Summary of Data from Onsite and Laboratory Analyses of Surface Water and Marsh Porewater from South Florida Water Management District Water Conservation Areas, the Everglades, South Florida, March 1995

By Michael M. Reddy and Charmaine D. Gunther

Abstract

This report presents results of chemical analysis for samples collected during March 1995 as part of a study to quantify the interaction of aquatic organic material (referred to here as dissolved organic carbon with dissolved metal ions. The work was done in conjunction with the South Florida Water Management District, the U.S. Environmental Protection Agency, the U.S. Geological Survey South Florida Ecosystems Initiative, and the South Florida National Water Quality Assessment Study Unit. Samples were collected from surface canals and from marsh sites. Results are based on onsite and laboratory measurements for 27 samples collected at 10 locations. The data file contains sample description, dissolved organic carbon concentration and specific ultraviolet absorbance, and additional analytical data for samples collected at several sites in the Water Conservation Areas, the Everglades, South Florida.

Introduction

The South Florida Water Management District, the U.S. Environmental Protection Agency (EPA), and the U.S. Geological Survey (USGS) South Florida Ecosystems Initiative have organized an intensive study of surface-water chemistry in southern Florida. In 1994, several locations were selected in the Water Conservation Areas of the South Florida Water Management District in conjunction with this multidisciplinary, multiagency research project. Surface-water and marsh porewater samples were collected and analyzed. Details of the onsite and laboratory procedures used in this investigation are described in other reports: Fishman and Friedman, 1985; Garbarino and Taylor, 1979 and 1980; Reddy and others, 1989; Skougstad and others, 1979; and Wood, 1976. Sample preparation methods, analytical procedures, and laboratory quality-control protocols used by the U.S. Geological Survey laboratory are described by Cotlove and others, 1958; Fishman and Friedman, 1985; Garbarino and Taylor, 1979; and 1980; and Schroder and others, 1980. Field procedures and equipment were adapted from a trace metal protocol developed by the USGS National Research Program (Taylor and others, 1995).

This work has been done as part of the USGS South Florida Ecosystems Initiative and was funded in part by the EPA (through Grant IAG #DW14936802-01-0). The purpose of this report is to make the results of our investigation of dissolved organic carbon (DOC) concentration, nature, and distribution available to the South Florida Ecosystem Research Community in a prompt and widely available manner. Further additions will be made to the data file as sample collection continues, and as laboratory analyses are completed.

The data file contains sample description, DOC concentration, and specific ultraviolet absorbance. Additional analytical data for samples collected at several sites in the Water Conservation Areas, the Everglades, and south Florida are included – these data are intended to be used by this project for chemical species modeling.

Data File

Data are available for samples collected in March 1995 and analyzed shortly thereafter. Surface-water samples were collected at a single depth from seven locations and at two depths at three locations. Photograph 1 illustrates a representative water sample collection at site U3 in Water Conservation Area 2A, Everglades Florida. Marsh porewater samples were collected at several depths below the sediment water interface at four locations. Surface-water samples were collected at each pore-water sampling location. Photograph 2 illustrates selected Everglades Study Site Locations superimposed on a composite map based on the Threshold Study Site Locations map of the South Florida Water Management District and a color satellite photograph taken during the spring of 1993. A replicate sample was collected to evaluate onsite-sampling variability. Distilled-water blank samples and standard reference water samples, SRWS (Schroder and others, 1980), were submitted to the laboratory with the onsite samples and were analyzed concomitantly with them. Reference samples were processed using the same procedures as the onsite samples. For further information about the availability, call Michael M. Reddy at (303) 236-5941 or e-mail at mmreddy@usgs.gov.

The data file consists of 34 variables. Variable names and codes established for sample description and identification are listed in table 1. Variable names for parameters measured onsite and in the laboratory are listed in table 2. Summary statistics for SRWS and distilled-water blank samples are given in table 3.

Samples that had analytical results less than the detection limits of the selected methods are indicated in the data set by the “less than” symbol (<). The detection limits of quantification are listed in table 4. The full data set is given in table 5.

Summary

A total of 27 samples, from 10 locations within South Florida Water Management District Water Conservation Areas, have been analyzed using a protocol designed to minimize errors associated with sample-handling procedures, laboratory analyses, and data-entry operations.

Table 1. Variable names and codes for sample description and identification.

[SRWS, standard reference water samples]

Variable name	Code	Definition
Collection date (mm/dd/yy)	date	date sample collected (month/day/year)
Collection time (HH:MM)	time	time sample collected (hour:minute)
KPH	alphanumeric	potassium acid phthalate reference sample
Lab ID	4-digit integer	lab identification number
Latitude (DDMMSS)	6-digit integer	latitude (degrees minutes seconds)
Longitude (DDMMSS)	6-digit integer	longitude (degrees minutes seconds)
M102	alphanumeric	major ion SRWS
M104	alphanumeric	major ion SRWS
M110	alphanumeric	major ion SRWS
M112	alphanumeric	major ion SRWS
M96	alphanumeric	major ion SRWS
Method	M R	manual collection replicate sample type
Missing data	-99	data not available
MPV	alphanumeric	most probable value
N	alphanumeric	number of samples
P11	alphanumeric	precipitation ion SRWS
Sample type	F J	pore-water sample type surface water sample type
Sampling depth (m)	floating point	depth that sample was collected (meters)
SBL	alphanumeric	laboratory blank sample
Site description	alphanumeric	long site description and notes
Site ID	alphanumeric	alphanumeric code for site identification
Site name	alphanumeric	short description of site
SRWS	alphanumeric	standard reference water sample
Subsample type	C Q	canal subsample type marsh subsample type
T107	alphanumeric	trace ion SRWS

Download Excel file (table1.xlsx)

Table 2. Variable names for onsite and laboratory measured parameters.

[mg/L, milligrams per liter; µeq/L, microequivalents per liter; µmol/L, micromoles per liter; °C, degrees Celsius; µS/cm, microsiemens per centimeter]

Variable name	Definition	Units
B (mg/L)	dissolved boron as B	milligrams per liter
Ba (mg/L)	dissolved barium as Ba	milligrams per liter
Ca (µeq/L)	dissolved calcium as Ca	microequivalents per liter
Cl (µeq/L)	dissolved chloride as Cl	microequivalents per liter
DOC (mg/L)	dissolved organic carbon as C	milligrams per liter
Fe (mg/L)	dissolved iron as Fe	milligrams per liter
Field pH (std units)	pH measured onsite	standard pH units
Field specific conductivity (µS/cm)	specific conductivity measured onsite	microsiemens per centimeter at 25°C
H ₄ SiO ₄ (µmol/L)	dissolved silica as H ₄ SiO ₄	micromoles per liter
Ion balance (%)	100% X (Cations - Anions) / (Cations + Anions)	(+/-)percent
K (µeq/L)	dissolved potassium as K	microequivalents per liter
Lab alkalinity (µeq/L)	alkalinity measured in laboratory	microequivalents per liter
Lab pH (std units)	pH measured in laboratory	standard pH units
Li (mg/L)	dissolved lithium as Li	milligrams per liter
Mg (µeq/L)	dissolved magnesium as Mg	microequivalents per liter
Mn (mg/L)	dissolved manganese as Mn	milligrams per liter
Na (µeq/L)	dissolved sodium as Na	microequivalents per liter
SO ₄ (µeq/L)	dissolved sulfate as SO ₄	microequivalents per liter
Specific UV (Absorb/mg C/L)	specific UV absorbance	absorbance per milligram carbon per liter
Sr (mg/L)	dissolved strontium as Sr	milligrams per liter
Water temp (°C)	water temperature measured onsite	degrees Celsius
Zn (mg/L)	dissolved zinc as Zn	milligrams per liter
