number of faults, some of the beds may be omitted or repeated. Section measured and sampled by R. L. Parker and E. R. Cressman in August 1948. Samples analyzed by U. S. Bureau of Mines Laboratory, Albany, Oregon.

KELLEY GULCH, MONTANA. LOT NO. 1249.

A, B, D, and part of E members of Phosphoria formation sampled in bulldozer trenches and C member measured in outcrops near Kelley Gulch, sec. 2, T. 6 S., R. 11 W., Beaverhead County, Montana. A dacitic? sill 2.7 feet thick occurs 2.1 feet above base of E member. Beds strike N. 25° E. and dip 45° NW. Section measured by R. L. Parker and D. A. Bostwick and sampled by R. L. Konizeski, J. E. Joyce, Bostwick, J. A. Kelleher, and E. T. Ruppel in August 1948. Samples analyzed by U. S. Bureau of Mines Laboratory, Albany, Oregon.

Stratigraphic interval of 286 feet between D-1 and approximate base of C member, includes few exposures of chert and limestone or dolomite.

Stratigraphic interval of 123 feet between approximate base of C member and approximate top of Quadrant formation, strata concealed.

SAWTOOTH PEAK, MONTANA. LOT NO. 1241.

C and E members and part of A member of Phosphoria formation measured in natural exposures, and B and D members sampled from hand trenches on Sawtooth Peak, NE $\frac{1}{4}$ SW $\frac{1}{4}$  sec. 10, T. 12 S., R. 5 W., Beaverhead County, Montana, on overturned east limb of Snowcrest anticline. Beds at top of section strike N. 5° W. and dip 75° W. Beds at base of section strike N. 40° E. and dip 64° SE. Section measured by F. S. Honkala and O. A. Payne and sampled by Payne in August 1948. Samples analyzed by U. S. Bureau of Mines Laboratory, Albany, Oregon.

## UPPER FRENCH CREEK, MONTANA. LOT NO. 1248.

D member of Phosphoria formation sampled in bulldozer trench near Upper French Creek, SW $\frac{1}{4}$  sec. 19, T. 5 S., R. 10 W., Beaverhead County, Montana. Beds strike N. 15° E. and dip 55° W. The stratigraphic sequence and thicknesses of the units are questionable due to thrust faulting exposed in the trench and to the fragmented and weathered condition of the strata. Section measured by D. A. Bostwick and R. L. Parker and sampled by R. L. Konizeski and J. E. Joyce in August 1948. Samples analyzed by U. S. Bureau of Mines Laboratory, Albany, Oregon.

WADHAM SPRINGS, MONTANA. LOT NOS. 1246 and 1247.

Phosphoria formation sampled in bulldozer trenches near Wadham Springs on southeast limb of anticline. Upper part of formation, lot no. 1246, sampled in north trench, SE $\frac{1}{4}$ SW $\frac{1}{4}$ , sec. 22; and lower part of formation, lot no. 1247, in south trench, SW $\frac{1}{4}$ NE $\frac{1}{4}$ , sec. 28. T. 13 S., R. 7 W., Beaverhead County, Montana. Beds strike N. 30° E. and dip 70-80° SE. Section measured by D. A. Bostwick, E. R. Cressman, and L. A. Thomas and sampled by Bostwick, Cressman, Thomas, and W. H. Wilson in August 1948. Samples analyzed by U. S. Bureau of Mines Laboratory, Albany, Oregon.

## CENTENNIAL RANGE TRENCH NO. 4, MONTANA. LOT NO. 1251.

B member of Phosphoria formation sampled in hand trench at Centennial Range locality no. 4 along south side of east fork of Odell Creek, near E $\frac{1}{4}$  corner sec. 6, T. 15 S., R. 1 W., Beaverhead County, Montana, on southward-dipping homocline. Beds strike N. 70° S. and dip 10° W. Section measured by F. S. Honkala and sampled by O. A. Payne in August 1948. Samples analyzed for P<sub>2</sub>O<sub>5</sub>, F, and acid insoluble by U. S. Bureau of Mines Laboratory, Albany, Oregon, and for other constituents by Trace Elements Section Laboratory, U. S. Geological Survey, Washington, D. C.

Bed no.	Rock description	Sample no.	Thickness (feet)	Chemical analyses (percent)				Cumulative thickness (feet)	Thickness x percent P <sub>2</sub> O <sub>5</sub> (cumulative) <sup>b</sup>

CENTENNIAL RANGE TRENCHES NOS. 2 AND 3, IDAHO. LOT NOS. 1254 AND 1255.

Phosphoria formation sampled in Centennial Range hand trenches nos. 2 and 3. Upper part of formation, lot no. 1255, sampled in trench no. 2, NW $\frac{1}{4}$  sec. 12, T. 14 N., R. 40 E.; lower part of formation, lot no. 1254, sampled in trench no. 3, NE $\frac{1}{4}$  sec. 7, T. 14 N., R. 41 E., Clark County, Idaho, at crest of range on southward-dipping homocline. Beds at trench no. 2 strike N. 65° W. and dip 14° SW., and beds at trench no. 3 strike N. 70° W. and dip 22° S. Section measured by F. S. Honkala and O. A. Payne and sampled by J. A. Kelleher and R. L. Konizeski in July 1948. Samples analyzed by U. S. Bureau of Mines Laboratory, Albany, Oregon.

## LUKE MINE, MONTANA. LOT NO. 1285.

D member of Phosphoria formation sampled in Luke Mine of Montana Phosphate Products Company, sec. 15, T. 10 N., R. 9 W., Powell County, Montana, on southwest side of Luke-Graveley syncline; samples 304-305, locality A, from southeast heading, 5,300 level, samples 306-307, locality B, from northwest heading, 5,300 level. Beds strike about N. 40° W. and dip 45° NE. Section measured and sampled by M. R. Klepper in September 1948. Samples analyzed by U. S. Bureau of Mines Laboratory, Albany, Oregon.
