MISCELLANEOUS PUBLICATIONS OF THE NATIONAL BUREAU OF STANDARDS

NOS. 265, 267 - 270

Hydraulic Research in the United States 1965

United States Department of Commerce

National Bureau of Standards

Miscellaneous Publication 270

THE NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards is a principal focal point in the Federal Government for assuring maximum application of the physical and engineering sciences to the advancement of technology in industry and commerce. Its responsibilities include development and maintenance of the national standards of measurement, and the provisions of means for making measurements consistent with those standards; determination of physical constants and properties of materials; development of methods for testing materials, mechanisms, and structures, and making such tests as may be necessary, particularly for government agencies; cooperation in the establishment of standard practices for incorporation in codes and specifications; advisory service to government agencies on scientific and technical problems; invention and development of devices to serve special needs of the Government; assistance to industry, business, and consumers in the development and acceptance of commercial standards and simplified trade practice recommendations; administration of programs in cooperation with United States business groups and standards organizations for the development of international standards of practice; and maintenance of a clearinghouse for the collection and dissemination of scientific, technical, and engineering information. The scope of the Bureau's activities is suggested in the following listing of its four Institutes and their organizational units.

Institute for Basic Standards. Applied Mathematics. Electricity. Metrology. Mechanics. Heat. Atomic Physics. Physical Chemistry. Laboratory Astrophysics.* Radiation Physics. Radio Standards Laboratory:* Radio Standards Physics; Radio Standards Engineering. Office of Standard Reference Data.

Institute for Materials Research. Analytical Chemistry. Polymers. Metallurgy. Inorganic Materials. Reactor Radiations. Cryogenics.* Materials Evaluation Laboratory. Office of Standard Reference Materials.

Institute for Applied Technology. Building Research. Information Technology. Performance Test Development. Electronic Instrumentation. Textile and Apparel Technology Center. Technical Analysis. Office of Weights and Measures. Office of Engineering Standards. Office of Invention and Innovation. Office of Technical Resources. Clearinghouse for Federal Scientific and Technical Information.**

Central Radio Propagation Laboratory.* Ionospheric Telecommunications. Tropospheric Telecommunications. Space Environment Forecasting. Aeronomy.

^{*}Located at Boulder, Colorado 80301.

^{**}Located at 5285 Port Royal Road, Springfield, Virginia 22171.

Hydraulic Research in the United States 1965

(Including Contributions from Canadian Laboratories)

Edited by Helen K. Middleton

National Bureau of Standards Miscellaneous Publication 270

Issued July 22, 1965

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C., 20402 · Price \$1.25

Library of Congress Catalog Card Number: 34-3323

FOREWORD

The information contained in this publication was compiled from reports by the various hydraulic and hydrologic laboratories in the United States and Canada. The cooperation of these agencies is greatly appreciated. The National Bureau of Standards cannot assume responsibility for the completeness of this publication. We must depend upon reporting laboratories for the completeness of the coverage of their own programs, as well as upon new laboratories engaged in hydraulics to bring their activities to our attention.

Projects are numbered and the number once assigned is repeated for identification purposes until a project is completed. The numbers 5258 and above refer to projects reported for the first time. All projects are in active state, unless otherwise noted under (f).

The National Bureau of Standards does not maintain a file of reports or detailed information regarding the research projects reported by other organizations. Such information may be obtained from the correspondent listed under (c) or immediately following the title of the organization reporting the work. It is of course understood that any laboratory submitting reports on its work will be willing to supply information to properly qualified inquirers.

A similar bulletin, "Hydraulic Research," compiled and published by the International Association for Hydraulic Research, contains information on hydraulic research being conducted in foreign countries. This bulletin is edited by Frofessor H. J. Schoemaker, Director of the Hydraulic Laboratory at the Technical University of Delft, Netherlands, and Secretary of the International Association for Hydraulic Research. Copies may be obtained from the Secretary at \$7.50 each (postage included).

A. V. Astin, Director

UNIVERSITY OF ARTZONA.

- (4620) EFFECT OF CROP COVER ON EFFICIENCY OF SPRINKLER IRRIGATION UNDER VARYING CLIMATIC AND OPERATING CONDITIONS.
 - Agricultural Experiment Station. (b)
 - (c) Mr. Kenneth R. Frost, Department of Agri-cultural Engineering, Univ. of Arizona, Tuscon, Arizona 85721.
 - (d) Laboratory for theory and design.
 (e) Precise water balance of growing crops under sprinkler application of irrigation water. Sprinkler application of irrigation water. Crops are grown in a tank of soil 12 feet in diameter and 2 feet deep. Instrumen-tation permits measurement of loss or gain of 0.005 inches of water on the area of the tank. Measurements permit evaluation of loss or gain of water from dew, rain, irrigation, evaporation, and transpiration on crops at any stage of growth and as functions of ambient atmospheric conditions.
 - Evapotranspiration during sprinkling is approximately equal to that during non-sprinkling periods since evaporation from (g) wet foliage replaces normal transpiration. Daily evapotranspiration ranges from 6-8 times the one-hour evapotranspiration at the period of peak rates. Cloud cover reduces evapotranspiration by one-third from that at full-run under the
 - Same Varor pressure deficit. "Factors Affecting Evapotranspiration Losses During Sprinkling," by K. R. Frost. Trans-actions of the American Society of Agri-cultural Engineers, Vol. 6, No. 4, pp. 282-283 and 287 Joza (h) 283 and 287, 1963.
- (4621) SPRINKLER IRRIGATION OF CITRUS UNDER SOUTH-WESTERN CONDITIONS.

 - (b) Agricultural Experiment Station.
 (c) Mr. Kenneth R. Frost, Department of Agricultural Engineering, Univ. of Arizona, Tuscon, Arizona 85721.
 (d) Field investigation for design data.
 (e) Investigation of the use of sprinkler application of irrigation water in production of Arizona corres. Implaction of Arizona corres. duction of Arizona crops. Irrigation efficiencies under sprinkling as compared to Incleacies under sprinkling as compared to efficiencies under surface applications. Irrigation scheduling and system design for sprinkler application of water. Crop yields per unit of land and per unit of water as functions of method of water application, soil type, irrigation schedules, and crop species and variety.
 - (g) Field tests of sprinkler irrigation on citrus. On coarse textured soils water savings of 50% have been achieved by sprinkling.
 - "Sprinklers versus Flood Irrigation of Citrus," by K. R. Frost. American Society of Agricultural Engineers, Paper No. 64-204, 1964.
- (4622) GROUND WATER SUPPLIES.
 - (b) Agricultural Experiment Station, The Univ. of Arizona; City of Tucson; and the Pima County.
 - (c) Prof. Harold C. Schwalen, Department of Agricultural Engineering, Univ. of Arizona, Tucson, Arizona 85721.
 - (e) Detailed continuing groundwater inventory of selected basins in Arizona including at present the Santa Cruz from Nogales to Red Rock, Avra, Altar, Little Chino, Reddington Area of the San Pedro. Groundwater contour maps are prepared annually. Specific yields storage coefficients and transmissibilities are determined from well tests. An electric analog of the Tucson groundwater basin is being developed.
 - (g) Groundwater elevation data has been developed for all areas studied. Volumetric un-watering estimates have been prepared. Water balance estimates have been prepared

for the Tucson Metropolitan, sahuarita Districts, and Cortaro Districts. Open files are maintained from which current ground water level data is available for any location in the area studied. (h) Irrigated Areas of Arizona, State Map.

- Arizona Agricultural Experiment Station and Agricultural Extension Service Folder No. 100, 1963. Irrigated Areas of Arizona, Sectional Map, ibid. Folder No. 101, 1963.
- (4624) HYDROLOGIC CHARACTERISTICS OF A GROUNDWATER BASTN.
 - (b) City of Tucson and Pima County through a cooperative agreement with the Agricultural Engineering Department, Arizona Agricultural Experiment Station.
 - (c) Mr. John Ferris, Department of Geology,
 - (c) Mr. John Ferris, Deparament of Geology, Univ. of Arizona, Tucson, Arizona 85721.
 (d) Analytical, laboratory, and field investi-gations for development, operation, design and theory, for Doctoral dissertation.
 (e) Attempts are being made to determine the hydrologic characteristics specific yield
 - and/or storage coefficient and transmis-sibility -- of the groundwater basin in the Santa Cruz Valley near Tucson, Arizona. Well tests are being made at sites where observation wells are available. Water budget analyses are being used in connection with mathematical models. A passive element electric analog model is being developed.(g) Well tests made during the past two years indicate that realistic values of specific
 - yield and/or storage coefficient are not obtained from such tests in the Santa Cruz Valley. Values of transmissibility are more consistent and reasonable.
- (4625) CRITICAL TRACTIVE FORCE OF UNIFORM SANDS.

 - (b) Departmental in cooperation with the U. S. Geological Survey.
 (c) Dr. Emmett M. Laursen; Department of Civil Engineering, Univ. of Ariz., Tucson, Arizona 85721.
 - (d) Analytical and laboratory investigation related to theory.
 - (e) Analytic and experimental attempts to relate the average boundary shear to the incipient movement of sediment particles composing the boundary.
 - (g) The experimental data plot on a Shield's diagram as two parallel lines for the laminar and turbulent cases. Both cases extend over the range usually considered the transition between a laminar sub-layer and fully rough turbulent flow. An approximate analysis lends credibility to the experimental results.
 - (h) "A Continuation of the Study of Critical Tractive Force", by Robert B. Conklin, Thesis for Master of Science in the Dept. of Civil Engineering, The Univ. of Arizona, May 1964.
- (4626) SCOUR AT RELIEF BRIDGES.
 - (b) Departmental in cooperation with the U.S.
 - Geological Survey. Dr. Emmett M. Laursen; Department of Civil Engineering, Univ. of Ariz., Tucson, Ariz. (c) 85721.
 - (d) Laboratory investigation related to theory and design.
 - (e) To find the effect of sediment size and velocity of flow on the limiting depths of clear-water scour in simple relief-bridge geometries. First, the case of the long contraction will be studied, then the case The last case to be studied, then the case of the long gradually-contracting channel. The last case to be studied will involve various simple abrupt contractions. Throughout the experiments, examination of the assumptions of the analysis of Dr. E. M. Laursen will be made and also of the time

dependency of depth of scour insofar as feasible.

- Equipment has been constructed and the (g) experimental program has been started.
- (4627)A STUDY OF PARTIALLY SATURATED FLOW IN SAND-EPOXY RESIN COLUMNS.
 - (b) (c) Departmental.
 - Professor Richard L. Sloane; Department of Civil Engineering, Univ. of Arizona, Tucson, Arizona 85721.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Laboratory investigation related to theory. The flow of water through soils often takes place under conditions of partially saturated flow. The prediction of fluid distribution and pressure under conditions of partially saturated flow is important to those interested in the problem of recharge to the ground water table from water applied to the surface of the earth. This study of partially saturated flow will make use of vertical columns made of sand The use of this type of sand columns will result in a model for which properties such as void ratio and particle arrangement will remain constant during a series of tests.
- (4628) RADIOCARBON AS A TRACER IN WATER SUPPLY PROBLEMS.
 - (b) Research Corporation unrestricted venture
 - grant and Geochronology Dept. funds.

 - thesis.
 - (e) The study of ground water movement through aquifers has been limited by the slow rate of movement of the subsurface waters. Thus, if a tracer is introduced, only limited information is obtainable between the times of spiking and observation. However, radiocarbon (C-14) has been naturally introduced into ground water reservoirs continuously throughout geologic time and, consequently, movement which has taken place during the last 45,000 years may be studied. In addi-tion nuclear technology is now producing radiocarbon at a greater rate than nature and so this artificially produced radiocarbon may also be used to trace recent water movements. Furthermore, it represents a poten-tial hazard to health and therefore it is tial hazard to neath and therefore it is essential to monitor the increment for the safety of the community. We propose to monitor the present carbon-14 content of surface water and organic matter in the Southwest and to measure the radiocarbon content of subsurface waters. The source of the carbon in water will be determined by ${\rm C}^{12}/{\rm C}^{13}$ measurements. This data will be related to ground water hydrologic problems such as the rate of laminar flow through aquifers, their permeability, the source and rate of recharge, paleoclimatology, radioactive contamination in water supplies, and the waste disposal problem. (g) Incomplete.
- (4630) DEVELOPMENT OF HYDRAULIC MODELS ANALOGOUS TO SUBSURFACE GEOLOGIC CONDITIONS FOR STUDYING AND DEMONSTRATING THE CHARACTER-ISTICS OF GROUND WATER MOVEMENT.

 - (b) National Science Foundation.
 (c) Dr. John W. Harshbarger, Dept. of Geology, University of Arizona, Tucson, Ariz. 85721.
 (d) Laboratory investigation, design, develop-
 - ment and operation.
 - The purpose of the project is to clarify (e) the characteristics of laminar flow in groundwater movement in a manner which will enable a visual flow net analysis. Hydraulic models are being developed which consist of consolidated media simulating sedimentary rock, enclosed in a water-tight case with a transparent side. Basic geologic structures

and lithologies can be synthesized and colored inks can be inserted into the flow system of the model, forming visible flow lines. These flow lines can then be observed and analyzed in order to better understand the pattern of laminar groundwater flow as controlled by geologic factors. A few of the empirical model experiments which are being carried out include: 1) Refraction of flow bands across lithologic inter-faces. 2) Continuity of flow around and laces. 2) continuity of flow around and through highly permeable and impermeable
lenses of different lithologies. 3) Flow net systems caused by a single pumping well.
4) Flow-net system of mutual interference of depression cones caused by pumping multiple wells. 5) Artesian aquifer systems. 6) Infiltration phenomenon. Models are being developed for use in education in science and hydrology at the college and university level.

- (f) Completed.
 (g) Models consisting of plexiglass cases containing artificially consolidated porous media which can be arranged in a nearly media which can be arranged in a nearly media to a mediate of geologic structures infinite variety of geologic structures and hydrologic situations have been developed. A wide variety of these models have been constructed and through their use it has become possible for the college student to obtain a clear description and understanding of previously conceived groundwater theories.

 (d) Analytical, field and laboratory investi-gations; basic and applied.
 (a) Study designed to avaluate offects of
- (e) Study designed to evaluate effects of phreatophytes, phreatophyte removal and phreatophytes, phreatophyte removal and replacement vegetation in relation to physiographic factors on consumptive use of capillary and ground water. Two study sites are located along the Gila River near Coolidge Dam on the San Carlos Indian Reservation. One site, Salt Creek, a tributary to the Gila River, is typical of many of the phreatophyte groups found of many of the phreatophyte zones found along the smaller and intermittent streams of the state. The second site on the Gila River is located 5 miles downstream from Salt Creek and is typical of the phreatophyte zones found along the major streams in the southwest. Three channel cross sections 700 to 900 feet long and 600 feet wide have been selected on Salt Creek and will be used for specific studies of the influence of phreatophytes and revegetation on consumptive use of water. Two sections extending from free water to a bench along the canyon bottom of the Gila River have been selected for study similar to Salt Creek. Replacement vegetation, mainly grasses, will be evaluated by analysis of emergence, survival, establishment, percentage ground cover, forage production, and reinfestation of phreatophytes. Each species will be replicated three times. Evapotranspiration of phreatophytes, and replacement vegetation will be determined by the aerial tent method. Instrumentation effects of this method will be evaluated by studying enclosure effects on the plant and comparing the energy budget inside and outside of the tent. Soil moisture will be determined by the neutron scattering technique and water table fluctuation by ground water wells in all areas. Detailed soil, vegetation, and climatic variables are being measured to aid in interpretation of the effect of phreatophyte and replacement vegetation on consumptive use of water in relation to physiographic factors.

 (d) The project is experimental and theoretical and is classified as basic research with definite practical andications.

 - (e) The purpose for which the work is being done is to describe the effects of stratification on the permeability of an unconsolidated
 - on the permeability of an unconsolidated porous medium in quantitative terms. In this work it was demonstrated that the size distribution of commercially available ion exchange resins, sands, gravels, anthracite coal, and granular activated carbon appear to be well represented by a geometrically (g) normal frequency distribution. This distribution is completely definable in terms of the geometric mean and the geometric standard deviation, both of which can be calculated from the results of a conventional sieve analysis. In addition an equation was developed that relates the permeability of an unconsolidated porous medium to the geometric mean and geometric standard deviation of its size distribution by weight. The equation appears

distribution by Weight. The equation appears to give reasonably accurate values of the permeability for all the previously mentioned porous media and glass beads.

 - Performance of a given design of the dam. The dam is about 15 ft. high and will be built on a sand foundation. There is a movable gate on the crest. The model is made to a scale of 1 to 35 and set in a wooden flume 20 inches wide with a sand bed downstream. The purpose is to study performance of the model and to scour under various flows.

- (3670) TURBULENCE AND PARTICLE ENTRAINMENT IN SETTLING TANKS.

 - (b) U. S. Public Health Service.
 (c) Frof. Vito A. Vanoni, Calif. Inst. of Tech., Pasadena, California 91109.
 (d) Experimental research.

 - Flow in a settling tank is simulated by introducing water with a low turbulence (e) level and uniform velocity into a flume 15 feet long with the bed covered by a thin layer of sediment. As the flow pro-ceeds into the flume, a boundary layer de-velops and becomes progressively thicker. The entrainment of particles is observed visually and the corresponding shear stress is deduced from measured velocity profiles.
 - (f) Completed. (g) Data on critical shear stress for entraining fine sand particles of diameters of 0.1 mm and smaller have been observed. "Measurements of Critical Shear Stress for
 - (h) Entraining Fine Sediments in a Boundary Layer", by Vito A. Vanoni, W. M. Keck Lab. of Hyd. and Water Resources, Calif. Inst. of Tech. Report No. KH-R-7, May 1964.

 (d) Experimental and theoretical research.
 (e) Studies are made (1) of the development of dunes with time on a sand bed with flows which produce low rates of sediment transport and of the resulting changes in fiber modificance as the dunes grow and (2) of flow resistance as the dunes grow and (2) on the mechanism of entrainment of sediment by flowing water and (3) of relations of geometric parameters of dunes and the frictional resistance to flow produced by the dunes with a view to predicting re-sistance from dune dimensions. (f) Project is continuing.

(4076) PRECISION TILTING FLUME.

- (b) National Science Foundation.
- (c) Prof. Vito A. Vanoni and Prof. Norman H. Brooks, Calif. Inst. of Tech., Pasadena, California 91109.

- (d) Development of facilities.(e) The flume which is 40 meters long, 110 centimeters wide, and 50 centimeters deep centimeters wide, and 50 centimeters deep is mounted on a rigid supporting structure carried on jacks. Water is circulated by pumps with variable speed drives for con-trolling the flow rate. The slope of the flume can be adjusted continuously without interrupting an experiment, up to a maximum of 2 per cent. The flume system can produce programmed unsteady flow and will be equipped with convenient recording equipment for obwith convenient recording equipment for observing such flows. It is designed as a general purpose facility for studies of open channel flow problems such as sediment transportation, boundary layers, and wave propagation in shear flow. Completed.
- Flume has been completed and is being used in several research projects.
- (4561) DYNAMICS OF DENSITY-STRATIFIED RESERVOIRS.

 - (b) U. S. Public Health Service (research grant).
 (c) Prof. Norman H. Brooks, Calif. Inst. of Tech., Pasadena, Calif. 91109.
 (d) Basic theoretical and experimental research.
 (e) (1) In reservoirs having density variation with depth, the pattern of flow toward an with depth. outlet may be quite different from the flow in a homogeneous reservoir. The withdrawal pattern has been studied experimentally in a laboratory tank of water having a linear density profile induced either by dissolved salt or heat. Application will ultimately be in management of water quality in rivers by selective withdrawal from reservoirs. (2) A theoretical stability analysis has also been made for viscous uniform two-layer flow down an inclined plane, a problem related to density underflows in reservoirs.
 - (g) (1) At very low Bynolds numbers there is a distinct "withdrawal layer" extending up-stream at the level of the outlet. Fluid above and below this layer is not with-drawn through the outlet. Results of two-dimensional experiments agree with a theoretical analysis based on the laminar boundary layer equations and the diffusion or outlor for the substrance courter dependent. equation for the substance causing density variation. A theoretical analysis has also been made of axisymmetric flow to a point sink. (2) Report (see below) includes curves of critical Reynolds number as function of depth ratio and density ratio, and also curves for relative amplitude of surface
 - and interfacial waves. "Viscous Stratified Flow Towards a Line (h) "Viscous Stratified Flow Towards a Line Sink," R. C. Y. Koh, W. M. Keck Lab. Report No. KH-R-6, Calif. Inst. of Tech., Jan. 1964. - (e) Alluvial flows in channels with artificially secured banks are studied systematically for their tendency to meander as expressed by the development of alternate bars. It is the aim of this study to de-velop criteria for stability.
- (f) Concluded.
 (g) It was found empirically that it is
 pratically impossible to create the
 characteristic alternate bars based on reversing secondary currents in laboratory flumes with smooth vertical banks. Under the same average flow and sediment conditions in the same flumes the alternate bars appear if rough sloping banks are substituted. The bank friction is used to explain the creation of the bars.

- (3026) SHIP RESISTANCE IN UNIFORM WAVES AS A FUNCTION WAVE STEEPNESS.
 - (b) David Taylor Model Basin, Dept. of the Navy.
 - (c) Mr. O. J. Sibul, Room 224, Bldg. T-3, Univ. of Calif. Berkeley, California 94720.

 - (d) Experimental. (e) Experiments were performed to study the resistance of ships in uniform waves. Motions as well as resistances were measured in more than 2,500 individual tests. The transfer functions necessary to predict the added resistance in irregular seaways were calculated from the experimental results.
 - (f) Completed. (g) The results indicate that the added reistance depends upon the block coefficient, the speed of the ship and the steepness of the waves. It has a maximum in the vicinity of the maximum motions and decreases again for the higher speeds. The added re-sistance is higher per unit displacement for smaller block coefficients.

 (d) Field investigations; applied research.
 (e) Systematic measurements of depth and water content of snow are being made at high elevations in Colorado and New Mexico mountain areas for the purpose of forecasting the mucht of the purpose of forecasting the superference of the purpose of the section. runoff of the principal rivers in the interest of irrigation, power, domestic supplies, and other uses. The use of electrical resistance soil moisture units is being tested to determine a factor of soil moisture deficiency for water supply fore-cast purposes. Most of the major basins now have two or more soil moisture stations in
 - stalled. Correlation of soil moisture and runoff is now being developed with the hope that this information can be used as a factor in forecasting.
- (g) Forecasts are now being issued at forty-four gaging stations in Colorado and New Mexico. As forecast procedures improve, additional streams will be forecasted and other areas of potential power and irrigation develop-ment will be investigated on the Colorado, San Juan, Animas and Arkansas Rivers. (h) Colorado Agricultural Experiment Station
- General Series Papers Nos. 780, 781, 782, and 783 covering monthly snow reports for all of Colorado and New Mexico. Nine small basin reports and one two-state

bulletin covering the South Platte River Watershed; Arkansas River Watershed; Rio Grande watershed in Colorado; Rio Grande watershed in New Mexico; Dolores River watershed; San Juan and Animas River watershed; Gunnison River watershed; Colorado River watershed; Yampa, White and North Flatte River watershed; Lower South Platte River watershed. Supplemental reports are issued January 1, May 15, and June 1. A summary of all back data was issued this fall. A bulletin entitled "Snow Surveys in Colorado" will be ready for distribution in December. This is co-authored by Norman A. Evans, Homer J. Stockwell and Jack N. Washichek.

- (821) GROUND WATER FLUCTUATIONS AND THEIR RELATION TO PUMPING.
 - Colorado Agricultural Experiment Station. Mr. M. M. Skinner, Assistant Civil Engineer. Field investigation; applied research. Semi-annual measurements of the depth to

 - the water table in approximately 610 observation wells are presently being obtained. The Ground Water Branch of the U. S. Geological Survey, Denver, Colorado are cooperating in furnishing measurements for about 130 wells. The observation wells are primarily existing irrigation wells in the South Platte and Arkansas River Basins, the High Plains area of eastern Colorado and the San Luis Valley. Electrical Power and Natural Gas Consumption data are compiled and estimates of groundwater pumpage made. Th purpose of the project is to detect areas The of ground-water depletion, to develop relationships between gross pumpage and respective ground-water reservoir storage volume changes, and acquire basic data for ground-water studies in the various areas of Colorado.
 - Ground-water levels of the spring of 1964 are generally down as compared to the spring of 1963 in the South Platte and Arkansas (g) River Basins and the San Luis Valley. Considerable ground-water pumpage is continuing in the High Plains area of eastern Colorado with some increase in pumping lifts resulting. Reported electrical power consumption by
 - Reported electrical power consumption by electrical pumping during 1963 in Colorado amounted to approximately 190,000,000 kilowatt hours for 9295 pumping units. "Artificial Ground-Water Recharge in the Prospect Valley Area, Colorado," Agri-cultural Experiment Station, General Series 792, M. M. Skinner, Nov. 1963. "Colorado Ground-Water Levels Spring 1964," (h) CER64MMS9, May 1964, by M. M. Skinner.
- (2770) TURBULENCE STUDIES IN LIQUID USING ELECTROKINETIC PHENOMENON.
 - (b) National Science Foundation.
 - Dr. J. E. Cermak.
 - Experimental research; basic research, doctoral thesis.
 - (e) The primary objective of the study is to determine the interaction between velocity fluctuations produced by turbulence in the liquid flow and electrokinetic potential fluctuations generated at a liquid-solid interface. Knowledge gained by this study will be applied to developing techniques for measuring turbulence characteristics in luquids.
 - (g) Probes constructed with electrode pairs have been used to measure the distribution of turbulence intensities (three components) and the turbulent shear stress across a diameter of a circular pipe. The distri-bution measured in water agree with those obtained by Laufer in air using a hot-wire anemometer. (h) "Electrokinetic-Potential Fluctuations
 - Generated by Jet Impingement", by L. Duckstein and J. E. Cermak. Journal of Heat and Mass Transfer, Vol. 7, pp. 159-167, 1964.

 (d) Experimental, laboratory investigation; applied research, operation and development.
 (e) New and improved devices and techniques for measurement of irrigation water are being developed. Specific objectives are developed. Specific objectives are (1) Design, evaluation and calibration of trapezoidal measuring flumes, (2) Design and evaluation devices for combined water measure-ment and control, and (3) Development of a
 - ment and control, and (5) Development of a probe using the drag on a suspended wire to indicate total flows, velocity distributions and forces on sediment particles. The development of trapezoidal measuring flumes is continuing. Flumes with cross-sections corresponding to common slipform concrete ditches have been designed and (g) calibrated. Two shapes of broadcrested weirs were evaluated with respect to their ability to measure flows accurately under high degrees of submergence.
- (3398) TURBULENT DIFFUSION IN SHEAR FLOW.
 - (b) National Institute of Health, Public Health Service, U. S. Dept. of Health, Education and Welfare, Washington, D. C.
 (c) Dr. J. E. Cermak.
 - (c) Dr. J. E. Cermak. (d) Experimental research; basic research,
 - doctoral thesis.(e) The objective of this project is to de-(land surface roughness, topography, structures), and thermal and aerodynamical factors (turbulence intensity and scale) upon atmospheric diffusion of heat and mass. "Laws of modeling" or "similitude parameters" are sought by obtaining detailed data under various conditions in the wind tunnel and by comparing them with similar data now existing for the atmospheric prototype.
 - (g) Application of a hypothesis of Lagrangian similarity to particle motions in a turbu-lent shear flow near a solid boundary has yielded similarity parameters and relation-ships between them which correlate the windtunnel diffusion data and available diffusion data obtained in the atmospheric surface
 - data obtained in the atmospheric surface layer.

 (e) The structure of the turbulent wind eddies, which produce the exchange of momentum between atmosphere and ground in the high between atmosphere and ground in the high mountains, is unknown. Yet these have sufficient force for the most part to blow the snow away from the mountain slopes above timberline. This snow in part drifts into high-altitude basins where it accumulates in depth augmenting the summer water supply; in text it duffs on slowes where it readily part it drifts on slopes where it readily evaporates. Much interest has been shown in the possibility of channeling the drift so that a substantially higher fraction goes into the basins. Technologically this appears to be feasible. Etc. any construction is dependent on knowledge of the turbulence is dependent on knowledge of the turbulence spectrum, especially on the first day follow-ing snowfall. In order to determine this spectrum, a first installation containing electronic wind and temperature measuring instruments have been established above timberline in the Central Colorado Rockies. (f) Field experimencs starting in winter of

 - (b) Office of Naval Research, Department of the Navy.
 - (c) Dr. Herbert Riehl, Professor of Atmospheric Science.
 - Basic research.
 - Basic research. The discharge of major western rivers (Colorado, Columbia, Sacramento, Rio Grande) has fluctuations with the order of magnitude of the mean annual discharge itself. These fluctuations are brought about mainly by variations in precipitation yield and by variable evaporation. Heavy precipi-tation may result from seasonal conditions favorable for the recurrence of cyclones over headwater areas. High evaporation (e)over headwater areas. High evaporation, requiring weeks of abnormally dry and warm conditions, must be a manifestation of general circulation anomalies of longer duration. The objective of the study is (1) to separate the "systematic" and "random" components of the precipitation, and (2) to determine the controls for the systematic anomalies of precipitation and evaporation.
- (4114) GRAVEL FILTER FOR TILE DRAINS.

 - (d) Experimental research; basic research, doctoral theses. (e) The effects of surface roughness and surface
 - The effects of surface roughness and surface heating or cooling upon the structure of turbulence in boundary layer flow will be determined. The flows investigated will be those existing on the heated or cooled floor of a wind-tunnel test section 6 x 6 ft in cross section and 80 ft long. Space-time competitions correlations, joint probability densities, spectra and intensities of the turbulent velocities and temperatures will be obtained by hot-wire techniques and special analog computers employing magnetic tape input.

Efforts are being made to determine the diffusion characteristics for instantaneous point and line sources of heat and mass located within the turbulent boundary layer. This work is another way in which the effect of vertical temperature gradients and the turbulent boundary layer effect the turbulence

- structure.
 (g) A 2.5 x 10⁻⁵ inch diameter, 90% platinum-10%
 rhodium wire was evaluated as a resistance thermometer. From steady state evaluation of the wire physical properties the transient response of the wire was predicted. The predictions agree well with measured time constants for the wire. The bare wire with a detection current of 0.1 milliamps will have a sensitivity of approximately .07 millivolts per $^{\circ}$ F. The frequency response of the wire in still air is 3200 cycles per second and this increased to approximately 6000 cycles in a moving air stream of 100 feet per second. The recent measurements of spectra within the neutral turbulent boundary layer over the roughened floor of the wind tunnel show very close agreement with turbulent spectra reported for water flow in an ocean tidal channel and for air flow of the sea surface.  - $\begin{pmatrix} d \\ e \end{pmatrix}$ Applied; experimental.
 - The objective of this research is to determine to what extent the transport of solid particles by water flowing through soli may be affected by the degree of saturation of soil. The term "soil" is interpreted broadly as including sands and gravels as well as agricultural soils. The solid particles to be considered in this study will be of sizes and shapes corresponding to that of viruses.
 - ponding to that of viruses.
 Active, continuing.
 A considerable amount of data has been accumulated which show that soils (and even sand) have a considerable capacity to adsorb virus-like particles. If, however, a continuous supply of these particles are supplied over a period of time, sand will eventually lose its capacity to retain additional particles. Under the latter conditions virus-like particles may be transmitted for considerable distances through sands (even fine sands).

 - research. (e)
 - The work underway in Colorado is for the purpose of perfecting techniques of porous media modeling. When these techniques have been perfected sufficiently a laboratory model of a large field installation will be constructed in the Hydraulics Laboratory. Work to date has established what soll param-eters need to be taken into account when a model media is selected. More work needs to be done to determine how to create a satisfactory model medium to satisfy the specific requirements of a model of a particular drainage facility. Work presently underway is intended to accomplish the latter objective.
 - (g) If the problems relating to the construction If the problems relating to the construction of valid porous media models can be overcome, it will be possible to solve many problems associated with flow into drains that are much too complex for analytical solutions. It is hoped that construction of a laboratory model can begin during the coming year. "Hydraulic Froperties of Porous Media," R. Bencks and A. T. Corey. Colorado State

Engineering.

- (5285) SYNTHESIS OF HYDROGRAPHS AND WATER SURFACE PROFILES FOR UNSTEADY OPEN CHANNEL FLOW WITH LATERAL INFLOWS.
 - (b) Ph.D. thesis research, supported by U.S.D.A.-A.R.S.-Soil and Water Conservation Research bitision, Cooperative Agreement No. 12-14-100-2433(41).
 (c) Asst. Prof. R. D. Black, 118 Riley-Robb Hall, Cornell Univ., Ithaca, N. Y. 14850.
 (d) Experimental and theoretical approach to

 - flood routing for application in streams with significant lateral inflow. This is applied research and a Ph.D. thesis study.
 - (e) This study is a numerical analysis of the complete differential equations for open channel flow. Experimental data for channel roughness and stage discharge relationships were used to route a flood through a reach of channel with lateral inflows added along the length of the routing reach. The numerical solutions were carefully compared with flood wave movements through a 72 foot long experimental channel. The purpose of this work was to develop a method for flood routing in streams where lateral in-flow within the routing reach is significant.
 - (f) Completed. (g) The numerical analysis of flood wave movements was in very good agreement with the experimental flood wave movements predicting stages and discharges within 2%. This method should be adaptable in the field if a high speed computer is available to those wishing to use the method. Certain field data necessary for this solution may not
 - data necessary for this solution may not be readily attainable but may be deduced from previous hydrographs and in a fashion similar to that used by many present methods. This thesis will be produced as a Cornell University Water Resources paper and will be available by March, 1965, from the Cornell Water Resources Center. (h)

- (e) Experimental measurements of rate of ripple dissipation, ripple geometry, and energy dissipation of bed ripples generated over a plane erodible bed. Experiments are being conducted in the Georgia Tech U-tube water tunnel in which water is oscillated with simple-harmonic motion over a stationary sediment bed. Independent variables are amplitude of water motion, frequency of constitute of water motion, frequency of oscillation, size of disturbance element from which the ripples originate, and characteristics of the bed material. Results are to be compared with theoretical model.
 (h) Quarterly progress reports.
- (5546) CROSS-CHANNEL DIFFUSION.

 - Laboratory project. Dr. M. R. Carstens, School of Civil Engrg, Georgia Institute of Technology, Atlanta, (c) Georgia 30332.
 - Theoretical and experimental, research for (d) Ph.D thesis.
 - (e) A study of shear flows as characterized by lateral transfer of linear momentum. This lateral transport of linear momentum can be accomplished by molecular diffusion, by turbulent diffusion, or by secondary currents superposed on the mean flow. In open chan-nel flow, the existence of all modes of linear momentum transfer is likely especially if the stream section consists of a main channel section and an overbank section. In this study air is being used in conjunction with an enclosed conduit consisting of a rectangular main channel with rectangular overbank section projecting from the center of one wall of the main channel. Geometric variations will be confined to this overall shape. Flow analyses are being made using detailed velocity measurements throughout a cross-section, Preston-tube measurements along the wall of a cross-section, and piezometric head measurements along the axis of the conduit. In this initial study direct measurement of turbulence characteristics will not be attempted. Instead linear-momentum transport will be computed from the mean-flow measurements listed above.
 - (f) Analytical and experimental work now in progress.
 - Velocity profiles and boundary-shear dis-tribution have been determined for one (g) channel section.
- SEDIMENT TRANSPORT FUNCTIONS WITH SPECIAL EMPHASIS ON LOCALIZED SCOUR. (5547)

 (e) Evaluation of potential yield of the sand and gravel deposits beneath the American Bottoms (East St. Louis area). Ground water levels are measured in more Ground water levels are measured in more than 200 observation wells, 9 of which are equipped with recording gages. Ground water pumpage, Mississippi River stages, rainfall, and quality of ground water data are continuously collected. Maps have been prepared showing the distribution and areal extent of the hydraulic properties, the thickness of the aquifer, and water-table contours. The amount of recharge from precipitation and from induced infiltration of river water, and the amount of sub-surface flow from valley walls into the American Bottoms were computed by flow-net analysis of water-table maps. An electric analog model consisting of a regular array of 2800 resistors and 1350 capacitors was

constructed to simulate the complex aquifer system. The accuracy and reliability of the analog model were assessed by comparing past records of water-level change and values of water-level change computed with the analog model. Excitation-response equipment, i.e., wave form generator, pulse generator and oscilloscope, was used to force electrical energy in the proper time phase into the analog model and to measure energy levels within the resistor-capacitor network. The analog model was used to estimate the practical sustained yields of existing pumping centers and to predict the potential yield of the aquifer with a selected scheme of development.

- (1335) GROUND WATER INVESTIGATION IN THE CHICAGO AREA.

 - (b) Laboratory project, in cooperation with Illinois State Geological Survey.
 (c) Mr. H. F. Smith, Illinois State Water Survey, Box 232, Urbana, Illinois 61802.
 - Field investigation; applied research. Study of variations of natural resources. Investigation of artesian well field with $\begin{pmatrix} d \\ e \end{pmatrix}$ wells 1200 to 2200 feet deep, locally heavily pumped. Study of ground water level recession, interferences, transmissibilities, effect of additional demands.
 (g) Results show the ground water resources in Chicago region are developed from four
 - water-yielding units: glacial drift aqui-fers, shallow dolomite aquifers, Cambrian-Ordovician Aquifer, and Mt. Simon Aquifer. The Cambrian-Ordovician has been the most highly developed source of large groundwater supplies. Future ground-water supplies should be taken from the shallow aquifers wherever possible. (h) Ground Water Supplies of Northeastern Illinds,
 - Joint Discussion: "Quality Problems in Well Waters," by T. E. Larson; "Potential Yield of Aquifers and Ground Water Pumpage," by W. C. Walton, State Water Survey Reprint Series No. 38, from Journal American Water Works Association, V. 56 (2): 169-188, February 1964. "Ground-Water Pumpage in Northeastern Illindis through 1962," R. T. Sasman, State Water Survey Report of Investigation 50, in press
- (1865) HYDRAULIC DESIGN OF DROP-INLET SPILLWAY STRUCTURES FOR SMALL RESERVOIRS.
 - (b) Laboratory project, in cooperation with Agricultural Research Service, Soil Conservation Service, and Illinois Agricultural Experiment Station.
 - (c) Mr. H. W. Humphreys, Illinois State Water Survey, Box 232, Urbana, Ill. 61802.
 (d) Experimental; generalized applied research for development and design.
 (e) To determine the most desirable proportions

 - and shapes of drop-inlet spilway structures that have unique flow characteristics and to develop anti-vortex devices. To provide the necessary information on flow relations and discharge coefficients so that these and discharge coefficients so that these structures may be economically designed. Initial phases of study concerned with hydraulics of square risers with free dis-charge. Effect of lip or crest shape and anti-vortex devices being studied. Second phase to include the complete spillway. Experimental apparatus constructed and tests are being conducted on the complete spillway. Information is being obtained on discharges, vortex effect on discharge, pressures, a flat plate anti-vortex device, and flow conditions.
 - (g) Hydraulics of various types of flow possible in square risers are well defined as well as some of the effect of non-square crest

shape. Model tests were performed on a arop-inlet spillway to determine whether or not a metal grating deck placed above the inlet can control vortices. The results of the tests show that gratings do not prevent or control strong vortices.

- (2532) EVAPORATION RETARDATION.

 - (b) Laboratory project.
 (c) Mr. W. J. Roberts, Illinois State Water Survey, Box 232, Urbana, Ill. 61802.
 (d) Field investigation; applied research,
 - design.
 - (e) Monomolecular chemical films to retard evaporation from water supply lakes and ponds in Illinois.
 - Additional tests planned. $\begin{pmatrix} f \\ g \end{pmatrix}$
 - 1963-64 results with soluble packets were favorable. Cooperation with lake owners to be continued in 1965.
- (2534) DENSE RAIN GAGE NETWORK PROJECTS.

- (3734) INDUSTRIAL WATER USE IN ILLINOIS.

 - Laboratory project. Mr. Ralph L. Evans, Peoria Laboratory, Illinois State Water Survey, Box 717, Peoria, Illinois. 61802. Field investigation; applied research. Determine withdrawal of water by industries in Illinois, with delineation according to kinds of industry, location by area, and sources of supply. $\begin{pmatrix} d \\ e \end{pmatrix}$

- (f) Project reactivated.
- (4135) CORROSION PREVENTION BY CaCO3.

 - Laboratory project. Mr. T. E. Larson or H. W. Humphreys, Illinois State Water Survey, Box 232, Urbana, Ill. 61802 (c)
 - Experimental. (d) les To determine chemical requirements and veloc-
 - ity requirements to provide protective coating in water pipes.
- (4137) DIURNAL DISTRIBUTION OF PRECIPITATION AND RELATED WEATHER ELEMENTS.

 - (b) Laboratory project.
 (c) Mr. S. A. Changnon, Jr., Illinois State Water Survey, Box 232, Urbana, Illinois 61602.
 (d) Applied research.
 - Investigation of the diurnal distribution of les various weather elements on a monthly, seasonal, annual, and geographic basis. Elements under study include rainfall, sleet, hail, tornadoes, thunderstorms, freezing rain, and fog.
 - (f) Suspended.
- (4138) EVAPOTRANSPIRATION IN ILLINOIS.

 - (b) Laboratory project.
 (c) Mr. D. M. A. Jones, Illinois State Water Survey, Box 232, Urbana, Illinois 61802.
 (d) Applied research.
 - Evaluation of methods for calculating evapo-transpiration and assessment of evapotranspi-(e) ration in Illinois.
 - PRECIPITATION PATTERNS OVER AND AROUND LOWER LAKE MICHIGAN.
 - (b)
 - Laboratory project. Mr: G. E. Stout, Illinois State Water Survey, Box 232, Urbana, Illinois 61802. (c)
 - $\left\{ \begin{array}{c} d \\ e \end{array} \right\}$
 - Applied research. Radar film records are being studied to de-termine the influence of Lake Michigan on precipitation processes.

 - ANALOG COMPUTER.
 - (b)
 - (c)
 - (d)
 - Laboratory project. Mr. R. J. Schicht, Illinois State Water Survey, Box 232, Urbana, Ill. 61802. Experimental; applied research. Purpose of project is to apply electric analyg computers to ground-water resource evaluation problems in Illinois. Ground-water develop-ment schemes are being tested and the relative merits of alternate choices of development are being appraised. The consequences of the (e) are being appraised. The consequences of the utilization of aquifers are being forecast. The electric analog computer in use consists of an analog model and excitationresponse apparatus, i.e., waveform genreator, pulse generator, and oscilloscope. The analog model is a regular array of resistors and capacitors and is a scaled-down version of an aquifer.
 - (g) Analog models have been constructed for three idealized aquifer situations to study the accuracy and reliability of the analog computer. Close agreement between analog computer and exact analytical solutions for the three selected aquifer situations has been obtained. A comparison of the analog computer and simplified analytical solutions for a selected complex aquifer situation indicates that resource evaluations based on incomplete data and analog or idealized mathematical models can be meaningful and useful. Analog models for sand and gravel aquifers in the East St. Louis and Champaign-Urbana areas have been constructed. Past records of pumpage and water levels have been used to establish the validity of the analog model for the East St. Louis area.

- (5051) GROUND-WATER RECHARGE AND RUNOFF IN ILLINOIS.

 - (b) Laboratory project.
 (c) Mr. R. J. Schicht, Illinois State Water Survey, Box 232, Urbana, Ill. 61802.
 (d) Field investigation; applied research.
 (e) Purpose of project is to describe recharge conditions throughout the state and to determine the relation between ground-water contribution to streams and basin characteristics.
 - (g) Recharge rates for several aquifers in Illinois have been estimated based on flownet analyses of piezometric surface maps. Recharge rates vary with vertical hydraulic gradients and are not constant but vary in space and time. Annual ground-water runoff from 109 drainage basins scattered through-out Illinois was estimated with streamflow hydrograph separation methods and flowduration curves. The relations between ground-water runoffs during years of near, below, and above normal precipitation and basin characteristics such as geologic environment, topography, and land use were determined by statistical methods. Studies indicate that no simple relation exists between ground-water runoff and the potential
 - between ground-water runoff and the potential or practical sustained yields of aquifers. "Estimating the Infiltration Rate of a Stream-bed by Aquifer-Test Analysis," W. C. Walton, State Water Survey Reprint Series No. 37, extract of Publication 63, I.A.S.H., pp. 400 420 Depender 1063 (h) 409-420, Berkeley 1963. "Ground-water Recharge and Runoff in Illinois," W. C.  - (b) A laboratory project.
 (d) Experimental and theoretical; basic research.
 (e) The objective is to select a method for
 - The objective is to select a method for integrating the partial differential equations which will form a part of the mathematical
 - (g) Solutions for the following continuity and momentum equations for unsteady, spatially varied flow in a wide channel were obtained by numerical integration using the IEM 7094 computer: 9.9

$$\frac{\partial y}{\partial t} + u \frac{\partial y}{\partial x} + y \frac{\partial u}{\partial x} = R$$
(1)

$$\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} + g \frac{\partial y}{\partial x} = g \left(S_0 - S_f \right) - \frac{uR}{y}$$
(2)

- in which = depth of flow, varying with time and position along the channel u = average velocity associated with the
- depth y
 g = gravitational constant
- $S_0 \Rightarrow$ channel slope R = rate of inflow per unit channel area
- S_f = energy gradient of the flow x = distance along the channel t = time

The initial condition for the problems solved was a dry bed (no flow). The boundary con-ditions were no inflow at the head of the channel, and a free overfall at the lower end with subcritical flow upstream. Resu were obtained for each of three finite Results difference approximations of equations 1 and 2 essentially as originally proposed by Isaacson, Stoker, and Troesch. The space and time increments, xx and At, used in representing the derivatives were subject to the interrelationship imposed by the method of characteristics. Although the laboratory model to be used for checking the numerical results has not been completed, an independent method of calculation was used to determine the equilibrium depth profile for given boundary conditions. The transient profiles approached the equilibrium profile satisfactorily over the upper two-thirds of the channel. All three methods proved to be unstable, however, in the region of greatly accelerated flow near the discontinuity at the free overfall. Reduction of the magnitude of the space increment, x_s , would improve the evaluation of the terms for $\partial u/\partial x$ and $\partial y/\partial x$, possibly improving the results immediately upstream from the overfall at the expense of a required reduction in the magnitude of at. The application of least square polynomial smoothing to each generated profile prior to calculation of the succeding profile effec-tively damped the oscillations of the solu-tions, but also had a cumulative effect which gradually distorted the shape of the calcu-lated water surface profiles.

UNIVERSITY OF ILLINOIS, Hydraulics and Water Resources Laboratory, Department of Civil Engrg.

doctoral thesis directed by V. T. Chow.

- (d) Experimental and theoretical.
 (e) To study the distribution of boundary shearing stress, or tractive force in a circular conduit flowing partially full and to determine the relationship between the shearingstress distribution and the velocity distribution.
- (g) The solution of the problem is based on the assumption that a turbulent flow in the channel has a uniform velocity distribution modified by boundary effects and turbulent mixing. The boundary effects are further considered to consist of two additive compoeffects caused by the restraint of the tureffects caused by the restraint of the tur-bulent fluctuations at the walls and the surface. The velocity of flow normal to the channel cross section is therefore expressed as the weighted sum of two functions of the Poisson equation type. The relative influence of the two functions of the total flow is de-fined experimentally for the relationship of the undered softicity to channel accountry. the weighted coefficient to channel geometry and roughness. The experimental determination of the coefficient is accomplished by using a smooth copper pipe and a rough steel pipe. The tractive force distribution is determined by a
 - tractive force distribution is determined by a "law-of-the-wall" method and with the Preston technique using Filot tubes calibrated in place. The equations are solved by the finite-differences method using the digital computer to evaluate the weight coefficient in the Foisson equations for both smooth and rough plaes. The relations developed from this investigation compare favorably with some published velocity distributions including those ob-

- - (b) Laboratory project supported by the University's Center for Advanced Study.
 - (d) Theoretical; basic research.
 - (e) To use the operations research techniques to optimize water resources system for the planning and development of water projects, by utilizing mathematical models and simu-lation. Optimization is made by deter-ministic and stochastic linear programming and dynamic programming, considering various types of constraints including economic efficiency and budget limitations. For mathematical simulation, both random sam-pling and systematic sampling are considered, pring and systematic sampling are considered, and additional hydrologic data are generated sequentially by means of Monte Carlo methods and Markov chain models. Study of the reservoir design is also made by using queuing theory through the use of the sequentially generated stochastic imput flow information.

 (e) To study the time variation of forces pro-duced by gravity waves on coastal and off-shore structures and to evaluate the subsequent structural motion. The effort in-volves laboratory studies of wave-structure interaction as well as analytical investigations.
 - (g) During the past year, laboratory equipment for small-scale investigations has been constructed, and experimental data relating

to type of disturbance and subsequent wave characteristics have been obtained.

- (4906) BASIC INVESTIGATION ON WATERSHED HYDRAULICS.
 - National Science Foundation research project. Experimental and theoretical; basic research.
 - (b) (d) (e) To investigate the basic laws governing the flow of surface water over drainage basins by controlled experiments on geometric basins. By controlling the various factors involved in the mechanics of flow, the experimental data so obtained can be more amenable to theoretical analyses for the determination of the basic laws. In addition to the shape of the geometric basin, other characteristics including slope, size, surface characteristics including slope, size, surface roughness, channel storage, channel density, etc., will be studied. The input rainfall excess is to be simulated by electronically controlled sprinkling systems composed of a large number of modules so that different patterns of rainfall supply and even the effect of the movement of rain-making clouds can be produced artifically. The output discharge from the basin is to be measured by electronic sensing devices which can automatically be digitized for the computer to construct the hydrographs of outflow.
 - (g) During the year, effort has been made to design the rainfall simulator system which is composed of 100 modules. Each module is a box of 4 feet by 4 feet in size with numerous holes on the bottom. By controlling the in-side pressure of the box, artifical raindrops are produced. The whole system is supported by a metal frame of 40 feet by 40 feet in size.
- (4907) A BASIC STUDY OF THE LINEARITY OF THE RAINFALL-RUNOFF PROCESS IN WATERSHEDS.
 - Laboratory project for M. H. Diskin's doctoral thesis directed by Prof. V. T. (b) Chow.
 - (d) (e) Theoretical; basic research. To investigate the nonlinearity of the of the kernal function is the transfer of the kernal function in the Duhamel convolution integral via the properties of its Laplace transform. The Laplace transform of the kernal function is the transfer
 - function of the drainage basin system. To facilitate the comparison of transfer functions and to accentuate the differences between transfer functions obtained from (g) various storms and basins, a special form transfer function is developed, which is dimensionless and eliminates the location of the centroid of the kernal function. By means of this complex mathematical transformation, various conceptual models for rainfall and runoff process in drainage basins can be easily compared, and the basins can be easily compared, and the nonlinearity of the actual basin process can be evaluated. The method developed from the proposed theory is tested with 31 storm records of rainfall and runoff for 14 drainage basins with areas ranging from 30 to 1,420 square miles. The result indicates that the instantaneous unit hydrograph varies systematically but nonlinearly with the storms, but there is also a random component

 - to determine pressures on impervious rigid

walls due to breaking waves with sufficient accuracy to afford an economical and safe design for sea walls and breakwaters; also to investigate the variation of pressure on the wall with respect to time and spacial distribution.

- (g) During the year five different wave conditions were investigated. The wave characteristics and pressure distribution on the face of the model wall for each of the wave conditions were measured. With the cooperation of the U. S. Army Engineers, the experimental work is being conducted at the U. S. Army Waterways Experiment Station.
- (4909) A STUDY OF THE EFFECT OF BASIN STORAGE ON SURFACE RUNOFF HYDROGRAPHS.
 - (b) Laboratory project for V. C. Kulandaiswamy's doctoral thesis under the direction of Prof. V. T. Chow.
 - (d) (e) Theoretical; basic research. To study the drainage basin taken as a lumped
 - hydrologic system.
 - hydrologic system.
 (g) Assuming a general nonlinear equation for the basin storage and combining it with the equation of continuity, a differential equa-tion for the system is formulated. The equa-tion for the system is formulated. tion is quasi-linearized by assuming that the tion is quasi-linearized by assuming that the coefficients are functions of the average in-flow and outflow of the sytem. Solution of the resulting equation produces four possible conceptual system models depending on the nature of the roots of the equation. Storms and the corresponding outflow hydrographs over six natural drainage basins varying from 7.16 to 1,141 square miles are analyzed by the proposed equation and theory. From by the proposed equation and theory. From the results of the analysis it is seen that three coefficients of the proposed equation vary with the outflow, thus indicating non-linearity, while the remaining two co-efficients do not change much and can be assumed constant. A study of the variation of the three coefficients seems to indicate that they decrease exponentially with the peak runoff. The storage equation derived in this study is shown for use in flood routing and it is proposed also for use in

 (e) To treat the inflow into a basin as a stochastic input, the basin as a linear stochastic outflow as the response Theoretical; basic research. system, and the outflow as the response of the basin to the input and to investigate the stochastic behavior of the system by sequential generation and simulation techniques.
 (g) The 28-year records of annual storm and flood from the French Broad River at Bent
 - Creek, North Carolina, covering a drain-age area of 676 sq. mi. are mainly used in models using shifting technique for the precipitation process in the annual storms precipitation process in the annual storms are formulated and tested, and their parameters are evaluated. Using Monte Carlo method, 1,000 years of sequentially generated storms are produced. The effective storm rainfalls are routed through a conceptual mathematical model consisting of a series of linear reservoirs. By considering the rainfall abstractions to consist of a deterministic component and a random component, a good agreement is obtained between the historical flood frequencies. Finally, stochastic flood duration curves are developed and

recommended for water resources design purposes.

 - (e) Study the dynamic qualities of an acceleration switching hydraulic servomechanism while operating in a closed loop under the presence of various loads and environmental conditions on the transfer valve, actuator and feedback transducer.
 - (g) The operation of a broad bandpass servo-mechanism driving a low resonant frequency linkage has resulted in radial design compromises to prevent instability. Extension of acceleration switching techniques without any mechanical modifications has permitted
 - closed loop operation with bandpasses equal to or exceeding the linkage characteristics. "Design of a Hydraulic Servo with Improved Bandpass Characteristics When Driving a Resonant Mechanical Load," APL/JHU CM-962, (h) by W. Seamone.
- (3436) ADAPTIVE ELECTRO HYDRAULIC SERVOMECHANISMS.
 - Bureau of Weapons, Department of the Navy.

 - Theoretical and experimental. Techniques have been developed for designing linear servomechanisms with a limit cycle instability about a relay type non-linearity. The closed loop characteristics of this servomechanism becomes invariant to any pure gain changes occurring in the linear elements. This servomechanism, categorized as a self-oscillating control servomechanism, appeared to be an evolutionary improvement over the acceleration switching hydraulic servomechanism.
 - A self-oscillating rate servomechanism has been operated with the loop closed around the valve spool position. Predictable self-(g) oscillation frequency was achieved and dy-namic performance bandpass was independent of hydraulic supply pressure between 500 and 2000 psi. The bandpass of both servomechanisms exceeded 60 cycles per second with the latter operating a complex me-chanical load system.

- (856) HYDROLOGY OF STORM DRAINAGE SYSTEMS IN URBAN AREAS.
 - (b) Baltimore City, Baltimore County, Maryland State Roads Commission, and the U. S. Bureau of Public Roads.
 - (d) Field investigation; basic research and design.
 - (e) Study of rainfall and runoff relationships as affected by various drainage area parameters. At present, runoff from 6 urban areas ranging in size from 10 to 150 acres are gaged, 5 by stage instruments and 3 by Farshall Flumes. Three recording systems which simultaneously record rainfall and runoff from 12 inlet areas provide good opportunity for detailed study. About 10 years of rainfall records now exist for a network of 12 recording gages covering an area of 50 square miles. (g) The Rational Method of storm drainage design
 - has been studied to see if the method could be verified or improvements in its use be verified or improvements in its use suggested. An attempt was made to study the assumption, implicit in the method, that the frequency of occurrence of the computed design peak runoff rate is the same as the frequency of occurrence of the selected rainfall intensity. The results suggest that constant values of the "C-Factor" and "time of concentration" can be selected for small upben once such that this assumption is urban areas such that this assumption is approximately correct for the range of rain-fall intensities commonly considered in design practice in the Baltimore area.

- (3437) RESIDENTIAL WATER USE RESEARCH PROJECT.
 - (b) Federal Housing Administration and 16

 - (d) Field investigation; applied research and design.
 - (e) This project is directed toward obtaining data on maximum hourly demands and water use patterns in residential areas having varying populations and located in various climatic regions throughout the country. It also is directed toward obtaining information on the effect of lawn sprinkling and other large water uses on maximum demands. The purpose of the project is to obtain a rational design criteria for water distribution systems, to provide a basis for evaluating water rate structures and a basis for improving system operation.
 - (g) Forty areas of subdivision size were selected so that water is supplied to each area through a single main with a compound meter-punched tape recorder. Areas were selected to represent major climatic regions of the country; and to represent varying economic levels, lot sizes, water rate structures, and other factors that influence water use. Some comments can be made about data collected during the summer of 1963. The magnitude of peak hourly demands in the west are about the same as those in the east for metered residential areas similar in character. Peak demands in metered areas are apparently correlated more with lot size than with climatic location. The ratios of peak to average use are lower in the west than in the east because average annual use is higher in the west where the sprinkling season is longer. Peak demands for unmetered areas are almost double those for metered areas. During the non-sprinkling season when all water is used for domestic purposes, variation from metered areas to unmetered areas is small.

Population density appears to be the factor with the greatest influence on domestic use. Weather conditions, proportion of consumers metered, and lot size appear to be the factors with the greatest influence on

Determination of the effects of parameters of design, construction, loading, and natu-ral phenomena on operation of sewerage systems. Research includes analysis and study of representative sewerage systems throughout the country. Completed.
 - General problems facing sewer designers have been studied using field data collected in four U. S. communities. Analysis of these data indicates that basic causes of maintenance difficulties are tree roots, accumulations of debris in the absence of accumulations of debris in the absence of roots, other causes, and in areas having cohesionless sub-soil, sewer cave-ins. Proportionately fewer blockages occur when grades are moderate, and pr portionately more occur at the upper terminals of the sewers. In eight-inch pipe, manhole spacing has little effect on the labor costs of stoppage relief. Emphasis is placed on stoppage relief. Emphasis is placed on statistical techniques for estimating domestic sewage flow. Flow of rainwater and groundwater was at times found to be excessive in all systems studied. Limited data on costs of operating and maintaining sewage pumping stations are reported and evaluated. "An Evaluation of the Problems of Sanitary Sewer System Design," by John C. Geyer and John J. Lentz, Federal Housing Adminstration, Technical Studies Fublication FMA No. 564, Washington, D. C., 20411, Sept., 1964.

- Tests of square and circular conduit with (g) free-jet, horizontal apron, and three dif-ferent wall flares, have been completed.
- (3084)STUDY OF IMPROVING DESIGN OF A HOPPER DREDGE PUMP.
 - District Engineer, U.S. Army Engineer Dist., Marine Division, Philadelphia, Corps of Engineers.
 - Applied and Basic Research. $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Applied and Basic Research. The Immediate purpose of the study is to improve design of a hopper dredge centrigu-gal pump for pumping silt-clay water mixtures. The long-term objective is to determine the effect of Bingham Body-type of fluid on pumping characteristics. The project has been divided into four phases: (1) Mcdel test of existing dredge pump; (2) recom-mendations for design changes of the dredge pump; (3) model investigation of the modi-fied design of the dredge pump; and (4) analysis of the investigation and final recommendations. Phase 1 involved instalanalysis of the investigation and final recommendations. Phase 1 involved instal-lation in the hydraulic laboratory of a 1:8 scale model of the dredge pump now used on the U.S. Corps of Engineers dredge ESSAYONS. Water as well as silt-clay-water mixtures (Bingham Body-type of fluid) were pumped and complete characteristics of the pump ob-tained for capacity of 0 to 1200 gallons per minute, speed of 1150 to 1900 revolutions per minute, and liquid concentrations of 1000 and 1380 grams per liter. Phases 2 and 3 involve modifications in the shape of vane and changes in the exit vane angle of the and changes in the exit vane angle of the

impeller. Experimental tests indicate con-siderable improvement in pump efficiency. Analysis of the experimental data resulted in recommendations for changes in pump de-

- $\begin{pmatrix} f \\ g \end{pmatrix}$
- sign. 1, 2, 3 and 4 completed. Considerable improvement in pump efficiency has been achieved.

 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Experimental. The object of the study is to determine the magnitude of wave reflections from rectangu-lar floating bodies. Tests are being con-ducted in a 67-ft. long, 2 ft.-wide and

2 ft.-deep wave channel equipped with pendulum-type wave generator and efficient absorbers. (f) Completed.

- (4645) EFFECT OF LENGTH AND SPACING OF SPUR DIKES.
 - Laboratory report.
 - (b) (d) (e) Experimental and theoretical; M.S. Thesis. The object of the study is to determine the effect of length and spacing of spur dikes on the magnitude of scour in uniform flow. The experiments are conducted in a 10-ft. wide, 35-ft. long open channel with movable sand bed. Scour patterns are observed and analyzed.
- (5172) MEASUREMENT OF SLURRY FLOW BY USE OF 90° ELBOW METER.
 - (b) National Bulk Carrier Inc., New York, New York.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Applied and Basic Research. A four-inch 90° elbow meter was calibrated against a magnetic flow meter. A flow range of from O-1100 gpm was effected in the calibration. Water and fine concentrations of silt-clay-water mixtures are included in the calibration tests. The basic theory of the "elbow meter" is discussed and an emperical mathematical relation between liquid concentration, differential head, Induce concentration, differential head, and pipe velocity is presented and discussed. The feasibility of use of the elbow meter for flow measurement of slurry type flow is highly possible, but calibration of meter in place is recommended. Also, the viscous properties of the material metered are believed to play an important role in the meteric performance meter's performance.
- (5173) SUCTION DREDGING LITERATURE SURVEY.
 - Ellicott Machine Corp., Baltimore, Maryland. $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Ellicott Machine Corp., Baltimore, Maryland. Applied and basic research. This report is a brief review and summary of selected literature pertaining to equipment and methods associated with dredging practice and laboratory studies of dredge pumps. It consists of four parts: (1) Sum-mary and discussion section. (2) Selected abstracts. (3) Annotated bibliography. (4) Bibliography. The discussion section consists of two parts. Part 1 discusses dredging equipment and dredging in general. Part 2 discusses dredge pumps.
- (5174) FERFORMANCE STUDY OF A 1:6 MODEL DREDGE PUMP.
 - Ellicott Machine Corporation, Baltimore, Md. (b) Applied and basic research. $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Performance tests were made on five 1:6 scale model impellers. Each impeller was tested at four constant speeds over a wide range of heads and discharges. Water and two concentrations of a typical dredging mud were tested with each impeller at all four speeds. Various graphs and design application curves were developed for making similarity studies and designs in the homologous series of pumps.
- (5550) CAVITATION STUDIES ON A MODEL DREDGE PUMP.
 - Ellicott Machine Corp., Baltimore, Md.
 - (d)
 - Ellicott Machine Corp., Baltimore, Md. Applied and basic research. Effect of various pump design parameters on cavitation is being investigated. Water and two concentrations of a typical dredging mud are being used as dredging material in the laboratory. Other variables, in addi-tion to geometric characteristics of the (e) pump, include pump speed and rate of flow. "Modification in a Dredge Pump Affect High
 - (h) Speed and Cavitation Characteristics," by W. P. Isaacs and J. B. Herbich, Fritz Laboratory Report No. 301.3, Lehigh Univ., 1964

- (5551) EFFECT OF LIQUID VISCOSITY ON CAVITATION OF A MODEL DREDGE PUMP.

- A numerical analysis to determine the amount (e) of dispersion between miscible fluids of differing quality in radial, confined flow through a porous medium has been completed. An investigation of dispersion arising from the injection of a contaminant through a recharge well and the withdrawal of fresh water through a pumping well, both pumping at the same rate, in an infinite, confined aquifer is being carried out currently. Results will be important to engineering projects in the recharging of aquifers with reclaimed waste water.
- (g) A general correlation has been made of known dispersion coefficients, using the correct dimensionless representation. Measurements have been made of the amount of dispersion (mixing) that occurs when a single well, (mixing) that occurs when a single well, pumping at a steady rate, discharges re-claimed waste water into an infinite, homogeneous, isotropic aquifer. A numerical solution of the governing differential equa-tion has been obtained. This solution is compared with several approximate methods of solution to the differential equation and to some known field and experimental results. In the final phase, the problem of two-dimensional dispersion, arising from the steady injection of a contaminant through a recharge well and the steady withdrawal of fresh water by a pumping well (both pumping at the same rate), is being investigated experimentally and numerically. A sand model of this two-well flow problem has been constructed.

 - (e) An investigation of the turbulent wakes generated by two- and three-dimensional bodies moving beneath the free surface. The effects of density stratification are included in the study.
 - (g) Velocity distributions have been measured at various distances behind a two-dimensional body moving at different depths of submergence in a homogeneous fluid, and at the interface of a two-layered density-stratified fluid. The turbulent mixing between the two layers has been measured by measuring concentration profiles of the tracer, initially present in only the lower, heavier layer, at various distances behind the body. The The vertical-diffusion coefficient has been found to decrease significantly with increasing density difference between the two fluid layers. The density stratification also layers. The density stratification als causes the wake width to decrease with increasing distance behind the body after attaining a maximum value at a moderate distance behind the body. The velocity profiles in the stratified fluid are of the exponential, similar type, but cannot be predicted using the methods developed for homogeneous fluids, because of the collapse of the wake width.  (e) The primary purpose of this project is to investigate the laws governing tide propagation and salt water intrusion in estuarial channels, and erosion, transport, and deposition of fine material in estuaries. The long range goals of these studies are: (a) To make possible a theoretical or an experimental prediction of salinity and current velocity changes caused by certain engineering operations in caused by certain engineering operations in estuarial areas; (b) to provide enough inestuarial areas; (b) to provide enough in-formation for a reasonable theoretical or experimental evaluation of fine sediment transport and deposition particularly in estuarial navigation channels; (c) to establish rational criteria for the stability of channels with cohesive bed and banks and their pro-(g) An annular rotating "endless" channel has been
 - constructed. An annular plate within the annular channel rotates in opposite direction annuar channel rotates in opposite direction to the channel, inducing shear stresses within the fluid. The shear stress on the annular plate is measured by means of calibrated strain gages. This setup will be used for an investigation to determine what factors are important in the erosion and deposition of cohesive soils.

Extensive field research was conducted during the summer of 1964 within the Maracaibo estuary to determine the sediment motion, salinity variations, and the major source satinity variations, and the major source or sources of sediment. An interesting sediment and salinity distribution pattern was disclosed, which eliminated certain sources of sediment and contributed signifi-cantly to the understanding of the general picture. Preparations for determination of internal currents within the Maracaibo octuary unders Dedemine D as a water tracer estuary using Rhodomine B as a water tracer are under way. Some flume experiments were carried on at the University of Zulia, Maracaibo on deposition rates of estuarial sediment.

 (d) Theoretical and experimental; basic research.
 (e) A study of the feasibility of small scale models in which similitude with respect to gravity and Coriolis forces is obtained. Velocity and time scales are obtained from Frondian conditions for a distorted model. Model is rotated to obtain effect of Coriolis acceleration.
 - (g) Surface current patterns on a small model of Lake Michigan have been obtained for a constant wind field both with and without rotation of the model. The effect of a vertical density stratification on current patterns has been studied. The production of a thermocline by infrared heating of the model surface has also been investigated. Results indicate that rotation of the model produces marked differences in circulation patterns when compared to non-rotating model A small model of Lake Maracaibo (Venezuela) has been constructed for the purpose of studying the peculiar pattern of salinity distribution which exists in the lake. Results indicate that pattern is produced by

interaction of wind generated currents and Coriolis effect.

 - (d) Experimental and theoretical; basic research (Master's thesis).
 - (e) An investigation of a free surface flow of a real fluid over a small-amplitude sinusoidal bed in a rectangular-cross-section channel.
 - (g) Velocity profiles upward from the bed and outward from the vertical side walls have been measured at various locations along a sinusoidial-shaped wavy bed, and along an isolated sinusoidial hump in the channel bottom. It has been found that the displacement thickness of the straight vertical walls varies periodically along the length of the channel with the same period as the wavy bottom. This undulation in the displacement thickness generates diagonal free-surface waves which criss-cross the flume, a new wave being generated by each wave on the channel bottom. Pressure and velocity measurements indicate that the perturbation in the displacement thickness is caused by secondary currents resulting from the interaction of the boundary layers of the vertical side walls and the distortion of the vertical and lateral pressure gradients caused by the curvature of the bed. The orientation of the diagonal wave is in good agreement with that predicted using small-amplitude wave theory.

 - (b) Cooperative with the U. S. Soil Conservation Service, U. S. Geological Survey, and Mass.
 - Water Resources Commission. (c) Prof. George R. Higgins, Engineering Research Institute, Univ. of Mass., Amherst, Mass. 01003.
 - (d) Experimental-field and laboratory; for design of watershed yield, flood peak reduction and general information.
 - (e) Mass curve and Duration curve studies for reservoir and water-shed yield have been done for nearly all the gaged streams in Massachusetts. The purpose of the study is to determine general information for optimum use of water resources of the state. Par-ticular emphasis on recreational aspects and low flow characteristics is presently being considered.
 - (h) Progress reports were submitted to the University Research Council in 1959 and 1960. Reports for the Massachusetts Water Resources Commission were submitted in 1963 and 1964.
- (4166) AGITATION CHARACTERISTICS IN LIQUID-LIQUID SYSTEMS.
- (b) National Science Foundation; University of Massachusetts Research Council.
 - (c) Associate Dean E. E. Lindsey, Engineering Research Institute, University of Mass., Amherst, Massachusetts 01003.
 - (d) Experimental; basic research for master's thesis.
 - tnesss.
 (e) Two immiscible or partly miscible liquids are used. Dispersions are produced in a dynamometer agitator and particle sizes of the sampled dispersion are measured by a light scattering technique. One thesis was concerned with developing the technique and study in geometrically similar, baffled tanks, another thesis with transient change in drop sizes at the start of agitation. Current project is to study variations in geometry. Work is continuing on development of light-scattering probe to measure particle size directly in the mixing tank. (g) Primary peaks in the drop size distribution
 - occurred at 1 to 3 microns, secondary peaks at about 30 microns. Drop size distribu-tion is essentially identical in geometrically similar vessels of different size of equal power/volume. There is a slight de-crease in size with increased agitator speed. Comparison of two liquid systems indicates drop size decreases with increasing vis-cosity. Steady state drop size distribution occurred in 30 to 60 minutes.
- (4167) PRESSURE DROP ACROSS FITTINGS.
 - Laboratory project.
 - (c) Dr. Kenneth D. Cashin, Prof. of Chemical Engineering, Dept. of Chemical Engineering, Univ. of Mass., Amherst, Mass. 01003. (d) Experimental; Senior Work Scholarship

 - (d) project; basic research.
 (e) Pressure drop is measured for a number of different pipe fittings placed in series and at different spacings; to determine effect on pressure drop of closely spaced fittings as compared with those widely separated.
 - as compared with onder widely separated. Two (or more) similar fittings when very closely spaced (1 to 4") give less pressure drop than the same two (or more) fittings when widely spaced (10" or more). The difference between the two different pres-(g) sure drops decreases with increasing Reynold's number.
- (4656) THE EFFECT OF NON-NEWTONIAN FLUID INJECTION ON THE TURBULENT BOUNDARY LAYER OF A FLAT PLATE.
 - (b) Laboratory project.

- (c) Dr. Charles E. Carver, Jr., Prof. of Civil Engrg., Univ. of Mass., Amherst, Mass. 01003 Experimental; basic research.
- (e) A number of non-Newtonian additives, including two types of guar gum, CMC, and a polyoxide mixed with water, are injected in the laminar boundary layer near the leading edge of a flat lucite plate at in the plate. The flat plate is installed in a small water tunnel through which clear water flows with a free stream velocity $U_{\rm O}$. A lead zirconate pressure transducer is installed flush with the plate a few inches downstream of the injection slot such that the overlying boundary layer is turbulent. It is found that no detectable decrease in turbulent intensity occurs with injection as opposed to no injection, for all addi-tives employed. Concentrations of additive varied from 0.125% to 5%. Completed.
- $\binom{f}{h}$ Master's thesis by A. Amatangelo in preparation.
- (4657) THE RESPONSE OF A DENSITY CURRENT TO A SINUSOIDAL PRESSURE PULSE.
 - (b) (c)
 - Laboratory project. Dr. Charles E. Carver, Jr., Professor of Civil Engineering, Univ. of Massachusetts, Amherst, Mass. 01003.
 - (d) (e) Experimental; basic research. A system of oscillatory waves is imposed on the upper layer of a two-layered system con-sisting of clear and saline water. The response of the interface is observed in terms of the frequency and amplitude of the imposed waves at the free surface. The amplitude of the interfacial wave is seen to increase in accordance with an inviscid theory of Stokes. (h) Master's thesis by Chao-ho Sung completed.
- (4658) THE EFFECT OF HEADER GEOMETRY UPON FLUID FLOW CHARACTERISTICS IN NUCLEAR REACTORS AND HEAT EXCHANGERS.
 - (b) Laboratory project.
 - Prof. Joseph M. O'Byrne, Engineering Research Institute, University of Massachusetts, (c) Amherst, Mass. 01003.
 - Ammerst, Mass. Olos. Experimental; applied research. To determine the relationships between such variables as core and tube diameter, tube lattice and spacing, header height, etc., upon the individual flow per tube for a pressure vessel in which fluid is introduced (d) (e) through a single radial line placed at the base of the header.

 - (d) Theoretical and experimental; basic research.
 (e) To investigate the fundamental principles underlying the flow of colloidal suspensions into or through porous media. The scope of this study will include the use of several granular materials and suspensions of colloidal materials. Initially, carborun-dum will be used as the porous media and Wyoming bentonite as the suspended material in wyoming betchilte as the suspended material in order that there will be continuity between the present work and past studies. Materials to be used later will include chemically active materials such as zeolite, natural occurring materials, such as soils and filter sands. The natural occurring materials will be used to tie this basic study to practical applications in the field. Both the porous media and the suspended materials will be characterized completely by determination of various physical and chemical properties. The granular material will be placed in a permeameter for testing. The actual test procedure will involve three phases: (1) Initial flow of de-aired; de-ionized water through the porous media in the permeameter; (2) followed by the introduction of the suspension into the permeameter; (3) finally the de-aired, de-ionized water will be reintroduced into the permeameter in order to determine the effect of the suspension
 - to determine the effect of the suspension flow on the system.

Inquiries concerning the following projects, should be addressed to Prof. Sam Shulits, Head, Hydraulics Laboratory, 212 Sackett Building, The Pennsylvania State University, University Park, Penna. 16802.

- (5181) ROUGHNESS COEFFICIENTS OF COBBLE-STREWN STREAMS.
 - (b) Laboratory project.(d) Experimental: appli
 - Experimental; applied research; doctoral thesis.
 - (e) Purpose: To provide a quantitative means of determining Manning's "n" or the coefficient K in V=KR^{2/3} S^{1/2} in cobble-strewn streams, K in V=KH^{2/2} S^{2/2} in cobble-strewn streams, particularly for use in the slope-area method of computing flood discharge. In a tilting flume, 5.5 ft wide, 1 ft deep and 53 ft long, roughness patterns are created with large and small concrete blocks. Maximum discharge 5 cfs, corresponding to a small stream.
 - (g) Previous work revealed systematic relationships among the roughness coefficient, Reynolds and Froude numbers, and a special quantitative Froude numbers, and a special quantitative parameter of the roughness pattern. See "Large-Scale Roughness in Open-Channel Flow" by J. B. Herbich and S. Shulits, Journal, ASCE Hydraulics Div., Vol. 90, No. HYG, Proc. Paper 4145, Nov. 1964. Where-as the latter dealt with cubical roughness elements in transverse rows and low flows, the current research treats two extensions: (a) High flows in which the height of the roughness elements (concrete blocks) is a small fraction of the water depth and (b) the condition in cobble-strewn streams of cobbles on a rough rock bottom with slight protrusions.
- (5182) TRANSITIONS IN SUPERCRITICAL FLOW.
 - (b) Pennsylvania Department of Forests and
 - Waters.
 - (d) Experimental; applied research, design.
 - (e) See Abstract in (g).
 - (g) Transitions of three different shapes were tested for Froude numbers varying from 1.2 to 3.0, representing test flows of 0.56 to 5.27 cfs. Each transition connected an upstream trapezoidal channel with a downstream (3143) REDUCTION OF SKIN FRICTION DRAG. rectangular channel, all three parts lying on one straight center line and having constant and continuous invert slopes. One transition type had warped walls. The other two effected the transition with The plane walls: one with a vertical surface above a sloping one, and the other with a above a sloping one, and the other with a sloping surface above a vertical one. The experiments with each of the three shapes covered combinations of five transition lengths with three depths in the trapezoidal approach channel. Twenty-eight different transitions were investigated. Tables and charts summarize the variation of the water

surface caused by the wave patterns due to supercritical flow, along the channel wall and the center line. Not only d Not only do these tables and charts give a picture of the complex wave patterns, but they are a basis for the design of transitions of the

basis for the design of transitions of the three tested shapes. A guide is offered for the application of the extensive data to actual design. "Open-Channel Transitions in Supercritical Flow-Part A-" by F. L. Blue, Jr., and S. Shulits, Hydraulics Laboratory Bulletin, December 1964. (h) Also a silent film, "Some Wave Phenomena in Transitions in Supercritical Flow."

(5183) EXNER EQUATIONS OF RIVER FORM.

- (b)
- Laboratory project. Theoretical; basic research. Felix Exner's simple erosion postulates of the 1920's result in equations which produce (d) (e) rather closely dune, bed and bank forms of real rivers. The accuracy of his equations and charts of river forms are being verified so that the concept embodied in the postulates can be extended and applied to the prediction of river development.
- (g) Two equations have been verified, one is in doubt.

- (5590) INVESTIGATION OF SHED WING VORTICES AND THEIR DECAY.

 - (b) Laboratory project sponsored by the Army Research Office, Durham, North Carolina.
 (c) Dr. Barnes W. McCormick, Jr., Ordnance Research Laboratory, University Park, Penna. 16802.
 - (d) Experimental; analytical; basic research.(e) The vortex sheet shed by a wind tunnel mounted, semi-span lifting wing has been investigated at various angles of attack and free-stream velocities. The vortex core has been studied by mapping the downstream flow field at distances up to 20 chord lengths. Tangential velocities of vortices have been determined by integrating the vorticity through the vortex core. The local vorticity is measured by a pitchless, cruciform vane which rotates in rotational flow. Rotational speeds of 40,000 rpm have been measured. Similar investigations will be conducted by mounting the vortex probe behind the wing of a full-scale flight test airplane. Cualitative characters of shed vortices have been studied by flying an airplane adjacent to a large tuft grid and photographing the motion of the tufts as
 - (g) It is believed that after completion of the investigations it will be possible to predict the vortex geometry of an arbitrary air-craft as a function of the airplane configuration and distances downstream.
- (5591) BCILING BOUNDARY LAYER.

 - (e) boundary layer on a flat plate.
- (5592) EXPERIMENTAL INVESTIGATION OF SECONDARY FLOW IN AXIAL FLOW INDUCERS.
 - Laboratory project sponsored by NASA. Dr. George F. Wislicenus and Dr. B. Lakshminarayana, Dept. of Aeronautical Engineering, The Pennsylvania State Univ., University Park, Pa. 16802.

- (d) Experimental and theoretical.
- (e) A three-foot diameter model of an axial flow inducer for a pump was built and will be tested with air, using smoke for direct observation of secondary motions in long and narrow vane passages. In addition, approximate measurements of the velocity distribution at inlet and discharge will be made to obtain at least a qualitative picture of the fluid motions under the predominant influence of viscous fluid friction.
- (5593) INVESTIGATION OF LAMINAR BOUNDARY LAYER AND TRANSITION IN THE VICINITY AND BETWEEN SUCTION SLOTS.
 - (b) Laboratory project sponsored by the Bureau of Naval Weapons and the Office of Naval Research.
 - (c) Dr. Thomas E. Peirce and Mr. Charles F. Holt, Ordnance Research Laboratory, University Park, Pa. 16802.
 - (d) (e) Experimental and theoretical.
 - This project will examine the characteristics of the flow at the entrance to suction slots and determine the effect the suction slots have on the laminar boundary layer flowing into each slot. This investigation will be limited to plane radial slots and the effect that variations in slot shape have on the laminar boundary layer.
- (5594) GRID TURBULENCE IN DILUTE POLYMER SOLUTIONS.
 - (b) Bureau of Naval Weapons and the Office of Naval Research.
 - Dr. John L. Lumley and Mr. Andrew G. Fabula, Dept. of Aeronautical Engineering, The Pennsylvania State Univ., University Park, (c) Pa. 16802.
 - (d) Experimental and basic research for Ph.D. thesis.
 - (e) Turbulent velocity measurements will be made behind a grid in a 48-foot towing tank filled with dilute polymer solution. Experimental spectra and correlation functions will be compared with previous measurements in Newtonian fluids and with theory, in order to investigate possible explanations of the Toms effect (the friction reduction in turbulent flow produced by extremely low concentrations of very high molecular weight polymers).
- (5595) TURBULENCE MEASUREMENTS IN THE VISCOUS SUBLAYER.
 - (b) Bureau of Naval Weapons and the Office of Naval Research.
 - (c) Dr. John L. Lumley and Mr. Henry Bakewell, Ordnance Research Laboratory, The Pennsyl-vania State University, P. O. Box 30, State College, Pa. 16801.
 - (d) Experimental, basic research for Ph.D. thesis.
 - (e) u-u space-time correlations will be taken in the viscous sublayer under a turbulent boundary layer in glycerin. The sublayer thickness is such that a $y^+ = 5$ corresponds to 0.25 inches. It is hoped that these measurements will shed light on the dynamics of the sublayer, in particular on the translation velocities of disturbances there.
 - - (b) Office of Naval Research.
 (c) Dr. John L. Lumley and Mr. Kirtan Singh, Dept. of Aeronautical Engineering, The Pennsylvania State University, University Park, Pa. 16802.
 - (d) Theoretical, basic research for Ph.D. thesis.
 - (e) Machine calculations will be made of the initial effect on the energy budget re-sulting from a sudden change in the constitutive relation (from Newtonian to any of several non-Newtonian types) of a

fluid in isotropic, homogeneous turbulent motion. It is hoped that the investigation will provide insight into the mechanism by which low concentrations of high molecular weight additives markedly change the skin friction in turbulent shear flows (the Toms effect).

PRINCETON UNIVERSITY, School of Engineering and Applied Science.

- (5184) FALL OF A SPHERE IN A HORIZONTALLY OSCIL-LATING FLUID.
 - Laboratory project. (b)
 - (c) Prof. Lucien M. Brush, Jr., Departments of Civil and Geological Engineering, Princeton University, Princeton, N. J.
 (d) Analytical and experimental, basic research,
 - (e) The purpose of this research is to predict
 - the temporal mean fall velocity of a spher-ical particle falling in a horizontally oscillating fluid. An analytical solution was derived for particles with a small (0.1) Reynolds number. A numerical solution is newholds humber. A humbers is further as possible for large Reynolds numbers. Experi-mental verification of the appropriate equations is the purpose of the study. The results will be applicable to problems involving turbulent diffusion of sediment.
- (5185) DYNAMIC STORAGE OF GROUNDWATER.
 - (b)
 - Laboratory project. Dr. R. J. DeWiest, Assoc. Prof. of Geological Engineering, Frinceton University, Princeton, New Jersey.
 - (d) Analytical and experimental, basic research, master's thesis.
 - (e) Purpose of the research is to investigate the dynamic behavior of a groundwater basin intersected by streams and from which water is withdrawn at a time dependent rate. An electric analog model (R-C) will be constructed.
 - Freliminary steady state study was published in the Journal of the Hydraulics Division, American Society of Civil Engineers, Nov. 1963. (h) "Replenishment of Aquifers Intersected by Streams," pp. 165-191, available from the American Society of Civil Engineers.
- (5186) MEASUREMENT OF UNSTEADY PRESSURES.
 - Laboratory project. Prof. C. P. Kittredge, Dept. of Aerospace and Mechanical Sciences, Princeton University, Princeton, N. J. Theoretical and experimental, M.S. thesis. The differential equations of motion for a
 - simple manometer system with non-linear damping have been programmed for an IBM 7094 data processing system. An experimental program to check the computation is planned.
- (5480) INERTIAL EFFECTS IN TURBULENT SUSPENSIONS.
 - (b) National Institute of Health, Public Health Service.
 - Prof. Lucien M. Brush, Jr., Departments of Civil and Geological Engineering, Princeton, N. J. Theoretical and experimental; basic re-
 - search.
 - (e) The purpose of this research is to examine the inertial lag between particle motion and fluid motion in a turbulent suspension. A turbulence tank consisting of an oscil-lating three-dimensional grid will be used for the emergined. for the experiment. Measurements are to be made of the energy contribution to the system as a result o collisions between particles and the grid. By varying the frequency of oscillation, grid spacing and size, and particle density, an attempt will be made to describe the de-

tailed particle motion and the sediment diffusion coefficient.

(4679) FLOW LAWS FOR THE MOVEMENT OF WATER IN SOIL.

- (b) Laboratory project.
- (c) Dr. Dale Swartzendruber, Department of Agronomy, Purdue Univ., Lafayette, Indiana.
 (d) Experimental and theoretical; basic for
- Ph.D. thesis.(e) The validity of basic equations for water relationships in soil, such as Darcy's proportionality and Buckingham's capillary potential function, is being tested under various circumstances. Revised equations and mathematical solutions for deviating behavior are also being sought.
- (g) An attempt was made to use the pressure-plate outflow method for measuring water diffusivity, specific water capacity, and capilary conductivity as a function of water content. Measurements were made on two nonswelling porcus materials over a pressure range of 100 to 900 mb., but with pressure steps ranging from 25 to 400 mb. The origination outflow curves did not The experimental outflow curves did not conform to theoretical predictions, thus making it difficult to compute a meaningful diffusivity value. Also, for sufficiently small pressure steps, the specific water capacity was a fluctuating function of water content, rather than changing monotonically. Since the capillary

conductivity is the product of the water diffusivity and the specific water capacity, a meaningful conductivity value is made quite difficult to determine. It is concluded that present mathematical solutions for the pressure-plate outflow method are inadequate. In a second study, involving water movement into initially air-dry, horizontal columns of soil, moisture distributions at various times were found not to reduce to a single curve when adjusted by the square-root-of-time factor as required mathematically by the solution of the nonlinear diffusion equation. The discrepancies found in this second study may be due to the same factors as are causing the deviations in the pressure-plate outflow method.

 - This program is part of a continuing analyt-ical and experimental study of liquid film cooling in rocket motors. The current phase (e) is concerned with the fundamental mechanisms of heat and mass transfer related to the of heat and mass transfer related to the liquid film in strictly controlled experi-ments in a wind tunnel. A liquid film is established on a polished flat plate. Air in both cold flow and at 1000R at a total pressure from 100 psia to 750 psi is passed over the liquid film. Negative pressure gradients of various values are inducted by contoured sections. The tem-nerature distribution in the test plate and perature distribution in the test plate and the profiles of velocity, temperature and concentration will be determined for various different combinations of flow parameters. Film stability and film thickness will also be investigated.

- (4197) FLUID LINE DYNAMICS.
 - Laboratory project. Prof. Rufus Oldenburger, School of Mech. Engineering, Purdue Univ., Lafayette, Ind. (b) (c) 47907.
 - (d) Theoretical and experimental project; Master's and Doctor's Thesis Research.
 - (e) Mathematical models in use for systems with significant fluid lines are generally so complicated as to make design with such models impractical. In this investigation models are sought which are as simple as possible but which still adequately describe the response of the system to the class of disturbances of interest. Using infinite product expansions of transcendental functions satisfactory results have been obtained for single conduits terminating in lumped elements. Viscosity, boundary effects and line vibration are being considered in the analytical work. Frequency response runs to verify the theory are being made to determine the range for which solutions obtained are applicable. The theoretical and experimental approaches are being extended to systems with two or more lines. Rational approxi-mations to the transfer functions of such systems are sought where the accuracy of the approximation, as is the case directly from the approximation, as is the case where infinite products have been applied. Studies so far have been restricted to medium and large diameter lines. They are being extended to very small lines in the capillary class.

The rate of dispersion of a pressure wave in a single line of constant cross section is also under study and the reinforcement of such a wave traveling back and forth in a conduit closed at both ends. (g) Theory and tests show that for a wide range

- of operation encountered in practice flow through bends may be treated as flow through straight conduits. Mathematical models developed for straight fluid lines describe their response to high frequency. However, if resonance effects are to be included a certain complication of the model is necessary, beyond which further simplifi-(h) "Simplification of Univ
- cation is not possible. "Simplification of Hydraulic Line Dynamics by Use of Infinite Products," R. Oldenburger and R. E. Goodson.  - St. Anthony Falls Hydraulic Laboratory.
 (d) Experimental; generalized applied research for development and design.
 (e) A two-sided drop inlet having a width equal

to the pipe diameter and a variable length is currently being tested to determine the effect of orifices in a drop inlet on the spillway performance. The tests on the drop inlet without orifice and having a flat bottom have been completed; tests of a drop inlet having a semi-circular bottom are planned. The anti-vortex device consists of a horizontal plate supported above the crest of the drop inlet by end piers. The character-istics, performance, losses, and pressures in the drop inlet and on the anti-vortex plate the drop inlet and on the anti-vortex plate are being determined for various combinations of drop inlet length, and height and overhang of the anti-vortex plate. Water is used as the model fluid to determine the performance characteristics, and head-discharge re-Mathematical and the second se loss coefficients and the pressure coefficients.

A square drop inlet having a hood barrel entrance is being tested to determine entrance loss coefficients for various drop inlet sizes and heights and various barrel slopes. Previous tests have evaluated the performance of this type of inlet. The effect of low-level orifices on the performance of the two-way drop inlet spillway has been studied. The theory of closed conduit spillways has

- (g) Results of tests on many forms of the closed conduit spillway entrance have been published. Pipe culverts laid on steep slopes may flow completely full even though the outlet discharges freely. Generalized methods for analysis and reporting of the results have been developed. The use of air as the model fluid has been verified by comparing test results with those obtained using water as the model fluid. The drop inlet with the horizontal anti-vortex device causes the spillway to act as a selfregulating siphon when the headpool level regulating siphon when the headpool level approximates the anti-vortex plate elevation. The height of the anti-vortex plate above the drop inlet crest and the overhang of the anti-vortex plate determine the effectiveness of the plate as an anti-vortex device. For one form of the inlet, tests have been made to determine the crest loss coefficient, the barrel entrance loss coefficient, the pressures on the plate and the drop inlet, the general performance of the inlet, minimum and maximum permissible plate heights, and the head-discharge relationship for plate control. Variables have been the length of the drop inlet, the barrel slope, the height and overhang of the anti-vortex plate, and the sidewall thickness. Tests on the hood drop inlet have shown that the hood barrel entrance can be used to reduce the minimum required height of the drop inlet. Minimum sizes of drop inlet and antivortex devices have been determined. Tests of low-stage orifices in the two-way drop inlet have shown that improper location and improper proportioning of the orifices can prevent priming of the spillway. The proper location and size of the orifices have been determined.
- (1168) A STUDY OF CANTILEVEBED OUTLETS.

 - A laboratory thesis study. Theoretical; Ph.D. thesis. To investigate the rotational effect on (b) (d) (e) the cavity and drag characteristics of the above flow over a wedge. The flow is assumed to be rotational with constant vorticity. The method is to solve the mixed boundary value problem on the upper half of the semi-infinite plane using complex variable technique.
- (5507) LINEARIZED, TWO-DIMENSIONAL, HYDRODYNAMIC THEORY FOR THE LIFT AND MOMENT ON A NON-CAVITATING HYDROFIL WITH AN OSCILLATING FLAP IN A CHANNEL OF LIMITED DEPTH.
 - (b) (d) (e)
 - A laboratory thesis study. Theoretical; Ph.D. thesis. The mathematical model for the hydrofoil and its wake consists of an initially unknown vortex distribution and its reflec-tions in the free surface and the channel bottom. The velocity potential for the multiple image system is obtained from thin airfoil theory and the boundary con-ditions are applied to obtain a correction potential. The unknown vortex distribution potential. The unknown vortex distribution is represented by a Glauert Trigonometric Series whose first four coefficients deter-mine the lift and moment. An integral equation resulting from one of the bound-ary conditions is expanded in Fourier's Series and the coefficients of like terms equated leading to an infinite terms equated, leading to an infinite set of linear inhomogeneous algebraic equations which are solved for the first four Glauert coefficients using a digital computer. The theoretical solutions are compared with experimental measurements and with the theoretical solutions for airfoils with oscillating flaps.
 - (f) Completed. (g) The compare The comparison with experimental data leads to the inference that separation effects invalidate the assumed flow model for small flap chord to foil chord ratios and that the application of the Kutta-Joukowski condition at the trailing edge is not proper. The comparison with airfoll theory shows that the quarter-chord moment coefficients may be adequately predicted from tabulated coefficients for airfolls with oscillating flaps and that the presence of the free surface reduces the lift substantially. The theory indicates that the influence of the channel bottom leads to a slight increase in the lift but that this increase is negligible for channel depths in excess of twenty foil aged abords when the reduced is negligible for channel depths in excess of twenty foil semi-chords when the reduced frequency is high. The corresponding in-fluence on phases and quarter-chord moments is found to be small for all channel depths considered.
 - considered. "Linearized, Two-Dimensional, Hydrodynamic Theory for the Lift and Moment on a Non-cavitating Hydrofoil with an Oscillating Flap in a Channel of Limited Depth," by William H. C. Maxwell, Ph.D. Thesis, Univ. of Minnesota, Aug. 1964. (Available on microfilm from University Microfilms, Ann (h) Arbor, Michigan.)

INTER-AGENCY SEDIMENTATION PROJECT IN COOPERATION WITH ST. ANTHONY FALLS HYDRAULIC LABORATORY.

- (194) A STUDY OF METHODS USED IN MEASUREMENT AND ANALYSIS OF SEDIMENT LOADS IN STREAMS.
 - Subcommittee on Sedimentation, Inter-Agency Committee on Water Resources, Personnel of the U. S. Army Corps of Engineers and the U. S. Geological Survey are actively engaged (b) on the project.
 - (c) Engineer in Charge, Mr. Byrnon C. Colby, Federal Inter-Agency Sedimentation Project, St. Anthony Falls Hydraulic Laboratory, Mississippi River at Third Ave., S. E.,
 - Minneapolis, Minnesota. 55414. (d) Experimental; applied research and development.
 - (e) Drawings and specifications are available to facilitate the manufacture of suspendedsediment and bed-material samplers, particlesize analyzers, and associated laboratory equipment. Approved designs for the measurement of suspended sediment include a single-stage sampler, 4-,22-, and 62- pound depth-integrating samplers, and electrically integrating samplers, and electrically operated point-integrating samplers weighing 100, 200, and 300 pounds. Samplers for the measurement of bed material include a piston-type hand-operated sampler, a 30-pound band-line sampler, and a 100-pound sampler for cable suspension. Additional items are a sediment sample splitter, a bottom-withdrawal sedimentation tube for size analysis, and visual-accumulation sedimentation tubes with recording equipment for particle size analyses of sands. The primary objective of the current program is the development of an instrusediment concentrations in flowing streams.
 - (g) Field and laboratory tests have been con-tinued on intermittent pumping-type samplers, turbidimeters and on electronic, ultrasonic and nuclear sensing devices. Field testing of the nuclear density probe was continued in 1964. An improved sedimentation chamber was installed in the ultrasonic device, and the turbidity meter was modified to use either transmitted or reflected light to measure the concentration
 - reflected light to measure the concentration of particles suspended in a fluid. Progress reports entitled "Electronic Sensing of Sediment" and the "Turbidity Method for Suspended Sediment Analysis" are in prepara "Determination of Fluvial Sediment Discharge", Report No. 14, 151 pages, 1963. For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 price 70 cents per copy. (h)

UNIVERSITY OF SOUTH CAROLINA, College of Engineering, Department of Civil Engineering.

Inquiries concerning the following projects should be addressed to Dr. Harold Flinsch, Civil Engrg. Department, University of South Carolina, Columbia, South Carolina 29208.

- (4) THE DEVELOPMENT OF SURFACE WAVES BY WIND.
- Laboratory project. General theoretical, experimental, and field (a) research.
- (e) Research on the theories of surface wave noise and provide on the other of surface wave origin and growth, on measurements in the laboratory and in nature, and on the com-parative results of theory and measurement. Equipment has been assembled for telemeter-ing and recording wave height, period, and direction direction.
- A lake shore receiving and recording station (g) is under construction.
- (1631) THE EFFECT OF WAVES ON BEACHES.
 - (b) Laboratory project.

- (d) General theoretical, experimental, and field research.
- (e) Research on beach slopes and contours, in the laboratory and in nature. (g) Eight-directional wave tank has been
- completed.
- (1907) SHIP STABILITY AND ROLLING PERIOD.
 - (b) (d) Laboratory project. General theoretical, experimental, and
 - field research. (e) Rolling and pitching period and metacentric height relationships are studied for stationary and moving ships, in still water
 - and under wave action. Model experiments have been assembled in a brief report. (g)
- (4701) THE EFFECT OF TIDES ON HARBORS, BAYS, AND ESTUARIES.
 - Laboratory project. (b) (d)
 - General theoretical, experimental, and field research.
 - A study of the scouring or shoaling effect of tidal currents in South Carolina harbors (e) and estuaries.

SOUTHERN METHODIST UNIVERSITY, Hydraulics Laboratory.

- (5518) DESIGN, CONSTRUCTION, AND APPLICATION OF A SEEPAGE MODEL.
 - (b)
 - (c)
 - Laboratory project. Assoc. Prof. Cecil H. Smith, Southern Methodist Un'versity, Dallas, Texas 75222. Experimental; design, operation. The design of a seepage model tank and all appurtenances. Experimental verification of the theory of seepage vs. penetration of a sheet pile wall. Completed. $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Completed.
 - The project developed and refined equipment The project developed and refined equipment necessary for accurate investigation of seepage in a porous media. An experimental study was performed to check the theory of seepage quantities through and the tendency to quicksand in a homogeneous medium partially penetrated by a sheet pile cut-off wall. Results show fair agreement to caetere theory, but quick conditions are seepage theory, but quick conditions are not produced where theory would indicate.

 - (b) Office of Naval Research, Department of the
 - Navy.
 (c) Mr. P. Ward Brown, Chief of High Speed Craft Division, Davidson Laboratory, Stevens Inst. of Tech., 711 Hudson Street, Hoboken, New Jersey.
 - (d) Experimental and theoretical; applied research.
 - (e) A continuing investigation aimed at providing basic design information on three-dimensional hydrofoils operating near a water surface, under conditions of either fully wetted or fully ventilated flow. To date the forces and moments on a series of surface piercing dihedral hydrofoils have been measured and the hydrofoils have been measured and the dynamics of systems employing such foils has been studied, including the problem of a hydrofoil impacting on the water surface and the stability of hydrofoil craft, and their response in waves.
 (g) Analytical expressions for the forces and monoto or expressions for the forces and the dynamic in the stability wated and the stability of hydrofoils.
 - moments on surface piercing fully wetted moments on surface piercing fully wetted and fully ventilated dihedral hydrofoils, including the effect of flaps, have been obtained and confirmed experimentally. Un-steady problems including those of stability, impact and ventilation of such foils have also been dealt with. The conventional linearized supercavitating foil theory has been extended to cover the entire angle of ottack pares with cimplative and provision attack range with simplicity and precision. The response of surface piercing hydrofoil systems in irregular waves has been analyzed and techniques developed and proved experimentally for making predictions of the time history of motion response in irregular waves.

 - (d) research.
 - (e) An experimental and theoretical study is being made of the smooth water operation of a 110-ton craft supported by a tandem set

of surface-piercing hydrofoils. The aim of the study is to develop equations of motion and obtain the hydrodynamic data necessary to permit the behavior of the boat to be predicted in the case of coupled six degrees of freedom motions. Previous work has been restricted mainly to the study of the pure pitching and heaving motions. Solution of the motion equations developed in the theoretical part of this report reunit the theoretical part of this report re-quired that the hydrodynamic damping force and moment rate coefficients (YI, N' and K') be evaluated. These quantities could not be determined from the experiments, so a set of formulae based upon available theory were developed for this purpose. In addition, formulae were also developed for predicting the static force and moment rate coefficients (Y, and N,). These rates were used to substantiate the values determined experimentally and to lend assurance to the methods used for prediction.

Solutions to a linearized set of the original motion equations were obtained via the use of a digital computer. The three part program written for the UNIVAC 1105 computer establishes the pitch plane equilibrium conditions, calculates the zeroes of the decoupled yaw and pitch plane equations, and calculates a running trajectory for the craft. At the present time, these calculations are being com-pleted and the results analyzed.

- (g) The experimental results show that the lift developed by the rear foil is reduced appreciably by the presence of the forward foll. The rear foil also ventilates under design conditions. For the first time a number of hydrodynamic derivatives with respect to turning angular velocity were obtained from the experimental test results.
- (h) Progress Reports may be obtained through Correspondent.

(4228) FLUTTER OF HYDROFOILS ON FLEXIBLE STRUCTURES.

- (b) David Taylor Model Basin, Bureau of Ships, Dept. of the Navy.
- (c) Mr. Charles J. Henry, Research Engineer, Davidson Laboratory, Stevens Inst. of Tech., Hoboken, N. J.
- (d) Theoretical; basic research.
 (e) Since hydrofoil flutter appears to be possible and since a flutter accident may be dangerous, a thorough investigation of this phenomenon is needed involving the use of a realistic theoretical model. A first step in this direction is the study of the hydroelastic instability of a hull-appendage configuration by means of the assumed modes or Rayleigh-Ritz method of vibration analysis.
- (f) Completed.
 (g) Equations of motion were derived for the free vibrations of an elastic beam with a foilshaped appendage. Unsteady hydrodynamic effects on the foil have been taken into account by two-dimensional unsteady flow theory, applied in a stripwise fashion, whereas the hydrodynamic loads on the hull were reduced to the added mass effect. Computer programs were developed to predict
- the decay rate and frequency of this system in up to six degrees of freedom. "Hydroelastic Study of Elastic Beams with a Foil-Shaped Appendage," C. J. Henry and M. R. Ali, DL Report 1022, July 1964. (h)

 (c) Dr. 3. J. Lukasik, Chief, Fluid Fhysics Division, Davidson Laboratory, Stevens Inst. of Tech., 711 Hudson St., Hoboken, N. J.
 (d) Experimental, theoretical, and field investigations; basic research.
 (e) The purpose of this work is to study energy loss processes in shallow water waves.

Theoretically, this is of interest because unsteady viscous flows have received rela-tively little attention, particularly the case of an oscillatory flow with no mean flow. Analytical and numerical solutions of the non-linear Navier-Stokes equations are under investigation. Laboratory measure-ments in the Stevens shallow water wave channel have been made of the wave attenuation coefficient of a progressive wave, the action coefficient of a progressive wave, the bottom shear stress under a progressive wave, and the time decay of standing waves. Field measurements of the bottom pressure and bottom velocity in 40 foot depths have been made off Block Island, R.I. These field measurements provide the possibility of determining the applicability of the laboratory measurements and the theoretical studies to the geophysical problem of the energy loss by ocean waves in shallow coastal waters.

Direct measurement of the wave attenuation (g) coefficient both at Stevens and MIT indicated that the energy dissipation in a shallow water gravity wave exceeded that which would be expected from a linearized laminar solution of the Navier-Stokes equation valid in the bottom boundary layer. Several hypotheses have been examined in order to reconcile the discrepancy. It appears that the cause of the excess attenuation lies in the fact that the finite amplitude nature of the wave potential flow must be considered when formulating the boundary layer problem. For small deviations from infinitesimal amplitude theory, the Stokes approximation is valid. The attenuation theory, when revised to include the effect of the first two harmonics as well as the fundamental frequency, is then in much better agreement with the laboratory measurements of the attenuation. Oceanographic studies to relate the theory and laboratory work on the attenuation of gravity waves to the case of ocean swell are continuing. "Wave Boundary Layers - Theory," C. E.

Grosch. "Wave Boundary Layers - Experiments," S. J.

Lukasik. Papers presented at the Symposium on Dye Diffusion in Oceans and Fresh Waters, Lamont Geological Observatory, 31 August -2 September 1964. Proceedings to be pub-lished by Oceanographic Society of Japan.

- (4711) STUDY OF THE PROPELLER SINGING PHENOMENON.
 - (b) David Taylor Model Basin, Office of Naval
 - (b) David Taylor Model Basin, Office of Naval Research, Dept. of the Navy.
 (c) Dr. Jumpei Shioiri, Visting Scientist from Tokyo Univ., and Dr. 3. Tsakonas, Head of Fluid Dynamics Division, Davidson Labora-tory, Stevens Institute of Technology, 711 Hudson St., Hoboken, New Jersey.
 (d) Theoretical; applied research.
 (e) To study the propeller singing phenomenon as a self-excited vibration system composed of the Karman vortex-shedding mechanism and
 - of the Karman vortex-shedding mechanism and the propeller blade.
 - the propeller blade. Completed, final report in preparation. A model for the propeller singing phe-nomenon based upon the self-excited version was presented to interpret the step and jump characteristics in the singing fre-quency versus flow velocity diagram. The different elements of the "closed loop" of the self-excited vibrational system are the self-excited vibrational system are presented and discussed. Stability criteria derived for the synchronized run of the shedding mechanism, together with the positive work criteria imposed upon the phase relation between the blade vibration and hydrodynamic reaction of the shed vortices give a reasonable interpretation for the step and jump characteristics.
- (5057) UNSTEADY LIFTING SURFACE THEORY FOR A MARINE PROPELLER OF LOW PITCH ANGLE WITH CHORDWISE LOADING DISTRIBUTION.

- (b) David Taylor Model Basin, Bureau of Ships, Dept. of the Navy.
- Dept. of the Navy.
 (c) Dr. S. Tsakonas, Head of Fluid Dynamics Div., and W. R. Jacobs, Senior Research Engineer, Davidson Laboratory, Stevens Institute of Tech., 711 Hudson St., Hoboken, N. J.
 (d) Theoretical; applied research.
 (e) The purpose is to solve the surface integral accustion for a mathematical model with
- equation for a mathematical model with chordwise loading based on the first term of Birnbaum's distribution and to apply the results to the problems of vibratory thrust and torque of a marine propeller and far-field pressure signal from the propeller when it is moving in non-uniform inflow.
- (f) Completed. (g) The integral equation is solved for a mathematical model where the chordwise loading is taken as the first term of Birnbaum's lift distribution (flat plate) in conjunction with Glauert's lift operator. It is shown that this model is an improvement over the modified Weissinger model used previously in this series because it contains as a nucleus the exact two-dimensional solution and thus it provides a sounder basis for determining the three-dimensional effects. The blade loading is determined for a propeller operating in flow disturbances induced by the presence of a hull, blade camber and incidence angle. Calculations are made for the propeller vibratory thrust and torque and conclusions are drawn on the dependence of loading on the important parameters-blade-area ratio,
- the important parameters--olade-area ratio, aspect ratio and propeller pitch.

- (5059)THREE DIMENSIONAL GUST PROBLEM IN THE PRESENCE OF A FREE SURFACE.

 - (b) Laboratory project.
 (c) Dr. S. Tsakonas, Head Fluid Dynamics Div., and Mr. Charles J. Henry, Research Engineer, Stevens Institute of Davidson Laboratory, Stevens Institute of Tech., 711 Hudson Street, Hoboken, N. J. Theoretical, basic research. The kernel function is derived which relates
 - (d) (e) the normal velocity to the load distribution on a thin oscillating wing of arbitrary configuration moving near a free surface in three dimensional flow. This kernel function is developed in such a way that the resulting integral equation is amenable to numerical solution.
 - Completed.
 - (f) Completed.
 (g) The kernel function of the surface integral equation, which relates the unknown loading with the known downwash distribution on a hydrofoil of arbitrary orientation moving near the free surface, is derived. Limiting forms of the kernel at high and low Froude numbers are expressed in analytical forms. The two-dimensional counterpart of the kernel for the finite Froude number case agrees with for the finite provide number case agrees with the results previously obtained by other in-vestigators. Solution of the integral equation for the case of a flat plate of finite aspect ratio moving near the free sur-face at high Froude number is discussed.

 - INVESTIGATE GAIN IN WATER SPEED OBTAINED BY COUPLING AMPHIBIOUS CRAFT.
 - $\binom{b}{c}$
 - Office of Naval Research, Dept. of the Navy.
 Mr. Howard Dugoff, Assistant Chief, Vehicle Research Division, or Mr. Robert L. Van Dyke, Research Engineer, Davidson Laboratory, Stevens Institute of Technology, Castle Point Station, Hoboken, N. J.
 Experimental investigation; applied research. The purpose of the study is to investigate the gain in water speed that can be obtained by coupling several amphibicus vehicles end-
 - (e) by coupling several amphibious vehicles endto-end. Towing tank tests are being per-formed with six wooden scale models of the LVTP5 tracked amphibian to establish the drag characteristics per vehicle while increasing the number of units. Operation of both individual and coupled vehicles in waves of reasonable size ranging from head to quarter to following seas is also being studied. (g) No major results have yet been obtained.
 - (5313) HYDRODYNAMIC TRACK PROPULSION.
 - (b) Office of Naval Research.

- (c) Mr. Howard Dugoff, Assistant Chief, Vehicle Research Div., Davidson Laboratory, Stevens Institute of Technology, Castle Point Station, Hoboken, N. J.
- (d) Experimental and theoretical investigations; applied research.
- (e) The purpose of the study is to investigate the mechanism by which floating land vehicles propel themselves through water by use of their tracks only. Towing tank tests are being conducted using a non-operating track section. A theoretical performance analysis of the test configuration is also being made for comparison with the experiments. The results of this initial program are intended to provide data for the optimum design of an operating track model to be built and tested in a subsequent study.
- (g) No major results have yet been obtained.
- (5314) HYDRODYNAMIC WHEEL PROPULSION OF FLOATING LAND VEHICLES.
 - (b) (c)
 - U. S. Army Tank Automotive Center. Mr. Howard Dugoff, Assistant Chief, or H. M. Parekh, Research Engineer, Vehicle Research Div., Davidson Laboratory, Stevens Institute of Technology, Castle Point Station, Hoboken, N. J.
 - Experimental investigation; applied research. The fluid dynamic mechanism by which a float-ing land vehicle can propel itself through water by spinning its fully submerged wheels $\begin{pmatrix} d \\ e \end{pmatrix}$ is being investigated. Studies are being conducted on two related yet essentially disthinct aspects of the problem: Phase 1 Hydrodynamic Studies of Spinning Disk. Tests are being conducted to determine the thrust force which acts on a disk rotating about an axis parallel to a plane boundary. The experiments are being performed for com-parison with a proposed theoretical solution, reported on in last year's issue (reference number 5067), intended to provide an insight into the basic elements of the wheel propulsion phenomenon. Phase 2 Tests on Scale Model of Floating Cargo Truck. Towing tank tests of self-propelled scale model of a five ton army cargo truck are being conducted for investigation of its wheel propulsion character-istics. The tests closely parallel experi-ments performed previously at another labora-tory. However, because of the paramount importance of viscous effects in the wheel propulsion phenomenon, they are based on a Reynolds number scaling law rather than the Proude number law used in the previous tests. (g) Phase 1. The experimental results follow the trends predicted by the theory. In
 - general, however, the measured values of thrust are lower than the theoretical predictions. It is felt that this may be due primarily to deficiencies inherent in the available apparatus and in the test setup employed. Thus additional tests with an improved setup are planned. Phase 2. No major results have yet been obtained.

TEXAS A AND M UNIVERSITY, Department of Oceanography and Meteorology.

- (4866) MODIFICATION OF TWO-DIMENSIONAL LONG WAVES OVER VARIABLE BOTTOM TOPOGRAPHY.
 - (b) Coastal Engineering Research Center, DA-49-055-CIV-ENG-63-9.
 (c) Frof. R. O. Reid, Texas A and M Univ., College Station, Texas.
 (d) Theoretical applied research.
 (e) The objective is to investigate the modi-fluction of free gravity waves in variable

 - fication of free gravity waves in variable depth, including reflection and transmission aspects, with particular attention being given to the interaction of tsunamis with islands. The analysis employs numerical methods.

- (g) Modified long wave equations have been developed for taking wave equations have been and dispersive character of waves into account. A system of development of an orthogonal coordinate system for an island of general configuration is being investigated which will facilitate numerical analysis of the wave field. In this system, the island contour represents a given value of one of the coordinates, while in the far field the coordinates reduce to a simple polar or cartesian form (depending upon the method of analysis).

TEXAS A & M UNIVERSITY, Water Resources Institute.

Inquiries concerning the following projects should Water Resources Institute, Texas A and M University, College Station, Texas.

- (5477) THE MECHANICS OF EROSION BY FLOWING WATER.

 - Texas A & M University. Experimental; basic and applied. The study is to determine relationships between water erosion of solls and the (e) hydraulic characteristics of the flowing water, to develop quantitative relationships between specific soil properties and an acceptable erosion index, and to develop design data by which the erosion hazard can be adequately considered in the design of water control and management systems.
 - (g) Laboratory research has been carried out in the research flume on channel erosion and sediment transport with shallow flow, both with and without simulated rainfall. The effects of soil compaction on soil erosion have been studied in the flume. Chemical and mineralogical data are available on the soils. In addition, a rotating shear apparatus has been constructed and tests performed to measure the erosion character of soils in this laboratory device under carefully controlled conditions. The effect on erosion resistance of changing the cations on the clay are being studied in this apparatus.

----UNIVERSITY OF TEXAS. Department of Civil Engineering.

Inquiries concerning Projects Nos. 2162, 2397, 3524, 4234, 4235, 4715, 5456 and 5457 should be addressed to Dr. Walter L. Moore, Department of Civil Engrg., Univ. of Texas, Austin 12, Texas.

- (2161) CHARACTERISTICS OF A HYDRAULIC JUMP AT AN ABRUPT CHANGE IN BOTTOM ELEVATION.
 - (b) University of Texas Research Institute and Bureau of Engineering Research.
 (c) Dr. Carl W. Morgan, Assoc. Prof. of Civil Engineering, Univ. of Texas, Austin, Texas.

 - Experimental. Experimental determinations were made of the $\binom{d}{e}$ flow characteristics at two-dimensional channel drops and rises. The velocity distribution and surface profile were deter-mined throughout the length of the jump for various relative changes in bottom elevation. The longitudinal location of the jump in relation to the change in bottom elevation was varied over a broad range in contrast with previous related investi-gations in which relative location of the jump was held constant.
- (2162) HYDROLOGIC STUDIES, WALLER CREEK WATERSHED.

 - Cooperative with U. S. Geological Survey. Field investigation; applied research. Measurements of rainfall and runoff for a (a)
 - (e) 4 square mile and a 2 square mile portion of 4 square mile and a 2 square mile portion of the Waller Creek watershed are being made to provide basic information for estimating runoff from small urban watersheds in the Southwest area. Two stream flow stations and a rain gage net are in operation. Studies of the correlation between runoff, rainfall, and the characteristics of the drainage basin are being made by various perpendent methods to serve as a base for proposed methods to serve as a base for comparison with the data as it is collected from the stream.
 - (g) The records are now long enough to begin comparing with peak discharge estimates pre-viously given at least for short recurrence intervals. A start is being made on this analysis.
- (2397) EFFECT OF UPSTREAM DEVELOPMENT ON THE RUNOFF FROM SMALL WATERSHEDS IN THE SOUTHWEST.
 - Laboratory project.
 - (b) (d) (e) Field investigation (thesis). For selected watersheds rainfall runoff relations are being developed on a storm by storm basis. Multiple correlation diagrams, based on data before changes in the watershed, have been developed and used to compute runoff for later periods. Comparison of these computed runoff values with measured values is taken as an index
 - of the effect of watershed development. (g) The first results were not conclusive values. Further studies are being made on another watershed with an improved method which better accounts for the spacial variation of rainfall.
- (2874) AN INVESTIGATION OF THE SCOUR RESISTANCE OF COHESIVE SEDIMENTS.
 - (b)
 - The University of Texas Research Institute. Dr. Frank D. Masch, Department of Civil Engineering, The University of Texas, Austin 12, Texas. Analytical and experimental (laboratory).
 - Exploratory tests have been made with two different schemes, one with radially outward flow between a circular disc and the soil sample, and one with a submerged vertical circular jet impinging on a horizontal soil surface. With the first scheme it was not possible to obtain the necessary precision of measurement at low scour rates, but with the second scheme satisfactory measurements were obtained. A correlation based on dimensional analysis gave consistent results in evaluating the relative scour resistance of several materials. Apparatus has been fabricated for a new test which permits direct evalua-tion of the shear stress at the soil

surface. In this test a cylindrical soil sample is submerged in a transparent concentric cylinder which can be rotated at a controlled speed to generate a shear stress on the soil surface. Attempts are being made to relate the scour resistance to other measurable soil properties, and finally to interpret the results in re-lation to field observations.

- The apparatus to determine shear stress at (g) soil surface has been constructed and the calibrated, a test procedure has been developed, and tests have been conducted on soil samples.
- (3522) LONG TIME FLUCTUATIONS IN STREAM RUNOFF.

 - (b) Laboratory project.
 (c) Dr. Carl W. Morgan, Dept. of Civil Engrg., Univ. of Texas, Austin 12, Texas.
 (d) Analytical and field study.
 (e) Values of runoff from selected but.
 - Values of runoff from selected drainage areas in the lower Mississippi River Basin and in basins of the rivers emptying directly into the Gulf of Mexico were studied. Variations in the runoff values for each stream were considered and these trends compared with solar variations. The relative sunspot numbers were used as the measure of solar variations and were correlated with the mean annual runoff.
 - correlated with the mean annual runoff. Further correlations are being made with different "lag" periods between solar activity and surface runoff. The gradual shifting of the centers of runoff excess and deficiency is consistent rather than random and appears to represent a gradual cyclic change in the runoff pattern. It appears that the locations of the centers of runoff deficiency are following roughly (g) of runoff deficiency are following roughly the same path that they did some 22 to 24 years previously. Correlation coefficients of plus 0.2 to plus 0.5 are obtained for selected rivers in Mississippi, Alabama, Georgia, and Arkansas when sunspot numbers in the ll-year sunspot cycle are correlated with runoff. Texas streams do not give significant correlation with the ll-year support cycle but give better correlation if runoff is compared with the double sunspot cycle in which sunspot numbers are assumed as negative in alternate cycles.
- (3524) GROUND WATER FLOW AND SEEFAGE IN NON-HOMOGENEOUS, NON-ISOTROPIC SEDIMENTS.
 - Laboratory project.

- (b) (d) (e) Theoretical, basic. A relaxation solution for the Laplace equation has been developed which is applicable across a boundary between two regions of different permeabilities. It It is believed that the method can be expanded to apply to any specified non-homogeneous and non-isotropic condition. It is intended that the solution be set up for computation on an electronic computer and that selected numerical solutions be checked against those from an electrolytic tank.
- (4234) EVAPORATION REDUCTION BY CONTROL OF ADVECTED ENERGY.
 - (b) Partial sponsorship by the Lower Colorado River Authority of Texas.
 - (d) A Master's thesis involving theoretical and field investigation.
 - Measurements have been made to determine the temperature field in Lake Travis for the 1962-63 season. A method was developed to estimate the effect of withdrawing water (e) from near the lake surface. Monthly esti-mates of the resulting temperature field and reduction in evaporation were made.
- (4235) TWO-PHASE FLOW IN CONDUITS.

 - (b) Laboratory project.
 (d) Experimental master's thesis.

- (e) It is apparent that for a two-phase flow system with a liquid and gas, many dif-ferent types of flow are possible. This investigation explored the use of sound measurements to detect the type of flow present, in a metal pipe. Various types of flow were established in a thin-walled aluminum pipe, 1.66 I.D., with a transparent plastic section at each end. Records of the sound pattern were made with different pick-ups and correlated with the visual ob-servation of the flow type. Magnetic tape records of the sound were also made.
- (g) Study of the recorded sound patterns re-vealed some identifiable characteristics related to the type of two-phase flow in the line. Additional work is needed to refine techniques and try other sound pick-up and recording methods.
- (4716) DRAG FORCES IN VELOCITY GRADIENT FIELDS.
 - (b) (c) David Taylor Model Basin, Dept. of the Navy.
 - David Taylor Model Basin, Dept. of the Navy. Dr. Frank D. Masch and Dr. Walter L. Moore, Department of Civil Engineering, The Univ. of Texas, Austin 12, Texas. Theoretical and experimental; basic research. The investigation is being conducted to determine the effect of a velocity gradient on the local and conventional drag coeffi-cients for cylinders of varying L/D ratio and at different Reynolds Numbers. The study will be extended to other shapes. $\begin{pmatrix} d \\ e \end{pmatrix}$
 - study will be extended to other shapes.(g) Freliminary studies have demonstrated that the velocity gradient along a cylinder affects the drag coefficient. The local drag coefficient decreases along the cylinder in the direction toward the end of the cylinder where the velocity is high The reduction in drag coefficient is related to a dimensionless measure of the velocity

 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Data from selected watersheds have been
 - collected. These are being studied to evaluate the effects of urbanization on the hydrologic characteristics of the watersheds.
 - (g) For the Waller Creek Watersheds, Austin, Texas preliminary results indicate that because of approximately twice as high percent of impervious cover in the lower part it produced yields per unit area approaching twice that of the upper area.
- (5456) MATHEMATICAL MODELS FOR RELATING RUNOFF TO RAINFALL.

 - (b) Laboratory project.(d) Doctoral thesis based on computer analysis of field data.
 - (e) The study is presently aimed at determining the runoff hydrograph from the rainfall data for individual storms. A computer solution to a multiple correlation method is used to obtain the amount of runoff for successive time intervals for individual sub areas of the watershed, and a modified unit hydrograph approach is used to obtain the runoff hydrograph at the lower end of the watershed. Preliminary results indicate that the method will be useful to estimate storm hydrographs where rainfall data are available for a long time, and flow records are available for a short period. It is hoped that onlv additional correlations can be developed for base flow making it possible to build up continuous runoff hydrographs based on
 - rainfall records. Preliminary results indicate good success in predicting runoff hydrographs for indi-(g)vidual storms.
- (5457) A NEW TYPE ENERGY DISSIPATOR FCR CULVERT OUTLETS.
 - Laboratory project.
 - Experimental and theoretical doctoral thesis. A study is being made of a culvert energy dissipator based on the use of a sector of a circular hydraulic jump. Apparent

advantages of the device are the stability of the jump over a range of discharge and tailwater conditions and the opportunity to spread the culvert discharge back to the original stream width. Problems of practical geometry need to be explored to see what compromises can be made and still achieve satisfactory energy dissipation performance.

 - (d) Theoretical, basic research for master's thesis and doctoral dissertation.
 - (e) In order to obtain better quantitative agreement with the experimental frequency determinations of Fultz and of Edge, the analytical solutions for both two-dimensional standing waves and axisymmetric standing waves are being carried to the fifth order in amplitude. Velocity distribution, free-surface configuration, and frequency of oscillation are being obtained.
- (5460) WIND WAVE OVERTOPPING OF SHORELINE STRUC-TURES.
 - (b) Bureau of Engineering Research, Univ. of
 - Eureau of Engineering Research, Univ. of Texas, Austin 12, Texas. Dr. Frank D. Masch, Dept. of Civil Engrg., Univ. of Texas, Austin 12, Texas. Experimental, thesis. This study is designed to compare over-(c)
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ topping from wind waves with that predicted from criteria based on uniform wave trains. Overtopping is being wave trains. Overtopping is being measured under varying wind and wave conditions. Particular study is being given to beach geometry immediately in the front of the structure and its effect on overtopping rates.
 (g) Results obtained to date show that the greater the depth of water at the wall, be repeted to the structure results.
 - the greater the overtopping rates. The offshore beach profiles appear to have little or no effect on overtopping from wind generated waves.
- (5461) ANALYSIS OF UNIT HYDROGRAPHS FOR SMALL WATERSHEDS.
 - (b) (c)

 - Laboratory project. Dr. Carl W. Morgan, Dept. of Civil Engrg., The Univ. of Texas, Austin, Texas. Field investigation, thesis. Characteristic, two-hour unit hydrographs were determined for each of three selected $\begin{pmatrix} d \\ e \end{pmatrix}$ watersheds. The derived dimensionless hydrograph shapes were compared with two widely-used empirical hydrographs. Tech-niques were studied for using the S-curve hydrograph as an aid in estimating the correct duration of rainfall excess by selecting that duration which caused the least fluctuation in the S-curve.
 (g) The dimensionless 2 hour unit hydrographs
 - developed in this study indicate that the falling limbs of the Commons and Mockus hydrograph shapes may need revision in order to be applied to watersheds of less than 100 square miles in area. However, these differences are only minor

suggesting that an average dimensionless graph and reliable estimates of only two parameters, period of rise and peak discharge may be sufficient to define the shape of the unit hydrograph. Results indicate the S-curve can be used to estimate by trial and error the rainfall excess duration if rainfall data is not available.

 (e) A basic study of relationships involved in
 - A basic study of relationships involved in flow in steep, rough channels where the roughness is relatively an appreciable part of the depth, and where channels are sufficiently steep or steeper than a slope such that supercritical flow can occur in connection with contractions caused by the roughness. The work is basic, however, it will have application to steep mountain streams and to hydraulic structures. The objective of the work is to relate descriptive parameters describing the size and configuration of the bed roughness to slope, depth and discharge of channels of this class. Studies began using simple bar and cube elements and have progressed through the use of beds formed by gluing natural gravel elements of various size, gradation and intensity to the bed. Nineteen field sites have been installed in streams, prin-cipally in northern Utah in the Wasatch Mountains, but also in New Mexico and Colorado. Piezometric type stilling wells have been installed at several sites and discharge and depth measured. Bed element distribution and size have been studied at all sites. A laboratory model study of and configuration of the bed roughness to all sites. A laboratory model study of scouring and paving of high-gradient streams under a constant discharge was completed. Flume studies are continuing using natural-gravel elements glued to the beds in order to attempt to delineate Reynold's numbers
 - (g) For the bed paving studies, a bed of graded sand and gravel was placed in the flume at a preselected slope and allowed to scour under constant discharge until scouring equilibrium occurred. This was repeated for several dis-charges and three sizes of sand and gravel. Cross sections and slope were accurately measured and samples were taken of the elements in the paved bed. The final size of the bed elements was related to the dis-charge and the final slopesize correlates well with data for similar non-cohesive materials from canals using tractive force equations, even though discharges and slopes equations, even though discharges and slopes differ by orders of magnitude. The relation-ship $f(Q/d_{50}V,S)=0$, in which d_{50} is the final mean bed size, V is the Kinematic viscosity, and S the slope is proposed. The correlations of the forms $W = aQ^{0}$, $D = cQ^{f}$, and $V = pC^{m}$ where W is water surface width, D is mean depth, and V is mean velocity, G is discharge, and a, b, c, f, p, m are constants as pro-posed by Leopold and Mattock were consistent with field data of others. with field data of others. It was not possible to maintain stable beds for F = V/γ gD> 1 increasing the slope of the flume increased scour and the formation of combination bed elements sometimes in the shape of transverse bars prevented further increase in Froude's number. It is suggested that this condition would be one of minimum energy density per unit weight of water. As stable slope in-creased W/D decreased and bed-element size increased.

 - (b) Laboratory project.
 - Dr. Gordon H. Flammer, Associate Professor, (c) Civil and Irrigation Engineering Dept., Utah State University, Logan, Utah 84321.
 - Experimental and theoretical research toward (d)
 - a Master's thesis. This study was made to gain further infor-mation on flow characteristics (primarily (e) drag) around a hemispherical roughness eleof the depth of the free surface flow. To accomplish this, water surface data, ve-locity profile data and primarily drag data was taken for a range of Froude numbers. The thesis attempts to answer certain questions concerning the effects on a single large hemispherical roughness ele-ment in open channel flow. Of particular interest is the flow condition where the element has an effect on the fluid surface configuration.

An M.S. thesis has been prepared on this project. This work, however, is considered to be only preliminary to a continued

- to be only preliminary to a continued study of much wider proportions. The results of this investigation may be summarized as follows: (1) The drag force on the hemisphere is due primarily to wave drag in the Froude number range 0.35 to 2.50 and for submergence intervals y/k up to 1.2. (2) At a given submergence interva the coefficient of drag decreases as the Froude number of 1.5 for all submergence intervals. (g) intervals. This constant value is approxi-mately 0.2. (3) The drag coefficient increases with an increase in submergence in the Froude number range up to 1.5. (4) The relationship between the coefficient of drag and the Froude number tends to become linear as the submergence increases.

 - (g) The flume has been constructed and field calibration data obtained. The data are presently being analyzed.
 - Publication will be issued during the early part of 1965.
- (5445) TRAPEZOIDAL MEASURING FLUMES.
 - (b) Laboratory project.
 (c) Dr. Calvin G. Clyde, Professor of Civil and Irrigation Engineering, Utah Water Research Laboratory, Utah State Univ., Logan, Utah 84321.
 - (d) Design; applied researcn.
 (e) A proposed trapezoidal measuring flume with a design discharge of 300 cfs has been modeled
 The purpose of this in the laboratory. The purpose of this investigation is to arrive at a proper design and also to determine the feasibility of using this type of flume with both critical depth and submerged flow.
 - (g) Testing program has been completed. Results to date look very promising regarding the use of this type of flume for discharge measurement under submerged flow conditions.
 - (h) Publication will be issued prior to June 1965.
- (5446) THEORY OF INFILTRATION AND FLUID MOVEMENT IN UNSATURATED POROUS MEDIA.

 - (b) Laboratory project.
 (c) Dr. Yu-Si Fok, Utah Water Research Laboratory, Utah State Univ., Logan, Utah 84321.
 (d) Theoretical, experimental; basic research, applied research.
 - (e) To develop mathematical relationships ex-
 - pressing the phenomena of infiltration. Primary interest is the infiltration of water into the soil. Further development is to extend the developed theory to other fluid and media. To develop mathematical relationships expressing the fluid movement in unsaturated porous media. Primary interest is the move-ment of water in unsaturated soil. To evaluate the validity and applicability of the relationships developed from the mathematical analysis by field and laboratory tests.
 - (g) Equations expressing the infiltration rate as a function of the flow time as well as

the hydraulic conductivity, the total poten-tial heads, and initial and final moisture content, and the porosity of the soil for different time periods have been developed. Equations expressing the water movement in unsaturated soils as a function of the flow time have been developed.

- (5447) EFFECT OF MINERALIZED SPRINGS ON UTAH'S WATER RESOURCES.
 - (b) (c) Utah Water & Power Board.
 - Dr. J. M. Bagley, Associate Professor of Civil Engineering, Utah Water Research Laboratory, Utah State University, Logan, Utah 84321
 - Field investigation, applied research. In many areas of Utah, water quality problems are aggravated by contribution from highly mineralized springs which feed (d) (e) into regular water supplies. This investigation is to assess the nature and magnitude of these problems and outline possibilities for management to minimize their effect.
 - (f) Completed.
 (g) A statewide inventory of mineralized springs
 has provided information about mineral
 has provided information about mineral as provided information about mineral constituents, quantities of flow, and geographic and geologic characteristics. Interpretation and evaluation of this in-formation has permitted appraisal of current and potential effects of these springs on important water supply sources. Possibilities for control and management are being studied.
- (5448) EFFECT OF VARIOUS IRRIGATION TECHNIQUES ON SOIL AERATION, SOIL STRUCTURE, AND CROP RESPONSE.
 - Laboratory project. Prof. Jack Keller, Assistant Professor, Dept. (c) of Civil and Irrigation Engineering, Utah
 - State University, Logan, Utah 84321. (d) Laboratory experimental project dealing with an applied research problem.
 - (e) Laboratory studies utilizing a water applicator capable of uniformly applying water appli-at any rate between .01" and 6.0"/hour to the tops of 15 cm diameter soil columns were conducted. The soil columns were fitted with special soil depth, air permeability, and drainage apparatus. Water application rates of .04, .08, .16, .32, .64, 1.3, 2.6, and 5.2"/hour were applied to samples of a silty clay loam soil having various initial moisture contents and salinity levels. Three salinity levels giving an EC of 8, 12, and 16 M MOS were produced by adding calcium chloride to the soil. Various salinity, soil moisture, density, permeability, and drainage measurements were recorded prior to, during, and following the application of a sufficient quantity of water to completely leach the salt from each sample.
 - (g) For each soil there is an application rate below which no change in apparent specific gravity or settlement takes place during the initial watering (the critical rate was approximately 0.2 inches per hour for the soils tested.) The percent saturation during watering follows the relationship of: %S = CIⁿ, where I is the application rate and C and n are constants for a given Soil and soil compaction. Determination of certain new relationships between water application rate, the inital salinity, density, and soil moisture con-tent, and leaching efficiency. The findings of the research to date are useful in irrigation system design and land reclamation

activities. Relationship between water appli-cation and leaching are important for salinity control and drainage investigations.

- Control and drainage investigations. "The Effect of Water Application Rate on Soil Structure," by Jack Keller. Paper No. 63-733, printed and presented at the 1963 winter meeting of the American Society of Agricultural Engineers. (Accepted for publication in Agricultural Produceting.) (h) Engineering.) "Less Soil Compaction with Low Application Rate Sprinkling," by Jack Keller. Utah Agr. Exp. Sta. Form Paper 399. Presented to the 1964 open technical meeting of The Sprinkler Irrigation Assn. and contained in the printed proceedings, pp. 45-50. "Sprinkler Application Rates on Soil Struc-ture," by Jack Keller. Irrigation Engineering and Maintenance, June-July 1964, pp. 17-18, 25.
- (5449) HYDRAULICS AND EFFICIENCY OF IRRIGATION APPLICATION.

 (d) Theoretical and experimental, theoretical
 - and applied. (e) Flow configurations over various types of
 - hydraulic structures such as weirs and sills are determined theoretically through the use of complex variables and conformal mapping. The results are to be compared with physical flows produced in the laboratory to establish the usefulness of the theory in describing the actual flow.

VIDYA DIVISION, Itek Corp.

- (5199) THE EFFECT OF FLOW SEPARATION FROM THE HULL ON THE STABILITY OF A HIGH SPEED SUBMARINE.
 - (b) Office of Naval Research, David Taylor Model Basin (jointly) under the BuShips Fundamental Hydromechanics Program.
 (c) Mr. S. B. Spangler, Vidya Division, 1450 Page Mill Road, Palo Alto, Calif. 94304.
 - (d) Theoretical; applied research.
 (e) The lift distribution on the fairwater and fairwater planes at angles of attack and fairwater planes at angles of attack and potential sideslip is characterized by a potential vortex system, whose vortex filaments trail aft over the hull and control sur-faces at the stern. A vortex interference force distribution is computed on the hull, stern planes, and rudders. The purpose of the work is to predict theoretically the static stability characteristics of high speed submarines with interference and hull flow separation.
 - (g) Results for low angles of attack and sideslip with no hull flow separation indicate that vortex interference effects are appreciable only for the case of high fairwater plane deflection angles at very small hull angles of attack and sideslip and the case of sideslip, where the
 - fairwater becomes loaded.
 (h) "Theoretical Prediction of Vortex Interference Effects on the Static Stability of a High Speed Submarine," S. B. Spangler, and J. A. Burnell. Vidya Rept. No. 157, December 1964.
- (5200) INTERFERENCE BETWEEN A HULL AND A STERN-MOUNTED DUCTED PROPELLER.

 - (b) Dept. of the Navy, Bureau of Ships Funda-mental Hydrodynamics Research Program.
 (c) Dr. A. R. Kriebel, Staff Engineer, Vidya Division of Itek Corp., 1450 Page Mill Road Palo Alto, Calif. 94304.
 (d) Theoretical investigation; applied research.

- (e) The hydrodynamic interference forces are predicted for an underwater hull with a ducted propeller mounted near the stern. The purpose is to determine the effect of duct shape, size, and location upon the interference forces for a specified hull shape and for steady axially symmetric flow. Existing potential flow theory is used to represent the ducted actuator disk and concentrated singularities are used to represent the hull and its wake.
- (g) The computed results indicate that certain highly cambered ducts produce no inter-ference drag on the hull and no leading edge suction on the duct even when the duct carries more thrust than the propeller. The effect of the duct boundary layer will be included in future analysis.
- "Interference Between a Hull and a Stern -Mounted Ducted Propeller," A. R. Kriebel, Vidya Report 161, Sept. 30, 1964. (h)
- (5201) THEORETICAL INVESTIGATION OF DYNAMIC STABILITY DERIVATIVES OF DUCTED PROPELLERS.
 - Bureau of Naval Weapons, Dept. of the Navy. Dr. A. R. Kriebel, Staff Engineer, Vidya Div. of Itek Corp., 1450 Page Mill Road, Palo Alto, Calif. 94304. (b) (c)
 - Palo Alto, Calif. 94304. Theoretical investigation; applied research. The force and moment coefficients at angle of attack and their dynamic pitching deriva-tives are predicted by potential flow analysis for an isolated ducted propeller. A first-order analysis is made of the interference between a pair of ducted propellers in a $\begin{pmatrix} d \\ e \end{pmatrix}$ freestream at angle of attack.
 - (g) Predictions based upon actuator disk repre-sentation of the propeller compare favorably with experimental data. The effect of non-uniformity of disk loading upon the predicted results will be investigated. Extension will be made of the analysis of interference which indicates that a large pitching moment is generated on a tander poin of ducted
 - which indicates that a large pitching moment is generated on a tandem pair of ducted propellers at angle of attack. "Theoretical Stability Derivatives for a Ducted Propeller," A. R. Kriebel, AIAA Jour. of Aircraft, Vol. 1, No. 4, pp. 203-210, July-Aug. 1964.  (d) Analytical and experimental study in part for Master's thesis.
 (e) This project is a study of jet reattachment phenomena at low Reynolds numbers. The study will include both parallel and in-olized walls and the officate of carries. clined walls and the effects of aspect ratio, offset, and wall angle.

WASHINGTON STATE UNIVERSITY, The R. L. Albrook

Hydraulic Laboratory.

Inquiries concerning the following projects should be addressed to Dr. E. Roy Tinney, Head, The R. L. Albrook Hydraulic Lab., Div. of Industrial Research, Washington State Univ., Pullman, Washington 99163.

- (1689) STUDY OF FLUID FLOW IN PIPE NETWORKS.
 - (b) Personnel responsible for the design and/or operation of water and gas distribution systems.
 - Analyses by analogue and digital computers. $\begin{pmatrix} d \\ e \end{pmatrix}$ Flow distributions have been made with the McIlroy Analyzer for over 50 cities, several gas systems, an air system, a generator cooling system, and several other unique systems. Losses throughout the system are obtained. Engineers use the analogue to design system pumps, tanks, and piping additions or revisions.
- (3848) CALIBRATION OF FLOW METERING FLUMES.
 - Agricultural Research Service, Boise, Idaho. (d) Experimental; design, development, master's thesis.
 - (e) Flumes for three specific measuring sites in a watershed of southern Idaho have been developed. Adequate provisions for sedi-ment exclusion are included. Field performance has verified hydraulic model design is presently being studied.
 - (g) Preliminary tests indicate that a standard design can be adapted for use at any site as long as topographic and streamflow conditions are within limits thus far investigated. Rating curves can be accurately predicted for the standard design without pre-calibration. Special tests showed that the sediment exclusion features operate so that even large sediment discharge does not affect the discharge rating.
 - (h) "Hydraulic Laboratory Development of Stream "Hydraulic Laboratory Development of Stream Gaging Stations for Reynolds Creek Experi-mental Watershed," Howard D. Copp, Manuel Th. Arce' and E. Roy Tinney. Washington State Inst. of Tech. Research Report 64/9-103, October 1964. "Effect of Sediment Discharge on the Perfor-mance of the V-Type Measuring Flume," Kannson Tsun-Hsien Liu. Thesis prepared as partial fulfillment of requirements for Master of Science Degree in Agricultural Engineering, Univ. of Idaho, June 1964.
- (4721) MODEL CALIBRATION OF ROCK ISLAND SPILLWAY.
 - (b) Public Utility District of Grant Co., Washington.
 - Experimental; analytical. A 1:50 scale model of the west section of the Rock Island Dam spillway was constructed. (d) lei Tests were made to determine the discharge influenced by adjacent and nearby bays, tailwater and apron elevations, and distribution of flow approaching the spillway discharges. Accurate discharge ratings were required in connection with power losses due to tailwater encroachment at Rock Island by the Wanapum pool.
 - Complete.
 - A technique was developed to compute discharge through the western section of the spillway. Effects of upstream topography,
 - opening are noteworthy. "Hydraulic Model Studies for the Cali-bration of the Rock Island Spillway," Claud C. Lomax. Bulletin 282, Washington State Inst. of Tech., Pullman, Washington, (h) June 1964.
- (4724) WELLS COMPREHENSIVE MODEL.

 - Bechtel Corporation. Experimental; design. A 1:78 model of the Wells Hydrocombine has been constructed to study potential erosion,

wave action, passage of migratory fish, spillway capacity, and construction sequences. Since the power house and spillway are combined into one structure, several unique problems in design and operation must be investigated. The model is 44 feet wide and 66 feet long and will pass the equivalent of 1,300,000 cfs.

- $\begin{pmatrix} f \\ g \end{pmatrix}$ Completed.
- Tests on project layout and operation pro-vided a sound basis for modifying original plans. Additional stream channel protection was required to prevent undue erosion. A rather unusual fish attraction system including several stratigically placed, highvelocity jet streams was developed. Downstream geologic formations will permit the spillway flow to scour its own escape channel thereby reducing costly machine excavation.
- "Wells Hydroelectric Project Vol. I Comprehensive Model Studies," John S. Gladwell, Howard D. Copp and E. Roy Tinney. Bulletin 289, Washington State Inst. of (h) Tech., Pullman, Washington. In press.
- (5043) THE PLACE OF PUMPED STORAGE IN THE POWER ECONOMY.

 - Laboratory project. Theoretical, field investigation. Review of principles and practices of (d)
 - (e) pumped storage projects in Europe and United States.
 - (g) Pumped storage will play an increasing
 - Tumped Storage will play an increasing role in large power systems. "Pumped Storage for More Effective Uses of Hydro Resources", R. A. Sutherland. Proc. -4th Blennial WSU Hydraulics Conference, WSU, November 1963. (h)
- (5519) SOUND SUPPRESSOR-HYDRAULIC MODEL TESTS.
 - (b) George C. Marshall Space Flight Center, NASA. (d)
 - Experimental, development. Development of a vane system to create uni-(e) form flow around a clover-shaped weir is re-quired. Investigation of initial surge pro-duced by rocket blast and surge suppression is also being undertaken.
- (5520) TRANSIENT SIPHONIC FLOW.
 - (b)
 - Laboratory project. Theoretical, experimental, basic research. Mathematical analyses are being developed (d) (e) the time of establishment of siphonic flow. Experimental tests with fluids of various viscosities are planned.
- (5521) HELLS CANYON HYDROELECTRIC PROJECT.
 - (b) Idaho Power Company
 - (d) (e) Experimental; applied research. Hydraulic model studies on several features of design have been completed. A 1:45 scale flume model of the spillway and low level outlets was employed to investigate energy dissipation characteristics and appurtenances. A 1:60 scale comprehensive model was utilized to study downstream erosion patterns, bank wash, wave generation, fish transportation facilities and diversion schemes during construction. (g) Special nappe deflector application provided
 - adequate energy dissipation at reduced construction costs.
 - (h) "Hydraulic Model Studies of the Hells Canyon Hydroelectric Project," R. A. Sutherland and E. Roy Tinney. Bulletin 284, Washington State Inst. of Tech., Pullman, Washington, June 1964.
- (5522) FLOW AROUND SHARP BENDS.
 - (b)
 - Laboratory project. Theoretical, experimental, applied research. Project is being conducted to determine the optimum geometry of channel bends to minimize flow losses. Hydrodynamic theory is being (d)

developed to consider flow near the inside curve.

- (5523) MECHANISMS OF MASS DISPERSION AND ENERGY DISSIPATION IN FREE LAMINAR AND TURBULENT LIQUID SHEETS.
 - Laboratory project.
 - Laboratory project. Theoretical, experimental, basic research. Two laminar or turbulent jets, colliding from opposite directions, form a thin expanding sheet or water-bell. G. I. Taylor's equation for the shape of a water-bell has been extended to include gravitational force. Possible mechanisms for mass dispersion and exampt discipation in these shears can being (d) energy dissipation in these sheets are being investigated.
- (5524) HYDRAULIC MODEL STUDIES FOR THE ROCK ISLAND FISH ATTRACTION FACILITIES.
 - (b) Public Utility District of Grant County, Washington.
 - (d)
 - The purposes of the model study were, (a) to develop a gate opening and closing sequence to facilitate the bassage of anadromous fish through the center and right bank fishladders, (5529) EVALUATION OF THE PULLMAN-MOSCOW GROUND WATER SITUATION BY TRITIUM AND CARBON-14 DATING TECHNIQUES. (e) and (b), to document flow patterns and vel-ocities in the tailrace region under encroachment conditions caused by the construction of Wanapum Dam.
 - $\begin{pmatrix} f \\ g \end{pmatrix}$
 - Complete except for report. The gate operating sequence appears to be adequate under field conditions.
 - (h) Report in preparation.
- (5525) TRANSIENT EFFECTS IN TIEN'S NUCLEATE BOILING
- HEAT TRANSFER MODEL.
 - (b) State of Washington and Mechanical Engineering Department. (d) Basic research.
 - (e) Attempt is made to account for transient heat convection effects near active nucleation sites in Tien's steady convec-tion model for nucleate boiling.
 - (f) Complete up to presentation at ASME Winter Annual Meeting.
 - (g) Inclusion of transient effects, modifies the
 - form of the resulting Yamagata equation. "Transient Effects in Tien's Nucleate Boil-ing Heat Transfer Model," R. F. Boehm and John H. Lienhard, ASME Paper 64-H-134. (h)
- (5526) ON CORRELATING THE PEAK AND MINIMUM BOILING HEAT FLUXES, PRESSURE AND HEATER CONFIGURATION. (3535) EFFECTS OF LOGGING ON PRODUCTIVITY OF PINK
 - (b) State of Washington and Mechanical Engineering Department.
 - (d) Basic research.
 - The peak (or burnout) nucleate boiling heat flux and the minimum film boiling heat flux are shown to be correlatable with geometric (e) scale and pressure.
 - Complete, up to presentation at Annual AIChE-ASME Heat Transfer Meeting (Los Angeles, (f) Aug. 1965).
 - (g) About 350 original data and conclusions about the separability of the pressure and geometry effects.
 - "On Correlating the Peak and Minimum Boiling Heat Fluxes Pressure and Heater Configuration," John H. Lienhard and K. Watanabe. ASME Paper (h) No. 64-H-165.
- (5527) A STUDY OF CAVITATION AND FLASHING IN FREE AND SUBMERGED JETS.
 - State of Washington.
 - Basic research. (d) Cavitation numbers have been obtained for various submerged water jets over large temperature ranges. Flashing behavior free water jets has been observed and Flashing behavior of correlated. Free jets have been found to sustain up to 100°F. superheat.

 - (f) Final write-up.
 (h) Discussion of paper 64 by Starkman, Schrock, et al, Jour. Basic Engr., June 1964.

- (5528) SEISMIC INVESTIGATIONS IN THE REYNOLDS CREEK EXPERIMENTAL WATERSHED.
 - (b) U. S. Dept. of Agriculture, Agricultural Research Service. Applied research in a field investigation. Refraction seismic studies are being
 - (b)
 - (e) directed toward the solution of complex structural and stratigraphic problems which control the movement of ground waters in the watershed. Much valuable information on the physical characteristics of the numerous rock units is being derived.
 - (f) Project is being conducted as funds permit.
 - Further work is anticipated. (g) Reports covering studies during the past two summers have been completed. Seismic techniques appear to provide much information not otherwise available.
 - (h) "Preliminary Reynolds Creek Seismic Studies," R. E. Cavin, Washington State Inst. of Tech., Research Report No. 63/9-152, 1963. "Seismic Investigations in the Reynolds Creek Experimental Watershed," James W. Crosby, III. Washington State Inst. of Tech., Research Report 64/9-111, 1964.
 - - (b) City of Pullman, City of Moscow, Washington Department of Conservation, Washington State University, University of Idaho.
 (d) A field and laboratory study involving both applied and basic research.

 - (e) Ground-water samples are being collected from specific aquifers throughout the Pullman-Moscow basin. These samples are being analyzed for their tritium and carbon-14 contents in the attempt to determine recharge conditions and localities of natural recharge.
 - (f) Project is continuing. (g) Current information indicates that ground (b) builtent information indicates that a point waters have been in storage for thousands of years and that recharge is minor.

 Fisheries Research Institute, University of

 - Washington, Seattle, Wash. 98105.
 (d) Experimental, theoretical, and field investigation; basic and applied research, including master's and doctoral thesis research
 - (e) To identify environmental factors causing mortality of pink salmon embryos; (2) to gain a more complete understanding of interrelationships among spawning behavior, physical and biological attributes of the stream and spawning bed, and mortality of embryos; (3) to determine how the quality of the spawning bed environment as it or the spawning oed environment as it pertains to growth, development, and mortality of embryos is affected by logging; and (4) to determine criteria for increasing production of fry, the improvement of natural spawning areas and construction of artificial spawning areas. Included among active routine studies are hydrological conditions interproved water could the conditions, intragravel water quality, gravel composition, streambed freezing, gravel shift, spawner counts, and embryo

mortality. Gravel sampling equipment and techniques are being tested and improved upon.

- (g) Methods have been developed for routine field measurements of intra-gravel water quality, gravel composition, and mortality of salmon embryos. The major causes of egg and larval mortality have been found to be: (1) redd superimposition, (2) streambed freezing, (3) inadequate supplies of good quality intragravel water, and (4) gravel shift due to floods. Stream environmental changes due to logging have been found to be mainly the result of the addition of logging debris or increased sedimentation. A theoretical model of factors controlling interchange between stream and intragravel water has
- been proposed and tested qualitatively.(h) A limited number of reprints of the following publications are available from Fisheries Research Institute, Univ. of Washington, Seattle, Washington 98105. The theses are available on Interlibrary Loan from the University of Washington Library, Seattle. - (4247) IMPROVEMENT OF SALMON SPAWNING AREAS IN INDIAN CREEK, ALASKA.
 - (b) U.S. Forest Service, Juneau, Alaska, Bureau of Commercial Fisheries, Alaska, and Department of Fish and Game, Juneau, Alaska.
 - (c) Prof. Donald E. Bevan, Associate Professor, Fisheries Research Institute, University of Washington, Seattle, Wash. 98105.
 - (d) Experimental, theoretical, and field investigation basic and applied research, including thesis research.
 - (e) Artificial spawning areas have been constructed on Indian Creek on Frince of Wales Island within the Tongass National Forest,

Alaska. The project is to test the general hydraulic considerations associated with the design of improved pink salmon spawning areas in natural streams. Objectives of the research program are to test the design of artificial improvements to salmon spawning grounds. The problem is to determine if we grounds. The problem is to determine it at can provide, at reasonable cost, small areas of stable permeable gravel in which low water flow of stream will be concentrated. The evaluation of artificially constructed channels will provide information of the detailed requirements of spawning fish as well as the requirements of eggs and larvae. Further information will be obtained on movement of bed material as no stream flow regulation is provided. (g) Flooding in the fall of 1961 and the winter

- of 1962-63 caused considerable gravel shift and streambed erosion in the artificial spawning channel, altering the originial design and necessitating reconstruction. The 1961 floods apparently caused no significant embryo mortality, while the 1962-63 floods did. For artificial spawning channels to be successfully maintained at reasonable cost in most southeastern Alaska streams, flow control must be provided.
- - (b) Institute of Forest Products, Univ. of Washington.
 - (c) Prof. Donald E. Bevan, Associate Professor, Fisheries Research Institute, Univ. of Wash.,
 - Seattle, Wash. 98105. (d) Experimental, theoretical and field investi-gation; applied research for M.S. thesis.
 - (e) The research is to evaluate ecological changes in salmon streams caused by de-forestation. Soil erosion, subsequent logging operations in a watershed, may cause large quantities of fine particles to be deposited in the beds of the streams adjacent to logging areas. The presence of fine materials reduces the permeability of the stream and gravel thereby reducing the rates of waterflow in the streambed and the rate of exchange of intergravel water. The rate of exchange between the intergravel and stream water limits the quality of the intergravel environment of the habitat for salmon eggs and larvae. The results of the proposed investigation will assist in determining if logging will affect salmon production. The objectives of the study are: (1) To evaluate the present gravel sampling procedures and index of streambed quality for salmon; (2) to deter-mine the physical factors controlling the size of the preside within the stream bed: (3) determine if streambed composition can be used to measure effects of logging on salmon.
 - (g) Data currently being analyzed.
- (5019) THE ECOLOGY OF BOISE CREEK.

 Fisheries Research Institute, Univ. of Washington, Seattle, Washington 96105. (d) Experimental, theoretical, and field
 - investigation; basic and applied research, including master's thesis research.
 - (e) Sewage effluents from industrial, agricultural and domestic sources have been regularly discharged into Boise Creek for many years. alsonarged into Boise Creek for many years. It is the purpose of the study to gather ecological, hydrographic, and chemical data in several strata of stream use to determine the suitability of Boise Creek as a spawning and rearing stream for salmonid fishes. (g) Data currently being analyzed.
- (5034) EVALUATION OF STREAM CARRYING CAPACITY OF FINE MATERIALS AS RELATED TO GRAVEL PERME-ABILITY.
- (b) Institute of Forest Products.
 (c) Prof. Donald E. Bevan, Associate Professor, Fisheries Research Institute, Univ. of Wash.,
- (d) Experimental, theoretical, and field investigation; applied research for M.S. thesis.
- (e) This research is to aid in evaluating the changes in salmon streams caused by logging. Soil erosion caused by logging at times increases the amount of fine particles within the flowing stream. Depending upon the hydraulic conditions within the stream and the water turbidity, the streambed perme-ability will be lowered. Reduced perme-ability lowers the water interchange between the gravel and bed. The amount of intra-gravel flow is vital to the survival of salmon eggs and larvae. The investigation will attempt to define the hydraulic conditions and define concentration for a conations and define concentration for a particular permeability. The objectives of the study are: (1) Determine experimentally the amount of deposition of fines in gravel; (2) for given hydraulic conditions, streambed composition and turbidity a theoretical prediction of the streambed permeability; (3) measurement of stream hydraulic conditions, turbidity, bottom conditions, turbidity, bottom composition and permeability; and (4) analysis of data and previous permeability data available to determine limitations of turbidity on salmon stream.

UNIVERSITY OF WASHINGTON, Charles W. Harris Hydraulics Laboratory.

- (4725) SALT WATER ENTRAINMENT FOR DILUTION IN SEWER OUTFALLS.

 - (b) U. S. Department of Health, Education, and Welfare-Public Health Service.
 (c) Prof. R. E. Nece, Dept. of Civil Engineering, University of Washington, Seattle, Wash., 98105.
 - (d) Experimental; basic and applied research. (e) The mechanism of the entrainment of a fluid from an infinite still reservoir through discrete ports into a conduit flowing full is to be studied experimentally and analytically.
 - Data have been obtained for a range of single (g) circular ports of varying sizes for zero and small density differentials between conduit and entrained fluids; some multi-port data have been obtained for the zero density difference case.
 - (h) Two M. S. Thesis completed (available on loan).
- (4726) A STUDY OF VELOCITY BARRIER DEVICE FOR DOWNSTREAM MIGRANT BYPASS.
 - (b) Columbia Fisheries Program Office, U. S. Bureau of Commercial Fisheries, Portland, Oregon.
 - Prof. H. S. Strausser, 317 Hydraulics Lab., University of Washington, Seattle, Wash., (c) 98105.
 - (d) Experimental investigation: developmental research.
 - (e) The problem requires a structure which will guide downstream migrant fish into a collection facility with a minimum obstruction velocity changes which would attract or repel the fish, thereby steering them into a desired location.
 - (f) Discontinued.
 - Results inconclusive. (g)
- (5113) MODEL STUDY OF THE MOSSYROCK DAM AND SPILL-WAY.

 - (b) Harza Engineering Company and the City of Tacoma, Major Projects Division.
 (c) Professors E. P. Richey and H. S. Strausser, Univ. of Washington, Seattle, Wash. 98105.

- (d) Experimental and applied research.
 (e) The study will be concerned especially with erosion resulting from spillway flows as well as the usual problems of a dam and spillway model.
- (f) Completed.(h) Report submitted to sponsoring agency.
- (5530) A STUDY OF INFILTRATION BENEATH A FOREST FLOOR.
 - (b) Office of Engineering Research; Univ. of Washington.

 - Washington.
 (c) Prof. Thomas H. Campbell, Dept. of Civil Engineering, Univ. of Washington, Seattle, Washington 98105.
 (d) Field laboratory investigation; theoretical.
 (e) Instrumentation permits accurate, continuous recording of flow of moisture past points in unceturated soil. Flow data obtained in unsaturated soil. Flow data obtained at various plan locations and at various depths are recorded on tape, transformed by computer to hydrograph display. This information will be correlated with an analytical model.
 - (5531) HYDRAULICS OF FLOW OVER AN INCLINED, POROUS PLATE.

 - (b) Laboratory project.
 (c) Prof. E. P. Richey, Dept. of Civil Engrg., Univ. of Washington, Seattle, Wash. 98105.
 - Experimental; basic research. Flow distribution, surface profile deter-mined as depending upon bed slope and (d) (e) porosity.
 - (5532) BED SHEAR AS AN INDEX OF HYDRAULIC JUMP EFFICACY.
 - Laboratory project. (b) (c)

 - Prof. R. E. Nece, Dept. of Civil Engrg., Univ. of Washington, Seattle, Wash. 98105. Experimental; basic research. (d)
 - (e) Boundary shear stresses are used as an index of determining energy dissipation efficiencies of hydraulic jump in rectangular stilling basins; the procedure provides another description of the effective length of the jump as that within which the bed shear is reduced to safe limits.
 - (g) Data have been obtained for jumps on a horizontal floor and for jumps with approach slopes of l in 5, l in 3, and l in 1.5.(h) One M.S. thesis completed (available on
 - loan).

WEBB INSTITUTE OF NAVAL ARCHITECTURE.

- (5202) DETERMINATION OF SHIP WAVE RESISTANCE.
 - (b) David Taylor Model Basin, Bureau of Ships, Dept. of the Navy.
 (c) Dr. Lawrence W. Ward, Prof. of Engineering,
 - Webb Institute of Naval Architecture, Glen Cove, Long Island, New York 11542.
 - Cove, Long Island, New York 11542.
 (d) Experimental and theoretical; basic research.
 (e) Investigation of means for direct experimental determination of ship wave resistance from measurements of the wave pattern during a model test. Purpose includes improvement in scaling model test results to full size as well as basic understanding of nature of a statement of the market and the statement of the stat ship resistance.
 - (g) Method utilizing forces exerted by the wave pattern on a long vertical cylinder has been developed and tests run. Results are encouraging and in agreement with other investigators. Experimental wave resistance when added to estimated skin friction is less than measured total resistance. New method utilizing wave slope records being investigated.
 - (h) Report in preparation.
- (5203) ASSESSMENT OF SEAKEEPING CHARACTERISTICS OF SHIPS.

- (b) Society of Naval Architects & Marine Engineers, Panel H=7 of Hydrodynamic Committee.
 (c) Prof. Edward V. Lewis, Research Prof. of
- Naval Architecture, Webb Institute of Naval Architecture, Glen Cove, L. I., N. Y. 11542.
 (d) Theoretical application of available experi-
- mental results and confirmation by model tests; applied research.
- (e) Application of available knowledge of ship model behavior in regular waves to the prediction of trends of ship performance in realistic irregular wave patterns. Experi-mental confirmation by means of model tests in waves. Purpose is to provide the ship designor with guidance in the colocian of designer with guidance in the selection of hull characteristics.
- (f) Theoretical work is completed.
 (g) The advantage of a high length/draft ratio in permitting higher speeds before shipping ing disadvantage in terms of likelihood of slamsting is found, requiring a balance to be made in selecting optimum ship characteristics.
- (h) "Applying Results of Seakeeping Research,"

 - (b) Philadelphia Electric Co., Philadelphia, Penn. (d)
 - Fenn. Experimental, for design. A 1/35.3 scale model of the intake structure, the immediate topography in the reservoir and a section of the vertical tunnel below the (e) intake were modeled to study the flow char-acteristics and evaluate the losses in both (f) Work completed.
- (5022) DYNAMIC EFFECTS IN FLOW METER COEFFICIENT
 - PREDICTION.
 - (b) (d)
 - Laboratory project. Experimental, for M.S. thesis. A number of differential producer type flow meters are being studied under different Reynolds Number levels with the same volume (e) flow rate. It is planned to evaluate the dynamic effects on the discharge coefficient. (f) Tests in progress.
- (5023) VELOCITY DISTRIBUTION INFLUENCE ON BEND LOSSES.
 - (b) Laboratory project.
 - (d)Experimental for M.S. thesis. An experimental and theoretical study of the variation in energy loss in a 90° pipe bend was carried out and evaluation of the loss set (e) up in terms of the upstream velocity distribution.
 - (f) Work completed.

- (5024) CORNWALL PUMPED STORAGE DEVELOPMENT.
 - (b)
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Uhl, Hall and Rich, Boston, Mass. Experimental, for design. A 1/56 scale model of the manifold and pen-stock sections was constructed of plexiglass and PVC pipe in the appropriate diameters. The sections varied in diameter (full scale) from 40' for the manifold to 10' for the penstocks at the powerhouse. Measurements of pressure head at each change in section and alignment were made to evaluate the loss coefficients in both the generating and pumping situations.
 - (f) Tests complete. (h) Report in preparation.
- (5268) LITTLE GYPSY STEAM POWER PLANT.
 - (b) Ebasco Services, Inc., New York.
 - (d)
 - Experimental, for design. A 1/12 scale model of the condenser cooling (e) water intake of the plant of the Louisiana Power Co., including the sump and vertical pump bell mouth was constructed. The studies included various modifications to insure a uniform velocity distribution at the pump intake for the required flows.
 - (f) Tests completed. (h) Report in preparation.
- (5269) CABIN CREEK PUMPED STORAGE DEVELOPMENT.
 - (b) Stone and Webster Engineering Corp., Boston, Mass.
 - A 1/100 scale model of the upper reservoir (d) (e) of the development of the Public Service Corp. of Colorado was constructed. The model included the reservoir, upper face of the dam and the water intake to the tunnel. The studies involved the flow patterns in the reservoir for various phases of operation including both pumping and generating. A qualitative study of ice flows in the reservoir under the influence of wind was conducted. Treatment of intake location and flow at the intake was evaluated.
 - Test completed. (h) Report in preparation.
- (5270) KASTRAKI HYDROELECTRIC DEVELOPMENT.
 - (b) Ebasco Services Inc., New York. (d)
 - Experimental, for design. A 1/100 scale model of the Kastraki develop-ment of the Public Power Corp. on the Acheloos River was constructed. The model (e) included a section of the reservoir, the Included a section of the reservoir, the gravity dam, spillway, powerhouse and river bed downstream including the confluence with the Zervas Torrent. The studies include the approach conditions to the side spillway, the supercritical flow in the spillway chute and the conditions in the tailrace area.
 - (f) Tests in progress.
- (5271) CAMPBELL STEAM POWER PLANT.
 - (ъ) Commonwealth Associated Inc., Jackson, Michigan.
 - Experimental, for design. A 1/10 scale model of the intake at the Campbell Plant of the Consumers Power (d) (e) Co. on Lake Michigan was constructed. The local lake section was duplicated in a steel head box and the intake structure was mounted outside to allow viewing of flow patterns through the transparent wall. Studies were aimed at reducing the head loss and disturbed flow in the screenhouse and gate structure. (f)
 - Tests in progress.
- (5272) INDIAN POINT STEAM PLANT.
 - (b) Consolidated Edison Co., New York.
 - Experimental, for design. A 1/60 horizontal by 1/40 vertical scale mode) was constructed of the Indian Point (d) (e)

Atomic Power Plant on the Hudson River. section of the river either side of the intake and including the intake and its allied docking facilities was modeled. The capability to model the hot condenser effluent was incorporated to facilitate the study of recirculation, mixing and allied density current effects.

- (f) Tests in progress.
- (5273) CICEROZ HYDROELECTRIC DEVELOPMENT.
 - Ebasco Services Inc., New York. (b)
 - (d)
 - Experimental, for design. The 1/70 scale model was constructed of the (e) The 1/10 scale model was constructed of the Cicerco development of the Electric Power Gen-erating Co. of Turkey. The model included the stream above and below the site, the arch dam, spillway and the powerhouse and allied water passages. The studies were involved with the approach flow to the spillway and powerhouse intake and the flow results in the tailrace for a variety of flow conditions. Penstocks were fabricated of clear plastic to allow observation of flow in various sections. Tests completed.
 - (n) Report in preparation.
- (5274) KEBAN HYDROFLECTRIC DEVELOPMENT.
 - Ebasco Services Inc., New York. $\begin{pmatrix} b \\ d \end{pmatrix}$
 - Experimental, for design. A 1/100 scale model of the project on the (e) Euphrates River was constructed for the Electric Power Generating Co. in Turkey. Included in the model was the river above the dam, the dam, water intakes, spillway, fuse dam, the dam, water intakes, spiriway, nuce plug, penstocks, spiriway chute, powerhouse and a section of river downstream in-cluding the tailrace. The studies involved intake operation, spiriway and gates, fuse plug performance, spiriway chute and wall design and tailrace flow patterns. Test completed.
 - $\begin{pmatrix} f \\ h \end{pmatrix}$ Report in preparation.
- (5275) PITTSBURGH GENERATING STATION.
 - (b) Stone and Webster Engineering Corp., Boston, Mass.
 - (d)
 - Experimental, for design. A 1/120 by 1/40 vertical scale model of a section of the White River has been con-(e) structed for the Indianapolis Power and Light Co. The model represents a section of the river above and below the Pittsburgh plant. Studies are being conducted on bed load movement necessary protective works at the intake, and possible recirculation of hot condenser cooling water. (f) Tests in progress.
- (5276) HOLYOKE POWER DEVELOPMENT.
 - Holyoke Water Power Co., Holyoke, Mass.
 - $\begin{pmatrix} b \\ d \end{pmatrix}$
 - Experimental, for design. A 1/15 scale sectional model of the gate (e) house structure at the canal entrance was constructed in the 3 foot glass sided flume. Studies were made of forces on various sections including gates and flow and velocity patterns were studied. The experimental work involved representatives of Stone and Webster, Holyoke Water Power and Alden Hydraulic Laboratory. Tests completed.
 - (h) Report in preparation.
- (5277) LAKE ONTARIO INTAKE.
 - (b)
 - (d)
 - Metcalf and Eddy, Inc., Boston, Mass. Experimental, for design. A 1/17 scale model of a section of submerged intake pipe was installed in a 12 ft. wide flume for the Monro County Water Authority in order to evaluate forces and movement of pipe sections as a result of combined lake currents and storm induced waves.
 - Tests completed. $\left\{ \begin{array}{c} f \\ h \end{array} \right\}$
 - Report submitted.

- (5278) METER CALIBRATIONS.
 - Potter Aeronautical Corp., Union, N. J. (b)

 - Experimental, for design. Calibration of turbine type flow meters from 2" to 24" in diameter of both the volume and mass flow design have been $\begin{pmatrix} d \\ e \end{pmatrix}$ calibrated. Piping arrangements include standard loop tests and variations such as tandem mounting.
 - (f) Tests in progress.
- (5279) METER CALIBRATIONS.
 - ITT General Controls, Warwick, R. I. (b)
 - (d)
 - Calibration of flow tubes in a range of sizes from 6" to 48" has been carried out. (e) Field piping as well as standard test loop installation have been used.
 - (f) Tests in progress.

(4639) WAVE REFLECTION STUDIES.

- (b) Laboratory project.
 (c) Dr. Warren DeLapp, Department of Civil Engineering, University of Colorado, Boulder, Colorado 80304.
- (d) Experimental, basic research, for Master's thesis.
- (e) Studies are being made of the reflection and transmission of artificially generated waves at submerged barriers and sills of various shapes. Investigations completed have in-cluded a flat sill with a vertical face, a thin plate at angles varying from 30° to 90 with the horizontal, and combinations of to 900 quarter-cylinders.
- Suspended. (f)
- Empirical relationships have been developed for wave transmission and reflection for different sills. In general the most impor-tant factor is the depth of submergence of the sill and flatter waves were found to be reflected more than steep waves. Decreasing the sill length increases the wave transmission and decreases the energy losses.

Department of Agriculture, Agricultural Research Service, Soil and Water Conservation Research Div., Southern Plains Branch, Project No. 4335, and Illinois State Water Survey Division Project No. 1865.

- (b) Cooperative with the Minnesota Agricultural Experiment Station, the St. Anthony Falls Hydraulic Laboratory, and the Illinois State Water Survey.
- (c) Mr. Fred W. Blaisdell, Hydraulic Engineer, St. Anthony Falls Hydraulic Laboratory, 3rd Ave. S. E., at Mississippi River, Minneapolis, Minnesota 55414.(d) Experimental; applied research for develop-
- ment and design.
- (e) Research dealing with the design, con-struction, and testing of structures for conserving and controlling soil and water are carried out. Studies during the past drop inlet for closed conduit spillways. The width of this drop inlet is equal to the barrel diameter. Its length varies. Water flows only over the two sides. The end walls support a horizontal plate over the drop inlet which acts as an anti-vortex device. The overhang of the plate supports a trash guard. Tests are conducted using both water and air as the model fluid to determine the performance, loss coefficients, and pressure coefficients for the drop inlet. Cooperation with and co-ordination of the tests at the Stillwater, Oklahoma, Outdoor Hydraulic Laboratory and the Illinois State Water Survey is maintained. Additional work on the two-way drop inlet concerns the effect of low-level orifices on the performance of the spillway. A square drop inlet having a hood barrel entrance is being tested to determine entrance loss coefficients for various drop inlet sizes and heights and various barrel slopes. Previous tests have evaluated the performance of this type of inlet.
 (g) If the anti-vortex plate is too low
- undesirable orifice flow will control the discharge. If the anti-vortex plate is too high, harmful vortices will form under the plate. Rules for determining acceptable plate heights have been determined. The overhang of the plate must be greater than a certain minimum to insure satisfactory performance. The action of the two-way drop inlet is that of a self-regulating siphon. The tests using air agree with the results obtained from the water tests and are much easier to perform. Air is used as the model fluid only for the condition of full conduit flow. Tests on the hood drop inlet have shown that the hood barrel entrance can be used to reduce the minimum required height of the drop inlet. Minimum sizes of drop inlet and anti-vortex devices have been determined. Tests of low-stage orifices in the two-way drop inlet have shown that improper location and improper proportioning of the orifices can prevent priming of the spillway. The proper location of the orifices and the The sizes of the orifices for satisfactory spillway performance have been determined.

(2316) RUNOFF FROM SMALL AGRICULTURAL AREAS IN TLLINOIS.

- (c) Dr. L. D. Meyer, Agricultural Engineer, ARS, Agricultural Engineering Building, Purdue Univ., Lafayette, Indiana.
- (d) Experimental; laboratory investigations, basic research.
- (e) Fundamental investigations of the mechanics of rainfall and runoff erosion are conducted at two Corn Belt Branch locations. At Morris, Minnesota, C. K. Mutchler and R. A. Young are using a 40-foot drop tower for studies of raindrop splash patterns as affected by drop size, surface irregularity, water depth, target softness, and target inclination. The pressure distribution at impact is also being investigated. At impact is also being investigated. At Lafayette, Indiana, the effect of slope steepness, runoff rate and particle size on erosion by rainfall and/or runoff is being investigated. Non-cohesive glass spheres (50-500 micron) were used initially, with sands, silts, and soils to follow.
 (g) High-speed movies of drops at impact showed
- that the splash crater became wider, higher,

and more outward as drop size increased. Increased surface roughness, softness, and water depth generally decreased the resulting

splash. Runoff erosion increased as slope steepness and runoff rate increased as stope stooping size decreased. Strong evidence of critical limits of these variables below which no appreciable erosion occurred was found. The resulting soil erosion relation-ships were similar to comparable sediment

- "When a Raindrop Strikes," USDA, ARS, Agri-cultural Research, 12: 8, 9, Nov. 1963. "Mechanics of Soil Erosion by Rainfall and (h) Runoff as Influenced by Slope Length, Slope Steepness and Particle Size," by L. D. Meyer. Ph.D thesis, Purdue Univ., Lafayette, Indiana, June 1964.

 - (c) Mr. W. H. Wischmeier, Research Statistician, ARS, Agricultural Engineering Dept., Purdue

 - (d) Experimental; Laboratory and field investigations, basic and applied.
 (e) The purpose is to investigate differences in the erodibility of soils; identify and evaluate the soil properties and profile characteristics that influence erodibility:

and, if possible, derive an equation that expresses the functional relationship of soil erodibility to these variables. The equation would serve as a means of computing locational values of the soil-erodibility factor in the universal erosion equation. Both "in situ" measurements on field plots and laboratory measurements on small, disturbed soil samples are made under simulated rainfall and related to laboratory analyses of the soils.

- (g) The studies have shown that the erodibility of a soil is not fully determined by those soil properties considered in standard soil-series classifications. The erodibility of Corn Belt soils generally increased with increases in silt content and decreased with increases in sand content, but differences in organic matter content, aggregation, dispersion ratio, and other variables resulted in broad ranges of erodibility within standard textural classes. Interactions of properties that affect infiltration rate and permeability with those that resist dispersion and transport were found to be highly significant. Efforts to develop a dependable soil-erodibility estimating equation are continuing.
- mating equation are continuing. "Relative Erodibility of Three Loess-Derived Soils in Southwestern Iowa", by B. L. Schnidt, W. D. Shrader, and W. C. Moldenhauer. Soil Sci. Soc. Amer.  (d) Experimental; field investigations, applied
 - research.
 - (e) After more than 30 years of measurements of runoff and soil loss from field plots under natural rain on steeply sloping Fayette soil near LaCrosse, Wisconsin, all work at that location was terminated at the close of the 1963 crop season.
 - (g) A 30-year summary report of runoff and erosion studies in Wisconsin is being prepared for publication as a USDA technical bulletin. "Corn Stover Mulch for Control of Runoff and
 - (h) Erosion on Land Planted to Corn After Corn, by R. E. Taylor, O. E. Hays, C. E. Bay and R. M. Dixon. Soil Sci. Soc. Amer. Proc. 28(1): 123-125, 1964.
- (4281) RUNOFF AND EROSION STUDIES IN THE MIDWEST CLAYPANS.

 - (b) Laboratory project, cooperative with the Missouri Agricultural Experiment Station.
 (c) Mr. Fred D. Whitaker, ARS, Agricultural Engineering Dept., Univ. of Missouri, Combined Macauta Macauta Columbia, Missouri.
 - (d) Experimental; field investigation, applied research.
 - (e) To evaluate effects of soil treatments, tillage practices and supplemental irrigation on runoff and erosion from Midwest Claypan soils. Measurements of runoff, soil loss and concomitant variables on a series of fractional-acre plots and small watersheds under natural reinfall are continuing. under natural rainfall are continuing.
 - (g) Fertilization adequate to produce high crop yields and large quantities of plant residues has greatly reduced the formerly serious soil and water losses from this gently sloping, claypan soil. Preparing seedbeds so that shredded cornstalks remained at the surface resulted in further significant reduction in soil loss from the high-intensity rains. Corn receiving full fertility treatment has been a more efficient user of water than has corn with only starter fertilizer.
- (4282) RUNOFF AND EROSION INVESTIGATIONS IN MINNESOTA UNDER SIMULATED RAIN.
 - (b) Laboratory project, cooperative with the Minnesota Agricultural Experiment Station.
 - (c) Mr. R. A Young, Agricultural Engineer, ARS, North Central Soil Conservation Research
 - Center, Morris, Minnesota. (d) Experimental; field investigations, applied research.
 - (e) Simulated rainstorms of design erosivity applied in each of three cropstage periods, are used to evaluate the relations of runoff and soil erosion to slope steepness, slope shape, row direction, intensity of cropping, residue management, tillage methods, and other variables in relation to crops that are common in this climatic area. Runoff hydrographs are obtained and changes in soil concentration of the runoff are determined by periodic sampling throughout each test. Tests are conducted on various soils of west-central Minnesota and eastern
 - South Dakota. (g) Crops tested in various sequences and at several growth stages have included flax, soybeans, corm and small grain. Initial tests have shown slope shape to be a significant factor in erosion. Effects of tillage methods are being tested in

relationship to associated cloddiness and surface configuration.

- (4307) RESERVOIR FORMULAS AND THE VOLUME-WEIGHT OF (5204) HYDROLOGIC STUDIES ON WATERSHEDS IN MISSOURI RESERVOIR SEDIMENT.
 - (b) Laboratory project, cooperative with the Soil Conservation Service and State
 - Agricultural Experiment Stations. Mr. H. G. Heinemann, Hydraulic Engineer, Bldg. T-12, P. O. Box 208, Columbia, (c) Missouri.
 - (d) Field investigations, development, and office analyses.
 - (e) This project provides criteria for more accurate determination of the sediment yield of watersheds from reservoir survey data. The investigations include: (1) Refinement of survey procedures and methods for determining reservoir capacities and sediment volume from reservoir sedimentation survey data: (2) explanation of variations in the volume weight of reservoir sediment; (3) recommendations on determination of the total weight of reservoir sediment; and (4) development of procedures for predicting the volume-weight of sediment in a pro-posed conservation structure.
- (4817) EROSION AND MOISTURE CONSERVATION STUDIES ON BARNES SILTY CLAY LOAM.
 - (b) Laboratory project, cooperative with the
 - Minnesota Agricultural Experiment Station. (c) Mr. R. E. Burwell, Soil Scientist, ARS, North Central Soil Conservation Research Center, Morris, Minnesota.
 - (d) Experimental; field investigations, applied research.
 - (e) Field plots under natural rain are used to characterize runoff and erusion on the Barnes soil of the North Central Region and to evaluate moisture conservation aspects of soil and crop management practices. Automatically controlled devices to heat the collecting and measuring equipment enable measurement of runoff from snow-melt and thaw. Soil moisture is measured by neutron probe techniques. Wind direction and velocity are automatically recorded.
 - (g) During years of average or below average rain-fall for this climatic area, moisture con-servation for crop use is of greater concern than soil erosion. The measurements have shown, however, that this soil is highly erodible in periods of concentrated rainfall and that erosion damage is a serious problem. The soil has been very responsive to soil and crop management practices as erosion-control

- (4825) RESERVOIR SEDIMENTATION STUDIES.
 - (b) Laboratory project, cooperative with the Soil Conservation Service and State Agricultural Experiment Stations.
 - (c) Mr. H. G. Heinemann, Hydraulic Engineer, Bldg. T-12, P. O. Box 208, Columbia, Missouri.
 - (d) Field investigations, development, and office analyses.
 - (e) Numerous small reservoirs form the basis for this study. The objectives of this project are: (1) Determine the amounts, rates, and character of sediment yields from agricultural watersheds; and (2) relate sediment accumulation in the reservoirs with sediment yield, precipitation, runoff, watershed characteristics, and cultural practices. Sediment yield and related in-formation are important factors in the planning and design of small reservoirs and other conservation installations.
- (5033) DRAINAGE INVESTIGATIONS FOR AGRICULTURAL LANDS.

See Ohio Agricultural Experiment Station, Dept. of Agricultural Engineering, page 62.

- VALLEY DEEP LOESS.
 - (b) Laboratory project, cooperative with the Iowa Agricultural Experiment Station.
 (c) Mr. K. E. Saxton, P. O. Box 208, Columbia,
 - Missouri.
 - (d) Field investigations, development, and office analyses.
 - (e) Two sets of paired agricultural watersheds are instrumented to observe the hydrologic budget and surface runoff in deep loess. Level terracing will be introduced as a variable on one of the watersheds of one of the pairs; a comparison of level terracing and grass cover will be made on the other pair. Variables observed are precipitation, soil moisture to 20-foot depths, surface flow, ground water recharge and outflow, and evapotranspiration.
- (5205) ANALOG STUDIES OF SUBSURFACE DRAINAGE.
 - (b) Laboratory project in cooperation with the Ohio Agricultural Experiment Station, Dept. of Agronomy.
 - Dr. George S. Taylor, Dept. of Agronomy, Ohio State Univ., 1885 Neil Ave., Columbus 10, (c) Ohio.
 - (d) Theoretical and experimental; basic and applied.
 - (e) An electrical resistance network analog is used to study the placement of subsurface drain tubes to provide optimum water table control for plant growth. (g) Removal of excess rainfall and artesian
 - water from a surface peat horizon, underlain with a thick slowly permeable silt layer, can be better achieved with tile drains on 40-foot spacings in the peat layer than with artesian relief wells into the aquifer.
- (5561) EROSION AND MOISTURE CONSERVATION STUDIES IN EASTERN SOUTH DAKOTA.
 - (b) Laboratory project, cooperative with the South Dakota Agricultural Experiment Station.
 (c) Mr. C. W. Doty, Agricultural Engineer, ARS, South Dakota State College, Brookings, South
 - Dakota.
 - (d) Experimental; field investigations, applied research.
 - (e) Field plots under natural rain are used to characterize runoff and erosion on the Poinsett soils of eastern South Dakota and to evaluate moisture conservation aspects of soil and crop management practices. Watersheds are being developed for evaluating improved terrace designs for moisture conservation and erosion control.
 - (g) Three years' measurements have shown these soils to be very highly erodible during periods of concentrated rainfall, but to be quite responsive to soil and crop management practices as a means of reducing soil erosian. In this area of about 20 inches average annual rainfall, moisture conservation for crop use is a major problem.
- (5562) RESERVOIR TRAP EFFICIENCY.
 - (b) Laboratory project, cooperative with the Soil Conservation Service and Iowa State Agricultural Experiment Station.
 - (c) Mr. H. G. Heinemann, P. O. Box 208, Columbia, Missouri.
 - (d) Field investigation, development, and office analyses.
 - (e) The purpose of this research is to evaluate those parameters that affect the sediment trapping ability of water-retarding structures. This will enable prediction of the trap efficiency of structures. Measure-ments are made of the sediment content of the inflow and outflow and the volume retained in the reservoir. Characteristics

or the sediment, watershed, reservoir, and other parameters are also used in the analyses.

- (5563) GULLY EROSION STUDIES IN DEEP LOESS.
 - (b) Laboratory project, cooperative with the Iowa Agricultural Experiment Station.
 (c) Mr. Robert F. Piest, P. O. Box 208, Columbia, Missouri.
 (d) Field investigation, development, and

 - office analyses.
 - (e) Measurements are being made on several actively-eroding gullies in controlled watersheds in the Missouri Valley deep watersheds in the Missouri Valley deep loess. The objectives are to learn the causes of gully and channel erosion, the rate of this erosion, and the effect of level terraces on gully growth. Measure-ments include amount eroded, changes in dimensions, surface flow, soil moisture, and ground water elevations.
- (5564) EVALUATING INTERFLOW WITHIN CLAYPAN SOILS.

 - (b) Laboratory project, cooperative with the Missouri Agricultural Experiment Station.
 (c) Dr. V. C. Jamison, P. O. Box 208, Columbia, Missouri.
 - (d) Field investigation, development, and office analyses.
 - (e) Field investigations are being conducted to identify and evaluate quantitatively the contribution to surface flow by the return to the surface of moisture infiltrated up the slope. Various lengths of plots and degrees of soil saturation are used.
- (5565) RUNOFF FROM CLAYPAN SOIL AREA OF MISSOURI AND ILLINOIS.
 - (b) Laboratory project, cooperative with the
 - Missouri Agricultural Experiment Station.
 - (c) Mr. Keith E. Saxton, P. O. Box 208, Columbia, Missouri.
 - (d) Field investigation, development, and
 - (d) Field investigation, development, and office analyses.
 (e) Precipitation, runoff, pond evaporation and seepage, pan evaporation, and land use are being measured on a 160-A. watershed near McCredie, Missouri. These and other rainfallrunoff data throughout this soil area are being analyzed to evaluate water yield and surface runoff.

 - (c) Mr. R. P. Apmann, Hydraulic Engineer, 21 South Grove Street, East Aurora, N. Y.

- (d) Experimental field investigations.
 (e) To determine the important streamflow qualities which materially affect the intensity of attack upon the stream channel periphery material and the variation throughout the flow boundary of forces de-structive to the channel periphery material. Investigations are conducted on selected natural reaches of Buffalo Creek and tributaries in the vicinity of East Aurora, New York and on the Pequest River in Warren (g) Thorough study and analysis are continuing
- on stream geometry and of hydraulic char-acteristics of channel improvements and stabilization works constructed by Soil Conservation Service on Buffalo Creek. The analysis of the March 30, 1960 and other floods is being carried out by assembling an atlas of high-water data and by pre-paring a topographic map showing the con-tours of the stream channel and of the flood plains. A method is being developed for estimating discharge by using the superelevation of the water surface in an superclevation of the water surface in an open channel bend. This method is based on the principle that the transverse difference in water surface at an open channel bend is related to the geometry of the bend and to the velocity head of the flow.
- (4284) DEVELOPMENT AND EVALUATION OF METHODS FOR CHANNEL STABILIZATION.
 - (b) Cooperative project with Soil Conservation Service and Cornell University.

 - (c) Mr. M. L. Johnson, Hydraulic Engineer, Route 2, Danville, Vermont.
 (d) Experimental field investigations.
 (e) Studies on a 1.5-mile reach of the Sleepers
 - River channel involving determination of: travel speed of controlled waves of different volumes; profiles of natural and controlled waves of different volumes; practical field methods of measuring the friction slope of mountain channels; comparisons between results obtained with flood routing formulas and observed flood wave data; and the relationship between channel
 - data; and the relationship between channel efficiency, flow duration curves, and watershed morphology.
 (g) Short reaches within the 1.5-mile reach were found to have a Manning's "n" value of between 0.035 and 0.040 for the bank-full conditions and a maximum of about 0.20 for very low flows. Channel roughness and geometry are intricately related to each other and to the lithology and climate of the watershed. This mountain stream is characterized by a relatively narrow and

deep cross-section. It is postulated that this geometry causes a rapid increase in velocity with increasing discharge, providing the erosional energy required for the eventual attainment of a most probable state. There is an unper limit to roughness in a stream is an upper limit to roughness in a stream channel, and this is approached in the length of stream studied. Addition of more roughness elements would only create a new bed with similar characteristics. The removal of a number of the element would very probably increase the resistance to flow because it would reduce the phenomena of shielding, in which the elements reduce the frictional effectiveness of one another due to close grouping.

- (4286) INFLUENCE OF SNOW AND FROZEN SOIL ON RUNOFF.
 - (b) Cooperative project with the Vermont Agricultural Experiment Station, Vermont Water Conservation Board, and Soil Con-servation Service and College of Technology of the University of Vermont.
 - Mr. M. L. Johnson, Hydraulic Engineer, Route 2, Danville, Vermont. Experimental field investigations. (c)
 - (d) (e) This study on the 43-square mile Sleepers River Watershed is concerned with the factors influencing the accumulation and melting of snow; the relationship of frozen soil to runoff; and the development of methods for predicting runoff associated with snow melt. Data are collected and analyzed from snow courses, precipitation gages, temperature records, heat budgets, soil moisture and frost measurements, and snow melt in conjunction with streamflow records at nine stations in the subdivided watershed. (g) The albedo consistently decreased from a
 - high value in January to a low value at the end of the snowmelt season and was found to be affected by the specific gravity of the snow, the age of the snow, and the number of degree-days above 32° F since the last snow. Snow structure was studied weekly by digging pits during the winter through the snow profile to the ground surface. During the winter the snow was distinctly structured, the temperature variations within the snow profile were relatively large, the temperature at the ground surface remained about constant at 32° F., and the specific gravity increased with depth. During the melt period the temperature within the entire snow profile varied less than 3 to 4 degrees, and the specific gravity situation reversed for its pits during the winter through the snow specific gravity situation reversed for its maximum value occurred at the snow surface. As the snow melted from the surface downward, the snow layers became less distinct, finally disappeared, and the snow pack became a homogeneous mass of coarse ice crystals. Until these conditions prevailed, very little free water was found to reach the snowmelt pan placed on the ground surface.
- (4287) PRECIPITATION PATTERNS AND CHARACTERISTICS.
 - (b) Cooperative project with the Vermont Agricultural Experiment Station and College of Technology of the University of Vermont, Vermont Water Conservation Board, and Soil Conservation Service.
 - (c) Mr. E. T. Engman, Hydraulic Engineer, Route 2, Danville, Vermont.
 (d) Experimental field investigations.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ The purpose of this study is to develop a method for calculating average precipitation on the 43-square mile Sleepers River watershed and its subdivisions in relation to elevation, storm source and direction; to study the behavior of summer convective storms in the northeast; and to provide information on rainfall depth-area-duration in relation to point rainfall in this part of the northeast.
 - (g) In a study to determine how watershed parameters affected rainfall and snow depth, altitude was found to be the most important

variable. Seasonal isoheyetal maps show that the variation is synonymous with elevation, the difference in precipitation being greatest in winter and least in summer. The areal randomness of thundershowers appears to account for the more equitable distribution in the summer. I The strong correlation between snow depth and elevation is due to the fact that the higher altitudes have greater snowfall, cooler mean temperatures, and more cloudy days. Though the rough and heavily wooded terrain of the higher altitudes provides abundant shade and shelter from the wind, aspect and exposure appear to have a minor influence on the relation between rainfall or snow depth and elevation in this watershed.

 - (d) Basic and applied research.
 (e) The purposes of this project are to evolve and test new concepts, theories and principles for understanding the hydrologic processes on agricultural watersheds; to test and adapt information from various sources for application to water control and related problems encountered in watershed engineering; to conduct special analyses involving ARS data from more than one Station or more than one Branch that can be more adequately carried out at a central location which has available a full-time staff of scientists with specialized training in hydraulics, hydrology, meteorology, and mathematics; and to provide case assistance to field personnel de-tailed to the Laboratory for specific anal-yses as requested by the field.
 - (g) The Hydrograph Laboratory is currently performing hydrologic computations with digital computers to simulate watershed performance as affected by various protective measures. In a continuation of the study reported last year, a system was developed for expressing the rising side of a hydro-graph, as well as the falling side in terms of the recession storage-flow relationship of the recession storage-flow relationship. It was found that two successive routings of rainfall excess through one-half of the the storage derived from the recession curves induces the lag needed to predict the rising

side of the hydrograph. Currently, the U.S. Hydrograph Laboratory is conducting a survey of hydrologic capacities of selected soils occurring on Agricultural Research Service study watersheds. These data are intended for use in computing infiltration curves and watershed retentions. Numerical studies are continuing in the hydraulics of flood flow including both kinematic and kinetic formu-These computations are programmed lations. lations. These computations are programmed for the 1620 computer and are presently adaptable for varied overland flow or for varied flow in prismatic channels. Depth-area duration studies of rainfall expectancies are underway using data from dense network watersheds as supplied by various participating agencies. Distribution patterns for major storms are also under study.

 (d) Experimental field investigations.

 - (d) Experimental field investigations (e) To develop procedures for estimating effectiveness of streambank stabilization and other measures in reducing the sediment discharge of a stream. It is postulated that the total sediment load of a stream is directly related to the mean concentration of the suspended sediment for a flood series, and that changes in time of the mean con-centration resulting from installation of streambank stabilization measures are indi-cative of changes in total sediment load. The streambank stabilization measures are being installed by Soil Conservation Service as part of the authorized flood prevention program in the Buffalo River watershed. Measurements of suspended sediment load concentration and of stream discharges are made for all floods above a certain magnitude.

 (e) This study is an experimental investigation utilizing a tilting flume in which a small channel 60-feet long is formed by natural

soil which is fixed in position against roughness forms can be created on the bed. The relation of roughness dimensions and channel shape to flow resistance is de-termined for a range of channel slopes and flow depths.

- (f) Inactive. (g) Relationships between resistance coefficients and measured roughness dimensions were developed for both laminar and turbulent flows. The transition between these flows was found to occur at a Reynolds number (RV/v) of 500 for these channels. For low Reynolds number flows (Re less than 500) over rough boundaries, normal flow depth was proportional to discharge, viscosity and roughness height and inversely proportional to roughness spacing and channel slope. For turbulent flows, re-sistance was a logarithmic function of roughness height and flow depth. The standard deviation of bed elevation measurements was used in both cases to represent the effective height of the nonuniform roughness elements. Effects of roughness spacing and channel shape on flow resistance could not be detected for turbulent flows.

 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Office analyses, applied research. To develop and test methods for use by field engineers to evaluate the downstream effects of upstream conservation use and treatment of land on water yields of creeks and rivers. The project is one purely of analytic hydrology. The project uses available
 - hydrologic and other data wherever it is available. It secures no new hydrologic data such as streamflow data, climatic data, or land-treatment data. The project is nearing completion. Studies have demonstrated that it cannot be
 - (g) proved statistically significant that there are downstream effects on stream flow of upstream conservation treatment and use of land, although it is axiomatic that in subhumid to arid areas such effects must exist. A rational method of evaluating such effects has been developed and tested. A summary of the studies performed and presentation of the rational method will be published through Department of Agriculture media during 1964.
- (4298) COMPARISONS OF RATES AND AMOUNTS OF RUNOFF FROM SMALL SINGLE-COVER WATERSHEDS.
 - (b) Laboratory project, cooperative with the Nebraska Agricultural Experiment Station.

 - Nebraska Agricultural Experiment Station.
 (c) Mr. Frank J. Dragoun, Hydraulic Engineer, ARS-SWC, Hastings, Nebraska.
 (d) Field investigations -- applied research.
 (e) To evaluate the effect of (1) different land use treatment and (2) different crops on the runoff from single crop watersheds in the Control Crock Plana, one of the similarian Central Great Plains, as one of the signi-ficant factors influencing runoff from complex watersheds. Replicate 4-acre single crop watersheds in meadow, pasture, culti-vated and eroded cultivated land seeded to grass are instrumented with recording rain gages, flumes and waterstage recorders. Six cultivated watersheds are in a wheat-sorghumon the contour, is practiced. Effects of different crops and land uses on storm runoff rates and amounts are determined by

analyzing hydrographs and histograms. Seasonal, annual, and long time effects are determined by analyzing precipitation and runoff data.

- (g) Twenty-four years of record show that runoff from a single crop 4-acre watershed averaged 3.3 inches. During the same period a 4-acre native-pasture yielded 2.0 inches and a native-meadow yielded only 0.25 inches. Rainfall during the period averaged 22.4 inches. These results indicate the relative differences that can be expected in runoff under different land-use practices.
- (4299) RUNOFF AND HYDROGRAPH CHARACTERISTICS OF LARGE MIXED-USE WATERSHEDS.
 - (b) Laboratory project, cooperative with the Nebraska Agricultural Experiment Station.
 (c) Mr. Frank J. Dragoun, Hydraulic Engineer, ARS-SWC, Hastings, Nebraska.

 - (d) Field investigations -- applied research.
 - To determine characteristics of runoff from (e) large mixed-use watersheds as related to, or affected by, precipitation, channel storage, transmission losses to valley alluvium, time of concentration, stream gradient, and watershed size. Three watersheds, in mixed use, 481, 2086 and 3490 acres in size, are instrumented with rain gages, weirs, and stage recorders for observing precipitation and runoff. Transmission losses to valley alluviums are estimated by use of gaged outflow and estimates of inflow from unit source areas of tributary land. These latter estimates are based on gaged rainfall on and runoff from small 4-acre single-use source area watersheds. Hydrographs and histograms are analyzed to obtain watershed retention (infiltration) rates and hydrograph characteristics.
 - (g) Twenty-four years of record indicate that average yearly runoff from a conventionally farmed area of 481 acres was 3.3 inches. On a single crop 4-acre area the average was 3.6 inches. Rainfall for the period averaged 22.4 inches. A comprehensive analysis of the 24 years of continuous records is underway.
- (4300) COMPARISON OF RUNOFF AND SEDIMENT YIELDS FROM CONSERVATION AND CONVENTIONALLY FARMED WATERSHEDS.
 - (b) Laboratory project, cooperative with the Nebraska Agricultural Experiment Station.
 - (c) Mr. Frank J. Dragoun, Hydraulic Engineer, ARS-SWC, Hastings, Nebraska.
 - (d) Field investigations -- applied research.
 (e) To determine the effects of conservation farming, land use, climate, and physiography on rates and amounts of runoff and sediment yields. Two 400-odd-acre watersheds, one conventionally farmed and the other conservation farmed, are equipped with recording rain gages, weirs and stage recorders, and sediment samplers, to measure precipitation, runoff, and sedIment yields. The two watersheds were operated the same during a calibration period from 1939 to 1947. One was then treated by terracing, contour tillage and seeding eroded cultivated land to grass.
 - (g) Current data substantiate previous analyses indicating conservation measures are effective in controlling soil erosion from average rainfall events. Six years of continuous measurement show that annual sediment yield from the area under conservation was 5.4 tons/acre compared with 8.7 tons/acre from the conventionally farmed area or a difference of 38 percent. In 1957, a year of above normal rainfall with intense storms, no significant re-duction in sediment yield was realized under conservation practices whereas in 1963, a year of above normal rainfall but no intense storms, the sediment yield from the area under conservation was only 14 percent of that from the conventionally

farmed area. The significance of kinetic energy of rainfall in sediment yield determinations is indicated.

- (4301) RELATIONSHIP BETWEEN INTENSITY OF GRAZING AND RUNOFF AMOUNTS ON FINE-TEXTURED SOILS.
 - (b) Laboratory project, cooperative with South Dakota Agricultural Experiment Station.
 - (c) Mr. Clayton L. Hanson, Agricultural Engineer, Newell Irrigation and Dryland Field Station,
 - Newell, South Dakota.
 (d) Field investigations -- applied research.
 (e) To determine the effects of light, moderate and heavy grazing and other factors such as frost and snow accumulation, on rates and amounts of runoff from fine-textured range soils in southwestern South Dakota. Replicated plots of about 2 acres in each of the lightly, moderately and heavily grazed pastures are instrumented to observe runoff amounts (stage recorders and H-flumes) rates and amounts (stage recorders and H-ilumes) rates and amounts of precipitation (recording rain gages), soil moisture, soil frost and vegetative conditions. The studies are being made on the South Dakota Range Experiment Station near Cotton wood, South Dakota. (g) Rainfall-runoff events during the first year
 - materially influences range cover and that runoff is normally higher from heavily grazed areas although storm sequences and antecedent moisture conditions can signifi-
 - antecedent moisture conditions can signifi-cantly influence the normal trend. "Runoff as Affected by Intensity of Grazing on Rangelands." A. L. Sharp, J. J. Bond, J. W. Neuberger, A. R. Kuhlman, and J. K. Lewis, Jour. Soil and Water Conserv. 19(3): 103-106, May-June, 1964. (h)
- (4302) MEDICINE CREEK WATERSHED INVESTIGATIONS.
 - (b) Laboratory project, cooperative with the Soil Conservation Service, U. S. Geological Survey, Bureau of Reclamation, and Nebraska Agricultural Experiment Station.
 - (c) Mr. V. I. Dvorak, Hydraulic Engineer, ARS-SWC, Hastings, Nebraska.
 - (d) Field investigations; compilation and analysis of data.
 - (e) Data from this southwestern Nebraska project are being analyzed for the following purposes: (1) To estimate the long-time runoff and sediment yields from 8 years of observed hydrologic watershed data; (2) to determine if acquired runoff, sediment and channel data will adhere to the existing channel regime equations for six runoff stations; and (3) to compile and prepare a publication indicating what data have been collected as part of the cooperative investigations, and where these data may be found.
 - (g) The long-time sediment yields for the six watersheds have been computed by three different approaches. In each of these methods, the observed runoff and sediment data for 8 years were used for the projection.
- (4303) SEDIMENT YIELD AS RELATED TO GULLY AND CHANNEL EROSION.
 - (b) Laboratory project, cooperative with the Soil Conservation Service, and Nebraska and Kansas Agricultural Experiment Stations.
 - (c) Mr. V. I. Dvorak, Hydraulic Engineer, ARS-SWC, Hastings, Nebraska.
 - (d) Field investigations; compilation and
 - (d) Field investigations; compliation and analysis of data.
 (e) The objectives of this project are: (1) To determine and relate rates of gully and channel erosion to causal factors; (2) to provide basic data on rates of land loss and los and land depreciation due to gully erosion; and (3) to develop criteria, based upon hydrologic and physical factors, for esti-mating quantities of sediment derived from gully erosion.

- (g) Results of studies covering an ll-year period indicate that channel slopes and shapes are related to erosion and runoff conditions. It was found that for a unit cross section area, depths of flow, in a gullied channel, increase in a downstream direction but the rate of increase declines with distance downstream from the head-cut. Head cutting erosion in one case was equivalent to 8 percent of the total sedi-ment yield and the material removed from the channel was equivalent to 30 percent of the total sedIment yield of the tributary drainage in the ll-year period.

- (b) Laboratory project, cooperative with the South Dakota Agricultural Experiment Station.
 (c) Mr. Clayton L. Hanson, Agricultural Engineer, Newell Irrigation and Dryland Field Station, Newell Irright
- Newell, South Dakota. Field investigations, applied research. To determine the frequency of water yields of various amounts from rangeland watersheds (d) (e) ranging in size from a few acres to 13,000 acres, and gross sediment yields (volumetric) from the same watersheds, as representative of the D-4, D-10, and D-11 soil conservation problem areas in eastern Montana, Wyoming and the Western Dakotas, Purposes of these and the Western Dakotas. Purposes of these studies are to provide data on water yields and information on which to estimate the probable useful life of ponds and reservoirs in the problem areas. The work is being done by gaging precipitation, measuring water yields in stockwater reservoirs, making reservoir sedimentation surveys, and securing date or ustorabed revuiced to concrement. data on watershed physical, topographic, ecologic and grazing use factors.
- (g) Data continue to show that sediment yields from fine-textured soils are double those from the medium textured soils (7.5 tons/ scre and 3.7 tons/acre respectively). Similarily, surface runoff from the fine-textured soils has continued to average 4 times that from medium-textured soils. In 1962, 6.1 inches of runoff or 27 percent of the 22.6 inches of precipation occurred in a 90 acre fine-textured soil area which is the highest percentage measured since the studies were initiated in 1957. The highest runoff during 1962 from the medium-textured soils areas was 6 percent of the annual rainfall.
- (4824) EVAPORATION AND SEEPAGE FROM RANGELAND STOCKPONDS.
 - (b) Laboratory project, cooperative with the South Dakota Agricultural Experiment Station.
 - (c) Mr. Clayton L. Hanson, Newell Irrigation and Dryland Field Station, Newell, South Dakota.
 (d) Field investigations -- applied research.

 - (e) To differentiate total stockpond water dissipation into evaporation and seepage and develop a basis for predicting expected stockpond water losses. The purpose of this stockpond water losses. The purpose of this study is to aid in the development of practical methods to reduce losses of water from stockponds to provide dependable water supplied for livestock.
 - (g) Data show that the ratio of the total pond Data show that the ratio of the total pond evaporation (floating pan) to that from the Class A land pan is 0.64. Seepage and deep percolation in ponds in the medium-textured soils region amount to 55% of the total pond dissipation. In one 12 ac. ft. capacity stockpond the volume of daily seepage loss over a 37-day period averaged 910 cu. ft. per day or an equivalent volume to water more than 600 cows each day. Stockponds on medium-textured soils are continuing to show medium-textured soils are continuing to show water losses exceeding inflow up to 80
- (4826) HYDRAULIC CHARACTERISTICS OF PARTIALLY SATURATED POROUS MEDIA.

- (b) Laboratory project, in cooperation with Colo. Agricultural Experiment Station.
 (c) Mr. R. H. Brooks, Agricultural Engineer, Hydraulics Laboratory, Colorado State Univ., Fort Collins, Colorado. (d) Basic research.
- (e) Certain hydraulic characteristics of porous media must be known for laboratory modeling of complicated field problems involving water movement in soils. Problems involving flow of fluids in partially saturated soils often cannot be solved except by inferences derived from the performance of models. The purpose of the study is to be able to

predict from equations how any porous medium will behave with respect to the functional relationship between permeability, degree of saturation (or fluid pressure) when certain media properties are known. A thorough understanding of the way permeability is effected by measurable properties of porous media might eliminate the necessity of selecting a porcus medium by trial for use in model studies.

- (g) A theory showing how the variables capillary pressure, water and air permeability are related to degree of saturation has been developed. Methods and equipment have been developed for measuring these variables using steady state experiments. Verification of the theory with experimental results has been good. It appears that hydraulic properties of partially saturated media can be described by three parameters: the bubling pressure, $P_{\rm b}$; a measure of the uniformity of the pores in the medium, ; and the saturated permea-
- bility K. "Hydraulic Properties of Porous Media and (h) "Hydraulic Properties of Porous Media and Their Relationship to Drainage Design," R. H. Brooks and A. T. Corey. J. Am. Soc. Agric. Eng. 7(1):26-27, 1964. "Hydraulic Properties of Porous Media," R. H. Brooks and A. T. Corey. Colo. State Univ. Hydraulics Paper No. 3:1-27, March 1964.

 - Objectives of the research are: (1) To follow deterioration of vegetation when converting from meadow to pasture; (2) to follow development of vegetation on crop-land seeded to native grasses; and (3) to follow changes in vegetative cover of a permanent pasture watershed. In all cases the effect on water yields will be determined It is the purpose of this research to provide needed information on the effect of changes in pasture and meadow land use on runoff and water yields.
- (5566)LABORATORY STUDY OF DELTA DEVELOPMENT IN-DUCED BY FLOOD-WATER RETARDING AND SEDI-MENT DETENTION STRUCTURES.
 - Laboratory investigations cooperative with the Colorado Agricultural Experiment Station. Mr. R. H. Brooks, Agricultural Engineer, ARS-SWC, Fort Collins, Colorado. Experimental investigations; basic and (b)
 - (c)
 - (d) applied.
 - Purpose of project is: (1) To investigate the dynamic processes involved in delta (topset bed) development above floodwater (e) or debris storage structures, and (2) to develop equations and graphical representa-tions describing the delta development processes in terms of the variables involved.
 - (g) Project initiated September, 1964. As yet, no data have been obtained.
- (5567) AUTOMATION OF SURFACE IRRIGATION SYSTEMS.
 - (b) (c) Laboratory and field investigations. Dr. H. R. Haise, Research Investigations Leader, Water Management, P. O. Box 758, Fort Collins, Colorado

- (d) Laboratory and field project. Applied research. Development, design and operation of automated system.
- or automated system. To develop labor-saving devices for surface application of irrigation water to farm fields for more efficient use of existing water supplies. Study involves development and testing of remote operation of a pneumatic valve (patents pending) capable (e) of controlling water in open ditch and closed pipe systems.
- (f) In early stages of development.
 (g) Water has been successfully applied to
 irrigation fields by radio control of
 pneumatic valves at distances up to one
 mile or more. Further studies are to be
 initiated at five locations where automatic
 systems will be operated and tested on a
 total farm basis.
- (5568) THE EFFECT OF SLOPE WITHIN A WATERSHED ON WATER INTAKE AND RUNOFF FROM RAINFALL.
 - (b) Laboratory project cooperative with Nebraska Agricultural Experiment Station.

 - Agricultural Experiment Station.
 (c) Mr. Norris P. Swanson, Agricultural Engineer, ARS-SWC, Lincoln, Nebraska.
 (d) Field investigations; basic and applied.
 (e) Purpose of the project is: (1) To measure and compare intake, runoff, and erosion from plots on slopes of approximately 3, 6, and 10 percent, located within small 4-acre watersheds using simulated rainfall; and watersheds using simulated rainfall; and (2) to construct runoff hydrographs using simulated rainfall data for comparison with hydrographs obtained from natural rainfall.

NORTHWEST BRANCH, P. O. Box 1096, Boise, Idaho, Dr. J. S. Robins, Branch Chief.

- (3550) THE EFFECT OF SPRINKLER PATTERN VARIATION ON IRRIGATION EFFICIENCY.
 - (b) Laboratory project.
 - Mr. Claude H. Pair, Research Engineer (Irr.), Agricultural Research Service, Snake River Conservation Research Center, Route 1, Box 186, Kimberly, Idaho.
 - Experimental; applied research and design. To determine the effect of sprinkler pattern on field irrigation efficiency and develop a method for calculation of field water application efficiency for a sprinkler system from sprinkler pattern, wind velocity, humidity, temperature, irrigation period, and related factors. Another phase of this project is to test typical sprinkler heads for reproducibility of water distribution pattern.
 - In completion stage. Tests conducted to date indicate that 90 percent of the water applied by the percent of the water applied by the sprinklers to the plots could be accounted for in the catch cans and correction for evaporation using the Frost-Schwalen nomograph. Only 79 percent of the water could be accounted for by the soil sampling method when corrected for consumptive use of plants and evaporation from the sprinkler nozzle to the soil surface using the Frost-Schwalen nomograph. The losses not ac-counted for above are being investigated. "Making Use of Sprinkler Pattern Data,"

 - (c)
 - (d)
 - University of Idano. Mr. J. Marvin Rosa, Hydraulic Engineer, P. O. Box 414, Moscow, Idaho. Analytical, basic and applied. To develop improved methods for estimating daily hydrographs of streamflow from (e) mountainous watersheds where the supply is from snowmelt and occasional rain.
- (4314) PRECIPITATION CHARACTERISTICS OF A NORTHERN SEMI-DESERT WATERSHED.
 - (b) Laboratory project.
 - (c) Mr. Freeman M. Smith, Research Botanist, P. O. Box 2724, Boise, Idaho.
 (d) Experimental, basic and applied.

- (e) The 93 square mile Reynolds Creek Experi-mental Watershed, Owyhee County Idaho, has recording raingages to a density in excess of one per square mile. From this network, methods for evaluating rainfall amounts and intensities for different areas are being developed. Seasonal distribution with
- respect to amounts, character, and areal extent of precipitation are being measured. Topography greatly influences precipitation in Reynolds Valley. The regression equations for the relation of precipitation to elevation, (g) computed for the east and west half of the watershed are parallel, but there is a five inch difference in the constant term in the equations. This is attributable to the position of the valley in relation to in-coming storms. Precipitation is extremely variable in the semi-arid Northwest. To estimate mean precipitation in a stream basin in the mountainous Northwest similar to Reynolds Creek in relation of precipitation to elevation, topography, elevation, storm patterns and rainfall with 95 percent confidence of being + or - 1 inch would require approximately 55 rain gages.
- (4315) THE DESIGN OF SELF-PROPELLED SPRINKLER SYSTEMS.
 - (b) (c)
 - Laboratory project. Mr. Claude H. Pair, Research Engineer (Irr.), Agricultural Research Service, Snake River Conservation Research Center, Route 1, Box
 - 186, Kimberly, Idaho. Experimental, applied research, design. Determine water application patterns of (d) (e) self-propelled sprinkler systems. Determine the effect of wind on application patterns of self-propelled sprinkler laterals, and develop method of designing self-propelled sprinkler laterals from theoretical formulas.
 - (f) In completion stage. (g) Patterns of individual sprinklers making up In completion stage. the self-propelled moving lateral have been determined and are to be put together to see how the synthetic pattern compares with the field pattern of the moving lateral.
- (4834) INFLUENCE OF PHOTO SCALE, VEGETATION, TOPOGRAPHY, AND SNOW CONDITIONS ON PHOTO-GRAMMETRIC MEASUREMENT OF SNOW COVER.
 - Laboratory project. Mr. Charles F. Cooper, School of Natural Resources, Univ. of Michigan, Ann Arbor, (b) (c) Michigan.
 - (d)
 - Experimental; basic and applied. This project seeks to determine the feasi-(e)bility of determining the quantity of snow stored in a snowpack on a selected area by photogrammetric technioues and evaluate the influence of topography and vegetation on the accumulation and melting of snow. The study of different photoscales on the precision of estimate is included in the project.
 - (f) Completed.
 (g) Photogrammetry is a practical means of
 determining the volume of snow on an area
 determining the volume of snow on an area or its depth at a point in relation to land form and solar radiation. Photogrammetric snow depths consistently exceed measured depths by 0.5 to 1.0 foot, but it is possible to eliminate this bias with improved ground controls. The calculated standard deviation of snow depths is 0.78 foot at a photo scale of 1/6000.
- (4835) LEAF AND CROWN AREA OF ARTEMESIA TRIDENTATA. Laboratory project.
 - (c) Mr. Freeman M. Smith, Botanist, P. O. Box
 - 2724, Boise, Idaho. Experimental: basic and applied research. Develop methods of determining total leaf (d) (e) area for a given size-vigor classification of A. tridentata. Determine the capacity of these leaves to store precipitation,

intercept precipitation and to transpire. Evaluate the effect of immediate vegetation structure on leaf area of individual plants. Since vegetation and soils on watersheds act as reservoirs which receive, store and discharge water, an understanding of their individual performance in these capacities is tantamount to an understanding of watershed hydrology.

- (f) Completed.
 (g) Leaf area of sagebrush is best determined by measuring leaf volume per plant and dividing by average leaf thickness. Crown area is best estimated by crown ellipse. Leaf weight accounts for 93 percent of the variance in leaf area.
- (4836) WATER BUDGET OF A UNIT SOURCE AREA.

 - (b) Laboratory project.
 (c) Mr. Freeman M. Smith, Research Botanist, P. O. Box 2724, Boise, Idaho.
 (d) Experimental; basic and applied research.
 (e) Determine as fully as possible the fate of the construction of a construction. water falling on a small representative watershed throughout the year and estimate evaporation and transpiration from readily obtained instrumental and climatological data. Such a general understanding of the disposition of precipitation on a area is basic to an understanding of the effects of soils, geology, vegetation and climate.
- (4837) FACTORS AFFECTING SNOW ACCUMULATION AND MELT ON UNIT SOURCE AREAS.
 - Laboratory project. (b) (c)
 - Mr. Freeman M. Smith, Botanist, P. O. Box 2724, Boise, Idaho. Experimental; basic and applied research.
 - (d) Determine physical and meteorologial factors contributing to non-uniformity of snow ac-(e) cumulation and melt in a shrub covered unit source area in the sagebrush zone of Owyhee County, Idaho. Any improvement in the quantity or timing of flow from snow fed streams by manipulation of vegetation or other practices requires a thorough understanding of the behavior of snow under these conditions. Such infor-mation must be derived from research.
- (4838) A STUDY OF SURFACE WATER DIVERSIONS AND RETURN FLOW IN REYNOLDS VALLEY.
 - (b) Laboratory project.
 - Mr. Clifton W. Johnson, Hydraulic Engineer, P. O. Box 2724, Boise, Idaho. Experimental; basic and applied research. (c)
 - (d) (e) (d) Experimental; basic and applied reserven.
 (e) This investigation is designed to find the consumptive use of water by an upstream irrigated area as it affects downstream water supplies. All of the inflow to Reynolds Valley is measured as is the outflow and general ground water levels.
 (g) Preliminary data indicate about 50 percent of the dot of the inflow to do the level of the level.
 - water diverted is retained on the land. Because of incomplete instrumentation, conclusive results are not yet available.
- (4839) GEOLOGIC CONTROL OF SUBSURFACE STORAGE AND FLOW CHARACTERISTICS OF BASALT TERRANE.
 - (b) (c)
 - Laboratory project. Mr. Gordon R. Stephenson, Geologist, P. O. Box 2724, Boise, Idaho.
 - Experimental; basic and applied research. The purpose of this project is to evaluate the hydrologic effects of the basalts found on Reynolds Creek Experimental Watershed, (d) (e) Owyhee County, Idaho. The objective is approached by studying the water balance on a closed basaltic basin.
 - (g) The basalts on Reynolds Creek are much less permeable than those on the Snake River plains.
- (4840) THE DEVELOPMENT OF A PORTABLE IRRIGATION SPRINKLER EVALUATION DEVICE.

 (d) Field investigation; applied research and
 - design.
 - (e) This project will develop criteria for de-This project will develop criteria for de-sign of pumping systems to return irrigation runoff water to the distribution system. Possible amounts and rates of runoff waters will be determined, both theoretically and on a field basis. Size of system, (pump, sump, pipeline, etc.) as well as system operation are being investigated.

U. S. DEPARTMENT OF AGRICULTURE, AGRICULTURAL RESEARCH SERVICE, Soil and Water Conservation Research Division.

SCUTHERN BRANCH, University of Georgia, Athens, Georgia, Dr. A. R. Bertrand, Branch Chief.

- (3869) FLUVIAL MORPHOLOGY.

 - (b) Laboratory project, cooperative with the Univ. of Miss. and Mississippi State Univ.
 (c) Dr. Neil L. Coleman, Geologist, and Mr. Richard A. Stein, Hydraulic Engineer, Sedimentation Laboratory, P. 0. Box 30, Oxford, Mississippi. (d) A joint field and laboratory project - basic
 - and applied research.
 - (e) Detailed field measurements are made on selected natural water courses and flood plains in the Yazoo River Basin and other selected locations in Mississippi to delineate the variables of stream geometry, bend and bank roughness factors, dune migration, and stream hydraulics in terms of sediment transport characteristics. Laboratory studies in both 100-foot and define significance of various factors under controlled conditions. Acquired data are studied for adherence to existing regime equations, tractive force concepts, resistance coefficients, and bed material transport formulae, and to develop new or improved concepts and relationships. (f) Discontinued.
 (g) The existence of a discontinuity in the
 - stage-discharge relation under certain conditions in sand-bed streams has been established. Changes in channel conveyance established. Changes in channel conveyance efficiency, occasioned by changes in bed configuration have resulted in variances in water discharge of over 100 percent for given water stages. Variations in Manning's roughness coefficient from 0.015 to 0.035 during the course of a storm runoff event have occurred, and for a given water discharge on separate occasions the "n" value has been known to double. Similar value has been known to double. Similar variations in the Darcy-Weisbach coefficient have been noted. Froude numbers for floods over plane beds or antidunes in the field are less than Froude numbers computed from comparable flow conditions in the laboratory flumes; this difference in Froude numbers is believed to be partly a function of depth.
 - (h) "Observations of Resistance Coefficients in a Natural Channel," by Neil L. Coleman. Publication No. 59, I.A.S.H. Commission on Land Erosion, pp. 336-352, 1962.
- (3870) AGGRADATION AND DEGRADATION AS RELATED TO CHANNEL STRUCTURES.
 - Laboratory project, cooperative with the Univ. of Miss. and Miss. State University. Mr. Joe C. Willis, Hydraulic Engineer, (b)
 - (c) Sedimentation Laboratory, P. O. Box 30, Oxford, Mississippi, and Mr. Paul Yates, Hydraulic Engineer, P. O. Box 33, Watkins-
 - ville, Georgia.(d) Field and laboratory investigations; basic and applied research.
 - (e) It is necessary for proper planning and design of agricultural watershed conser-vation work to have knowledge of the extent of aggradation or degradation that is It aggravation of degravation that is likely to occur with placement of structures in alluvial channels. Studies of deposition and scour as related to actual structures at various locations in Mississippi, Georgia, Wisconsin and other selected locations to provide the needed field data are underway to develop procedures and criteria useful in predicting channel adjustments with structural installations and accompanying changes in sediment transport and flow
 - (g) Channel surveys show a slow rate of de-gradation of the streambed of Barber Creek, Georgia, where the control of flood flows

by flood water detention structure is greatest. Here the watershed 1s about 95 percent con-trolled. The degree of channel scour and channel erosion rates are being determined in connection with several structural installations in Mississippi. Case histories of over 70 gully control structures in Wisconsin have been established. Laboratory studies of degradation have been started. The rates of degradation of laboratory sand-bed channels following suspension of sand feed to the channel were measured. Three different sands were used.

- (3871) LABORATORY STUDIES OF SEDIMENT TRANSPORT.
 - (b) Laboratory project, cooperative with the University of Mississippi and Mississippi State University.
 - Mr. Richard A. Stein, Hydraulic Engineer, USDA Sedimentation Laboratory, P. O. Box 30, Oxford, Mississippi.
 - Experimental; basic and applied research.
 - Laboratory flume experiments are conducted to determine bed material transport, bed
 - to determine bed material transport, bed material qualities, and stream hydraulics.
 (g) In laboratory tests with a 400-micron median-diameter sand and depths of flow ranging between 0.4 ft. and 1.1 ft. the variable <u>V 1.1</u> is related to the type <u>1.4 (y + 1.0)</u> of bed form, the mean dune height, and the percervice depth of force well

Darcy-Weisbach friction factor rather well. Total load and bed load was determined by mean velocity when moving dunes were mean velocity when moving duries were present on the bed. When mean velocity was larger than the value producing minimum bed friction factor, total load was a function only of mean bed shear stress. A comparison of transport rates with those calculated by certain formulas, showed Schoklitsch's to be preferable because of applicability and ease of computation.

- (4305) TRAP EFFICIENCY OF RETARDING-TYPE RESERVOIRS.
 - (b) Laboratory project, cooperative with the Soil Conservation Service and the U. S.

 - Geological Survey.
 (c) Mr. D. A. Farsons, Director, Sedimentation Laboratory, P. O. Box 30, Oxford, Mississippi.
 (d) Theoretical and field investigations, and office analyses.
 - (e) The trap efficiency of a reservoir is a The trap efficiency of a reservoir is a measure of the effectiveness of the structure in retaining incoming sediment. Structures need to be designed and built with different degrees of trap efficiency, and information is needed so that the influencing parameters can be adjusted to provide the desired trap efficiency. In this study we are endeavoring to (1) collect and study data from retarding two reservoirs in order to from retarding-type reservoirs in order to determine those factors that influence trap efficiency, and (2) derive and test methods for predicting the trap efficiency of retarding-type reservoirs.
- (4316) HYDRAULICS OF CHANNELS RELATIVE TO CHANNEL STABILITY.

 - (d) Experimental, field investigations, applied and basic research.
 - (e) The determination of flood flow qualities in selected reaches of Pigeon Roost Creek Mississippi, and other streams in studies of the resistance to creater of structure to the resistance of structure of the streams in studies of the resistance to erosion of streambank and bed materials, and streambank vegetation. Measurements of the boundary shear stresses in curved channels as affected by bend radius, bed angle, and Froude number.
- (4317) PRINCIPLES OF STABLE CHANNELS IN COHESIVE MATERIALS.

- (b) Laboratory project, cooperative with the University of Mississippi and Mississippi State University.
- (c) Dr. Earl H. Grissinger, Soil Scientist, Sedimentation Laboratory, P. O. Box 30,
- Oxford, Mississippi. Experimental, applied and basic research. To study the properties of cohesive materials that determine their stability to flowing (d) (e) water. Rates of erosion are measured by subjecting remolded materials to a constant erosive flow of water. Objectives are: (1) to determine the reasons for the resisting ability of soil and stream-bank materials to erosion by flowing water; (2) to determine the kinds of tests needed to measure the resistance; and (3) obtain the quantitative values of the resistance for natural and synthetic materials.
- (g) The stability of cohesive material was found to be dependent upon the type, amount, and orientation of the clay minerals; the bulk density, antecedent moisture, and wet-age time of the sample; and the temperature of the eroding water. In general, stability increases with increasing clay mineral content and with increasing density. Stability was greater for the 2:1 type clay mixture than for the 1:1 type.
- (4318) METHODS OF CHANNEL STABILIZATION.
 - (b) Laboratory project, cooperative with the University of Mississippi and Mississippi State University.
 - (c) Mr. D. A. Parsons, Hydraulic Engineer (d) Experimental, field investigations, applied and basic research.

 - (e) Includes: (1) Determination of the speeds of motion and the requisite conditions for of motion and the requisite conditions for beginning of motion of solid particles in fluid flow for various flow, particle quality, and boundary conditions in a laboratory study; (2) field investigations on Pigeon Roost Creek, Mississippi, and other streams of the resisting ablities of bank and bed materials and heak variation bank and bed materials and bank vegetation as determined by measured flood experiences (this study is associated with the one on channel hydraulics); and (3) laboratory and field study of the behavior of non-cohesive stands and silts in a stream channel bank for the conditions of lateral seepage flow to the stream.
- (4319) SEDIMENT YIELDS AND CORRELATION WITH WATERSHED CHARACTERISTICS.
 - (b) Laboratory project, cooperative with the University of Mississippi and Mississippi State University.
 - (c) Messrs. Farris E. Dendy and Andrew J. Bowle, Agricultural Engineers, Sedimentation Laboratory, P. O. Box 30, Oxford, Mississippi.
 - Field investigation, applied research. Analyses of hydrologic, hydraulic, land use, soils, and physiographic characteristics of agricultural watersheds (varying in size from a fraction of an acre to 100 sq. mi.) (d) (e) from a fraction of an acre to 100 sq. ml., are made to establish relationships with sediment transport rates, amounts, and delivery ratios. Establishment of method-ology for determining long-time average annual sediment yields from fragmental field data, correlation of characteristics of the basic runoff-sediment relation (sediment rating curve) with affecting hydraulic and hydrologic parameters, and evaluation of the
 - hydrologic parameters, and evaluation of the role of large storms as sediment contributors, are all basic objectives that will lead to better sediment yield prediction procedures.
 (g) Data from Pigeon Roost Creek Basin, Miss., indicates that sediment yields are highly correlated with direct runoff. Variations in unit direct runoff (and therefore unit evaluations in the between unit the sediment variations in the sediment variations bediment) yields between watersheds of the basin are marked. They have to some extent been correlated with basin physiography

and land use. There are significant channel transmission losses in streams of the basin.

- (4320) SEDIMENT ORIGIN AND ROUTING.
 - (b) Laboratory project, cooperative with the University of Mississippi and Mississippi
 - (c) Dr. L. L. McDowell, Soil Scientist, Sedimentation Lab., P. O. Box 30, Oxford, Mississippi.
 - Experimental, basic research.
 - (d) Experimental, basic research. (e) Runoff and sediment production are measured from a small gully typical of the Yazoo-Tallahatchie Watershed. Sediment produced from this gully will be related to gully area, thereby providing information on the rate of gully erosion. When applicable, comparisons will be made between the estimated sediment discharge utilizing radioactive tracer sand, and the measured sediment discharge.
 - Runoff and sediment measuring equipment have (g) been installed. A detailed topographic survey has been made of the gully area. Surveys will be made periodically to observe changes in gully shape.
- (4321) RESERVOIR SEDIMENTATION.
 - (b) Laboratory project, cooperative with the University of Mississippi and Mississippi State University.
 - (c) Dr. J. Roger MoHenry, Soil Scientist, Sedimentation Laboratory, P. O. Box 30, Oxford, Mississippi. (d) Experimental and field investigation for
 - basic research and developmental work.
 - (e) To relate sediment accumulation in reservoirs to sediment yields, runoff, and physical parameters of the watersheds. The alogy, chemistry, and biology are studied in relation to distribution and deposition within the reservoir. Nuclear methods are used where applicable.
 - (g) A number of reservoirs have been periodically surveyed for sediment accumulation. Nuclear means of determining in situ densities have been employed.
 - "A Two-Probe Nuclear Device for Determining the Density of Sediments," by J. Roger McHenry, IASH Publication No. 65, 189-202, (h)
- (4322) DEVELOPMENT OF METHODS FOR UTILIZING RADIOACTIVE ISOTOPES AND RADIOACTIVE MATERIALS FOR SEDIMENTATION AND HYDROLOGY RESEARCH.
 - (b) Laboratory project, cooperative with the University of Mississippi and Mississippi State University.
 - Dr. J. Roger McHenry, Soil Scientist and Dr. L. L. McDowell, Soil Scientist, Sedimentation Laboratory, P. O. Box 30, (c) Oxford, Mississippi.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Experimental basic research. To devise, develop, and utilize procedures for "tagging" sediment particles with radioisotopes and identifying same in the laboratory and in the field. Results are to be used in predicting sediment production, transport and deposition.
 - (g) A satisfactory method has been developed for "tagging" quartz particles with scandium-46, silver-110, cerium-144, and antimony-124.
- (4323) SEDIMENT PRODUCTION AND CONTROL PRACTICES ON HIGHWAY CUTS AND FILLS.
 - (b) Laboratory project, in cooperation with Georgia State Highway Dept., Soil Conser-vation Service USDA, the University of Georgia College of Agriculture Experiment Stations, and Bartow County, Georgia.
 - (c) Mr. E. G. Diseker, Agricultural Engineer, P. O. Box 124, Cartersville, Georgia.
 (d) Experimental, field; applied.

- (e) Runoff and soil losses are measured from one pair of bare roadbank plots and two pairs of plots vegetated in early 1963 (approximately 1:1, 2:1, and 3:1) on Cecil Clay subsoil using six H-flumes and Coshocton vane samplers. On the two pairs of plots that were vegetated annual soil loss was approximately 13 times greater than before they were vegetated. Metal hub stakes are used as an adjunct in determining bank erosion, and for measuring deposition or scour from the flow channels. Over 30 different plants have been tested on 850
- (g) Bare bank losses have varied from 25 to 400 tons per year per acre for the past 5 years depending on the rainfall, frost action, bank aspect and slope. Bank aspect and frost action have been major factors in the erosion process. Banks facing northwest haw lost, on an average, 2.2 times as much soil as those facing southeast. Plants which have proved satisfactory for erosion control are fescue, common Bermudagrass, lovegrass, broomsedge, Pensacola and Wilmington Bahiagrasses, crownvetch, sericea lespedeza, honeysuckle and kudzu. For the establishment of satisfactory cover on slopes 2:1 and steeper, mulches were necessary particularly for the slowly developing plants such as crownvetch and Bahiagrasses. For maintenance of most plants, especially the grasses, a timely application of fertilizer is necessary. Previously outlined pro-cedures to determine fertility requirements for maintaining vegetation on roadside areas in the Piedmont Uplands of Georgia were put into practice in the fall of 1962. Studies to determine rates and amounts of sediment delivery for selected storms at monthly intervals and annual production and delivery from bare road banks in relation to (1) rainfall intensity (2) antecedent moisture and temperature conditions and (3) face slope length with different aspects on Cecil type soils will begin in the spring of 1963. A study was initiated in the spring of 1963 to determine sediment pro-ductions and delivery rates from fully developed, mature stands of five different representative plant species.

 (d) Laboratory and field investigations, both
- basic and applied for evaluating measured
- basic and applied for evaluating measured environmental conditions.
 (e) Laboratory and field procedures are employed to determine moisture intake, retention and transmission characteristics of mineral and organic soils. Controlled water table studies in non-weighing lysimeters are conducted to determine evapotranspiration, even creative and cold retermentation. crop growth, and soil physical properties as influenced by various water table depths. Field and plot studies in organic soils are conducted to determine soil subsidence.
- (g) Average daily evapotranspiration of Bermudagrass ranged from 0.07 inch for the three winter months to 0.14 inch for the period April through August. During an extended rain-free period of six weeks, evapotranspiration was about 23 percent less for the 36-inch water table than for the 12-inch water table. Good correlation existed between radiant energy, measured at the earth's surface, and measured poten-tial evapotranspiration of Bermudagrass and standard pan evaporation. Surveys over established subsidence lines on the organic soils of the Florida Everglades in 1963 show that the average rate of subsidence since 1912 has been 0.096 foot per year. Seepage through the rock strata underlying a peaty-muck soil at the Everglades Experiment Station appears to be an important factor affecting water table control.
- (4329) HYDROLOGIC RESEARCH ON SMALL AGRICULTURAL WATERSHEDS IN CENTRAL AND SOUTHERN FLORIDA.

 - Wr. E. H. Stewart, Soil Scientist, Attention: W. H. Speir, Engineering Technician, P. O. (c) Box 9087, Fort Lauderdale, Fla.(d) Experimental, field investigations; basic
 - and applied research.
 - and applied research. To collect, analyze, and correlate basic hydrologic data on agricultural watersheds ranging in size from 4,000 to 63,000 acres in the Coastal Plain of Florida. To de-termine the influence of climate, topography, soils, geology, and land use on the rate and volume of runoff and to evaluate the water (e) balance. To devise methods of interpreting watershed characteristics as similitudes related to physiography of other areas.
 - (g) For an unimproved 98.7-sq. mile watershed the maximum daily discharge (Oct. 1956) was 2.28 inches-over-area with an instantaneous peak rate of 70 c.f.s./sq. mile; and for the 15.7-sq. mile upper sub-basin the respective rates were 3.14 inches and 158 c.f.s./sq. mile. For an improved 78 square mile water-shed the maximum daily discharge (Sept. 1960) was 2.37 inches-over-area with an instantaneto of runoff to rainfall averaged 0.43 for the artesian-irrigated 78 sq. mile watershed until 1959. Increased use of artesian irriga-tion water increased this ratio to 0.55 after 1959. For the 98.7-sq. mile unimproved water-shed this ratio has averaged 0.32 and for the 15.7-sq. mile sub-basin, 0.27 since 1955. Total storm yield varied inversely with area on the unimproved watersheds. For the 98.7 sq. mile watershed base flow has averaged 84%, interflow 8%, and overland flow 8% of total streamflow. For the 78-sq. mile watershed stream flow components have averaged 75%, 19%, and 6% respectively. For the 15.7 sq. mile watershed they averaged 40%, 32%, and 28%. Data from three watersheds were analyzed to determine the suitability of the Cypress Greek Formula ($Q = CM^{5/6}$) for drainage design and to develop the relation of C to probable flood recurrence frequency. In this formula, Q is the maximum runoff rate for 24 hours in c.f.s.; M is drainage area

in square miles, and C is a coefficient. The formula appeared to be suitable for estiformula appeared to be suitable for esti-mating required drainage capacity in sandy flatwoods areas of the Southeast. The relation: C = 16.39 + 14.75 x rainfall excess provided a guide for selecting C values based on rainfall excess. The prob-ability of occurrence of excess rainfall can be related to 24-hour storm rainfall by sub-tracting the local soil storage notential.

- De related to 24-hour storm rainfall by sub tracting the local soil storage potential. "Using the Cypress Creek Formula to Estimate Runoff Rates in the Southern Coastal Plains and Adjacent Flatwoods Land Resource Areas," by John C. Stephens and W. C. Mills. U. S. Dept. Agr.  - (b) Laboratory project cooperative with the Univ. of Miss. and Miss. State Univ.
 (c) Dr. Neil L. Coleman, Geologist, U. S. Sedimentation Laboratory, P. O. Box 30,
 - Oxford, Mississippi.
 - (d) (e) Experimental project; basic research. An enlarged Reynolds Model of a section of An enlarged Reynolds Model of a section of stream bed has been constructed in a water tunnel. Transducers for measuring the force exerted on an exposed individual particle on the model bed are being de-veloped. Attempts will be made to determine whether the force applied to the particle by the flow has lift and yaw components as well as a drag component. If the study is successful the data obtained will be successful, the data obtained will be represented as plots of lift, drag, and yaw coefficients against Reynolds number. This information could then be used, with certain limitations, to predict the forces to be expected under various flow conditions on particulate beds of material ranging in size from that of sand grains to that of rip-rap stones.
 - (g) The development of transducers is progressing.

- (5575) A STUDY OF BED FORMS IN SAND BED CHANNELS.
 - (b) Laboratory and field project, cooperative with the Univ. of Mississippi and Mississippi State University.
 - Mr. Richard A. Stein, Hydraulic Engineer, Sedimentation Laboratory, P. O. Box 30, (c) Oxford, Mississippi.
 - Basic and applied research. (d)
 - (e) Relate the median and the standard deviation of dune height, dune propogation speed, water depths over dune crest, and water surface slopes to mean velocity and depth of flow. Define the bed material and hydraulic conditions that are related to types and size of bed configurations.
 - (g) The parameter $\frac{V 1.1}{1.75y + 1.25}$ appears to describe

the median values of the dune properties studied. The standard deviations of these dune properties appeared to be independent of mean velocity and depth except for the depth of water over the dune crest, which increased with depth.

- (5576) A STUDY OF BOUNDARY IRREGULARITY IN A CHANNEL WITH A SAND BED.
 - (b) Laboratory project, cooperative with the University of Mississippi and Mississippi State University.
 - Dr. Neil L. Coleman, Geologist, U. S. Sedimentation Laboratory, P. O. Box 30, (c) Oxford, Mississippi.
 - (d) Experimental investigation, Dasid resca
 (e) Flows with various bed regimes (dunes, Experimental investigation, basic research. Flows with various bed regimes (dunes, antidunes, or other) were established in a laboratory flume. An echo-sounding instru-ment called The Dual Channel Stream Monitor was used to take detailed bed and water surface profiles over a 50-foot reach in the flume. The profiles are now being analyzed by means of a computer program that yields the mean depth of each experimental flow, the standard deviation about the mean depth and standard deviation about the mean depth, and a depth autocorrelation function for each flow. The autocorrelation function can be integrated to yield a length which may be considered a wave length of the boundary irregularities. The depth standard deviation is an expression of the amplitude of the irregularities. The purpose of the study is to determine if these length scales will adequately portray the geometry in studies of bed forms, the migrations and the

influences on open channel flow resistance. ----

U. S. DEPARTMENT OF AGRICULTURE, AGRICULTURAL RESEARCH SERVICE, Soil and Water Conservation Research Division.

SOUTHERN PLAINS BRANCH, ARS-USDA, Bushland, Texas, Dr. J. R. Johnston, Branch Chief.

- (3879) CHARACTERIZATION OF THE "HOT SPOT" PROBLEM IN THE LOWER RIO GRANDE VALLEY OF TEXAS.

 - (b) Laboratory project.

 (d) Experimental and field investigation -
 - applied research.
 - (e) The purpose of the study is to determine the extent of salinity problems; characterize and correlate the water table, soil, topo-graphic and related measurable factors associated with salinity problems in the area.
 - (f) Completed; manuscript for publication in review stage.
 - (g) Extensive water table observations show a fluctuating seasonally high saline water table beneath the area. The water table and ground surfaces slope approximately one foot per mile to the northeast in the general direction of the Gulf Coast.

(3880) THE MICRODYNAMICS OF UNSATURATED MOISTURE

FLOW.

- (b) Laboratory project.
 (c) Dr. Craig L. Wiegand, Soil Scientist, P. O. Box 267, Weslaco, Texas.
 (d) Experimental, basic research.
- $\begin{pmatrix} d \\ e \end{pmatrix}$
- The objectives are to obtain evidence on the generality of the parabolic moisture distribution with respect to the interface of extraction and to interpret unsaturated moisture flow in terms of molecular level mechanisms of flow. The experimental technique is that of inducing moisture flow by various techniques at a series of temperatures and measuring the flow rate. The Arrhenius equation is applied to the data and an activation energy calculated. The activation energy is then interpreted in terms of energy barriers to molecular level flow mechanisms. The soil columns are sampled at the end of the runs to determine the moisture distribution with respect to the interface of extraction.
- (g) The results to date indicate that the resulting moisture distribution is a function of peculiarities of the microdynamic flow processes involved and independent of the method of extraction.
- (3881) FACTORS AFFECTING THE EVAPORATION OF FREE WATER.

 - (b) Laboratory project.
 (c) Dr. Craig L. Wiegand, Soil Scientist, P. 0. Box 267, Weslaco, Texas.
 - (d) Experimental, basic research. The evaporation of free water is being studied under controlled conditions to: (e) (1) Obtain quantitative informations to: rate of evaporation of free water under controlled atmospheric conditions; (2) measure the rate of evaporation of water as a function of water temperature; and (3) a function of water temperature; and (3) correlate the rate of evaporation with (a) the saturation deficit of the atmosphere, and (b) the fugacity of the water molecules. Evaporation is being measured under all combinations of 10, 20, 30, and 40 degrees C water temperature; 10, 20, 30, and 40 degrees C air temperature; and 30, 50, 70, and 90% relative humidity. Water tempera-ture is controlled to plus on minus. ture is controlled to plus or minus .1 degrees C, ambient temperature to plus or minus .1 minus 1.0 degrees C, and relative humidity to plus or minus 3%.

 - (f) Completed.
 (g) Water loss (evaporation) and gain (con-densation) have been studied as a function of water surface temperature, ambient humidity, and ambient temperature. Data number of the state of the sta condensation in cm./day, \mathbf{p}_0 is the vapor pressure of water, and p is the vapor pressure of air accounts for 99.4% of the variation in evaporation and condensation rate. It fits the data very well over the entire range 1.65 cm./day condensation to 4.9 cm./day evaporation. A second regression analysis in which relative humidity of the air (R.H.), ambient temperature (Ta), and water temperature (Tw) were the independent variables explained 89.7% of the vari-ation. This equation is not recommended for predictive purposes, however, because it predicts to low superprise patter in it predicts too low evaporation rates in the upper and lower ranges, and too high evaporation in the midrange. A reduction in regression analysis showed that R.H. accounted for 4%, ambient temperature for accounted for 4%, amotent temperature for 11%, and water temperature for 76% of the total sum of squares. Temperature of the evaporating surface is concluded, therefore, to be the variable of major importance in determining the evaporation rate when water is available for evaporation.

(4335) THE HYDRAULICS OF STRUCTURES USED IN SOIL AND WATER CONSERVATION WORKS.

 - (d) (e) Rain gage networks are established on the Blacklands Experimental Watershed near Riesel, Texas, and on the Edwards Plateau near Sonora, Texas. Information is being obtained on amounts, duration, seasonal distribution, and other characteristics of rainfall to the extent that the characteristics influence runoff from agricultural watersheds.
 - (g) Data from 25 recording rain gages on 4,683acre experimental area near Riesel, Texas, and 14 recording rain gages on 48-squaremile area near Sonora, Texas. A study of depth frequency for periods from 1 to 15 days has been completed and a report prepared.
 - (h) Reported in USDA MISC. PUB. 945.
- (4349) RELATION OF CLIMATIC AND WATERSHED FACTORS TO STORM RUNOFF AND TO WATER YIELD FROM AGRICULTURAL WATERSHEDS IN THE BLACKLANDS OF TEXAS.

 - (b) Laboratory project.
 (c) Mr. Ralph W. Baird, Hydraulic Engineer, F. O. Box 1147, Riesel, Texas.
 (d) Field investigation, applied research.
 (e) Twenty watersheds at the Blacklands Experimental Watershed near Riesel, Texas, varying in size from approximately 3 acres to 5860 In Size from approximately 5 acres to 5860 acres, have been equipped with precalibrated flumes or with current meter rated weirs to measure runoff rates. Frecipitation is meas-ured by recording rain gages. The land factors are determined by periodic inventory of crops, covers, and crop systems on the Belotionebize between eligatic and land. Relationships between climatic and land factors and the runoff produced are analyzed to develop prediction methods for esti-
 - mating storm peaks and water yields. (g) The effects of conservation practices on storm runoff from major storms of infrequent occurrence is not great but is appreciable for many of the smaller storms. (h) Reported in USDA MISC. PUB. 945.
- (4350) RUNOFF PRODUCTION BY UNIT SOURCE AREAS IN THE BLACKLANDS OF TEXAS.
 - (b) (c)

 - Laboratory project. Mr. Ralph W. Baird, Hydraulic Engineer, P. O. Box 1147, Riesel, Texas. Field investigation, applied research. Ten watersheds of from one-fourth to (d) (e) twenty acres in size and with single land use on each are instrumented with precalibrated flumes to measure runoff. Soil moisture, tillage operations, and crop yields are also obtained. The relation-ships between the runoff and the associated precipitation as influenced by the land characteristics are investigated. These relationships will facilitate the pre-diction of runoff from ungaged watersheds composed of combination of these single soil-cover, sub-watersheds or unit source areas.
 - (h) Reported in TAES Misc. Pub. 404, and USDA Misc. Pub. 945.
 - SEDIMENT YIELD IN RELATION TO CLIMATIC AND WATERSHED CHARACTERISTICS OF AGRICULTURAL AREAS IN THE TEXAS BLACKLANDS AND THE EDWARDS PLATEAU.
 - (b) Laboratory project.
 (c) Mr. Ralph W. Baird, Hydraulic Engineer, P. O. Box 1147, Riesel, Texas.
 (d) Field investigation, applied research.

- (e) At the Blacklands Experimental Watershed near Riesel, Texas, sediment yield measurements have been or are being made on twenty-four plots or watersheds varying in size from one-quarter to 5860 acres. These sediment yields are correlated with precipitation, runoff, topography, soils, land use, and conservation practices. The data are analyzed to develop techniques and procedures for estimating sediment yield and sources from ungaged watersheds. On Lowry Draw in the Edwards Plateau area near Sonora, Texas, sediment range lines have been established, in cooperation with Soil Conservation Service, at two detention reservoir sites with drainage areas of 4.38 and 16 S square miles. In addition are and 16.85 square miles. In addition, ar-rangements have been made for sampling the flow from the reservoir spillways.
- In the Texas Blacklands sediment yields (g)from watersheds of 100 to 200 acres having a large percent of cultivated crops have been reduced about 85 percent by changing to a complete conservation program.
- (4352) RELATION OF CLIMATIC AND WATERSHED CHARACTER-ISTICS TO STORM RUNOFF AND WATER YIELD IN THE EDWARDS PLATEAU AREA OF WEST CENTRAL TEXAS.

 - (b) Laboratory project.
 (c) Mr. Walter G. Knisel, Hydraulic Engineer, P. O. Box 1147, Riesel, Texas.
 (d) Field investigation, applied research.
 (e) Five detention reservoirs in Lowrey Draw are equipped with water level recorders. Runoff changes in the reservoirs. The watersheds above the reservoirs range in size from 686 to 10,787 acres. A current meter rated gaging station is at the outlet of the Lowrey Draw watershed which has a drainage area of 48 square miles. A rain gage network is used to determine the precipitation over the area. In addition to the development of the rainfall-runoff relationship for this area, a study will be made of the disposition of the water temporarily stored in the reservoirs.
 - A major storm of 7 to 12 inches occurred on (g) the 48-square-mile watershed Sept. 19-24. A special storm report is being prepared.
- (4353) EVALUATION OF OPERATION AND DESIGN CRITERIA OF OLD TILE DRAIN SYSTEMS.
 - (b) (c)
 - Laboratory project. Mr. Victor I. Myers, Research Agricultural Engineer, P. O. Box 267, Weslaco, Texas. Field investigation applied research.
 - A study to evaluate the effectiveness of some old existing tile systems in draining and leaching soils; to evaluate the functioning of tile drains with and without filter materials; and, to evaluate the adequacy of tile drain design criteria. (g) Tile lines laid in certain soils, without
 - This lines faid in certain soils, without filter or envelope materials provided, accumulate soil over a long period of time until they become plugged or only partially effective. Studies are shedding light on the occurrence of the salinity - clay mineral complex and interactions that influence movement of soil particles into drain lines.
- INFILTRATION RATES AND PROFILE CHARACTER-ISTICS IN RELATION TO THE OCCURRENCE OF (4354)SALINITY.
 - Laboratory project. Dr. Craig Wiegand, Research Soil Scientist, (b) (c) P. O. Box 267, Weslaco, Texas.

 - (d) Field investigation; applied research.
 (e) The purpose of the work is to relate infiltration rates to the occurrence of salt-affected profiles. Infiltration rates are to be determined on about a dozen salt affected and adjacent non-affected (4844) TESTING OF MATERIALS FOR IMPROVED SUBSURFACE profile pairs which have been chemically

and physically characterized. The infiltration rates will be related statistically to the severity of salinization and to the chemical and physical properties of the profiles.

- (f) Completed.
 (g) The final intake rate (5 hours) in the non-saline sites averaged about 3 times those of the adjacent saline sites. Analysis of variance revealed that saline profiles were higher in percent clay, are slightly elevated relative to the nonsaline sites and have relative to the nonsaline sites and have greater surface slope than do the nonsaline sites. Multiple regression analyses pre-dicted 95% of the variation in final intake rate. Differences in clay content surface elevation and soil slope are concluded to result in differences in leaching effectiveness of rainfall due to their influences on infiltration and runoff.
- (4356) EFFECTS OF BENCHING AND TERRACING ON MOISTURE CONSERVATION ON SLOPING HARDLANDS OF THE SOUTHERN GREAT PLAINS.
 - (b) (c)
 - Laboratory project. Mr. Victor L. Hauser, Agricultural Engineer, Southwestern Great Plains Field Station, Bushland, Texas.
 - (d) Field investigation, applied and design research.
 - (e) 1. To test the feasibility of altering the configuration of the land to intercept, spread, and infiltrate surface runoff in contour basins. 2. To determine the extent to which such intercepted runoff will add to available soil moisture supplies and how such additional soil moisture may best be utilized for crop production. 3. To deutilized for crop production. 3. To de termine the relative value of the three types of terrace systems, conservation benching, graded, and level closed end for moisture conservation and crop production. 4. To measure runoff from well managed contour farmed hardland soils.
 - (g) It has been found that graded and level terraces are equally effective in conserving runoff water under semi-arid conditions where 10 or 11 months of fallow precade planting either wheat or grain sorghum. has been found that the conservation bench terrace system is superior to either graded or level terraces in the conservation of runoff water.
- (4357) EFFECT OF CROPPING SYSTEMS AND CLIMATE ON RUNOFF, EROSION, AND CROP YIELDS UNDER BLACKLAND CONDITIONS.

 - (c)
 - (d)
 - Laboratory project. Mr. D. W. Fryrear, Agricultural Engineer, P. O. Box 748, Temple, Texas. Experimental applied research. Runoff and soil loss are measured from 12 field scale (1 1/2 acre) plots representing a typical cultivated slope of Blackland Prairie soils. The plots are in three (e) cropping systems with row cropping every year, in alternate years, and every third year. By taking soil moisture and crop residue measurements, in the future the interactions of varying climatic influences with crops and management are determined as a basis for determining runoff and erosion
 - (g) Statistical analysis of runoff results for 4-year period 1959-62 indicated no signifi-cant difference between plot replications or the statistical statistex statistical statistical statistical statistical statistical cropping systems but a significant difference in runoff for different years. Similar analysis of soil loss data for this period showed no significant difference between cropping systems, and a significant differ-ence between plot replications and years. Complete statistical analysis of runoff, soil loss, and yield data will be made after the 1964 harvest.
 - DRAINAGE.

- (b) Laboratory project.
 (c) Mr. Victor I. Myers, Research Agricultural Engineer, P. O. Box 267, Weslaco, Texas. Experimental; applied research. (d)
- Laboratory tank studies will be made to (e)evaluate drainage materials with particular emphasis on filters and new drain tube materials. One or more field installations will be made in which drainage materials will be compared and evaluated. Electric analogue studies will be made for predicting flow rates into tile lines.
- Laboratory studies with semi-rigid plastic lines have shown that the material can (g) withstand loadings imposed by deep in-stallation, to 9 feet, if installed in a narrow 10-inch width trench and if installed in an excavated cradle to provide some lateral strength.
- (4845) SOIL-WATER-PLANT RELATIONS OF IRRIGATED COTTON AS INFLUENCED BY DEPTH TO WATER TABLE.

 - (b) Laboratory project.
 (c) Mr. L. N. Namken, Research Soil Scientist, P. O. Box 267, Weslaco, Texas.
 (d) Field investigation; applied research.
 (e) A set of thirty-six lysimeters, one meter A set of thirty-six lysimeters, one meter square and ten feet deep, are being utilized to study the influence of soil moisture level, water table depth and water table salt level water table depth and water table salt level treatments on evapotranspiration, vegetative growth and yield of cotton. The objectives of the project are: (1) To determine the contribution of a water table to the water requirement of cotton; (2) to study soil moisture use and extraction by cotton as influenced by various water table depths; and (3) to study the effect of water table colt encountering and the salt moument and
 - and (5) to study the effect of water table salt concentration on salt movement and moisture uuuptake by the cotton plant. Total moisture use, lint yield, and plant dry weight of cotton grown with the water table at 3 feet were significantly less than from (g) cotton grown with 6 and 9 feet deep water tables. The highly saline condition of the entire soil mass above the 3-foot water table apparently caused these differences. There was a significant interaction between moisture level and water table depth treat-ments on total moisture use, lint yields and dry weight production by cotton. Under high moisture conditions, cotton grown over a 9 foot deep water table had significantly greater total moisture use, lint yields and dry weight production than cotton grown with a water table of 6 feet. There was a complete reversal under the lower moisture treatment where cotton with the 6 foot deep water table had greater total moisture use, lint yields, and dry weight production than cotton with the 9 foot deep water table. Cotton under low soil moisture conditions (M-2) combined with a 9-foot water table depth had a 440 pound/acre reduction in lint cotton yields, a 33% reduction in dry weight production, and a 7.3 inch reduction in total moisture use compared with cotton under high soil moisture conditions (M-1) and a 9-foot water table depth. Evapotranspiration rates of cotton were influenced by the amount of moisture in the profile, stage of plant growth and water table depth. Maximum rates generally occurred under high soil moisture conditions after irrigations or rains during the bloom stage of plant growth. Maximum evapotrans-Justice of plant growth. Waximum evaportants for the small area official evaportation affected. I were .22, .40, and .45 inch/day for the 3-, 6-, and 9-foot water table depths, respective-ly. Maximum rates under moisture level II Southern PLAINS. were .20, .35, and .38 inch/day for the 3-, 6-, and 9-foot water table depths, respectively.
- (4846) EFFECT OF VARIOUS METHODS OF STUBBLE MULCH TILLAGE ON RUNOFF FROM UNIT SOURCE WATER-SHEDS.
 - (b) Laboratory project.

- (c) Mr. M. B. Cox, Agricultural Engineer, P. O. Box 128, Cherokee, Oklahoma.
 (d) Field investigation; applied research.
 (e) Comparison of three types of tillage tools
- for residue management on runoff from unit source watersheds ranging in size from 1.7 to 2.2 acres on land slopes from 2.2 to 3.5 percent, cropped annually to wheat. Six watersheds with three treatments and
- two replications. (g) Treatment 1, large sweeps (8 ft.) conserved the most residue and produced the least amount of runoff; Treatment 3, chisel tool, was the next treatment for conserving residue, but more runoff re-sulted; Treatment 2, light disking and chisel tool, conserved the least residue and produced the most runoff.
- (4848) GRADED FURROWS FOR RUNOFF AND EROSION CONTROL.

 - (b) Laboratory project.
 (c) Mr. D. W. Fryrear, Agricultural Engineer, P. 0. Box 748, Temple, Texas.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Field investigation; applied research. Purpose of work is to determine relationships between furrow length and slope, runoff and soil loss, and to see if graded furrows will permit increased terrace spacing. Terrace spacing is doubled and a channel rather than a conventional ridged terrace is used to convey runoff water. Increased terrace spacing is accomplished by planting on 40-inch lister furrows on a 1 percent grade. The amount of runoff and soil loss from the furrows is measured along with rainfall intensities, soil moisture, and surface residues. (g) Physical system was established in summer of
 - 1963. Special techniques and methods of measuring runoff and soil loss have been designed and developed including sampling designed and developed including sampling apparatus for separating runoff increments into various amounts to permit determination of timing of major portion of erosion. Limited runoff data collected in 1964 indicates slightly more runoff from furrows on a 1 percent grade than from furrows on the contour. Runoff data also show that furrows 300, 600, and 900 feet long on a 1 percent grade will convey at least 4.44, 2.85, and 2.06 inches per hour, respec-tively.
- (4849) EVALUATION OF DRAINAGE METHODS FOR THE NONIRRIGATED AREA OF THE LOWER RIO GRANDE VALLEY OF TEXAS.
 - (b) (c)
 - Laboratory project. Mr. Ronald R. Allen, Agricultural Engineer, or Mr. Victor I. Myers, Research Agricul-tural Engineer, P. O. Box 267, Weslaco, Texas.
 - (d) Experimental and field investigation;
 - (d) Experimental and the anti-term applied research.
 (e) The purpose of the study is to compare the effectiveness and cost of installation operation and maintenance of three drainage operation and maintenance of three drainage methods; open drain ditches, subsurface drain tile, and drainage wells in reduction of soil salinity and control of a ground water table.
 - (g) An underlying permeable sand aquifer limits installation depth and effectiveness of open drain ditches and subsurface drain tile. Pump drainage by wells has incurred considerable expense for the small area
 - - (b) Laboratory project.
 - (c) Mr. J. T. Musick, Agricultural Engineer, Southwestern Great Plains Research Center, Bushland, Texas.
 - Field investigation; applied research. $\begin{pmatrix} d \\ e \end{pmatrix}$
 - To determine number and timing of irrigations for most efficient use of limited irrigation and expected precipitation; plant spacing for

most efficient use of limited water; and some soil moisture-plant growth-yield relation-ships under limited soil moisture conditions.

- One or two well-timed seasonal irrigations resulted in good yields and efficient use of (g) limited irrigation water which permitted a reduction in irrigation water requirements. In addition to considering soil moisture, proper timing of limited irrigation should consider expected seasonal rainfall and stage of plant development. Narrow row and plant spacings are necessary for most effi-cient use of water at higher yield levels.
- SOIL LOSS FROM THE ENDS OF LEVEL TERRACES AND THE EROSION OCCURRING BETWEEN TERRACES. (5212)

 - (b) Laboratory project.
 (c) Mr. M. B. Cox, Agricultural Engineer, P. 0. Box 128, Cherokee, Oklahoma.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Field investigation; applied research. Purpose of work is to determine soil losses from terraces and from different sections downslope within terrace intervals. Runoff and soil loss are measured from a system consisting of 8 terraces and 20 small plots. Half of the area is clean tilled and half stubble mulched. Terraces are arranged in pairs, one concrete and one soil channel. Concrete lined channels are used to provide a permanent base for measuring soil movement into terrace channels. Plots, located at the ends of the pairs of terraces, permit determination of silt contribution from three sections of normal terrace intervals.
 - (g) Terrace installations are completed and 1963-64 runoff and soil loss data have been obtained. Data showed some variation between different pairs of terraces but marked similarity of both runoff and soil loss was obtained within pairs, i.e., between concrete and regular soil channel terraces. The small plot portion of the study is installed but no data have been obtained.
- (5213) WATER INTAKE AND DISTRIBUTION OF SOIL MOISTURE UNDER GRADED FURROWS ON PULLMAN SILTY CLAY LOAM.
 - (b) (c)
 - Laboratory project. Mr. W. H. Sletten, Agricultural Engineer, Southwestern Great Plains Research Center, Bushland, Texas.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Field investigation; applied research. Determine water intake characteristics, storage, distribution, and irrigation efficiency of long furrows on Pullman silty clay loam soil.
 - (g) This soil has a high initial intake rate which rapidly drops to a very low basic rate. One to two inches of initial intake occurs during and soon after water passes a point in the furrow. The intake rate then declines rapidly after runoff begins from a short furrow segment to a basic rate of 0.1 inch per hour or less about 4 hours later. Cutting off the water soon after it reaches the end of long furrows results in high application efficiencies, relatively good distribution and decreases tailwater runoff losses.
- (5214) DEVELOPMENT AND TEST OF A SIMPLE SYSTEM TO CLARIFY PLAYA WATER WITH FLOCCULENTS AND THE USE OF AN IRRIGATION DITCH AS A SETTLING BASIN.
 - (b) (c) Laboratory project.
 - Mr. Victor L. Hauser, Agricultural Engineer, Southwestern Great Plains Field Station, Bushland, Texas.
 - Field investigation; applied and design (d) research.
 - (e) To develop a simple system for removing sediments from muddy playa lake water. This research project will be an effort to assemble relatively simple equipment to clarify muddy lake water prior to injection into a shaft as a means of storing runoff water and thus prevent its loss to the

atmosphere by evaporation.

- (f) This experiment was terminated early in 1963. (g) The system design specified in the research outline is not capable of removing enough sediment to be used in widespread recharge projects. The modified system including a sand filter did remove enough sediment to be used in recharge work but the capacity of the system is low.
- (5216) GEOPHYSICAL EXPLORATION OF A PLAYA AND ITS WATERSHED.

 - (b) Laboratory project.
 (c) Mr. Wayne Clyma, Agricultural Engineer, Southwestern Great Plains Field Station, Bushland, Texas.
 - (d) Determine the stratigraphy of a playa and its watershed using surface electrical resis-tivity and electric and gamma-ray well logging equipment.
 - (e) The playa will be surveyed with the electrical resistivity equipment on a 500 foot grid. Data will be collected and analyzed according to standard practice. Each bore hole drilled on the playa watershed will be logged electrically and these data correlated with the drillers log and the stratigraphy and properties of each litho-(f) Initiated in 1963, field and laboratory
 - work is continuing.
- (5217) RUNOFF PRODUCTION BY UNIT SOURCE AREAS IN THE EDWARDS PLATEAU OF TEXAS.
 - (b)
 - (c)
 - Laboratory project. Mr. Walter G. Knisel, Jr., Research Hydraulic Engineer, P. O. Box 1147, Riesel, Texas. Field investigation, applied research. Six watersheds, five selected, one installa-tion completed in 1963 and three under con-(d) (e) struction in 1964. These watersheds are all in range areas of different soil and geologic formations, and runoff will be measured by precalibrated flumes. The relationship between the runoff and the associated precipitation as influenced by range use, geology, and soils are investigated.
- (5218) THE DURABILITY AND EFFECTIVENESS OF DRAINAGE MATERIALS UNDER FIELD CONDITIONS.
 - (b) (c)

 - Laboratory project. Mr. Victor I. Myers, Research Agricultural Engineer, P. O. Box 267, Weslaco, Texas. Field investigation; applied research. A field installation of old and new drainage tile, pipe and tubing is being made to eval-uate the durability, and effectiveness of the materials. In addition, the investiga-tion includes a study of the effectiveness of providing envelope material to increase the flow of water and decrease movement of $\begin{pmatrix} d \\ e \end{pmatrix}$ the flow of water and decrease movement of sediment into drain lines under stratified

 - (f) Initiated in 1963 as a field study.
 (g) A field installation of 1/8 mile lines has been completed consisting of concrete with and without fiberglass envelope material, and erited fiberglass. and asphalt fiber pipe with a fiberglass envelope. This will be a test of the durability and effectiveness of drainage materials.
- (5577) PHOTOGRAMMETRY AND REMOTE SENSING TO DETERMINE THE MOISTURE STATUS OF PLANTS AND SALINITY IN SOILS.

 - (b) Laboratory project.
 (c) Mr. Victor I. Myers, Research Agricultural Engineer, P. O. Box 267, Weslaco, Texas.
 (d) Part of the project is theoretical basic
 - research and the remainder is applied research.
 - (e) The purpose of the project is to (1) test and adapt radiation measuring instrumenta-tion for aerial measurement of plant temperatures and soil moisture stresses, and

(2) improve procedures for rapid prediction of plant moisture stress and soil salinity conditions from the air, using remote sensing instrumentation and aerial photography.

- (g) Ektachrome infrared aerial photographs were used for estimating salinity in the 0-5 foot profile using nonirrigated cotton as an indicator plant. On the basis of color tones it was possible to distinguish six levels of salinity. Infrared radiometer measurements of cotton leaf temperatures were made on the ground and from an airplane. The limited aerial measure-ments made compared favorably with ground measurements. Statistical studies of the temperature data taken on the ground indicate that soil salinity can be predicted from cotton leaf temperatures with reasonable accuracy.
- (5578) AERATION MEASUREMENTS FOR DETERMINING DRAIN-AGE NEEDS.
 - (b) Laboratory project.

 - (b) Laboratory project.
 (c) Dr. Ross W. Leamer, Research Soil Scientist, P. O. Box 267, Weslaco, Texas.
 (d) Determine the suitability of (1) bare platinum electrodes, (2) membrane covered gold electrodes, and (3) gas chromatograph for indicating soil drainage conditions.
 (e) Aeration measuring devices are installed in coil acourt which write the lowed com
 - a soil column in which water table level can be varied. The response of aeration measure-ments resulting from changes in water table level determine sensitivity to drainage conditions.
 - (f) Initiated in 1964. Continuing.
- (5579) EFFECT OF WIND ON A FALLING WATERDROP.

 - (b) Laboratory project.
 (c) Dr. E. L. Skidmore, Agronomy Dept., Waters Hall, Kansas State University, Manhattan, Kansas.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Laboratory investigation; basic research. Purpose of research is to determine influence of wind on the velocity of a falling raindrop; to determine effect of wind on path of drop; to determine effect on horizontal acceleration of drop; and to determine effect of wind on kinetic energy and momentum of raindrops. The experiment is being conducted in a wind tunnel-rain tower facility where conditions of wind and other variables can be rather precisely controlled.
 - Problems associated with drop formation and (g) lighting required for photographic techniques are presently being worked on and resolved. Experimental data will be taken during 1965.
- (5580) LIMITED IRRIGATION OF WHEAT AND SORGHUM IN A FALLOW-WHEAT-SORGHUM SEQUENCE.
 - (b) (c)
 - Laboratory project. Mr. J. T. Musick, Agricultural Engineer, Southwestern Great Plains Research Center, Bushland, Texas.
 - Field investigation; applied research. Determine response to limited irrigation of winter wheat and grain sorghum at two critical efficiencies, and plant sorghum at two errice. stages of plant growth on yields, water use efficiencies, and plant characteristics; and to evaluate the ability of an extended pre-seasonal crop period (11 to 12 months pre-ceding both sorghum and wheat) to supply soil moisture storage at planting and thus decrease irrigation water requirements.
- (5581) TIMING OF PRESEASONAL IRRIGATION IN RELATION TO EFFICIENCY OF SOIL MOISTURE STORAGE.
 - (b) Laboratory project.
 (c) Mr. W. H. Sletten, Agricultural Engineer, Southwestern Great Plains Research Center, Bushland, Texas.
 - Field investigation; applied research. Determine relationship between the storage (e) efficiency of preseasonal irrigation water and timing of irrigation and the effect of antecedent soil moisture on storage efficiency

of preseasonal precipitation and/or irrigation.

- (5582) WATER REQUIREMENTS OF MARRS ORANGES, RED BLUSH GRAPEFRUIT, AND VALENCIA ORANGES IN THE RIO GRANDE VALLEY:
 - (b) (c)
 - Laboratory project. Mr. Marvin D. Heilman, Research Soil Scientist, P. O. Box 267, Weslaco, Texas. Field investigation applied research.
 - (d)
 - This field investigation is designed to lei provide quantitative information on moisture use of Marrs and valencia oranges and red blush grapefruit in the Rio Grande Valley. From this data water management recommenda-tions will be made for citrus production supply. In addition, the investigations will determine the effects of the various citrus varieties.
- (5583) VARIATION OF SATURATED HYDRAULIC CONDUC-TIVITY OF HOUSTON BLACK CLAY WITH SOIL DEPTH AND WITH DIAMETER OF SOIL CORES.
 - (b) ARS-SWC, Blackland Conservation Experiment Station, Temple, Texas. Laboratory project.
 (c) Mr. J. L. Tackett, Research Soil Scientist, F. O. Box 748, Temple, Texas 76502.
 (d) Experimental and basic research.

 - Saturated hydraulic-conductivity will be determined for each 6-inch interval of undisturbed 9-foot soil column of 16- and 29-inch diameter and for 3-inch long soil cores of 3- to 3 7/8-inch diameter. The purposes will be (1) to determine the saturated flow rate of water through undisturbed cores of Houston Black clay profiles and through various layers of the profile, (2) to develop methods and procedures for utilizing large diameter cores for measuring the hydraulic conductivity of soils, (3) to study the relation between core size and saturated hydraulic conductivity, and (4) to determine the relation between direction of water flow and hydraulic conductivity.

U. S. DEPARTMENT OF AGRICULTURE, AGRICULTURAL RESEARCH SERVICE, Soil and Water Conservation Research Division.

SOUTHWEST BRANCH, P. O. Box 2326, Riverside, Calif., Mr. W. W. Donnan, Branch Chief.

- (151) LINING OF IRRIGATION CANALS AND RESERVOIRS.
 - (b) Laboratory project, in cooperation with the Utah State University and Bureau of Reclamation.
 - (c) Dr. C. W. Lauritzen, Soil Scientist, Utah State University, Mechanic Arts, 130, Logan Utah.
 - Experimental; basic and applied research. Linings for irrigation canals and (d) (e) reservoirs are being tested to develop more effective and lower cost methods of reducing seepage losses in irrigation systems. The investigation included: (1) Evaluation of physical properties of lining materials; (2) model testing of linings in an outdoor laboratory; and (3) field testing at selected sites to determine relative durability under varying subgrade and climatic conditions.
 - (g) After nearly 10 years both vinyl and polyethylene film employed as buried linings con-tinue to provide effective seepage control. thue to provide ellective seepage control. A built-up asphalt coated jute lining is highly effective after 7 years. After 9 years as an exposed canal lining the tensile and elongation of butyl sheeting remained unchanged. After 17 years of exposure on a walking deck butyl sheeting retained 80 per-cent of the original tensile and elongation.

 - And Natural Resources. Mr. Anthony S. Dylla, Agricultural Engineer, P. O. Box 8014, University Station, Reno, (c) Nevada.
 - (e) To measure the evapo-transpiration of meadow vegetation in the Humboldt Basin area which subsists primarily under shallow water table conditions. The data will be used to determine areal use of ground waters by native vegetation and phreatophytes and to native vegetation and phreatophytes and to develop methods of more efficient utilization of those water supplies.
 - (f) Progress report covering three years data underway.
 - (g) Evapo-transpirational rates are being obtained by water use measurements of meadow grasses growing in plastic lysimeters. Vegetative growth, soil moisture, water table, and weather data are being collected to which evapo-transpiration rates from tanks can be related.
 - "Evapotranspiration Studies on Native Meadow (h) Grasses, Humboldt Basin, Winnemucca, Nevada, by A. S. Dylla and Dean C. Muckel, Univ. of Nev. Agr. Expt. Sta. Rept. Series No. R-9, October 1964.
- (3872) DYNAMIC SIMILARITY IN PIPE ELBOW FLOW METERS.

 - Laboratory project. Mr. Lloyd E. Myers, Director, Water Conser-vation Laboratory, Route 2, Box 816-A, Tempe, (c) Arizona.
 - (d) Experimental; applied research.
 - ASA, class 125, cast iron, 90-degree, flanged elbows of 3-, 6-, 10-, and 12-inch diameters from five manufacturing sources were calibrated to determine the expected accuracy of flow measurements made with uncalibrated elbow meters. Effects of various fittings and installations on the calibration were determined for 3-inch diameter elbows. Reactivated. (f)
 - Uncalibrated elbow meters can be expected to be accurate within 5 percent if properly installed.
- (3873) GROUND COVERS AND OTHER STRUCTURES FOR COLLECTING AND STORING PRECIPITATION.

 - (b) Laboratory project, in cooperation with the Utah State University.
 (c) Dr. C. W. Lauritzen, Soil Scientist, Utah State University, Mechanics Art, 130, Logan, Utab Utah.
 - Experimental and applied research. There are areas in many regions where water for livestock and even culinary uses is scarce or nonexistent, yet considerable water in the form of precipitation falls each year. As an example, the precipitation on one acre of land in an 8-inch rainfall area amounts to 217,248 gallons. This is enough to supply water to more than 200 head of cattle for 100 days. This study includes the development and testing of materials for ground covers and storage facilities to be used for the collection and storage of water in low rainfall areas together with the design and operation of these facilities. (g) Cround covers and closed storage structures
 - have been developed for intercepting and storing precipitation. To satisfy the need for a name this combination of structures has been termed a "Rain Trap." Butyl sheeting continues to be the most satisfactory material for both the interceptor

and the storage reservoir. Other materials are being investigated, and there are indications that some of these will be less expensive and reasonably serviceable as ground covers. Modifications have been made in the design and fabrication of ground covers and storage bags made of butyl to improve their performance.

- (4358) FLOOD WAVE MOVEMENT AND ROUTING IN ALLUVIAL CHANNELS.
 - (b) Laboratory project, cooperative with the Arizona and New Mexico Agricultural Experiment Stations, and the U. S. Soil Conservation Service.
 - Mr. R. V. Keppel, Agricultural Engineer, (c) P. O. Box 3926, Tucson, Arizona. Experimental, field investigation.
 - (d) Water level recorders are located at 2,000-foot intervals in a 3-mile reach of natural (e) channel. The reach has a gaging flume at the inlet and at the outlet, and major tributary inflow is gaged. Flood waves generated by cloudburst type thunderstorms are being studied.
 - (g) Propagation of the peak of the flood wave for discharges between 1000 and 2000 cfs took place at velocities of 10-15 feet per second, as compared with velocities of 5-7 feet per second for the front of the wave moving on a dry channel bed.
 - (4359) PRECIPITATION CHARACTERISTICS INFLUENCING RUNOFF FROM SEMIARID WATERSHEDS.
 - (b) Laboratory project, cooperative with the Arizona and New Mexico Agricultural Experi-ment Stations, and the U. S. Soil Conservation Service.
 - (c) Mr. H. B. Osborn, Hydraulic Engineer, P. O. Box 3926, Tucson, Arizona.
 (d) Experimental, field and laboratory; basic
 - research. (e)
 - Raingage networks with densities of one recording gage per square mile are being operated on the 58-square-mile Walnut Gulch watershed in southeastern Arizona and the 67-square-mile Alamogordo Creek watershed in northeastern New Mexico. The walnut Gulch study is augmented by horizontal-search 3-cm. radar. Objectives of the study are to determine precipitation parameters of importance in predicting runoff and sediment yield, and to give particular attention to the small area, highly intense, convective summer thunderstorms typical of the region.
 - (g) Data from Walnut Gulch watershed for a 7-year period of record indicate that summer convective thunderstorms are elliptical in shape with the major axis approximately 1.5 times the minor axis. Within the boundary of the Walnut Gulch watershed, 80% of the storms cover less than 4 1/2 square miles in area, and 96% cover less than 10 square miles. Maximum runoff events are typically the result of multi-celled storms separated in space and time. On the Alamogordo Creek watershed, convective thunderstorms are of greater intensity and larger areal extent than at Walnut Gulch. The difference is due to the greater amount of precipitable water in the air mass in eastern New Mexico as compared with southeastern Arizona, and to the fact that frontal action is more common thus giving an added lift to convective storm cells.

Service.

- Service.
 (c) Mr. R. V. Keppel, Agricultural Engineer, P. O. Box 3926, Tucson, Arizona.
 (d) Experimental; applied research.
- (d) (e)
- On semiarid rangeland watersheds up to 43,000 acres in size, runoff measurements are being maintained, and an attempt is being made to relate water yield to climatic and watershed characteristics, and to evaluate the effects of a range conservation program on rates and amounts of flood runoff and on net water yields. A new design of critical depth flume with capacities up to 22,500 cfs is being used to gage the flashy, sediment-laden flows.
- On 5 Walnut Gulch watersheds ranging from (g) 560 to 36,900 acres, water yield decreases exponentially with the 0.3 power of the watershed size. All of the water yields to date have occurred from June to September as a result of intense convective thunderstorms. On the Alamogordo Creek Watershed (43,000 acres), flow events originating on the central portion of the valley floor cause a flat-top hydrograph with a sustained peak lasting 2 to 3 hours. It is believed that this is caused by unusually large valley storage located upstream from a channel discontinuity. On the other hand, runoff events originating on the highly incised southeast or southwest branch of the main stem are sharp-peaked.
- (4361) THE ROLE OF VALLEY AND CHANNEL MATERIALS AND VEGETATION IN THE HYDROLOGY OF SEMI-ARID WATERSHEDS.
 - (b) Laboratory project, cooperative with the Arizona and New Mexico Agricultural Experiment Stations, and the U. S. Soil Conservation Service.
 - (c) Mr. K. G. Renard, Hydraulic Engineer, P. O. Box 3926, Tucson, Arizona.
 - (d) (e)
 - Experimental, field investigation. Measurements from tandem gaging stations are utilized to evaluate the losses that occur as runoff traverses ephemeral stream channels. Records from shallow wells show depletion patterns of the transmission loss water.
 - (g) Losses up to 25 acre-feet-per-mile of channel have been measured on one reach of channel in a single flash flood. Records water tables indicate that in one reach of the main channel, most of the water is dissipated by evaporation and transpiration, while in another reach there may be some movement from the channel alluvium down to the regional water table.
- THE HYDROLOGY OF SEMI-ARID WATERSHEDS AS INFLUENCED BY CHARACTERISTICS OF SOIL AND (4362)NATIVE VEGETATION.
 - (b) Laboratory project; cooperative with Ariz. and New Mexico Agricultural Experiment Stations, and the U. S. Soil Conservation Service.
 - Dr. J. L. Gardner, Botanist, P. O. Box 3926, (c) Tucson, Arizona. (d) Experimental, field and laboratory. Basic
 - research.
 - Interrelations of soils and native vege-(e) tation as they influence water and sediment yield are being evaluated on rangeland watersheds of 100 to 43,000 acres in Arizona and New Mexico. Supplementary to studies on entire watersheds, infiltrometer studies on 6 x 12' plots are in progress. A primary objective of the infiltrometer studies is determination of parameters of rangeland vegetation most effective in evaluating its influences on runoff and sediment production on watersheds.
 - (g) On the infiltrometer plots, maximum runoff is reached in about half the time on areas supporting brush as compared to those supporting grass. On small watersheds above stock tanks, average annual sediment pro-

duction -- but not runoff -- is logarith-mically correlated with basal area of grass cover.

- (h) "Soil and Vegetation Parameters Affecting Infiltration Under Semiarid Conditions," b D. R. Kincaid, J. L. Gardner, and H. A. Schreiber. Bul. of International Assoc. Scientific Hydrology, No. 65, pp. 440-453, by 1963.
- (4363) HYDROLOGIC DATA REDUCTION WITH ANALOG-TO-DIGITAL CONVERTER.
 - (b) Laboratory projects, cooperative with the Arizona and New Mexico Agricultural Experiment Stations.
 - (c) Mr. H. B. Osborn, Hydraulic Engineer, P. O. Box 3926, Tucson, Arizona.
 - (d) Experimental; laboratory.
 (e) Hydrologic records in analog form are being reduced to digital form by means of an automatic analog to digital converter. Information is transferred primarily from rainfall charts to punched cards for future computer programs.
- (4364) RUNOFF AND SEDIMENT MOVEMENT ON UNIT SOURCE WATERSHEDS AS INFLUENCED BY MICRO-CLIMATE, WATER BALANCE, SOIL AND VEGETATION.
 - (b) Laboratory project, cooperative with the Arizona and New Mexico Agricultural Experiment Stations, and the U. S. Soil Conservation Service.
 - (c) Mr. H. B. Osborn, Hydraulic Engineer, P. O. Box 3926, Tucson, Arizona.
 (d) Experimental, field and laboratory. Basic
 - research.
 - (e) Runoff and sediment yields are being measured from several small, single soil-cover subwatersheds located within larger experimental watersheds having mixed soilexperimental watersneas having mixed soll-cover situations. Objectives are to eval-uate the effects of various, soil-vegetation complexes, microclimate and water balance phases on local runoff and sediment pro-duction, and to identify and characterize unit source-areas controlling the net storm runoff and sediment yields of larger, more complex watersheds.
 - (g) Average annual sediment yield from small predominantly grass-covered watersheds is about 1%, by weight, of their water yield. Sediment yield measured from predominantly brush-covered watersheds ranges from around 2%, by weight, of water yield upward.
- SEDIMENT MOVEMENT ON COMPLEX WATERSHEDS AS INFLUENCED BY CLIMATE AND WATERSHED CHARAC-(4365)TERISTICS.
 - (b) Laboratory project, cooperative with the Arizona and New Mexico Agricultural Experiment Stations, and the U. S. Soil Conservation Service.

 - (c) Mr. Kenneth G. Renard, Hydraulic Engineer, P. O. Box 3926, Tucson, Arizona.
 (d) Experimental, field and laboratory.
 (e) The objectives of this study are: (1) to determine the relationship of sediment production on unit source areas to sediment yields of complex watersheds, (2) to develop methods for sediment yield prediction. and (3) to develop methods for reducing sediment yields from semiarid rangeland watersheds in the Southwest. Integrated depth samples of suspended sediment are being collected, and single-stage samples by automatic samplers. Total load and particle sizes are being determined for correlation with storm and runoff measurements on several experimental watershed with varying soil, vegetation characteristics, and drainage features. Studies will be carried out over a number of years during which effects of changing range cover and corresponding changes in flow regimes of the watersheds may be evaluated.
 - (g) Sufficient samples have not as yet been collected or analyzed to develop sediment

rating curves nor to determine the suspended sediment load associated with the individual hydrographs. Suspended sediment samples collected in the mainstream of Walnut Gulch have been found to vary between 2 and 8 percent by weight. Unfortunately, these results have been confined so far to relatively small discharges. The following are indications from the samples analyzed to date: (1) The sediment peak precedes the hydrograph peak. (2) The sand load is relatively low in the samples collected before the hydrograph peak, and from the peak on is higher and seems to be more closely related to the actual dis-charge than are the small fractions. (3) Silt load is heavy at the sediment peak and drops off thereafter, i.e., clay to silt ratio rises after the sediment peak. (4) Correlation of consecutive depth-integrated samples is very good when the stage is not fluctuating rapidly. (5) The majority of the single stage samples on the main channel appear to agree well with the depth-integrated samples taken during the same period. (6) There is a considerable increase in the percentage of clay for samples taken in the mainstream as compared to samples taken upstream in the good grasslands. Greater gullying on other areas and bank erosion along the main channels are probably responsible for this increase.

- DEVELOPMENT OF A PORTABLE IRRIGATION (4368)SPRINKLER EVALUATION DEVICE.
 - (b) U. S. Dept. of Agriculture, Agricultural Research Service, Soil and Water Conser-vation Research Division.
 - (c) Mr. Rhys Tovey, Agricultural Engineer, ARS, Box 8014, University Station, Reno, Nevada.
 (d) Experimental; applied research.
 - (d) (e) (1) To develop a portable device that can be used in the design and evaluation of sprinkler irrigation systems and (2) to determine procedures for the use of the portable irrigation sprinkler evaluation device in measuring soil intake rates, sprinkler application rates and other factors pertinent to the efficient design of sprinkler irrigation systems.
 - A portable irrigation sprinkler evaluation (g) device has been designed and constructed. Tests show that the device works satisfactorily. Procedures for measuring soil intake rates for sprinkler irrigation system design have been developed.
- (4850) WATERSHED RELATIONS TO RECHARGE OF DIRECTLY ASSOCIATED GROUND WATER BASINS.
 - (b) Laboratory project, cooperative with Calif. Dept. of Water Resources, California Agric. Experiment Station, and the U. S. Soil Conservation Service.
 - Mr. Paul R. Nixon, Agricultural Engineer, (c) P. O. Box E, Lompoc, California.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Basic and applied research. Soil moisture measurements (made with neutron scattering moisture meters to depths of ten to twenty-eight feet) together with measurements of precipitation and other climatological factors are being made on a watershed near Lompoc, California, to dewatershed hear Lompoc, tailfornia, to de-termine how much, if any, of the rainfall in certain areas penetrates beyond the root zone, to recharge groundwater. The thirteen sites now being studied represent various cover, soil, and topographic conditions. A study is made of movement of water in various soils to help determine net contribution to ground water recharge by deeply penetrating rainwater. A technique for predicting ground water recharge by deep pene-tration of rainwater is being developed which will provide probability estimates of seasonal recharge based site conditions and (g) Downward translocation of moisture has been
 - observed to continue during the dry season following winter precipitation. The magnitude of this migration is predictable and

amount of downward movement of moisture through the root zone can be estimated fairly accurately without the benefit of periodic moisture determinations; provided monthly precipitation data are available and the range of available moisture in the root

- "Soll Molsture Interface Effects Upon Read-ings of Neutron Molsture Probes," by G. P. Lawless, N. A. MacGillivray, and P. R. Nixon. Soll Sci. Soc. Am. Proc. 27:502-507, (h) 1963.
- (4851) WATERSHED EVAPOTRANSPIRATION LOSSES IN CENTRAL AND SOUTHERN CALIFORNIA.

 - (c) Mr. G. Paul Lawless, Soil Scientist, P. O. Box E, Lompoc, California.
 - (d) Experimental and field investigation, basic and applied research.
 - (e) Measurements of soil moisture content are being made at 13 neutron scatter metering sites on a watershed near Lompoc, Calif. Soil suction is measured at one site by tensiometers. Precipitation is measured within a complex of four of the soil moisture sites. Outside of the watershed, in a plot (approx. one acre) of perennial ryegrass, soil moisture data are obtained by an electronically weighing lysimeter, neutron blocks. Soil temperature, soil heat flux, drainage from the lysimeter, wind velocity and direction, solar, total hemispherical, and net radiation, albedo, air temperature and humidity are measured in or near the lysimeter. Most of this data is suternation Most of this data is automatilvsimeter. cally recorded. Data is also obtained from an adjoining USWB class A type climate station, which contains extra instruments consisting of a hygrothermograph, spherical atmometers, and recording rain gage. Purpose of this work is to determine the relationship between evapotranspiration and various climatic, soil, and plant influences as these relationships affect watershed performance with respect to net water yield.
 - (g) Much of the available water in the root zones of the native vegetation was quickly used after each dry season started. The lack of available water reduced evapotranspi-ration rates. It was found that these rates of evapotranspiration correlated to considerable degree with the soil moisture content of the root zones.
- (4853) SALINITY BALANCE INVESTIGATION OF CITRUS IRRIGATION ON RESIDUAL SOILS, USING COLORADO RIVER WATER.
 - (b) Laboratory project, in cooperation with the U. S. Soil Conservation Service, and Riverside County (California) Flood Control Dist.
 (c) Mr. Sterling Davis, Drainage Engineer, P. O. Box 629, Pomona, California.

 - (d) Experimental.
 - The salinity of the soil and drainage (e) water from this watershed is compared with total Colorado River water irrigation appli-cation plus rainfall to determine the salinity trends within a 1,000 acre water-shed planted primarily to citrus orchards. Granodiorite rock underlying these soils minimizes loss of effluent to deep percolation. Bi-annual soil samplings are taken of selected sites within the watershed. Intensive investigations including flow recorders, flumes, and recording rain gages, were activated in May 1961. The program was expanded in 1962 to include sufficiently large flumes to measure winter storm runoff. The project was established as a five-year program.
 - (g) Preliminary observations have demonstrated the capabilities of this research technique in securing information on salinity trends

on a watershed-wide basis.

- (4854) EFFECT ON TILE DRAINS OF MANGANESE AND IRON SOLUBILITY IN SOILS.

 - (c)
 - (d) (e)
 - Dr. H. A. Schreiber, Soil Scientist, P. O. Box 3926, Tucson, Arizona. Experimental; field and laboratory. The objectives of this study are: (a) To determine the relation of soil moisture to vegetation and soil characteristics; (b) to determine and evaluate effects of soil moisture and related vegetation conditions on detention, retention, and deep penetration of rainfall; (c) to compare with the naturally occurring imposed moisture regimes on soil and vegetation characteristics relating to the hydrology and sediment production of semiarid rangelands;

(d) to study the effects and interactions with soil moisture of maintaining a higher than natural level of fertility on soil and vegetation characteristics affecting the runoff net water yield, and sediment yields and forage production of semiarid rangeland watersheds.

- (5222) PRECIPITATION CHARACTERISTICS AFFECTING HYDROLOGY AND SEDIMENT PRODUCTION OF SMALL AGRICULTURAL WATERSHEDS IN CENTRAL AND SOUTHERN CALIFORNIA.
 - (b) Laboratory project, cooperative with Tehachapi Soil Conservation District, and California Agricultural Experiment Station.
 - (c) Mr. Paul R. Nixon, Agricultural Engineer, P. O. Eox E, Lompoc, Calif. 93438. Experimental and field investigations; basic
 - (d) and applied research.
 - Objectives of this study are to develop storm (e) time-depth-area relationships of rainfall in Central and Southern California to geographic location in the detail needed for design of flood runoff control works on agricultural watersheds of 400 square miles or less; and to characterize other precipitation parameters relating to the net water yields, flood runoff and sediment production of such watersheds.
- (5223) DETERMINING THE EFFECTS ON PHYSICAL WATERSHED MODELING RELATIONSHIPS CAUSED BY MANIPULATING THE PHYSICAL PROPERTIES OF THE FLUID USED IN THE MODEL'S RAINSTORM SIMULATOR.
 - (b) Laboratory project, cooperative with the Utah Water Research Laboratory, Utah State University.
 - Mr. D. L. Chery, Jr., Hydraulic Engineer, USU Box 229, Logan, Utah. Experimental laboratory. Applied research (c)
 - (d) (also for a doctoral thesis).
 - (e) To determine the effect on model-prototype relationships of changes in the physical properties of water-chemical mixtures used in a model watershed's rainstorm simulator. Data from the model are compared with records of the prototype watershed (97-acre semiarid watershed near Albuquerque, New Mexico) to ascertain which water-chemical mixtures give the best model verification. The water-shed model consists of a 1:175 fiberglass topographical model and an automatically operated rainstorm simulator. In the storm simulator the liquid is applied in several independent subunits by positive displace-ment pumps driven by variable speed D. C. electric motors. The fluid is distributed evenly over a subarea by equal length polyethylene tubing (0.011 inch ID).
- (5224) GROUND WATER AS A FACTOR IN THE WATER BUDGET OF SEMIARID WATERSHEDS.
 - (b) Laboratory project, cooperative with the Arizona and New Mexico Agricultural Experi-ment Stations, and the U. S. Soil Conservation Service.
 - (c) Mr. D. E. Wallace, Geologist, P. O. Box 213, Tombstone, Arizona.
 - (d) Experimental, field; applied research.
 (e) Objective of the study is to provide information on ground water accretion and movement and aquifer-streamflow relationship as affected by surface and subsurface geologic conditions.
 - (g) Research will include: (1) Preparing maps and stratigraphic sections of the watershed and associated areas; (2) collecting cores and samples of the various materials for laboratory analysis; (3) utilizing drilling techniques and sensory methods to determine porosity, permeability, and transmissability of aquifers and valley material. Pumping tests and tracers will also be utilized in determining flow movement in subsurface strata.

(5225) HYDROLOGIC EFFECTS OF RESEEDING RANGELAND.

- (b) Laboratory project, cooperative with Agri-cultural Experiment Stations of Arizona and New Mexico, U. S. Soil Conservation Service, local ranch owners.

- (c) Mr. D. R. Kincaid, Research Botanist, P. C. Box 3926, Tucson, Arizona.
 (d) Experimental, Ffield; applied research.
 (e) Treatments comprise combinations of brush removal, soil pitting and reseeding to perennial range grasses. They are applied to replicated 6x12-foot plots, and to drain-age areas up to 10 acres. Objective is to investigate affects of a practical range com investigate effects of a practical range conservation program on yields of water and sediment.
- (g) Mean runoff from eleven storms in the summer of 1963 varied significantly among 24 un-treated brush-covered 6x12-foot plots. Soil and vegetation characteristics to which these differences are due are being investigated. Indications are that microrelief, cover of erosion pavement, and cover of vegetation are the most important.
- (5226) DYNAMICS OF WATER AVAILABILITY TO PLANTS.

 - (c)
 - Laboratory project. Dr. W. R. Gardner, U. S. Salinity Laboratory, P. O. Box 672, Riverside, California. Experimental and theoretical; basic research. Principles involving uptake of water from soil by plants and subsequent loss to $\begin{pmatrix} d \\ e \end{pmatrix}$ atmosphere are under study. A mathematical atmosphere are under study. A mathematical model for the soil-plant atmosphere system has been derived. Experiments are conducted in the greenhouse and growth chamber to test the validity of the model.
 (g) The unsaturated conductivity of the soil as well as the soil suction has been shown to be dimensioned in comparing water without the brain the second state of the soil suction has been shown to be dimensional the comparing water without the second state of the soil suction has been shown to be dimensional the comparing water without the second state of the soil suction has been shown to be dimensional state of the second state of the seco

- (5587) THEORETICAL ASPECTS OF SEEPAGE FROM OPEN CHANNELS.
 - (b) (c)
 - Laboratory project. Dr. Herman Bouwer, Research Hydraulic Engineer, U. S. Water Conservation Laboratory, Route 2, Box 816-A, Tempe, Arizona. Theoretical, applied research.
 - (e) The theoretical effect of channel shape and water depth on seepage was studied with a resistance network analog and analytically for a wide range of soil conditions and positions of the ground water table. The seepage flow systems is discussed. Completed.
 - Dimensionless graphs were constructed showing (g) seepage in relation to water depth in the channel, soil hydraulic conductivity, position of water table at considerable distance from the channel, position of an impermeable layer in the soil, or position of a highly permeable layer in the soil. An equation is developed for the seepage

from channels with a thin, slowly permeable (clogged) layer at the wetted perimeter.

- (5588) WATER BUDGET OF EPHEMERAL STREAM CHANNELS IN RELATION TO WATER DYNAMICS, GEOLOGY, AND VEGETATION.

 - (b) Field and laboratory project in cooperation with Arizona Agricultural Experiment Station.
 (c) Mr. Hasan K. Qashu, Soil Scientist, and Mr. D. E. Wallace, Geologist, P. O. Box 3926,
 - Tucson, Arizona. (d) Laboratory and field research, basic and applied, part of which will be presented as a doctoral dissertation by Mr. Qashu.
 - (e) The investigations are aimed at (1) assessment of ground water in local, water tables and development of management practices for sustained supply and improved quality of usable water; and (2) basic research on the relation of temperature variation and fluctuation of the water table to soil moisture movement and evaporation. During the summer rainy season, large proportions of the ephemeral flows are absorbed by the stream channel, resulting in a rise of the surface of the local water table. Many channels with deep alluvial deposits over-lying these perched water tables support dange stands of physicrobutas. Evenetures dense stands of phreatophytes. Evapotrans-piration from such areas on the Walnut Gulch Experimental Watershed is being studied by means of both the water budget and the heat balance approach. Amounts of water storage and rates of recharge are determined in the field. Outflow from the area is recorded to the nearest cubic foot, and diurnal fluc-tuation of the outflow and of the surface of the water table is continuously noted. Using Darcy's Law and a combination of Using Darcy's Law and a combination of methods for determining soil permeability and hydraulic conductivities, rates of sub-surface inflow are computed. By use of a portable seismic unit and 28 observation wells, extent of the aquifer has been determined and an area-depth curve has been prepared.
- (5589) RELATION OF SEDIMENTS AND STRATIGRAPHY TO THE HYDROLOGY OF SEMIARID WATERSHEDS.
 - (b) Laboratory project, cooperative with the Arizona and New Mexico Agricultural Experiment Stations and the U.S. Soil Conservation Service.
 - (c) Dr. Philip Seff, Research Geologist, P. O. Box 3926, Tucson, Arizona. (d) Experimental, field and laboratory; basic
 - research.
 - (e) Sediment collection stations are located at half-mile intervals where good surface exposures exist near the various experimental watersheds. Detailed sample collections of each stratigraphic unit are made and subsequently analyzed in the laboratory. This procedure coupled with a fluvial geomorphic analysis of the existing stream channels provides the necessary data for geologic interpretations, and recognition of changing climatic conditions.
 - (g) Information obtained indicates that the major source of sediments is derived from the non-consolidated Lake Cenozoic valley fill deposits on the Walnut Gulch watershed. Heavy mineral analysis is a valuable aid in locating the source areas of sediment. Subsurface water flow is restricted on both the Alamogordo and Walnut Gulch watersheds by high to medium indurated beds of Mesozoic age and older.

(3563) SUBSURFACE WATER MANAGEMENT ON NORTHERN

HARDWOOD FOREST AREAS.

- (b) Laboratory project.
 (d) Experimental and field investigations; basic and applied research.
- (e) Movement of subsoil water will be studied in various geologic and soil types to: (1) Develop techniques for quantitatively measuring subsurface water movement from small plots; (2) to learn the effect of artificial rainfall on quantity and timing of subsurface water movement; and (3) to develop a flow equation, including coeffi-cients for the significant variables affecting that flow. This information will aid watershed technicians in making land management decisions on areas that have lots of subsurface stormflow.
- (g) A plot 125 feet long by approximately 18 feet wide was wetted by a sprinkler system. The surface soil of the plot was predominately silt loam textured on a 20 percent slope. The soil surface was well prototed by a purchase the started beddynded well protected by an undisturbed hardwood leaf litter cover. Hardwood roots and root channels were concentrated in the top 24 inches of soil, with extremely dense net-works of the surface 11 inches. At a depth range of 32 to 50 inches below the surface a clay loam texture was predominate, in this horizon roots and root hairs were scattered and almost non-existent. Rainfall intensities from the sprinkler system varied from 0.6 to 1.2 inches per hour and storm lengths varied from 90 to 150 minutes. Seepage outflow measurements were made with 8 foot wide troughs inserted in the downslope face of the plot. These troughs were spaced at 0, 24, 32, and 50 inches below the soil surface--the depths corresponding to textural discontinuities. Seepage results from the 1964 fall runs have not been completely analyzed. However, the following preliminary observations were made:

(1) For the range of storm intensities used, no surface runoff occurred. The leaf litter protection appears to maintain the permeable condition of the surface soil even after 20 storms in 8 weeks.

(2) As in past runs, greatest volumes of seepage flow occurred from the uppermost soil horizon (a coarse textured silt loam overlying a finer textured silt loam). Large quantities of flow appeared to come from root channels and small structural cracks in this surface horizon. This seepage flow peaked shortly after rainfall ended and receded to insignificant quantities in about 6 to 8 hours.

Flow from the underlying fine silt loam and clay loam textured horizons was steady and uniform for about 16 to 20 hours following the start of rainfall. (3) No general seepage loss occurred in a lateral direction from the wetted plot soil

into the adjacent dry soil; this was confirmed by several batteries of tensiometers installed at the edge of the wetted strip. However, seepage loss from a zone approxi-mately 6 to 8 feet beyond the wetted edge occurred. Because of observation and known soil conditions, it was surmised that this seepage was being channeled off the plot through interconnected biological channels. This has led to the conclusion that there is a critical plot length-width ratio for forest soils having wide-spreading, interconnecting root systems. Future research will be aimed at studying this in more detail with laboratory model studies. The subsurface stormflow plot (with sandy

loam texture on a 29 percent slope) used in the 1963 runs was recallbrated with sprinklær runs. Then a 54-inch deep trench was dug across the plot at right angles to the direction of flow and filled with wood shavings. Again, the seepage results have not been fully compiled and analyzed; however, tensiometer and piezometer readings show

the presence of a mounded zone of saturation immediately above the subsoil trench. This indicates a lag in outflow or break in continuity of flow at the sharp air-soil interface. It is felt that this subsoil trenching technique may be a useful tool for temporary detention of subsurface stormflow from shallow soils, such as are found in the Allegheny-Cumberland Plateau. This technique will also be studied in further detail by the use of laboratory models.

- (4373) USE OF NUCLEAR RADIATION EQUIPMENT FOR MEASURING FOREST SOIL MOISTURE AND DENSITY.
 - (b) (d)
 - Laboratory project. Experimental and field investigations; basic and applied research.
 - Some newly developed equipment, operating on the principle of nuclear radiation, facili-tates the measurement of soil moisture and (e) the soil's closely alled property--bulk density. We now have a five-piece set of this nuclear radiation equipment. We are investigating principles that will guide us in the use of this equipment. Completed.

- THE CHARACTERISTICS OF A CONIFEROUS PLANTA-TION THAT ARE MOST CLOSELY RELATED TO TREE GROWTH AND TO WATER AVAILABLE FOR STREAMFLOW. (4752)
 - (b) (d) Laboratory project.
 - Experimental and field investigations; basic and applied research.
 - (e) This is an intensive soil-moisture study initiated to discover some basic tree stand characteristics that are closely related to tree growth and to water available for stream flow and to develop guides for field use in managing forest plantations to obtain optimum production of wood and water.
 - (g) In the first growing season after cutting, treatments have opened plantation spacing, but soil moisture and growth results have The wood removed in plantation thinnings was chipped and scattered over the study plots before the start of the 1964 growing season.
- (4753) FOREST RESTORATION AND WATERSHED MANAGEMENT ON SURFACE MINED AREAS IN THE APPALACHIAN COAL FIELDS.
 - (b) (d)
 - Laboratory project. Experimental and field investigations; basic and applied research. Surface runoff on spoil banks, freshly formed (e)
 - during strip mining in the Appalachian coal fields, has a high soil erosion and sediment transport potential. This seriously affects water quality and has other deleterious effects on watersheds in which coal is harvested. It is highly desirable to establish a vegetative cover as quickly as pos-sible after mining disturbance in order to The purpose of this project is to (1) develop practical methods of reducing damage to watershed values during surface mining operations and (2) find feasible ways to restore mined areas to productive forest uses. Studies by individual scientists are divided among five disciplines including (1) Spoil Placement, (2) Soil Chemistry, (3) Haul Roads, (4) Revegetation, and (5) Hydrology. General hydrology studies recently started include (1) A study of stormflow and sedi-ment yield from stripmined terraces; (2) a study of stormflow and sediment yield from outslopes of stripmined soil banks; and (3) a study of the hydrology of ponds

originating on stripmined lands. In these studies a number of small San Dimas flumes have been installed to measure storm runoff from a number of terrace and outslope drainages. In the pond hydrology study a number of stilling wells and recorders have been installed on ponds. Raingage networks have been installed to cover each sample drainage area.

- (g) The program to develop revegetation techniques which will protect and stabilize the disturbed areas was accelerated last year. Early results are encouraging but inconclusive, because the inherent chemical and physical variability of spoils material causes in-consistencies which will require intensive study to explain. However, after two growing seasons black locust planted at a 4 by 18 foot spacing in contour rows promises to provide belts of vegetation on the steep out-slopes which can stabilize the banks. As these trees develop, they may affect the micro-environment and create conditions more favorable for the establishment and growth of other vegetation. Trials of quick cover species were continued with some success. Encouraging results were obtained with annuals, Blanco lupine and Balbo rye, and the perennials tall fescue and weeping love-grass. Density of these ground covers was quite variable even on small areas due to physical and chemical characteristics of the banks. Physical properties affecting seedlings germination and growth were the erosive nature of the spoil surface and a tendency of the surface to crust over as it dries out. Chemical properties which may influence revegetation practices are: acidity, generally below pH 5; high concentration of soluble salts; and the pressure of high concentrations of available iron, sulphur, aluminum and manganese.

- (5295) SNOWMELT FLOOD AND SEDIMENT REDUCTION.

 - Laboratory project. Experimental and field investigations; basic and applied research. (d)
 - (e) To determine quantitative relations of forest characteristics and timber hervesting procedures on snow accumulation and melt, streamflow peaks, sedimentation, and improved timing of water yields.
 - (g) A flow meter, consisting of a small Parshall flume and an attached water-level recorder, has been developed to record groundwater seepage continuously from road cut banks. For low flow rates, inserts in the flume throat convert the Parshall flume to an easily register changes in groundwater discharge caused by fluctuations in evapotranspiration. A major problem in watershed management is the design of proper drainage facilities on logging roads to prevent erosion and delogging roads to prevent erosion and de-terioration of streamflow. An important component of the problem is the volume of drainage water emanating from roads. Study roads are located at the 6400-foot elevation in the Engelmann spruce-fir type. On the inside ditches, 12 Parshall flumes collect and provide measurement of seepage flow from 100-foot sections of the cut

bank of the road. Data on the amount of seepage flow during the period, June 5-29, 1964, show that the hydrograph for the road in the forested block is generally subdued and less abrupt than the one representing the clear-cut block. In addition, the seepage-flow peaks on the hydrograph for the forested area are smaller than those on the hydrograph for the clear-cut block. Usually the daily upsurge of seepage flow-and by inference, snowmelt-begins and ends sooner in the clear-cut block, probably because snowmelt is dependent primarily upon direct solar radiation that begins as soon as the sun's rays reach the snowpack. Snowmelt in the forested stand depends more upon longwave radiation. Tree cover distributes this radiation more evenly throughout the day and helps to keep the environment warmer into the night. From the date the snowpack disappeared (June 24 in the clear cut and June 29 in the forest), both seepage hydrographs began the long summer decline interrupted only by rain showers. Mapping of the subsurface configuration of bedrock and the presence of the water table has been completed in the six treatment blocks on the road hydrology study area. A portable NED Geochrome seismograph was used to determine bedrock depth under the 24-acre study area with a quartz monzonite bedrock. A problem arose when certain portions of the area remained saturated long after the remainder of the area dried We surmised the cause was a relatively shallow depth to bedrock which forced groundwater to the surface to create the marshy area. This became particularly evident after clear cutting the spruce-fir stand. One hundred-foot traverses were laid out over the study area wherever the terrain indicated the likelihood of change in bedrock configuration. Traverses were also located on all sides of the marsh to pinpoint any bedrock "dikes" or ridges. Two 2-man crews completed a forward and reverse run on 36 seismic traverses, making a total of 72 individual traverses. Results of this work showed that the average seismic velocities, V_1 , V_2 , and V_3 were 1612, 4884, and 9629 feet per second, respectively. Also, the average D_1 (depth to V_2 layer or water table) was 7.5 foot end the average D_1 (depth to V_2 layer or water table) was 7.5 feet and the average D_2 (depth to bedrock) was 25.7 feet. The V_1 layer represents the unsaturated soil layer and the seismic velocity increased to V_2 at the water table. The presence of the water table at about 7.5 feet was verified by measurements taken in numerous observation wells within the study area. A $V_{\rm 3}$ value of 9,000 to 10,000 feet per second is reasonable for this type of bedrock. Seismic traverses uphill from the marsh area showed depth to bedrock in excess of feet. This is about the maximum point of sensitivity in picking up seismic waves generated by a sharp sledge-hammer blow on a metal plate. For measuring greater depths, blasting powder is used. Near the upper edge of the marsh, bedrock depth decreased to 29 feet, and below the marsh the bedrock depth ranged from 11 to 15 feet. Slope distance from the upper to the lower edge of the marsh was 300 feet. We concluded that this decreasing depth to bedrock did cause groundwater to seep out and create a marshy area. A multiple regression of soil-moisture data taken at randomly located points over the 24-acre plot showed that bedrock depth was a statistically significant variable which could be used to help predict soil moisture; i.e., as the depth to bedrock decreased, soil moisture increased. - (5296)SOILS STABILIZATION IN RELATION TO LOGGING ON STEEP TIMBERED SLOPES IN THE NORTHERN ROCKY MOUNTAINS.
 - (b) (d)
 - Laboratory project. Experimental and field investigations; basic and applied research.
 - (e) To identify and quantify the interrelations of soil, water, and vegetation to soil stability; to determine mechanical and vegetation requirements for stabilizing soil; and to determine effects of timber harvesting and roadbuilding on soil movement and water yield.
 - (g) Stability of fill slopes of newly constructed roads may be increased by establishing a good grass cover. In many instances, however, a grass cover is difficult to establish because the broadcast seed roll off the crusted soil of the fill. Loss of seed is particularly severe when such firm, rounded seeds as yellow sweetclover or cereal rye are used. Laboratory tests show that seed retention may be increased markedly by seeding upon a hay mulch, wet or dry paper netting, a wet soil surface, or on a "pockmarked" soil surface.

Two study compartments were established on very steep forested terrian in central Idaho. The purpose of the study is to compare soil erosion caused by jammer and high-lead logging methods. Erosion is measured both on small watersheds and on 1/100-acre plots. One compartment ("Deep Creek") was established in 1960, and the following year two roads were built into the jammer area but not into the high-lead area. Both areas were then logged in 1962. Prior to road construction, measurable erosion from both areas was negligible. As a general rule, soil movement in this area takes place mostly during the spring runoff period. This is illustrated by figures for the high-lead area where, as the after-math of logging activities, only 3 TSM (tons per square mile) eroded during the 7-month cold season in contrast to 25 TSM during the few weeks of the spring thaw. Where only tree-removing activities occurred, soil damage was negligible as evidenced by the zero figure of the high lead area. In contrast, damage was high (552 TSM) in the presence of raw fills on newly built

Very little information is available about runoff and erosion from small forested watersheds in central Idaho. Although these watersheds are primary sources of water, little is known about their hydrology, and nothing is known about the consequences of logging. As a first step in bridging this hiatus in knowledge, we began (toward the end of 1962) taking simultaneous stream measurements from two contiguous watersheds. In correlating streamflow with the amount of precipitation falling on these watersheds, runoff represents only one-third of the total precipitation, and evaporation and transpiration utilize fully two-thirds of total annual precipitation. Appropriate field instruments have yet to be devised for the continuous measurement of sediment movement. Nevertheless, our studies lead us to believe that sediment movement is best understood by its seasonal During the summer and early occurrence. fall when streamflow is low, sediment is pushed or rolled along the streambed. In Circle End Creek, daily movement during this period amounted to only 0.003 ton per square mile. In contrast during the early spring, rapidly rising streams flush out accumulated sediment. During this period, daily soil movement in Tailholt Creek was 0.15 ton per

square mile.

Finally, we also found that the two contiguous watersheds (Tailholt and Circle End) react very similarly to any given storm. If, as the result of a storm, streamflow rises in one watershed, we can predict very accurately the rise in the adjacent stream. If we know the time required for one creek to peak, we can accurately predict the time for the other.

- (5297) WATERSHED PROTECTION REQUIREMENTS AND RE-HABILITATION MEASURES FOR THE REDUCTION OF FLOOD RUNOFF, EROSION, AND SEDIMENT FROM DETERIORATED FOREST AND RANGELANDS.

 - Laboratory project. Experimental and field investigations; basic (d) and applied research.
 - (e) To relate soil and vegetation characteristics to infiltration, overland and subsurface flow, and soil erosion; to develop flood and erosion hazard criteria and protection requirements for deteriorated rangeland; and to determine effects of watershed rehabilitation on erosion hazard and flood potential.
 - (g) A recent study on a grass-forb subalpine range in central Utah showed that infiltration capacity, as measured by the inches of water retained on infiltrometer plots during simulated rainfall of 50-minutes duration, is influenced primarily by bulk density and noncapillary porosity of the surface 4 inches of soil and secondarily, by density of protective cover afforded by plants, litter, and stone. The study also shows that soil stability, as measured by the amounts of soil eroded from the infiltrometer plots, is influenced primarily by the density of protective cover and, secondarily, by soilbulk density.

The past summer we began a study designed to investigate the infiltration and sedimentation characteristics of newly constructed contour trenches in soils and fractured underlying mental Watershed. The soils are derived from pre-Cambrian sediments that have been metamorphosed to produce quartities, gneisses, and schists. Specific objectives of the study are to determine: (1) Infiltration rate characteristics of water ponded in contour trenches, (a) during the first year of trench installation, and (b) in subsequent years. (2) Whether there is differential permeability between the cut-slope and fillslope portions of contour trenches. (3) Which of several soil and vegetation factors affect first-year infiltration rates, changes in these rates with time, and changes in differential permeability between cut and fill portions of the trenches. (4) The sources of and quantities of sediment moving into contour spring runoff seasons. (5) which of several soil, vegetation, and topographic factors affect the amount of sediment moving into contour trenches. (6) The volume (storage capacity) changes of contour trenches with time as affected by: (a) subsidence or settling of trench fill sections, and (b) sediment deposition in trench bottoms. The volumes of 10-foot sections of trench are being determined by filling plastic-lined sections with water measured through a sensitive flow meter and calibrated to manometers for depth. Infiltration rates

are being measured by slitting and removing the plastic liners and measuring the changes in water depth on the manometers with time. The effect of temperature on the mobility of water in unsaturated soil is an important consideration in virtually all studies in-volving soil-moisture movement. Whether we are interested in infiltration, soil-moisture depletion, deep percolation or other unsaturated soil-moisture flow processes, the influence of temperature should be recognized. It has generally been assumed that variation of soil-moisture conductivity with temperature could be accounted for by corrections based on published values of viscosity of free water. However, theoretical considerations suggest viscosity of water near soil-water interfaces is greater than that of free water. Measurements of self-diffusion of water in unsaturated soil systems tend to confirm this hypothesis. In general, the stronger the bonds between molecules in a liquid the greater is the effect of temperature changes on the fluid properties of that liquid. Soil water, being subject to adsorptive forces of the soil solids, can be expected to exhibit greater temperature dependence of flow greater temperature dependence of flow properties than does free water. In saturated soil, especially one with large pores, a large portion of the water is not subject to strong attractive forces and the effects of temperature may not be appreciably greater than for free between water molecules are greater than they are in free water, and these forces can be expected to increase as soilmoisture tension increases. As a result, the effects of temperature on fluid properties would be greater in unsaturated soil than in saturated soil, and a temperature correction based on published free-water viscosity values would be inadequate. Soil physicists have recently borrowed

the activation energy concept from chemical kinetics in order to measure strengths of bonds between soil water molecules. In its simplest form, activation energy may be defined by the Arrhenius equation:

$$E^* = RT^2 \frac{d \ln K}{dT}$$

in which E* is the Arrhenius activation energy, K is a chemical rate constant or any other accurate parameter of molecular reaction, R is the universal gas constant, and T is absolute temperature. The temperature dependence of a large number of simple chemical reaction rates can be characterized by equations of this type. E* is the energy barrier which must be surmounted for a reaction to take place. In the case of evaporation, it is energy of vaporization. In the case of viscous flow, it is N times the average energy required for a molecule to move out of one quasiequilibrium position far enough to be pulled into another quasi-equilibrium position, N being the number of molecules in a mole. If bond energies between molecules of water in soil systems are the same as those of free water, a temperature correction based on the viscosity of free water would be satisfactory, and the corresponding activation energy would be 4.16 kilocalories per mole at 20°C. In the laboratory we measured capillary-conductivity coefficients of two clay loam soils and a silt loam at 12°, 20°, 30°, and 40°C. over a range of moisture contents corresponding to moisture tensions varying from 0.05 to 0.5 atmosphere. We calculated activation energies using the Arrhenius equation with conductivity coefficients as rate constants. Averaged over the range of moisture contents studied, the activation energies in kilocalories per mole

were: 12.7±1.0 for one clay loam, 14.9±1.6 for the other clay loam, and 7.8±0.4 for the silt loam. This means that aver-age bond strengths in soil water under the experimental conditions were two to three times as great as in free water. This, in turn, indicates that higher viscosity of adsorbed water materially influences moisture flow in the 0.05 to 0.5 atmosphere tension range. According to available evidence, a simple correction based on the temperature dependence of free-water viscosity will usually account for temperature-induced changes in soilmoisture diffusivity at the low-moisture tensions at which the bulk of liquid flow occurs during infiltration. However, at greater tensions, such as exist at field capacity, soil-moisture conductivity appears to be much more temperaturedependent than is free-water viscosity. The influence of temperature on moisture conductivity in this moisture range cannot be satisfactorily accounted for by a simple vis-cosity correction. No reliable alternative can be suggested at this time; further study is required to develop accurate cor-rection factors for any soils other than the ones tested in this experiment. The results of this experiment emphasize the need for careful temperature regulation in studies involving liquid movement in soils in the field moisture content range.

(h)

- Laboratory project. Experimental and field investigations; basic and applied research. Tests the influence of forested bogs on
- (e) streamflow and groundwater behavior. The five major studies reported for 1963 are Five major studies reported for 1963 are still underway. In studies of forest bog hydrology, an additional bog has been in-strumented with an H-flume bringing the total number of bogs under instrumentation to 6 with a total of 6 recording wells, 55 nonrecording wells, and thirteen 10-foot-diameter bottomless lysimeters. This sixth bog is intended for studies in manipulation of water level to determine its effect on evapotranspiration.
- (g) A preliminary analysis has been made for several warm season evapotranspiration losses from May 1 to October 1 for two bogs by two methods. The first involved precipitation, runoff, and water table levels in the bog used as an indicator of storage changes. This method was then compared with potential evapotranspiration storage changes. This method was then compared with potential evapotranspiration computed by the Thornthwaite method from available temperature records taken near the two bogs. For any one 5-month season, there was rather close agreement between the two methods with the maximum difference being 1.20 inches and the minimum being 0.13 inch. For combined evapotranspiration, values were 18.46 and 18.57 inches respectively. For individual, monthly, or similar

short-term periods, the differences expressed percentagewise are considerably larger. Another aspect of these bog studies involves water-movement rates through laboratory cores and in situ using a piezometer and tube method tests. These indicate a sub-stantial difference by the two methods with the field results preferred over the laboratory results obtained with cores. Another aspect of the bog hydrology studies involved a comparison of predicted rise of water based on laboratory measurements of specific yields from several peats and actual rise of water trom several peaks and actual rise of Water table obtained in stage recorders. The results based on 38 growing-season storm periods during 1961, 1962, and 1963 indicate a correlation coefficient (r) of 0.96 and show that the slope of the line was very nearly 1.0. The storms involved ranged from 0.04 to 1.69 inches, and the range of water table elevations was 0.676ct

- from 0.04 to 1.69 inches, and the range of water table elevations was 0.67foot.

- (3889) WATERSHED MANAGEMENT RESEARCH IN THE DRIFT-LESS AREA OF SOUTHWESTERN WISCONSIN.
 - (b) Laboratory project, with some aspects in cooperation with Wisconsin Conservation Dept.
 - (d) Field investigations; basic and applied
 - research. (e) Major emphasis is given to methods of con-trolling runoff and erosion, including gully stabilization through reforestation, and other land-use treatments. To date, a total of 37 water-measuring devices have been installed on small watersheds, on small runoff plots, or at springs. Included are 3 V-notch weirs, 4 San Dimas flumes, and 30 H-flumes. Of the above devices, three are at springs with permanent flow. To further probe the usefulness of the forested zone on the steeper hillsides, additional research is now underway to estimate where channel absorption is best in gullies and to determine if this can be correlated with a specific underlying geologic stratum. This will involve a series of low earth dams each with a stage recorder which will show rate of recession of water behind each structure. Also in process of installation are trials of water diversion and water spreading to intercept runoff water before it gets into a gully and to spread it thinly against a series of logs placed on the contour or into a series of several small catchment basins in which it is hoped to achieve some recharge to ground water. (g) Further runoff studies of eight dual-use
 - watersheds (i.e., partly in farmland on gently sloping ridgetops and with timber cover on the steeper land below) indicate that at four of the eight valley flumes there has been no runoff to date since installation 2 to 3 years ago, even from snow-melt and from a 5-inch rain. At two other flumes there was runoff only once--during snowmelt. Only one of the eight watersheds yielded a number of flows at valley flumes. These results imply substantial absorption of runoff from upland farmland by forested land lying below it. Apparently there is considerable infiltration into the bottom considerable infiltration into the bottom of the gullies within the forested zone. Some additional wells drilled near a spring involving 29 wells 20 to 100 feet deep bolstered a conclusion reported last year

that there are ground-water highs under topographically low areas (natural drainage ways) and vice versa. However, periodic measurement of water levels in these wells over winter showed no consistent pattern-with some rising, some falling, and others staying about the same. In the past year, a study was made of some file records and reports on a series of lysimeters installed in 1935 near La Crosse, Wis. Each tank was 10 by 20 feet in dimensions and 4 feet deep, filled with monoliths of loessal Fayette silt loam, and capped with an 8-inch layer of topsoil. Various tree, grass, and grain crops were involved. Results indicated highest percolate yield with mulched hardwoods and the level from annual crops. More details on the study are given in the two publications listed below. "Water Yield and Soil Loss from Soil-Block

- (3890) WATERSHED MANAGEMENT RESEARCH IN LOWER MICHIGAN.

 - (b) Laboratory project.
 (d) Field investigation; basic and applied research.
 - (e) Two major projects have been undertaken to date: 1) A major study is designed to determine the hydrology of ground-water recharge and consumption in deep sandy soils of the Udell Hills area in Michigan. Installations to date include a series of 114 ground-water wells in deep morainal areas and adjoining outwash plains; of these, 8 have automatic recorders. After the cali-bration period, the effect of cover manipu-lation -- especially plantation establishment and harvesting methods -- on ground-water recharge and use will be established. (2) A second major study is concerned with streambank stabilization and the sediment problem in streams flowing through these sandy areas. Major objectives of this study are (a) to determine the influence of land use upon sediment production, and (b) to evaluate the effect of streambank stabilization measures upon suspended sediment loads. A total of 20 sampling stations have been established on ll streams. A new aspect of the study on streambank stabili-Zation includes tests of rock riprap at or near the waterline and planting brush species above it. Upperbank treatments also include seeding and fertilizing plus various chemical mulch applications.
 - (g) An analysis was made of several aspects of ground-water exploration with seismic refraction and electrical resistivity methods. The analysis showed these things: (1) There (1) There is a clear separation between seismic velocities in saturated and unsaturated sands; (2) unsaturated clay tills were not dis-tinguishable from saturated sands; (3) areas with till cap over unsaturated sands are not (4) where till cap occurred, the electrical resistivity method supplied the only useful data on depth to the saturated layer; (5) saturated clay could not be distinguished from saturated sands by this method; (6) with control wells at one-half mile spacing and reasonably straight slopes, seismic methods can predict water table depths within l or 2 feet; and by resistivity methods they were predicted within 5 feet, in sandy drift up to 150 feet in depth. A second aspect of the research here involved calculation of evapotranspiration for 2 water years 1961-62 and 1962-63 in different conditions of cover type and water table depth in sandy soils. These showed a range from 16.14 inches to 21.85 inches with somewhat greater losses in two conifer types than in broadleaf types,

apparently due to a longer evapotranspiration period (especially spring and autumn) and greater evaporation from snow, including that from snow intercepted by crowns. Net recharge to ground water is inversely related to gross evapotranspiration. A third facet of the study in the Lower Peninsula of Michigan involved a calculation of mean sediment yield in streams in sandy land with steep eroding banks and as affected by land use. Cultivated banks and as affected by fand use. Cultivated land yielded 2,200 pounds of sediment per square mile per day; pasture land, 1,800 pounds; and forest lands, 360 pounds. It is presumed complete exclusion of livestock from eroding banks and use of riprap will reduce the sediment yield. This idea is now under trial on the Tobacco River.

- (1188) WATERSHED MANAGEMENT RESEARCH, FERN EXPERIMENTAL FOREST, WEST VIRGINIA. FERNOW

 - (b) Laboratory project.(d) Field investigation; basic and applied research.
 - (e) Studies were started in 1951 on the Fernow Experimental Forest, Tucker County, W. Va., to determine the effect of different levels of cutting practices, different logging methods, and different forest uses upon water quantity and quality. Nine water-sheds have been equipped with streamgaging stations and rain-gages.
 - (g) A commercial clearcutting was made on a 74acre gaged watershed; skidroads were loggers' choice -- without limitations as to grade or provisions for drainage. After-logging infiltration rates in the watershed remained well above maximum rainfall intensities except on portions of the skidroads. Over-land flow occurred only from the skidroads; it resulted from the combination of rain directly on the skidroads and interception of subsurface flow by the road cuts. In-creased storm runoff in the growing seasonsup to a maximum of about 1/2 area-inch in any one storm--was largely the result of decreases in field-moisture deficiency rather than changes in the proportions of surface and subsurface flow. A method was developed for approximating total soil-moisture storage capacity of an experimental watershed from precipitation and stream-flow records. Precipitation minus runoff -- in selected periods when ample precipitation follows a dry spell -- provides the estimate of soilmoisture storage capacity. The method is illustrated with data from the Fernow Experimental Forest and is applied to two other watersheds in the Northeast. Limitations of the method are also discussed.

 (d) Field investigation; basic and applied re-
 - search.
 - (e) At Pennsylvania State University a cooperative study was started in 1957 to determine the effect of forest cover and treatment on quantity and quality of streamflow in the oak-hickory type in Pennsylvania, and to study associated and basic soil-water relationships. Six experimental watersheds have been selected, weirs have been constructed, and climatic stations established. At Baltimore, Md. a cooperative study started in 1958 to determine effect of growth of loblolly and white pine in plantations on streamflow, and to compare streamflow from watersheds in conifer plantations with stream-flow from a hardwood-forest watershed. Stream-flow of three experimental watersheds is being measured and a climatic station has been established. An inexpensive weir to gage small streams was built of wood and lined with a sheet of vinyl film. The cost was about \$850 and the weir is expected to last 5 to 10 years without repair. At Newark, N. J. a cooperative study to determine the influence of selected treatments of forested municipal watersheds on water supply. Weirs on 3 experimental watersheds were built in the fall of 1958 and stream gaging and climatic measurements were started in the spring of 1959.
 - (g) In a single-watershed calibration of the experimental Dilldown Watershed in Pennsyl-

annual runoff and monthly water loss or runoff. The basic relationships were developed from streamflow, climatic groundwater, and soil-moisture records, but the final equations were expressed in terms of runoff and climatic variables only. Standard errors of estimate were well below the minimum change in yield considered significant, namely, 10 percent of the annual or monthly runoff. Trough gages used to measure throughfall under vegetation and rainfall in the open at the Dilldown Watershed in Fennsylvania gave deficient catches due to rainfall splashing out of the trough. The deficiency was inversely related to the slope of the trough Convection regressions were corretrough. Correction regressions were com-puted. A 90° and 120° V-shaped trough may give a better catch than the semicircular, used in this study for raindrops would not bounce vertically from the steep sides. Recording instruments that have a clockdriven chart drum and pen-arm assembly may be converted to a wind-movement recorder with a \$5 expenditure for an electromagnet, dry cells, and assorted small hardware. Dry cells are connected in series with the contacts and the electromagnet. Closure of contacts activate the magnet, a counterweight, and the pen-arm. If no instrument is available the necessary parts may be purchased for about \$80. A relationship between bulk density and soil depth plus stone content was developed from Lakeland sand and Lakehurst sand in the Coastal Plain of New Jersey. From this, bulk density was estimated for each soil-moisture sample in five 1-foot layers. Moisture con-tent by weight for each 1-foot layer was converted to moisture content by volume by applying the respective estimated bulk den-sities. Variations within and between the relatively close-spaced plots are presented for estimated bulk density and moisture content by volume for each of the 1-foot layers. Vegetation along the stream channels of two small forested watersheds was sprayed with 2, 4,5-T with a mistblower to determine the extent of streamflow contamination. Water samples were taken just above and below the treatment area and 1 mile downstream immediately after spraying, 4 hours later, and for several days thereafter. Samples taken just below the treated area, within 4 hours of treatment, and later after a 1-inch rain were contaminated. There was no contamination ore mile downstream.

- (4758) WATERSHED LOGGING METHODS AND STREAMFLOW.
 - (b) Laboratory project with some phases in co-operation with City of Portland, Bureau of Water Works and Oregon State University.
 - (d) Field investigations; basic and applied research.
 - (e) Research is conducted at three field locations in the Cascade Range of Western Oregon: Bull Run watershed (domestic supply area for Portland), H. J. Andrews Experi-mental Forest, and South Umpqua Experimental Forest. Studies are confined to two forest types representing major segments of the remaining old-growth forests of the Pacific Northwest: (1) Douglas-fir, western hemlock, western redcedar, and (2) Douglasfir, sugar pine. Investigations represent an initial effort to study precipitation runoff, erosion, and soil moisture in undisturbed stands, and to follow changes caused by several methods of logging. Included are studies in four categories: (1) Soil movement on logged land and an evaluation of effectiveness of grass seeding on roadbanks; (2) changes in water quality resulting from roadbuilding, two methods of cable logging, two degrees of forest removal -- 25 percent and 100 percent -- and slash burning; (3) changes in streamflow caused burning; (3) changes in stream'low caused by clear cutting and partial cutting in groups of varying size on matched watersheds in old-growth Douglas-fir and sugar pine-fir. Pretreatment measurements are still being made to provide statistical basis for treatment evaluation; (4) soil moisture movement and disposition and the role of vegetation in evapotranspiration, including measure of seasonal changes in soil moisture under a Douglas-fir stand, vertical movement of water in Douglas-fir soils, rainfall interception by crowns of old-growth Douglas fir soils, rainfall interception by crowns of old-growth Douglas-fir, and changes in plant succession following logging and slash burning.
 - (g) Soil surface condition and bulk density were investigated after tractor and highlead logging. The surface area of four clear-out units was classified into four disturbance classes by means of point sampling. High-lead and tractor areas had about the same proportion in the slightly disturbed and deeply disturbed classes (approximately 23 percent and 9 percent respectively). The tractor-logged area had about three times more area within the compacted class than did the high-lead (27 percent vs. 9 percent), and a corresponding decrease in the amount in the undisturbed class (36 percent of the tractor area vs. 57 percent after high-lead logging). Surface soil bulk densities of samples from undisturbed and slightly disturbed areas were the same as prelogging values. Values for both the deeply disturbed and compacted classes were significantly higher, indicating a decrease in soil porosity. Compaction undoubtedly results in increased runoff and erosion. However, these undesirable effects are minimized if slopes are gentle and skid-trails correctly located. Streamflow from small drainages on the

western slopes of the Oregon Cascades is strongly influenced by a maritime climate strongly influenced by a maritime climate characterized by excessively wet winters and dry summers. Although annual precipitation is high (94 inches in the study area), sur-face runoff is virtually unknown. Peak flows result largely from subsurface flow and under conditions in which both retention and detention storage are filled during extended periods of low intensity rainfall. Under these conditions, vegetation appears to exert a minimum influence on high streamflow. Lowest streamflow occurs from late August to mid-November and may follow a 60-100 day period with little or no rain. The dense vegetation of this portion of the Douglas-fir region appears to exert its major in-fluence at this time. Removal of vegetation from only a portion of a 250-acre watershed has shown a 12- to 22-percent increase in minimum streamflow. All soils are derived from volcanic rocks and exhibit unusually low bulk densities, generally well below 1.0 gm/cc. Soil textures range from medium to fine. Soils derived from reddish tuffs and breccias are finer textured than those found on greenish tuffs and breccias. The least permeable soil layers generally allow percolation rates of 4 inches per hour or greater. Most soils have large moisture storage capacities (up to 35 inches in the surface 100 inches of soil). This is largerly due to the deep deposits of colluvium and well-decomposed rock which underly many of the soils. "Storm Runoff Characteristics of Three

(h) Small Watersheds in Western Oregon", by Loyd O. Barnett, Jr. M. S. Thesis, Colo. State Univ., 84 pp. 1963. "Net Precipitation Under a Douglas-Fir Forest," by Jack Rothacher. Forest Sc. 9(4): 423-429, Dec. 1963.

U. S. DEPARTMENT OF AGRICULTURE, FOREST SERVICE, Pacific Southwest Forest and Range Experiment Station.

- (4996) WATERSHED MANAGEMENT RESEARCH IN CALIFORNIA'S SNOW ZONE (SNOW MANAGEMENT RESEARCH).
 - (b) Laboratory and the following cooperators: State of California, Dept. of Water Resources, Atomic Energy Commission, and Pacific Gas & Electric Company. (c) Dr. James L. Smith, Project Leader, Snow
 - Management Research, Pacific Southwest Forest & Range Experiment Station, 1960
 - Addison Street, Berkeley 1, California. (d) Experimental; field investigations; basic and applied research.
 - (e) The objective of this project is to determine methodology for increasing water yield and changing of timing of water delivery by vegetation manipulation, by evaporation suppressants, etc. Its area of interest is confined to the snowpack zone of the Sierra Nevada of California. Present studies emphasize development of methods for management of high elevation snowpacks for yield and control of water; the effects of timber cutting upon soil moisture losses and snow accumulation and melt; and the evapotranspi-ration from various sites -- species combinations. Project scientists are located in Berkeley with field personnel and studies located at the Central Sierra Snow Laboratory, Soda

Springs, California, and studies only located at Teakettle Experimental Forest in the headwaters of the north fork of the Kings River above Fresno, California. Both sites lie at 7000-8000 feet elevation. At the Teakettle Experimental Forest four small watersheds (0.27-0.86 square miles in area) are under study prior to installation of log roads and a timber harvest to determine their effects upon water yield and sediment. At the Central Sierra Snow Laboratory five small watersheds are gaged for the study

of logging effects upon water yield. In the headwaters of the Feather River a practical sized logging is being tested for snow accumulation and melt effects. Gamma and neutron probes are being tested for measuring hydrologic characteristics of snowpacks. Evaporation suppressants are being tested for reduction of such losses from snowpacks.

- (g) Rapid measurement of hydrologic characteristics of snowpack which may permit more accurate appraisal and prediction of delivery of snowmelt water has been possible using gamma and neutron probes. Commercially gamma and neutron probes. Commercially available probes with gamma and neutron sources (Nuclear-Chicago, P-20 and P-19 probes) were tested for the ability to measure snow density, ice lenses, and the thermal quality (free water) of the individ-ual layers in the snowpack. Usable regressions of snow density (D) at each denth measured gravimetrically and with depth, measured gravimetrically and with neutron counts (Cn) and gamma counts (Cg) in CPM in the snowpack were obtained. Much greater sensitivity of measurement was obtained by lowering a cesium source in one tube of a twin-tube probe and a detector in the other tube. This transmission method resulted in measurements to within 2 percent accuracy where a snowpack was profiled in 3-inch increments. Ice lenses in the snow were readily detectable by shifts in the were readily detectable by shifts in the neutron probe counts; neutron counts would increase markedly at the occurrence of ice; gamma counts were only slightly affected. In a study of changes in the thermal quality of snowpack throughout the day and from day to day, neutron counts were directly related to the percentage of ice in the snow, as contrasted with free water. Winter surface evaporation from snowpack at high elevation sites were reduced by the addition of the suppressant hexadecanol. Snow density at maximum pack (near April 1) was found to be constant for an aspect regardless of the cover density or even lack of cover. While mean density or even lack of cover. While mean snow depths for various cover conditions ranged from 67.1 to 83.5 inches, snow density ranged from only 31.6 to 34.9 per-cent. Standard deviations for depth ranged from 10.28 to 16.30: for density the range was from 1.93 percent to 3.17 percent. Snow water content accumulation (in area inches) Snow Water content accumulation (in area inches) by cover conditions amounted to: clear cut 27.5, scattered young timber 26.7, alder-willow thickets 27.6, natural openings in a forest 24.1, 20 percent forest cover 21.6, 40 percent forest cover 20.2, 60 percent forest cover 20.2. A stratified randomized sampling of the area using 210 sample points resulted in a mean standard deviation of 14.76 resulted in a mean standard deviation of 14.76 from a mean snow depth for all conditions of 72.7 inches. At the same time a line-transæt sample using 428 points resulted in a mean snow depth for all conditions of 73.8 inches with a standard deviation of 17.3. from wildland watersheds.

(g)

Laboratory analyses of the soil samples taken in the study of erodibility of Hawaii wildland soils has been completed and some relationships of soil characteristics to site characteristics determined. Seventy-five sampling sites were used in obtaining the soil samples, selected along 26 transects of the Waianae and Koolau Mountain ranges of Oahu. Soils were sampled under trees, shrubs, or grass cover under widely different precipitation, aspect, and elevational and geologic conditions. Parent rock was of three main types: basaltic flows, pyroclastic deposits, or detritaled materials. A variety of multiple regression, principal components (including varimax rotation), canonical, and factor analyses have been run on the data. Soil characteristics were the dependent variables and geology, zone, vegetation type or species, rainfall and elevation were the independent variables. Soil characteristics included the mean weight diameter of water stable aggregates, various fractional sizes of aggregates, and suspension percent. The soil characteristics were predictable from These the site variables, with the explained variance ranging from 52 to 76%. Precipitation, elevation, geology, and vegetation were significant, but the interaction of geology and vegetation was not significant at the 5% level. Regressions using vegetation species as a variable were more significant than those using vegetation types. Air-drying soil samples, before determining the aggregate sizes, reduced the predictability of the soil characteristics as compared with keeping the samples moist before laboratory analysis. Of the multivariate techniques used, principal components with varimax rotation gave good predictability and easily interpreted factors. Estimation of soil moisture and snow storage from climatic variables for input to watershed runoff analyses has been developed using a ainulation program. A 7094 program computes daily values of potential evaporation, soil moisture deficit or excess, available moisture, and storage capacity, together with accumulation and melt of the snowpack. Input data are from the U. S. Weather Bureau 1009 daily weather cards; other controlled information entered are relative day length for a given latitude and date, soil moisture storage capacity, degree-day melt factor, and degree-day base temperature. Different levels of total soil moisture capacity may be assumed and different temperature adjustments made to the daily temperature data. Tests of the applicability of various multi-variate analysis methods to the problems in hydrology have been explored using a known physical model (a hollow cylinder), employing both rational and somewhat irrational measure ments on the physical system. Multiple regression, stepwise multiple regression, principal components analysis, varimax rotation and regression, oblimax rotation, and key cluster analyses have been tested. Principal components analysis with varimax rotation and key cluster analyses gave similar results and seemingly rational clues to the physical system. Analyses of soil moisture data collected in

Analyses of soil moisture data collected in Hawaii during 1960 and 1961 in a cooperative program with the Corps of Engineers have been analyzed to determine the effectiveness of rainfall in charging the soil. Data were selected when available storage in the soil exceeded precipitation, and the relationship of soil moisture accumulation to available storage, precipitation their squares and interactions, determined by principal components analysis, separately by species and site for two amounts of daily rainfall, 0.25 and C.50 inches, the effectiveness in percent of the rainfall for six sites is summarized below:

Species		Soil Moisture Gain, percent of precipitation				
		Precip.=0.25	Precip.=0.50			
Bamboo Eucalyptus Grass Uluhi-Ohia Pineapple Eucalyptus	spp. robusta	8 31 33 38 41 50	59 49 45 47 70 41			

Note that for precipitation of 0.25 inches, which wasabut the mean daily precipitation, very little of the rainfall in the bamboo stand reached and charged the soil -- only 8 percent; however, with more precipitation, 0.50 inches, soils under bamboo were second most effectively charged with moisture, only exceeded by soils under pineapple. Soils under grass did not differ markedly from soils under the tree species. Because surface runoff was probably negligible from storms of these sizes, one might infer that differences between precipitation and soil moisture gain is a measure of interception (or more precisely, the combined interception and evapotranspiration). Variation in soil moisture accumulation explained by rainfall ranged from 60 to 85%, with the highest explained variance being under the pineapple, and the lowest under the two eucalyptus species.

wildland watersheds (Kaukonahua Watersheds on Oahu) were determined from the records collected by the territorial Forester in the water years, 1952 to 1955. Relations were compared for the natural conditions of tree vs. fern-covered watersheds and relations after the fern watershed was burned and partially planted trees in 1953. After adjustment for differences in antecedent precipitation and storm characteristics, the total storm runoff (Qs) and the storm precipitation (Ps) were found to remain highly consistent between periods, but vary widely between the tree vs. the fern watersheds. Explained variance ranged from 55 to 90% when principal component analysis was used. Equations relating storm runoff and storm precipitation, both in inches, are given below, together with computed runoff from the average size storm of 2.0 inches:

								(P	=2.0)
	Conditio	on			F	Soua	ation		
TREE TREE	(1952, (1954,	1953) 1955)	ິເຮ Qs	1	0.051 0.042	Ps Ps	exp. exp.	1.24 1.28	.120
FERN FERN	(1952, (1954,	19 53) 1955)	Q S Q S	H H	0.065	Ps Ps	exp. exp.	1.53	.188

Note that storm runoff from the fern watershed was approximately two times that from the tree watershed in both periods.

OF CALIFORNIA.

- (b) Laboratory project. Cooperators are: California Department of Water Resources, California Division of Forestry, East Bay Municipal Utilities District, California Department of Fish and Game.
- Mr. Robert P. Crouse, Project Leader, Lower Conifer Zone, Pacific Southwest Forest & (c) Range Experiment Station, 1960 Addison
 Street, Berkeley, California.
 (d) Experimental; field investigations; basic and
- applied research.
- (e) This project conducts basic studies of forest hydrology which will suggest methods of land management for improving water yield, preventing floods and controlling sediment in the commercial timber zones of California below the snowpack. A study of soil moisture depletion in the Sierra zone of the Lower Conifer Zone concerns the magnitude of soil moisture storage and depletion under different stand and timber cutting intensities. Because soil creep and landslides are prevalent in the zone, a study of gravitational mass movement will form an effort to develop the means of estimating the consequences of mass movement in terms of sedimentation. The ultimate objective is to develop the means of predicting the role of land management practices, such as logging and road building in initiating or accelerating mass movement. (g) Soil moisture data has been collected at 2-
- week intervals from 84 neutron moisture meter access tubes installed to a depth of 20 feet in a wide range of logging intensities. Water table observation wells have been drilled to a depth of 50 feet for the purpose of evaluating capillary recharge to the unsaturated soil rooting depth. The standard Radium-beryllium sources in the neutron meters have been replaced with Americiumberyllium sources. The second experimental site of the soil creep study has been located in a 35-mile zone transecting the Coast Ranges in the vicinity of Fort Bragg and Covelo. The watershed calibration period at Caspar Creek is continuing with measurements of streamflow, sediment discharge, and precipitation.

 - (d) Experimental; field investigations; basic and applied research.
 - (e) Purposes are (1) to determine how watersheds function: what happens to the precipitation, and how water and soil movement are influenced by conditions of vegetation, soil, geology, and topography; and (2) to develop methods of watershed management, including treatment of areas denuded by fire, to insure maximum yield of usable water and satisfactory flood, runoff and soil erosion control. Principal work center is the 17,000-acre San Dimas Experimental Forest situated in the San Gabriel Mountains. A fire started by lightning in July 1960 consumed the vegetation, mostly brush, on 90 percent of the area and destroyed or damaged many of the research installations. Immediately after the fire a major emergency research program was started to test the effectiveness of various measures used to reduce flood runoff and erosion on the denuded watersheds. These rehabilitation measures include seeding grasses and mustard singly and in combination with physical treatments such as wattling, channel barriers and contour

terraces. The tests are being made on 38 watersheds of 2 to 90 acres each, equipped to measure rainfall intensity, peak discharge and suspended sediment. Twenty-five have basins to measure bedload. Studies of the erosion processes and tests of applied management methods to decrease the erosion potential are being continued.

(g) The lack of rapid infiltration over a burned watershed contributes to excessive surface runoff. Reducing debris movement from burned watersheds then appear to be partly a problem of getting water into the soil mantle.

Surface soils following a fire are usually "non-wettable" as a result of particle coatings with a chaparral leachate. In a recent burn, we tested a wetting agent treatment on six small plots. The objective of the treatment was to establish the suit-ability of a surfactant for reducing debris movement.

During the dry winter of 1362-1963, the plots treated with the wetting agent produced 95 percent less debris and 32 percent less surface runoff than the treated plots. There was additional evidence that the treatment benefited grass establishment. The treated plots had four times the vegetative cover of the untreated controls. This year field plots have been installed to evaluate the effectiveness of a surfactant when applied by two methods which would be practical for wide spread aerial applications. The disposition of the surfactant in the

soil has not been evaluated. A question of prime importance is the longevity of such a chemical treatment. Laboratory studies are underway to estimate the ability of a wetting agent to persist in

- ability of a wetting agent to persist in soil through numerous wettings and dryings.

 - (c) Mr. Leonard F. DeBano, Froject Leader, Pacif-ic Southwest Forest and Range Experiment Station, 110 North Wabash Avenue, Glendora, Calif.
 - (d) Experimental; field investigations; basic and applied research.
 - The work center is the 17,000-acre San Dimas Experimental Forest in the San Gabriel Mountains of Southern California. (e) Field investigations include studies concerned with the hydrologic factors of chaparral watersheds, riparian zone hydrology, and evaluation of water yield improvements. Laboratory studies on the movement (saturated and unsaturated), loss and storage of water in brushland soils supplement field studies on chaparral and riparian zone hydrology. Purpose of the work is (1) to establish fundamental plant, soil, water relationships as they influence water losses and water

yields; and (2) to develop and test cultural

- practices aimed at improving water yield. Basic laboratory studies are being conducted (g) on unsaturated moisture movement in soils which are difficult to wet. The "non-wettable" condition exists as a soil layer parallel to and below the soil surface. The upper part of this non-wettable layer which is of variable thickness, is located about 1-3 inches below the soil surface. The presence of the non-wettable layer appears associated with burned and unburned watersheds which either have or are supporting a dense cover of chaparral brush. Laboratory experiments carried out in the laboratory indicate that the nonwettable soil property can be altered by heat treatments. Heating in a muffle furnace at 800° F for 18 minutes destroys the non-wettable property, whereas heating at the same temperature for only 7-8 minutes intensifies it. Preliminary results from horizontal infiltration experiments carried out in the laboratory indicate that the non-wettable soils have different moisture transmitting proper-ties than similar textured wettable soils. The time required for water to move 20 cm in soil columns packed with wettable soil was 78 minutes while in the non-wettable soil it was 1,861 minutes. The soil moisture distri-bution between the water source and the wetting front was also different for the wettable and non-wettable soils. In the wettable soil the soil moisture content decreased about 10 percent between the water source and the wetting front, whereas for the non-wettable soil it decreased about 25 percent. Both wettable and non-wettable soils had the same moisture percentage at the water source and the difference in moisture content increased uniformly as the wetting front was approached. Evaporation experiments on columns packed with wettable and non-wettable soils indicated that the presence of a non-wettable substance also effects evaporation phenomena. The amount of water lost from wettable soils was about 65 percent greater than that lost from non-wettable soils during a 90-day evaporation period. Infiltration and evaporation studies on Infiltration and evaporation studies on soil columns having a non-wettable soil layer of varying thickness are now being planned. These experiments will more nearly simulate the arrangement of the soil layers under field conditions.  (c) Mr. Robert E. Nelson, Chief, Hawaii Research Center, Pacific Southwest Forest and Range Evaniment Station 400 South Perstande Station
 - Experiment Station, 400 South Beretania St., Honolulu, Hawaii.
 - (d) Experimental; field investigations; basic and applied research. The objective is to develop a hydrological
 - (e) and meteorological base in Hawaii's wildland watersheds that will suggest methods of land management for maintaining or improving water yield and water quality and minimizing soil erosion and sedimentation; to obtain adequate understanding of the processes of receiving and discharging water and being able to predict the effects of a wide span of forest land management practices upon water yield and water control; such studies are to suggest ways to manage watersheds that will (1) assure

the continued protection of watersheds; (2) improve the distribution of the water yield by modifying the balance between the groundwater recharge and surface waterflow; (3) increase water yields by decreasing evapotranspiration losses; and (4) minimize flood runoff and sedimentation. Major work center is in Honolulu. The principal studies under way are the determination of soil erodibility indices for forest soils in Hawaii, the measurement of evapotranspiration from several selected wildland vegetation types, and a study of rainfall-runoff relations on two small forest watersheds. (g) Erodibility indices found useful elsewhere

have been determined from soils collected along transects across the major mountain ranges on Oahu. Parent material, vegetation ranges on Oahu. Parent material, vegetation type, precipitation, and elevation signifi-cantly affect erodibility. Summer evapotranspiration losses during 1963 in the Waianae Range of Oahu varied from about 11 inches for grass, 17 inches for brush and up to 20 inches for paperbark Eucalities Losses for the summar of 1964 brush and up to 20 inches for paperbark Eucalytus. Losses for the summer of 1964 were appreciably less because of limited rainfall, both during the winter soil moisture recharge period and during the summer. Detailed analyses of rates of loss at various depths are under way. Analyses of the rainfall-runoff relations on two small watersheds indicate that an intentional burning of the uluhi fern on one had little, if any, effect. Likewise, no effect on runoff of replanting the burn to forest tree species was detectable the first 2 years after replanting. Plans call for the publication of the results of these studies. New studies of the effect of forest plantations on the value of forest lands as producers of water will be initiated.

U. S. DEPARTMENT OF AGRICULTURE, FOREST SERVICE, Rocky Mountain Forest and Range Experiment Station.

- (377) WATERSHED MANAGEMENT RESEARCH, FRASER HYDROLOGIC LABORATORY.
 - (b) Laboratory project.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Field investigations; applied research. To determine influence of lodgepole pine and spruce-fir forests and of the management of these forests for wood products on factors associated with the yield of water, largely from stored snow. The purpose is to solve problems in the management of forested watersheds of the high altitude zone of the Rocky Mountains for maximum yields of usable water. (g) Data from 82 snow sampling locations were
 - used to investigate snow cover depletion and ablation on Fool Creek in relation to selected physiographic characteristics of the watershed and streamflow. This water-shed possesses relatively uniform topography with respect to exposure, solar radiation, and other factors affecting deposition and melt.

A comparison of the snow cover depletion, ablation, and generated runoff relationships for the period April 1-July 31, 1952, indicates that ablation began several weeks prior to both the spring rise of Fool Creek and the appearance of bare ground. In addition, the rate of ablation was much faster than the rate of depletion. Approxi-mately 60 percent of the area was snow covered on the peak day (June 10). However, the pack contained only about 30 percent of the seasonal water equivalent. A comparison between the cumulative ablation and cumulative generated runoff relationships also indicate that there was a greater volumetric decrease

of the pack than was indicated by generated runoff. The displacement of the ablation curve relative to the generated runoff curve is due to losses. Almost all of the losses to the water yield from snowmelt occurred prior to the time of peak streamflow. The steepness of the depletion curve also reflects the rather homogeneous physiographic characteristics of this watershed. The snow cover remained intact for a relatively long time and depletion took place rapidly. Final analysis of the observations made in the snow physics study during Febraury and March of 1963 have been found to support the hypothesis (Bergen 1963) of extensive buoyant convection within the snow cover at these periods with warm current velocities in the range of turbulent flow (1 to 2 cm. sec. for the snow cover examined). These convective currents appear to be of a continuous character resembling the buoyant plumes studied in homogeneous media and representing a continuous flow of soil heat to the upper layers of the snow cover. Such currents tend to sustain higher average surface temperatures for the snow cover and thus in general higher ablation rates in a given environment than would otherwise be the case. A more significant effect is the in-crease in grain size at the upper layers due in part to the moisture transport by these currents. Accretion of this moisture by the surface granules may be an important factor in the rapid decrease of albedo observed through the months of deep snow cover amounting to a two-fold increase in the

- absorption of solar energy and a consequent acceleration of daytime ablation rates. "Vapor Transport as Estimated from Heat Flow in a Rocky Mountain Snowpack," James D. Bergen, Internatl. Assoc. Sci. Hydrol. Pub. 61, pp. 62-74, illus. (h)
- (657) WATERSHED MANAGEMENT RESEARCH, TEMPE, ARIZONA.
 - Laboratory project.
 - (b) (d) (e) Experimental; basic and applied research. To study the disposition of rainfall as influenced by waterhed vegetation; to determine the influence of various types of forest and grassland vegetation as well as vegetation modified by cultural treatment such as grazing and timber harvest, on streamflow, water use, water loss, and erosion and sediment yield; and to determine for phreatophytic vegetation (water-loving plants) the amount of water used, methods for reducing water use by phreatophytes or for replacing them with more useful plants. At Sierra Ancha Experimental Watersheds in central Arizona, rainfall, runoff, and erosion are measured on three watersheds in the pine-fir vegetation type at high eleva-tion, on two watersheds in the ponderosachaparral type, and from four watersheds in the grassland-chaparral type at intermediate elevations, and on nine small watersheds in the semidesert-chaparral type at low elevations. Water use by different types of plants in various soils is studied on eleven large lysimeters. Three watersheds have been established on the ponderosa pine type, three in the mixed-conifer type. and two watersheds in the high (9,300-foot elevation) grassland type. Current plans are to treat one ponderosa pine watershed in 1965, testing current Forest Service methods of harvesting methods to lead to eventual even-aged management. Soils from grass, aspen, and mixed-conifer plots are being laboratory tested for hydrologic characteristics. Soil moisture is followed with a neutron probe. Gaging stations for four watersheds in the pure chaparral type are also available to evaluate watershed-game interrelations. One cluster of two watersheds and and another cluster of three watersheds are available for testing the effect of mani-

pulating chaparral cover. Supplemental studies are determining the proper use of chemicals, fire, and mechanical treatment for manipulating shrub in the type. Ecology for manipulating should in the operatory of Tamarix pentandra and other phreatophytes is under investigation. Germination, seedling survival, sprouting ability, and rate of spread studies were continued.

Clearing 80 acres of moist-site forest (g) vegetation, dominantly white and Douglas-fir, and replacement with grass in the 248-acre North Fork of Workman Creek Watershed, caused an average of about a 55% increase in water yield. Water yields for the treatment period are also fairly well distributed along the posttreatment regression as follows:

	Actual Streamflow (inches)	Expected streamflow (Inches)	Percent increase
1958-59	1.4	0.9	56
1959-60	6.4	4.4	45
1960-61	1.6	1	60
1961-62	5	3.1	61
1962-63	3	1.8	67

Results of timber harvest on South Fork in which 45% of the basal area of trees were removed by individual tree selection did not change water yields significantly. The gravimetric determination of moisture in airstreams is presently being investi-gated. The purpose of the study is to develop methods for determining water vapor in airstreams by means of adsorbents and/or absorbents, and refrigerants. The amount of water collected is then determined gravine trically. This method is of interest for the purpose of providing a measure of a period of several hours. A group of desiccants was tested in a system in which air was saturated with water at 30 $^{\circ}$ C, and was then passed at a constant rate through three U-tubes of a given desiccant. A total volume of 10 cubic feet of air was passed through the system for each test. The results of these tests indicated that silica gel was the most desirable desiccant for the type of system used. It combined more desirable characteristics that the other desiccants tested, and adsorbed all of the moisture in the first U-tube. Artificial reseeding with Lehmann lovegrass and transplanting of native curlymesquite grass clumps on Base Rock lysimeters 3 and 2, respectively, was completed during summer of 1961 and 1962. Artificial watering was considered necessary during the late spring-early summer dry period, ending on Sept. 20, 1962. The original grass and halfshrub 1962. The original grass and halfshrub cover was left undisturbed on (control) lysimeter number 1. Following replanting in 1962 and through the summer of 1963, surface flows from lysimeters 2 and 3 exceeded that from lysimeter 1. During late winter of 1962-63 percolation flows from the two were greater than from lysimeter 1, with the same condition generally carrying through the summer of 1963. The winter of 1963-64 had less precipitation than in 1962-63 and there has been no appreciable differences between the water yields of the three lysimeters. Following a wildfire in June 1958, shrub sprouts were "controlled" on a 76-acre watershed by repeated aerial spraying. Shrubs were sprayed each May for four successive springs. Treatment consisted of 2 pounds active of 2,4,5-T ester, although other chemicals (TBA, PBA, 2,4-D) were also tried. Repeated chemical treatment held shrub cover on Watershed "C" to about 5%, which on an adjacent untreated watershed, cover rose to 34%. However, something less than 40% of the dominant species, shrub live oak, was

actually killed. Higher kills were noted on other less abundant chaparral shrubs. Dense growth of chaparral morningglory (Ipomea coccinea) and other forbs and grasses, plus the mass of dead brush sprouts, formed and "umbrella" over new shrub sprouts and appeared to make further aerial spraying unpromising. Therefore, in August 1964 all surviving shrubs were hand treated with 25% fenuron at the rate of 16 pounds active ingredient per acre. Amount of chemical pershrub was based on its crown area; e.g., a 4-foot diameter shrub was treated with about 11 grams of fenuron. The chemical was sprinkled uniformly through the crown. All plants 0 to 4 feet in diameter received the same treatment. It is expected that this treatment method will cause minimum damage to the excellent stand of seeded and native grasses and, therefore, will have little effect on soil stability on these steep, highly erodible slopes. - (d) Applied research.
 (e) Evaluation of range-watershed conditions on small watersheds in the San Luis drainage of the Rio Puerco. Three contiguous water-sheds, ranging from 338 to 555 acres located about 8 miles north of the San Luis community and west of the Rio Puerco main channel proinflow are measured in small reservoirs formed by earthen dams. Precipitation rates and amounts of vegetation changes are periodically measured over the watersheds. Ten years of data have been collected under cattle data have been collected under cattle grazing during a 5 1/2-6 month overwinter period (November 1 to April 30). Evaluation of soil ripping on surface runoff, erosion, and vegetation. Surface runoff plots (64), 10' x 31', are installed on a north and south aspect and upper and lower slopes rep-resenting different soil conditions in the Rio Jemez drainage. Precipitation, runoff, and sediment are measured. To obtain inventory information on the hydrologic variables of the pinyon-juniper type, six small watersheds with ephemeral streams are being gaged by means of a pre-fabricated, fiberglassed version of the Beaver Creek filme Creek flume. On 12 watersheds in New Mexico, size of water-(g)
- shed, percent bare area, and parent soll material had an important effect on the portion of precipation measured as runoff. Between 0.8

and 9.3 percent of precipation showed as runoff in areas of about 12" of annual precipitation, Construction details and costs for a simple plot to measure runoff and erosion have been published. Just as new growth started, kill ranged from 95 to 100%. The herbicide, which must cover the plant completely, is equally effective as a mist or large-drop spray. Soil ripping re-duced surface runoff 96% and erosion 85% the duced surface runoff 96% and erosion 85% the first year; reductions were 85% and 31% re-spectively, after 3 years. Surface pits were ineffective after 3 years. These mechanical treatments may have initiated or speeded up undestrable soil piping. Utilization patterns on small watersheds grazed by yearling cattle were about the same before and after fencing. Yearling heifers gave more uniform utilization on rough terrain; mixed classes gave most uniform use when grazed on open range.

- (2658) WATERSHED MANAGEMENT RESEARCH, RAPID CITY, SOUTH DAKOTA.

 - Laboratory project. Experimental; basic and applied research. (1) To evaluate water yield and sediment pro-duction in relation to standard forest management practices in ponderosa pine. (2) To determine surface runoff and rates of recovery from soil compaction on Kentucky bluegrass range in the Black Hills. (3) To determine soil moisture relations of ponderosa pine thinned to different reserve densities
 - and by stand types.(g) First year record from the first of the three gaged Sturgis watersheds shows interesting characteristics. The three watersheds are located on one of a number of rather extensive cenozoic igneous intrusions of the northern Hills. Topography is rough, slopes are steep, soils are relatively shallow and apparently highly permeable. The entire apparently highly permeable. The entire area is timber covered (ponderosa pine) and has been little disturbed for many years. Watershed 1 (217 acres) yielded ll inches, 202 acre-feet, of water from December 1, 1962, through Sept. 30, 1963. Total precipitation was 28.83 inches during the same period. Flow response to heavy precipitation is apparently due more to rapid drainout than to surface runoff. The individual storm hydrograph for the heavy June 15 storm peaked nearly 3.5 hours after rain stopped. The absolute peak reached 63.7 c.s.m. Calculated concentration time for this 217-acre watershed is 13 minutes.
- (3569)WATERSHED MANAGEMENT RESEARCH, LARAMIE, WYOMING.
 - Laboratory project.
 - Field investigation; applied research. (1) To determine the effects of big sage-brush on total runoff from snowmelt, snow accumulation and storage pattern. Three high elevation sagebrush watersheds, 60 to 106 acres, in western Wyoming provide the study area. V-notch weirs gage the runoff, and suspended sediment samples

are taken periodically. Snowpack is sampled along permanent transects and at random points. Precipitation is sampled by a network of re-cording and non-recording gages. (2) To determine the soil moisture withdrawal pattern under natural stands of big sagebrush, and the effect of sagebrush eradication on moisture withdrawal. Four 0.1 acre plots on an east and a west exposure have been established within high elevation sagebrush type in western Wyoming. Sagebrush on two of the plots on each exposure has been eradicated by spraying. Soil moisture samples are taken periodically to trace moisture withdrawal under each condition. (3) To evaluate the com-parative efficiencies in terms of water stored in accumulated snow, of tandem 4-foot slatted snow fences erected at different spacing intervals on open windswept slopes in southeast Wyoming. (4) To evaluate the effects of inducing snow accumulation on a watershed through use of artificial barriers. Three experimental grassland-type drainages, 88 to 144 acres, have been selected for the study area in southeastern Wyoming where snow transport by wind commonly occurs. V-notch weirs are installed to measure water yield. Snowpack is sampled in areas of natural accumulation along permanent transects. Summer precipitation is sampled by a network of recording and non-recording gages. (5) To determine the basic hydrology of mountain bogs in Wyoming. The prevalence of small bogs along many perennial streams in the mountains of Wyoming has stimulated the posing of various questions concerning the hydrologic significance of these areas in relation to management techniques for water yield improvement. To provide information basic to advanced studies oriented toward this problem, hydrologic characteristics of a 3-acre bog were studied intensively during the summer of 1963 and will be continued for another field season. Observations of vegetation and physical conditions on the bog indicate possible relationships between various species and environmental conditions such as peat depth and surface-water depth.

- (g) A significant relationship has been established between potential evapotranspiration calculated by Penman's equation and daytime evaporation pan measurements. Late summer measurements subsequent to the disappearance of a free water surface on the bog indicated that the water table had no diurnal oscillations but instead decreased in a stairstep fashion. Piezometer and well data suggest that the interchange of ground water across bog perimeters is a significant hydrologic property requiring further investigation. Preliminary drift-gage data indicate that the delivery of snow to a snow fence in a draw may have an efficiency of about 170 percent as compared to upland areas. Topographic features of a sample of draws were analyzed to arrive at a means of classifying channels into two classes: those that accumulate snow naturally and those that do not. Results suggest that the factors of cross sectional area (i.e., width, depth and width/depth ratio) may offer a means of predicting natural snow accumulation, and thus augment the basic information requisite to prescribing snow fence treatment on a watershed basis. - (3896) WATERSHED MANAGEMENT RESEARCH, FORT COLLINS, COLORADO.

Laboratory project.

- (b) (d) (e) Field investigations; applied research. Field plot to observe the adaptability and growth characteristics of twenty-three tree shrub and twenty-six grass and forb species for further testing on critical erosion sites. Research to find the influences of mechanical watershed rehabilitation measures on the microclimate and other site factors in the southern Rocky Mountains. To determine the effect of range conditions and related factors on sediment production and runoff on three mountain grassland watersheds in western Colorado. Range condition is being measured by means of 20 or more 3-step transects on each watershed. Ninety degree V-notch weirs are used to gage the water-sheds which vary in size from 86 to 272 acres. Water samples are taken several times daily during snowmelt and periods of storm runoff for determination of suspended sediment; bedload is measured in the weir ponds.
- (g) On the three Black Mesa watersheds, winter precipitation for the period 1957-63 has ranged from 13 to 39 inches per year. The percentage of runoff varied between 1 and 53%. Summer storms have produced runoff on only 2 years out of the 7 in spite of 5-minute precipitation intensities of 3 inches per hour which have occurred frequently. Ground cover index is significantly related to snowmelt peak discharge but grazing treatments have had slight effect on measured ground cover index. On the Alkali Creek watershed it has been repeatedly observed during prior years that the suspended sediment load of the melt flows is closely related to time since start of melt runoff rather than rate of discharge. Thus, in measurements made during 1964, at station "30 feet below concrete check dam, there was a suspended sediment concentration of 20,700 p.p.m. at a discharge of 8 c.f.s. on April 14, while 2 days later 13,400 p.p.m. were contained in a flow of 19 c.f.s. At station "Mesa-Garfield County Line," on April 15, 63,800 p.p.m. of suspended sed1-ment were sampled in a flow of 79 c.f.s. This decreased to 35,100 p.p.m. on April 16, although discharge was 107 c.f.s. By the last week of May 1964, the flow in all gullies was almost clear. Samples taken in the catch basin of the concrete check dam, at the waterfall of the structure, and 30 feet downstream had sediment concentrations of 13,700 p.p.m., 13,400 p.p.m., and 13,400 p.p.m. respectively. The regimen of the flow is drastically different between these stations so that the close agreement of these samples indicates that true suspension of the sediment existed at the time of sampling. This seems reasonable because analyses gave 97.5 to 96.1% silt and clay in these samples.

U. S. DEPARTMENT OF AGRICULTURE, FOREST SERVICE, Southeastern Forest Experiment Station.

- (380) WATER RESOURCE AND WATERSHED MANAGEMENT RESEARCH.
 - (b) Laboratory project. For general public use and information.
 - (c) Dr. Thomas F. McLintock, Director, Southeastern Forest Experiment Station, U. S. Forest Service, F. O. Box 2570, Asheville, North Carolina. 28802.
 - (d) General investigations of forest influences in the southeastern United States, with primary emphasis on fundamental hydrologic research on watershed processes and related application in watershed management.
 - (e) Basic research into forest hydrologic processes from the precipitation of water over an area until it leaves the watershed as streamflow or evapotranspiration. Demonstrations of several cover types and land water yield, quality and their effect upon water yield, quality and flow characteristics. Development of watershed management methods pertinent to the region and cooperative trials and demonstrations of these methods. Most of the experimental and hydrologic data are collected on the 5600-acre Coweeta Hydrologic Laboratory, located in the zone of maximum precipitation for the eastern United States (Nantahala Range of the southern Applachians). The basic hydrologic gaging network at the Coweeta Hydrologic Laboratory, near Franklin, N. C., includes 3 multiple and 12 unit watersheds currently active and 16 standby watersheds on which up to 30 years of continuous streamflow records and a cumulative total of more than 700 years are available on drainages ranging from 4 acres to 8 square miles, 12 recording and 11 standard rain gages, 1 recording hygrothermograph, 1 metering anemometer, 1 evaporation pan, and 1 anemometer, i evaporation pan, and i recording pyrheliometer. Occasional water samples are collected from selected watersheds for quality analysis on a storm period basis. Soil moisture is measured in the field with 3 neutron scattering devices servicing a network of some 77 access tubes. A small laboratory equipped for instrument repair and soil and plant physical analysis now includes a dew point hygrometer. Most recording devices are of the chart-trace type with exception of 14 analog-to-digital streamflow recorder. Streamflow data are being reduced from chart traces to punch cards by an Oscar-K chart reader with subsequent computation and analysis by computers sequent computation and analysis by computers at the National Weather Records Center in Asheville, N. C., and at the University of Georgia, Athens, Ga. Supplementing the plant-soil-water studies at Coweeta is a research unit located in the piedmont at Union, S. C. Now largely inactive, these research facil-ities include 4 unit watersheds and installations for studying comparative water use by cover types and soil moisture recharge. Research studies include: (1) a review of the relation of rain gage catch to actual precipitation on steep forested watersheds; (2) Incident solar radiation on forested and cleared slopes; (3) effect of forest cover and mountain physiography on the radiant energy balance; (4) increasing water yield by nondestructive transpiration control; (5) distribution of roots of common forest trees in the southern Appalachians; trees in the southern Appalachians; (6) movement and storage of soil water on steep slopes; (7) rainfall interception by white pine; (8) predicting soil moisture in steep terrain for hydrologic purposes; (9) morphology of the soil mantle related to moisture storage and movement; (10) the effect of forest cutting on water yield; (11) the hydrology of mountain unit watersheds under several cover types; (12) mechanizing streamflow data collection and computing; (13) stream diversion on a steep forested slope to stabilize and increase late summer slope to stabilize and increase late summer

yield; (14) source, volume, and timing of streamflow from mountain watersheds; (15) a regional study of the small watershed hydrograph based on records from Coweeta, Bent Creek, Union, and Fernow, and (16) a pilot study testing multiple uses such as water, timber, recreation, and wildlife on a 360-acre watershed. Research by personnel of the Wetland Improvement Project at Charleston, South Carolina is developing effective water control practices to improve productivity of wetland forest soils of the southeastern coastal plain and evaluating effects of these practices on wetland hydrology and soils. Accordingly, much of the program consists of drainage studies in cooperation with National Forests, wood-using industries, and other wetland forest managers who have made or plan capital investments to drain their land. In addition, research is also being conducted on the Santee Experimental Forest, located 32 miles north of Charleston, which has a small soils laboratory and two stream gaging stations on watersheds of 400 and 8,000 arres. Active studies include: (1) response of wet, slash pine flats to drainage; (2) relationships between soil and water conditions and to tree response on drained wetlands; (3) study of the water-balance of selected wetland units; (4) evaluation of the drainage state of representative wetland sites; and (5) precipi-tation-runoff relations on small forested watersheds in the coastal plain.

(g) The 22-acre watershed converted in 1960 from hardwood to grass has shown small increases in streamflow since 1961. These increases apparently are related to dry matter production as the dense fescue cover developed after heavy initial fertilization has gradually thinned out. This hypothesis w111 be tested when the grass is heavily refertilized in 1965 to return dry matter production to 1960 levels. A grass covered soil column 4.5 feet wide, 7 feet deep, 200 feet long, and inclined at 38 percent has been allowed to recharge and deplete natu-rally. Both recharge and depletion are more rapid than on a nearby small forested watershed, indicating less storage capacity in the plantic lined acting less storage capacity in the plastic-lined soil column. During 1964, evapotranspiration from the soil column was 26.5 inches, only 1 inch less than potential as calculated by the Thornthwaite method. A review of all available hardwood interception studies shows that throughfall does not differ materially among mature hardwoods of eastern United States. Stem-flow is greatest on smooth-barked trees, least on older, rough-barked trees. Frag-mentary documentation shows litter losses about 2-4 inches annually with possibility of much higher losses under very warm or much colder climates. Analysis of rainfall data at Coweeta indicates that gage site selection with reference to wind speed is critical to both accuracy and precision of precipitation sampling. The natural shielding provided by 45° openings in the dense native forest usually provides suitable samples if problem areas such as exposed ridges, gaps, and lee sides of peaks are avoided as gage sites. Helicopter application of a transpiration retardent (5 gallons per acre of .01 m glyceryl succinic acid) along the riparian zone of a calibrated watershed did not affect diurnal stream fluctuation nor did it influence total water yield. A pilot study shows that intensive multiple use management is economically feasible but that large storms increase sediment loads in streams even when logging is very carefully done. Gravimetric methods of calibrating neutron probes has been found to underestimate the true slope of the calibration curve. A volumetric calibration process was developed in which the standard error of calibration was less than four counts per each percent soil moisture by volume. Volumetric cali-bration gave more accurate estimates of

moisture changes than previously used gravimetric calibration curves. Recent research results from Charleston indicate shallow collection ditches have little additional impact on ground water levels during dry Impact on ground water levels during dry years beyond that created by the main ditches. They expedite the removal of water from the ground surface and upper soil layers in wet **periods** when water levels are high. It does not appear that a 5-chain spacing of shallow collection ditches in fine sandy soils underlain by sandy clay will result in overdrainage of the site for young slash pine trees.

CORPS OF ENGINEERS, U. S. ARMY, Coastal Engineering Research Center.

Inquiries concerning the following projects should be addressed to the Director, Coastal Engineering Research Center, 5201 Little Falls Road, N. W., Washington, D. C. 20016.

- (181) EQUILIBRIUM PROFILE OF BEACHES AND STUDY OF MODEL SCALE EFFECTS.
 - (b) Laboratory project.
 - (a) Experimental; basic research. (e) Equilibrium beach profiles will be determined experimentally for waves up to 6 feet in height in a prototype tank; the waves will be modeled at a 1 to 10 scale in small laboratory tanks (to determine scale effects) for various median diameter and specific gravity sediments.
 - (g) Additional tests were made using crushed coal of average specific gravity 1.5 (modeled by the settling velocity relationship to give corresponding characteristics of material tested in the large tank). Observed material movement and profile changes corresponded basically to the large scale results in the prototype tank, although the coal slope deteriorated somewhat faster. A partial explanation for differences is the wide range of specific gravities of individual coal particles. Tests for a few selected storm waves were made in the large tank with waves from 2 to 5.5 feet in height

using a sand of 0.4-mm. median diameter. The profiles obtained in these tests may be compared with those obtained earlier with 0.2-mm. sand to indicate differences in rates of scour and degree of protection with different sized material. A single test was made simulating a tidal condition.

- (660) OBSERVED WAVE CHARACTERISTICS.

 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Laboratory and field project. Field investigation; basic research. To secure a more thorough knowledge of the characteristics of ocean waves. Wave gages have been installed in a number of locations in coastal waters. These wave gages provide electrical recordings and also magnetic tape recordings. The records from the paper chart recorders are analyzed for significant wave height and wave period. The records from the magnetic tape recorders are analyzed to provide a spectral analysis of wave frequency (or period) versus: (1) Linear average wave height; (2) squared average wave height; and (3) peak wave height.
 - height.
 (g) An additional wave recording station was installed at Daytona Beach, Florida, during 1963. Installation of 3 wave sensors at the Buzzards Bay Light Tower (coast Guard) was delayed due to tower modifications (installation of stainless steel cable gage supports). Installation of the cables and gages is expected during first quarter of 1965. These coacts will be used to ortablish Drassure gages will be used to establish pressure gradient at different water depths. This data will be compared to surface waves as recorded by a surface wave gage. Additional wave recording stations are planned to be installed at: (a) Coast Guard Light Tower, Frying Fan Shoals, (b) Galveston, Texas, and (c) Los Angeles, Calif. (2).
- (975) METHODS OF BY-PASSING SAND PAST INLETS.
 - Laboratory project.
 - Field investigation; applied research. To study methods and requirements for pumping (d) (e) sand past inlets and to determine the applicability of the methods in stabilization of beaches adjacent to inlets. Data are being procured on the effect to the shoreline of sand by-passing operations at Port Hueneme, California and Lake Worth Inlet, Fla. and on the effect to the shoreline of a new harbor constructed at Ventura, California. This latter harbor involves an offshore detached breakwater along with orisnore detached breakWater along with entrance jetties to the new harbor. Data at the three locations include periodic hydro-graphic surveys south and north of the inlet, wave data, sand samples, detailed records of pumping operations, and detailed records of entrance channel maintenance. A general study is being made of the possibility of adapting commencial instruments utilizing a medicactive commercial instruments utilizing a radioactive source to the discharge line to measure quantity of material pumped in by-passing operations.
- (976)ESTABLISHMENT OF CRITERIA FOR CONSTRUCTION OF ARTIFICIAL BEACHES.
 - Laboratory project.
 - Theoretical; applied research.
 - To develop criteria for construction of beaches by artificial means. The present continuing phase of this general study involves the measurement of a natural beach slope and attempts to determine its response to the forces normally incident upon the shore such as wave height and period, angle of wave approach, tide, and direction and magnitude of littoral current. By statisti-cal methods the relative importance of the forces or combinations of forces may be evaluated.
 - (g) Computing machine techniques have been applied to the statistical evaluation of the importance of the forces and of the parameters. (2192) REGIONAL STUDIES OF THE ATLANTIC COAST OF

- (977) DEVELOPMENT OF WAVE HEIGHT AND WAVE DIRECTION GAGES.
 - Laboratory project. Experimental; development. (b) (d)
 - (g)
 - Three additional wave gages were furnished Total gages in this project is now nine (9). Total gages in this project is now hile (9). Data from these gages are to be used in a wide study of the Great Lakes for pollution control by the Fublic Health Service. One of the new gages is unique in that it operates from electrical power provided by a thermo-electric generator using propane gas as fuel. An ultrasonic flow meter was checked in the laboratory large wave tank as a wave direction gage. Preliminary data shows good promise of adapting the flowmeter to function as a wave direction gage. Further tests are planned at Atlantic City, N. J. upon procurement of a modified flowmeter. This test is to provide information as to the suitability of this device in an actual measurement condition.
- (2190) STUDY OF EFFECT OF A GROIN ON THE RATE OF LITTORAL MOVEMENT.
 - (b) Laboratory project.
 - (d) Experimental; basic research. (d) Experimental; basic research.
 (e) To study the effect of groins on the rate of littoral drift passing a groin system.
 Initial tests consist of waves generated at a 30-degree angle to the sand beach with a sourcepted angle to the said being made at the downdrift end. The tests planned for the immediate future, as have the current season tests, will continue to emphasize the task of collecting and establishing reliable calibration data on the relationship between the littoral transport rate and the wave characteristics. These generalized (not to specific model scale) studies are being made in the Shore Processes Test Basin of the Coastal Engineering Research Center.
 - (g) Analysis of comprehensive wave height measurements made in the North Sector of the Shore Processes Test Basin indicate the presence of a cross-basin wave. Curve pattern similarities and differences (opposites) from the wave height measurements in dif-ferent locations of the basin show the effect on the wave height distribution of the cross basin wave and that it has the same wave period as the generated (incident) wave. Comparison of curve patterns representing separate locations in the basin generally show that where the curve patterns at each location are the same type, as a maximum or minimum height at each location, the wave travel time or distance between points of measurement is an even multiple of half wave lengths; conversely, where the wave patterns are of opposite type, as a maximum height at one location and a minimum height at the other location, the wave travel time or distance is equal or very near an odd multiple of half wave lengths. The presence of a cross-basin wave has been fairly well demonstrated by special analyses of the SPTB curves showing wave height distribution with distance. However, this height at a fixed gage. In order that a cross basin wave of the same period as the generated wave, cause height variability at a fixed gage, it would be necessary that its phase shiftslightly with successive generator starts or during wave generation. Although no direct evidence of a cross-wave phase shift with successive generator starts has been observed, in view of the large range of height variability measured, it seems the large range highly improbable that such a phase shift does not actually occur. A slight phase shift has been observed during wave generation from the time or sequence measurements of height variability at a fixed gage.

NEW JERSEY; AND THE DELAWARE-MARYLAND-VIRGINIA SHORE LINE FROM CAPE HENLOPEN TO CAPE CHARLES.

- Laboratory project.
- $\left\langle d \\ e \right\rangle$ Field investigations; basic research. To compile all existing data pertinent to shore processes on a regional scale. Reports to consist of three chapters: geomorphology and shoreline histories, littoral forces, and littoral materials. Subject matter to include physiography, geological development of the shore region, sources of littoral material, waves, tides or water level fluctuations, current physical character-istics of the littoral materials, interrelation of sedimentary properties, relation of properties of littoral materials to position in the littoral zone, and changes in shoreline configuration.
- The Delaware-Maryland-Virginia shoreline (g) from Cape Henlopen to Cape Charles is currently under study. Data compilation for this reach is essentially completed and the report is under preparation.
- (2193) SHORE PROTECTION PLANNING AND DESIGN.
 - Laboratory project.
 - (b) (d) (e) Design.
 - To supplement and revise the Coastal Engineering Research Center's (formerly Beach Erosion Beard) Technical Report No. 4, "Shore Pro-tection Planning and Design" as new data and techniques are developed for use in the solution of coastal engineering problems
 - The supply of the October 1961 edition of the report has been depleted. It is antici-pated that the new edition will be available in the Fall of 1965. (g)
- (2195)RE-EXAMINATION OF ARTIFICALLY NOURISHED AND CONSTRUCTED BEACHES.
 - (b) (d) Laboratory project.
 - Field investigation; applied research. To study the behavior of beach fills placed to restore or nourish a beach sector and the effect of the fill on adjacent shores. A selected number of beach fills are being re-examined.
 - (g) Follow up report prepared, but not yet published, on beach fill at Seaside Park, Conn. Other reports in preparation for beach fill projects, at Presque Isle, Pa., Sherwood Island State Park, Conn., and Hammonasset Beach State Park, Conn. Arrange-ments have been made to collect follow up data for beach fill and nourishment projects in California, Florida, and New Hampshire.
- STUDY OF QUANTITY OF SEDIMENT IN SUSPENSION IN THE SURF ZONE (INCLUDING TEMPERATURE (2660)EFFECTS).
 - Laboratory project.
 - Experimental; basic research. To determine the relationship between wave, water, and sand characteristics, and the amount of material maintained in suspension (d) and, hence, available for longshore trans-port by currents.
 - (g) A tractor-mounted suspended sand sampler for A tractor-mounted suspended sand sampler for wave action sampling was developed at CERC laboratory and field tested at Jennette Fier, Nags Head, N. C. More than 400 suspended sediment samples were collected in the field tests at Nags Head, N. C. Most of the samples were collected nearshore in and near the breaker zone. Several samples were collected on the outer bar near the end of the pier, about 600 feet offshore. The samples have been analyzed for weight (concentration) and size distribution. A report describing the size distribution. A report describing the development of the suspended sediment sampler with preliminary analysis of the samples collected in the field tests is in preparation.
- (2661) WAVE RUN-UP ON SHORE STRUCTURES.

- (b) Laboratory project. (d) Experimental; design.
- (e)Wave run-up is determined experimentally for various waves for different types of shore structures. Effect of both structure roughness and permeability is being investigated.
- (g) Some field measurements of run-up on a beach were obtained in an attempt to delineate the run-up distribution function. Some model tests also indicate that in a model wave tank measurement of wave action may depend to a significant extent on the location of the result of the solution the measurement point relative to the wave generator, because of the generation of secondary waves and the importance of the phase relation of these to the main waves, which changes with distance of travel.
- (3228) MODEL TESTS OF WAVE SETUP ON BEACHES.
 - Laboratory project.
 - $\left\langle \frac{d}{d} \right\rangle$ Experimental; basic research. To relate increase in water level at the shore due to wave action alone, to the inci-dent wave characteristics and shore hydro-
 - graphy. See project (5328) "Characteristics of a Plunging Breaker". (g)
- (3897) RADIOACTIVE TRACERS FOR BEACH STUDIES.
 - (b)
 - Laboratory project. Experimental; research. (d)
 - (e)Studies of possible field sites for the application of radioactive and/or fluorescent tracers are being continued.
- (4760) EXPERIMENTAL STUDY OF DUNE BUILDING WITH SAND FENCES.
 - Laboratory project. (b)
 - (a)
 - Experimental; design. The experimental study consists of the construction of various types and arrangements of sand fences to determine the fence type and arrangement most effective in building and arrangement most effective in building a dune by trapping and holding wind-blown sand. Slat-type snow fencing and locally constructed brush fencing have been used in straight, straight-with-side spurs, and zigzag configurations. The study is being conducted on the Outer Banks of North Carolina between Cape Hatteras and Cape Lookout.
- (4762) CORRELATION OF STORM WAVE ATTACK AND BEACH EROSION.
 - (b) Laboratory project.
 - Field and office investigation to develop quantitative correlation between storm violence and shore erosion.
 - (e) Repetitive profiles are taken at selected beach areas. The storm wave action between surveys is analyzed and correlations between the wave action and observed profile changes are established. Repetitive profile lines were established in September 1962 at nine locations between Delaware Bay and Cape Cod. These profiles were resurveyed at weekly and bi-weekly intervals. The resurvey interval now is 4 to 6 weeks. Storm wave action is measured by the Coastal Engineering Research Center ocean wave gages and storm surges by
 - U.S.C.&G.S. tide gages and storm surges by U.S.C.&G.S. tide gages. "Seasonal Changes in Beaches of the North Atlantic Coast of the United States", by John M. Darling, Hydraulic Engineer, Re-search Division, Coastal Engineering Re-search Center was presented at the IX (h) Coastal Engineering Conference in Lisbon, Portugal, in June 1964. It is being edited by the ASCE and will be published in early 1965.
- (4763) OFFSHORE SAND SOURCES.

- (b) Laboratory project.
- Field investigation; applied research.
- Field Investigation; applied research. Four selected areas along the Atlantic Coast of New Jersey have been explored by geophysical (sonic) methods and by shallow borings. A preliminary dredge feasibility operation has been completed in Chesapeake Bay (Thimble Shoals Channel).
- It has been determined from preliminary data (g) that the cost of pumping sand to the beach is competitive with conventional sources.
- (5079) WAVE HEIGHT PREDICTION FOR WAVE MAKERS IN SHALLOW WATER.

 - Laboratory project. Theoretical and experimental; basic research. By equating the volume of water displaced in half a period by a displacement-type wave (a) maker to the volume of wa.er raised above mean water level in a sine-shaped wave, a simple relation results for shallow water waves which gives wave height as a function of wave length, wave maker stroke, and wave maker geometry. For shallow water, this relation agrees with hydrodynamic theory for piston-type and flap-type wave makers, and with published and unpublished data for waves generated by displacement-type wave makers in absolute water depths ranging from 0.5 feet to 13 feet.
 - (f) Completed. (g) The height of wave generated by displacement-type wave makers in shallow water is approximately equal to $2\pi~S/L$ times an appropriate dimension of the wave maker. S is the stroke of the wave maker, L is the wave length given by small amplitude theory, and the wave maker dimension is measured perpendicular to the direction of S. This relation agrees with the hydrodynamic theory for piston and flap-type wave makers over the Society of America, p. 65. THE FFFECT OF SECONDARY WAVES ON WAVE RUN-UP. range of depths usually used in coastal engineering experiments, and it is supported by data from 4 piston-type and 2 plunger-type wave makers for depths satisfying the condition
 - $\frac{2\pi d}{L} < 1.$
 - (h) "Wave-Height Frediction for Wave Generators in Shallow Water", C. J. Galvin, Jr., U. S. Army Coastal Engineering Research Center, Technical Memorandum No. 4, March 1964, 21 pp.
- (5082) EFFECTIVENESS OF LOW CRESTED OR SUBMERGED BREAKWATERS.

 - Laboratory project. Experimental; applied research. To determine the relative effectiveness of low-crested and submerged rubble mound
 - in the laboratory of the transmission of wave energy over and through both permeable and impermeable rubble mound breakwaters cf varying crest width, crest elevation, and water level elevation. Tests were made at both small scale (maximum 6" wave) and large scale (maximum 4-foot wave). Variation in crest width had much less
 - (g) effect in reducing transmitted wave height than did crest elevation. Effectiveness impermeability of breakwater decreases with higher waves, and particularly with higher water levels. Final report furnished Navy Bureau of Yards and Docks, Southwest Division.
 - (h)
- (5325) FILLD MEASUREMENT OF LONGSHORE CURRENT VELOCITY.
 - (b) (d) (e) Laboratory project. Field investigation.
 - Longshore current velocity was measured by timing the travel of water filled balloons in the surf on the beach near Nags Head, N. C.; breaker angles were measured with a Brunton compass, by triangulation and by measuring the speeds of the crest and plunge

point of the breaking wave; beach slope was obtained from profiles through the surf zone; and wave heights and periods were measured from wave gage reocrds.

- (f) Suspended.
 (g) For the five sets of data obtained, longshore
- current velocity, V, is roughly predicted by the equation, V = gmTsin2 $\theta_{\rm b}$, where m is beach slope, g acceleration due to gravity, $\theta_{\rm b}$ is the breaker angle, and T is the wave period.
- (5326) RESONANT EDGE WAVES ON LABORATORY BEACHES.
 - Laboratory project.
 - (b) Laboratory pro (d) Experimental. (e) An unusual sta An unusual standing wave in the runup on laboratory beaches is under study. The com-binations of slope, period, breaker type, standing wave length, and resonant amplification are being measured in order to describe the phenomena and to understand its affect on laboratory and natural beaches.
 - (g) The run-up from lightly plunging or surging waves occasionally resonates between the sidewalls of a wave tank 1.5 ft. wide. The resonant period is twice the period of the waves reaching the beach. Whenever the resonance is present on the plane beach, it always has a resonant period, beach slope, and tank width (1.5') which fits the equation and tank width (1.5') which fits the equation for resonant edge waves. When this resonance occurs on a sand beach 40 feet wide, it occasionally produces cusps whose spacing is one-half the edge wave length. The width of the sand beach is not necessarily an integral multiple of the cusp spacing.
 (h) "Cusps Formed by Standing Edge Waves on a Laboratory Beach", C. J. Galvin, Jr., program 1964 Annual Meeting of Geological Society of America, p. 69.
 - - Laboratory project. (b)
 - Experimental; basic research. This project was begun to learn the cause of
 - certain pecularities in the variability of wave run-up with wave period and height on steep slopes. Run-up tests were made in a $2^{1} \times 1-1/2^{1} \times 72^{1}$ wave tank on smooth slopes installed at various locations along the tark. Slopes varied from 1:15 to 1:6. Each slope was tested in three water depths (0.65, 0.90, cert 1.25 footh in an attempt to determine the certain pecularities in the variability of and 1.25 feet) in an attempt to determine the effect of water depth on the wave run-up.
 - (g) It was learned from an analysis of the tests that a strong correlation exists relating the phase angle between the primary and secondary waves and the height of wave run-up. The run-up for a given wave condition is a maximum if the primary and secondary waves are 1800 out of phase (i.e. if the secondary wave is in the trough of the primary wave) and a minimum when the two waves are in phase. This variable phase relationship of primary and secondary waves causes the run-up to vary up to a factor of 3 for steep slopes. For flatter slopes (about 1:6) this effect had essentially disappeared.
- (5328) CHARACTERISTICS OF A PLUNGING BREAKER.
 - Laboratory project.
 - (d) Experimental and theoretical, basic research. The wave height, mean water depth, and dis-tance traveled in the breaking process are being measured for waves which break by plunging on a plane concrete beach in a wave tank 96 feet long and 1.5 feet wide. Farallel wire resistance wave gages measure the wave heights, damped plezometers buried flush with the beach surface measure the mean water level and photographs record the distance traveled in breaking. This study is undertaken to increase knowledge of the breaking process, to relate the energy flux of the incoming waves to the resulting wave setup and to provide engineering criteria for the design of coastal structures. (g) Analysis indicates that the depth at which a

wave initially becomes unstable is probably directly proportional to wave height, but that the relation between breaker depth-to-height ratio and slope is an apparent one due to the wave moving into shallow water before wave deformation has progressed far enough for breaking conditions to be defined. From these considerations, it can be predicted that between the initial instability and the defined breaking point is a horizontal dis-tance approximately equal to 4.5 times the breaking wave height, and that between the defined breaker position and the point where the plunge of the wave is complete is approxi-mately equal to 2 times the breaking wave height. Preliminary measures of the breaker depth-to-height ratio and the horizontal distance traveled by waves plunging on a 1:10 slope are in fair agreement with this analysis.

U. S. ARMY ENGINEER DISTRICT, CORPS OF ENGINEERS, Portland.

Inquiries concerning Projects Nos. 406, 4504, 5068, 5069, 5070, 5071, 5315, 5316, and 5318 should be addressed to the District Engineer, U. S. Army Engineer District, Walla Walla, Building 602, City-County Airport, Walla Walla, Wash. 99362.

(406) MODEL STUDY OF SPILLWAY AND STILLING BASIN FOR ICE HARBOR DAM, SNAKE RIVER WASHINGTON.

 $\begin{pmatrix} f \\ h \end{pmatrix}$

- Completed "Spillway and Stilling Basin for Ice Harbor Dam," U. S. Army Engineer Division Hydraulic Laboratory, Bonneville, Oregon. Tech. Report No. 31-1, December, 1964. (Available on loan). Final report covering the test results.
- (1465) MODEL STUDY OF SPILLWAY AND STILLING BASIN FOR THE DALLES DAM, COLUMBIA RIVER, OREGON AND WASHINGTON.
 - (c) District Engineer, U. S. Army Engineer District, Portland, 628 Pittock Block, Fortland, Ore. 97205.
 - (f) Completed. (h) "Spillway and Stilling Basin for the Dalles Dam," U. S. Army Engineer Division Hydraulic Laboratory, Bonneville, Oregon. Tech. Report No. 55-1, November, 1964. (Available on loan). Final report covering the test results.
- (3231) MODEL STUDY OF OUTLET WORKS AND STILLING BASIN FOR COUGAR RESERVOIR, SOUTH FORK MCKENZIE RIVER, OREGON.
 - (c) District Engineer, U. S. Army Engineer District, Portland, 628 Fittock Block, Portland, Ore. 97205.
 - Completed. "Outlet Works and Stilling Basin for Cougar Reservoir, South Fork McKenzie River, Oregon," U. S. Army Engineer Division Hydraulic Laboratory, Bonneville, Oregon. Tech. Report No. 87-1, May 1964. (Available on loan). Final report covering the test results.
- (4504) GENERAL MODEL STUDY OF LITTLE GOOSE LCCK AND DAM, SNAKE RIVER, WASHINGTON.
 - (b) U. S. Army Engineer District, Walla, Corps of Engineers, Walla Walla, Washington.
 (d) Experimental; for design.
 (e) A fixed-bed model constructed to an un-
 - distorted scale ratio of 1:100 reproduces the Snake River bed and pertinent overbank topography between river miles 68.3 and 71.6. The dam axis is at mile 70.3. The original layout consists of a straight, 8-bay, gravity-type spillway controlled by 50by 52-ft tainter gates, a powerhouse for six Kaplan turbines (initial installation three units), an 86- by 675-ft navigation lock

having a maximum lift of 101 ft, concrete nonoverflow sections, rockfill abutments, and facilities for passing migratory fish over the dam. The initial power installation will produce 405,000 kilowatts. Furposes of the model are to check the structures layout and flow conditions affecting cofferdam placement, power generation, navigation, and fish passage.

- (g) Following tests of various cofferdam layouts, the original structure and excavation plan (with maximum excavation in tailrace and downstream navigation lock approach) was studied. Investigations with minimum down-stream excavation and maximum erosion in the spillway exit channel are in progress.
- (4506) MODEL STUDY OF FINGERLING COLLECTOR FOR GREEN PETER DAM, MIDDLE SANTIAM RIVER, ORE.
 - (b) U. S. Army Engineer District, Portland, Corps of Engineers Portland, Oregon.
 - (c) U. S. Army Engineer District, Portland, (c) D. S. Almy Engineers, 101 District, 101 Block, Corps of Engineers, 628 Pittock Block, Portland, Oregon 97205.
 (d) Experimental; for design.
 (e) Two undistorted hydraulic models are being used for studies of facilities for down-

 - smigrant fingerling salmon and steelhead trout at Green Peter Dam. The proposed facility is composed of an entrance horn, vertical adjustable-height riser, separator, flow distribution control device, trough, flexible hose, transverse pipe system, and outlet pipe followed by a flume into the tailwater. The collector will be located on the upstream face of the dam at the focal point of reservoir discharge. Its 20-ft-high horn will collect fish near the water surface with a minimum submergence over its top of 5 ft and a maximum submergence at its bottom of 40 ft. About 200 cfs will enter the horn and carry migrating fish inward, upward, and across a separator screen (a 10- by 20-ft perforated plate) covering the compartmented flow distribution device through which from 190 to 194 cfs will pass vertically into a collector well and then be punped back to the reservoir. Fish in the remaining 6 to 10 cfs will be carried from the separator screen through a flexible hose attached to laterals through the dam and thence by open channel flow to the tailrace. A trash boom at the upstream face of the dam will prevent small floating and suspended debris from entering the fingerling collector.

 - (f) Tests have been completed.
 (g) Two-ft-wide sections of prototype and model separator plates were tested in a flume model as the first step in deter-mining model-prototype similitude relationships. The model perforated plate that reproduced flow conditions over the proto-type plate in the most satisfactory manner was used in a 1:4-scale model of the entire fingerling collector. Tests of different distributor bar spacings, trough designs, deflector locations, and separator slopes were made in the 1:4-scale model.
 (h) Final report is in preparation.
- (5068) MODEL STUDY OF SPILLWAY FOR LITTLE GOOSE DAM, SNAKE RIVER, WASHINGTON.
 - (b) U.S. Army Engineer District, Walla Walla, Corps of Engineers, Walla Walla, Washington.
 - (d) Experimental; for design.
 (e) The 1:42.47-scale model includes a 3-bay The first includes a starting basin. Tests are being made to evaluate hydraulic performance of the proposed spill-way and to develop revisions in design that would increase performance or reduce construction and maintenance costs.
 - (g) Pressures, head-discharge relationships, and pier contraction coefficients were determined for free flow over the crest and for unequal openings of adjacent crest gates. Although an acceptable design for a horizontal stilling

stilling basin is adopted. Attempts to eliminate the stilling basin paving through were not satisfactory. Tests are in progress to determine whether satisfactory hydraulic conditions and minimum downstream erosion can be obtained with a slotted or dentated roller-type bucket.

- (5069) MODEL STUDY OF LITTLE GOOSE NAVIGATION LOCK, SNAKE RIVER, WASHINGTON.
 - (b) U.S. Army Engineer District, Walla Walla, Corps of Engineers, Walla Walla, Washington.
 (d) Experimental; for design.
 (e) A 1:25-scale model reproducing the intake model 26 fb wide but 675 fb intake
 - manifolds, 86-ft-wide by 675-ft-long lock chamber, split lateral filling and emptying system, outlet culverts, and portions of adjacent approach and outlet areas is adjacent approach and outlet areas is being used to check the suitability of the original design and to develop improve-ments if needed. An alternative method for distributing flow to the lateral culverts through a central junction chamber is being studied in a separate
 - chamber is being studied in a separate 1:25-scale model.
 (g) Satisfactory designs for all elements of the structure were developed. The lock chamber can be filled in 11.5 minutes and emptied in 12.8 minutes under an initial head of 101 feet through a split lateral hydraulic system. Maximum beweer forces on a 8-barge tow comhawser forces on an 8-barge tow comnawser forces on an 8-barge tow com-pletely filling the lock will average about 5 tons. After numerous revisions, good flow distribution was obtained in the junction chamber model. This hydraulic system was not tested in the comprehensive model. Tests of the final design lock are scheduled for completion early in 1965.
- (5070) MODEL STUDY OF SPILLWAY FOR DWORSHAK DAM, NORTH FORK CLEARWATER RIVER, IDAHO.

 - pertinent overbank topography for about 3600 feet upstream and downstream from 3600 feet upstream and downstream from the project axis. Presently installed are the cofferdams, diversion tunnel, tunnel outlet channel, and temporary fishway entrance. Later the forebay height will be increased to reproduce the 673-ft-high dam, and the spillway, stilling basin, regulating outlets, and fish facilities will be installed for tests of these elements. Verification was completed. The 40-ft horseshoe-shaped tunnel and cofferdam were installed and the study of flow conditions during diversion were begun. Tests indicated that flow conditions were improved by relocating the tunnel entrance and realining the tunnel and downstream approach. Studies were made to determine the best method of
 - (g)were made to determine the best method of dissipating energy at tunnel pertain in order to provide satisfactory conditions for log passage and fish attraction. Investigation of method to be used in sealing diversion tunnel is in progress.
- (5071) GENERAL MODEL STUDY OF LOWER GRANITE LOCK AND DAM, SNAKE RIVER, WASHINGTON.

 - (b) U.S. Army Engineer District, Walla Walla, Corps of Engineers, Walla Walla, Wash.
 (d) Experimental; for design.
 (e) An undistorted, 1:100-scale, fixed-bed model will reproduce the Snake River bed and reprinted to verber to proceed by the dist.

basin was derived in the model, protection against unusual amounts of artesian water underneath the concrete apron will greatly increase construction costs if a conventional tidlice brain directed thermony for the second transformation of the Snake and Columbia Rivers). Studies will be made to determine flow conditions during successive construc-tion stages and after proposed structures

- (g) Verification tests were completed. Model tests of the original first-stage cofferdam plan are in progress.

 (d) Experimental; for design.
 (e) Tainter-type sluice valves planned for the regulating outlets at Libby and Dworshak
 - regulating outlets at Libby and Dworshak Projects will operate under maximum heads greater than 260 feet. Because such heads are unusually high for this type of gate, sealing and deformation tests on rubber side seals for the gates were considered necessary. (f) Completed. (g) Three-foot-long specimens of Teflon-clad
- Inree-root-long specimens of Terion-clad and unclad rectangular rubber seals and a Teflon-clad, rounded-bulb "J" seal were tested under 300 ft of head in a l:l-scale pressure tank. The test seals were of natural rubber having a durometer index of about 65. With a gap of 1/8 inch between the Teflon-clad rectangular seal bulb and the seal plate, the seal closed against or retracted from the seal plate at pressures less than 5 psi. Almost the entire 1-1/2-inch face of the seal bulb contacted the seal plate under 300 ft of head. The downstream corner of the seal protruded 1/8-inch into a 3/8-inch gap between the retainer bar and seal plate after the first 10 days of a 30-day test. No further deformation occurred, and the seal regained its original shape within an hour after removal from the pressure chamber. Clearance between the seal bulb and seal plate was increased from 1/8 to (b) U.S. Army Engineer District, Walla Walla, Corps of Engineers, Walla Walla, Washington.
 (d) Experimental; for design.
 (e) An undistorted, 1:50-scale, fixed-bed model reproduces the river bed and

 (c) Experimental; for design.
 (c) An undistorted, 1:50-scale, fixed-bed model reproduces the river bed and
 (c) State Was increased from 1/5 to reduced from 30 to 15 days for tests of unclad rectangular and Teflon-clad rounded-bulb seals. Seating and retracting heads were slightly higher with the rounded-bulb seal, and semi-permanent deformation of this seal was noted 6 days after the 15-day test was concluded. Performance of all three seal types was considered satis
 - factory under the conditions tested. (h) No final report is planned. The test re-sults will be included in the final report for Dworshak spillway.
 - (5315) MODEL STUDY OF REGULATING OUTLETS FOR DWORSHAK DAM, NORTH FORK CLEARWATER RIVER, IDAHO.
 - (b) U. S. Army Engineer District, Walla Walla, Corps of Engineers, Walla Walla, Wash.
 (d) Experimental; for design.
 (e) With the spillway gates closed, or with pool level below the spillway crest, reservoir outflows will be controlled by three 9- by 12.5-ft tainter gates located near the upstream end of separate conduits at elevation 1350. Head on the conduits will vary from 95 feet at minimum pool elevation 1445 to slightly more than 250 feet at maximum pool elevation 1601. The outlet conduits will discharge onto the spillway chute at about elevation 1150. Total outlet capacity will vary from 28,300 cfs at minimum pool to approximately 40,000 cfs at maximum pool. Pressures, flow condi-tions, and discharge relationships will be will reproduce the Shake hiver bed and Checked in a 1:25-scale sectional model pertinent overbank topography for 1.4 miles that reproduces a portion of the forebay, upstream and 1.7 miles downstream from the an outside conduit (with streamlined en-project axis (107.5 river miles upstream trance and center line angled 5° - 38' to checked in a 1:25-scale sectional model

head wall), and a section of spillway down-stream from the conduit outlet. (g) Model design and construction are in progress. (856)

- (5316) MODEL STUDY OF FISH LADDER FOR LITTLE GOOSE DAM, SNAKE RIVER, WASHINGTON.
 - (b) U. S. Army Engineer District, Walla Walla,
 - Corps of Engineers, Walla Walla, Wash. Experimental; for design. A 1:10-scale model was used for tests of the 24-ft-wide, 1-on-10 sloped fish ladder (e) for Little Goose Dam.
 - Velocities, flow patterns, and discharge relationships were determined for typical weirs, orifice control section, and slot-type fish counting station. (f) $\left(g \right)$
- (5317) MODEL STUDY OF COLUMBIA RIVER, OAK POINT TO VANCOUVER, WASHINGTON.

 - (b) U. S. Army Engineer District, Portland, Corps of Engineers, Portland, Oregon.
 (c) District Engineer, U. S. Army Engineer District, Portland, 628 Pittock Block, Portland, Oregon 97205.
 (d) Experimental; for design.
 (e) A 40-ft-deep by 600-ft-wide navigation channel between Columbia River miles 52 and 109 and from the Willematte River mouth to Portland
 - from the Willamette River mouth to Portland, Oregon was authorized recently. Five Oregon was authorized recently. Five separate movable-bed models, with 1:300 horizontal and 1:100 vertical scales, will be required to cover improvements in the Columbia River. The models will be used initially to check plans for constructing and maintaining the 40-ft channel. During these studies the location and need for pile dikes, channel alignment and location of spoil areas will be investigated. Later the models will be useful on a continuing basis to check operation and maintenance
 - activities and new construction. Design and construction of the first model, between Columbia River miles 64 and 78, (g) was completed and construction of the second model (miles 52 to 65) was begun. Verification tests of the first model were begun.
- (5318) MODEL STUDY OF POWERHOUSE SKELETON UNIT FOR JOHN DAY DAM, COLUMBIA RIVER, OREGON AND WASHINGTON.

 - (b) U. S. Army Engineer District, Walla Walla, Corps of Engineers, Walla Walla, Washington.
 (d) Experimental; for design.
 (e) Owing to an accelerated schedule for com-pleting construction of the John Day powerhouse, it is proposed to place as much of the draft tube concrete as diversion require-ments will allow. The proposed skeleton bay interior would be much different from the present contract plans and from that at The Dalles Dam, which is the only unit that has been model tested. Tests of the contract plan and proposed skeleton unit will be made in a 1:25-scale model.
 - (g) Design and construction of the model are in progress.

(f) Apparatus under construction.

U. S. DEPARTMENT OF COMMERCE, WEATHER BUREAU.

Inquiries concerning the following projects, except as indicated, should be addressed to Mr. William E. Hiatt, Director of Hydrology, Weather Bureau, U. S. Dept. of Commerce, Washington, D. C.20235.

- (1015) MEASUREMENT OF EVAPORATION.
 - (b) Laboratory project.

- by the horizontal motion of spheres througn (d) Theoretical and field investigation; applied research. research. (e) Studies are directed toward the derivation of
 - studies are directed toward the derivation of reliable procedures for estimating evaporation from reservoirs (existing and proposed) and land surfaces, utilizing readily available meteorological data and pan evaporation obser-
- realistic soil moisture accounting model to provide an improved method for computation of runoff from rainfall in river forecasting operations. The latest model is in the final phase of testing on several basins with different rainfall-runoff characteristics. In compliance with the recommendation of the World Meteorological Organization (WMO) Commission for Instruments and Methods of Commission for Instruments and Methods of Observation, an installation has been com-pleted at the Weather Bureau's Test and Evaluation Laboratory at Sterling, Virginia, for comparison of Class A, BPI and insulated experimental evaporation pans with the Soviet GGI-3000 and 20m² evaporation tanks. GGI-3000 tanks were purchased directly from the Soviet Union. The 20m² tank was built according to specifications provided by the WMO. The 20m² tank is approximately 17 feet in diameter and over 6 feet deep, made of 1/4-inch boiler plate and is installed in Navy. Dr. G. Kulin, Hydraulic Engineer. Experimental; basic research. Investigation of effect of a following wind on a mechanically produced swell, with emphasis on changes in wave damping and on hydraulic roughness of the resulting surface. Experiments in progress. Experiments in progress. the ground. The GGI-SOUC time fect in diameter and 2 feet deep and is in-stalled in the ground. Observations started in August 1964. It is hoped to make a significantly different climatic regime. The joint project of the Weather Bureau and Forest Service (Intermountain Forest and Range Experiment Station) to study the content and exposure effects of elevation, aspect and exposure on evaporation has completed the third year of observations. The project consists of 13 Class A evaporation pan stations installed at various elevations (4300 to 9000 feet) on the windward and lee slopes of the Wasatch Range near Farmington, Utah. The data have been punched on cards and are
 - (h) "Simulation of Daily Catchment Water Balance," by M. A. Kohler, presented and published in Proceedings of National Symposium on Water Resources, Use and Management, held at Canberra, Australia, September 9-13, 1963.
 - (1744) DEVELOPMENT OF RIVER FORECASTING METHODS.
 - (b) River Forecast Centers for: Lower Ohio River Basin, Cincinneti, Ohio, Upper Ohio River Basin, Pittsburgh, Pa.; Susquehanna and Del-aware River Basins, Harrisburg, Pa.; Missouri River Basin, Kansas City, Mo.; Columbia River Basin, Portland, Oreg.; Middle and Upper Mississippi River Basin, St. Louis, Mo.; Columbia River Basin, St. Louis, Mo.; Mississippi River Basin, St. Louis, Mo.; Arkansas and Red River Basins, Tulsa, Okla.: New England and Hudson River Basins, Hartford, Conn.; South Atlantic and East Gulf River Basins, Augusta, Ga.; West Gulf Drainage Basins, Ft. Worth, Tex.; Middle Atlantic River Basins, Washington, D.C., and California Drainage Basins, Sacramento, Calif. (d) Theoretical and field investigation; operation and applied research.
 - (d) Theoretical and field investigation; operation and applied research.
 (e) The purpose of these investigations is to develop modern river forecast procedures for all ranges of flow for various streams of each basin. Procedures include: (1) Rainfall-runoff relations involving consideration of the physics of soil moisture, vegetative reception, transpiration, evaporation and geological features of the basins; (2) snow-melt forecasting relations involving con-sideration of the physics of sow and heat sideration of the physics of snow and heat transfer; (3) unit hydrographs; and (4) streamflow routing procedures, based uton adaptations of basic hydraulic principles, using electronic or mechanical analogues.
 - (g) Forecasting procedures have been developed for key points. Refinement and modification

owing to reservoir construction, channel improvements and other changes are a con-tinuing project. The IBM 1620 computer is being used effectively for operational river forecasting at the Ft. Worth, Kansas City, Sacramento, Portland and Washington, D. C. River Forecast Centers. Efforts are being made to incorporate the decisionmaking aspects of river forecasting in the operational computer programs.

- (1745) WATER SUPPLY FORECASTS FOR UNITED STATES.
 - (b) Work being conducted in following field offices: River Forecast Center - Portland, Oreg., Water Supply Forecast Unit - Salt Lake City, Utah, River Forecast Center - Kansas City, Mo., River Forecast Center - Sacramento, Calif., River Forecast Center - Hartford, Conn.
 - (d) Theoretical and field investigation; operation
 - and applied research.(e) The purpose of these investigations is the development of precipitation-runoff relations for water supply forecasting utilizing statistical methods to correlate precipitation during the winter with runoff during the melting season. Research is being conducted on a new technique for water-supply forecasting which is based on a model which provides for a volumetric accounting of all the water in the basin. Study is also being made of storm types as related to the ratio of high-elevation to low-elevation precipitation amounts and to determine their value for improvement of
 - (g) Water Supply Forecasts.
 (g) Water Supply Forecasts are prepared for nearly 400 points in the United States. These forecasts of water-year and residual These forecasts of water-year and residual flow are released in Monthly Water Supply Forecast Bulletins, January through May. This research program is of a continuing nature designed to improve and extend the present forecasting service. "Development of a Digital River Basin Model," by J. F. Hannaford, and "The Little Used Third Dimension," by Fugene L Peace proceeded at Mostom Sport
 - (h) Little Used Third Dimension," by Eugene L. Peck, presented at Western Snow Con-ference, Nelson, British Columbia, April 21-23, 1964, and published in Proceedings of Conference.
- (2437) UNITED STATES STORM CHARACTERISTICS.
 - (b) Soil Conservation Service, Department of Agriculture.
 - (d) Theoretical and field investigation; applied research and design.
 - (e) Studies to provide rainfall data for design criteria in estimating required capacities of hydraulic structures. Work includes: (1) Development for the United States, Puerto Rico and the Virgin Islands of a generalized relationship between depth, area, duration and frequency for areas up to 400 square miles, durations from 2 to 10 days, and return periods from 2 to 100 years. (2) Development of a relationship between snow depth, water equivalent, and frequency of maximum water equivalent of March snow cover in north central United States. (3) Investigation of the appli-cability of a Markov Chain probability model to sequences of wet or dry days in climatically different regions. (4) Determination for the 48 contiguous states of mean monthly number of days having daily precipitation amounts greater than 0.49, 0.99, 1.99 and 3.99 inches. (5) Development of physiographically adjusted 6-hour rainfall-frequency maps for Arizona, New Mexico, Colorado, Utah, Nevada, Wyoming, Idaho and Montana for areas up to 400 square miles.
 (f) Items (2) and (3) completed; items (1), (4) and (5) active.
 (h) "Two- to Ten-Day Precipitation for Return Periods of 2 to 100 Years in the Contiguous

United States," Technical Paper No. 49, U. S. Weather Bureau, 1964. "Frequency of Maximum Water Equivalent of March Snow Cover in North Central United States," Technical Paper No. 50, U. S. States," Feenheal Paper No. 50, 0. 5. Weather Bureau, 1964. "Sequences of Wet or Dry Days Described by a Markov Chain Probability Model," by L. L. Weiss, Monthly Weather Review, Vol. 92, No. 4, pp. 169-176, April 1964.

- (2438)STORM TIDE PREDICTIONS.
 - (b) (c) Laboratory projects.
 - Mr. D. L. Harris, Project Leader, Storm Surge Research Branch, Sea-Air Interaction Laboratory, Office of Meteorological Re-Search, U. S. Weather Bureau, Washington, D. C. 20235.
 - (d) Theoretical and field investigation;
 - basic and applied research.(e) The basic research is the numerical approximation to the solutions of the hydrodynamic storm surge equations and is being done to give a better understanding of the physical processes involved in storm surge generation and modification. The applied research is the development of empirical methods of forecasting storm surges with the purpose of improving storm tide forecasts.
 - (g) Empirical methods of forecasting these inundations are being developed and used in the Weather Bureau's hurricane and storm warning service. Continued improvement in these forecasts is expected to result from this research.
 - (h) "A Regression Model for Storm Surge Pre-diction," by D. L. Harris and A. Angelo, Monthly Weather Review, Vol. 91, No. 10, 11 and 12, pp. 710-726, Oct., Nov., and Dec. 1963. "The Relation of Wind and Pressure to Extra-moving! Storm Surges at Atlantic City." Tropical Storm Surges at Atlantic City," by N. A. Pore, Journal of Applied Meteorology, Vol. 3, No. 2, pp. 155-163, April 1964. "Some Problems Involved in the Numerical Solutions of Tidal Hydraulic Equations, by D. L. Harris and Chester P. Jelesnianski, Monthly Weather Review, Vol. 92, No. 9, pp. 409-422, Sept. 1964.
- (2943) METEOROLOGICAL RADAR TRANSPONDER (MRT) FOR REPORTING RAINFALL.

 - (b) Laboratory project.(d) Field investigation; development and operation.
 - (e) A compact device, consisting of a Fischer-Porter precipitation punch-tape gage and transponder, that can be installed in relatively remote areas at an average distance of 70 miles from the radar and up to 140 miles with a mountain-top installation. Activated by a signal from the radar, the MRT transmits a pulsed signal which appears in Binary code on the radar scope indicating the accrued amounts of precipitation. Investigations are continuing for application to reporting of river and tide stage, and snow water-equivalent data.
 - (g) MRT-1 is obsolete and has been taken out of service. As of July 1963 ten MRT-2's have been installed of which two are operational; the other eight being refurbished with Bischor Derior generation in the service of the servic Fischer-Porter gages. Fifteen remaining in-stallations are to be completed.
- (3251) PRECIPITATION DISTRIBUTION AS DETERMINED BY WSR-57 RADAR.
 - (b) Laboratory projects at Weather Bureau Offices (c) Elaboratory projects at weather Eureau office in Detroit, Mich., Evansville, Ind., Kansas City, Mo., Missoula, Mont., Oklahoma City, Okla., Sacramento, Calif., St. Louis, Mo., and Wichita, Kansas.
 (d) Theoretical and field investigation, operation
 - operation and applied research.
 - (e) Studies are being made to relate, within

100 N.M. of the radar, the intensity and duration of weather echoes with observed rainfall. Estimates of rainfall can be determined by use of the calibrated attenuators on the radar and converting these db values to theoretical rainfall rates by means of a rainfall rate-echo intensity graph. This use of radar applies to flood forecasting and water-supply forecasting. (g) Results indicate that by averaging point

- radar estimates of rainfall over a river basin and comparing them with observed averaged rainfall over the same basin favorable correlations within 10 percent are possible under certain weather regimes.
- Data collection being continued. "Results of Precipitation Measurements with Weather Bureau Radars," by Allen F. Flanders, Proceedings of the 11th Weather Radar (h) Conference, Boulder, Colorado, Sept. 1964.
- (3601) STUDY OF TECHNIQUES FOR MEASURING RAINFALL BY REFERENCE TO RADAR ATTENUATION.
 - (b) Laboratory project in cooperation with Stanford Research Institute, Menlo Park, Calif.
 - (d) Experimental; development and applied research.
 - (e) By measuring the attenuation of short wave length radar signals over a fixed course and relating it to the measured precipitation along the path of the radar beam, a relationship can be established enabling an instrument to monitor areas above damsites and small headwaters for the purpose of alerting downstream interests to heavy rainfall.
 - (f) Additional work temporarily suspended.
- (3602) EXTENSION OF RATING CURVES.
 - Laboratory project.
 - (b) (d) Field investigation; operation and applied research.
 - The flood forecasting procedures used by (e) the Weather Bureau are primarily based on discharge. However, the flood warnings to be of any value must be in terms of stage (or elevation). This is accomplished by use of U.S. Geological Survey rating curves relating discharge to stage. Rating curves are defined only to the maximum observed stage of record. Therefore, it is imperative to devise a reliable method of extending rating curves in order to issue accurate stage predictions for the record breaking flood.
 - (f) In abeyance, work being done by U. S. Geological Survey.
- (3920) FLOAT-TYPE RESISTANCE RIVER GAGE.

 - (d)
 - Laboratory project. Experimental; development. A device employing a Helipot (multi-turn potentiometer) operated by a float or connected to an existing river gage and linked by wire or radio to an observation point (up to 3 miles by wire and 50 miles by radio). A reading is obtained by by radio). A reading is obtained by balancing the resistance in the system with a similar unit at the observation point. May be operated on AC or DC power. Completed, now operational; 120 now in use. Field installation of units linked by land
 - (g)lines operational, radio link now feasible.
- (3921) PUNCHED-TAPE RECORDING, WEIGHING-TYPE PRECIPITATION GAGE WITH TELEMETERING CAPABILITY.
 - Laboratory project. (d)
 - Experimental; development. A twenty-inch capacity, weighing-type battery-operated precipitation gage pro-viding a punched tape record which can be machine processed, capable of over one manthle upstreaded expertion (e)month's unattended operation. Gage so designated that data can be telemetered

through use of a "black box" attached to (f) Now operational, 200 installed.
 (g) Initial gages procured and the

- Initial gages procured and undergoing laboratory and field tests. Installation and field testing began Sept. 1963.
- (4401) BINARY-DECIMAL TRANSMITTER FOR USE WITH ANALOG-DIGITAL RECORDER.
 - (b) Laboratory project in cooperation with Fischer & Porter Co.
 - (d) Experimental; design development. (e)
 - Black-box attachment for Analog-Digital Recorder (ADR) permitting interrogation by telephone or radio of river stage data. Completed, now operational; 100 installed, both radio and wire. (f)
 - (g) Initial installations undergoing field test.
- (4402) RADAR PRECIPITATION INTEGRATOR.
 - (b) Laboratory project in cooperation with Stanford Research Institute, Menlo Park, Calif.
 - (d) Experimental and field investigation, applied research and development.
 - (e) A system for measuring precipitation by S-band radar, employing six levels of intensity on the log receiver, which quantizes the received radar signal from selected grid locations. The accrued precipitation is recorded on paper tape as well as dis-played in units of depth by a series of electro-mechanical counters set in a map corresponding to the 140 grid locations. Because of the pulsed digital nature of the readout it is possible to transmit the signal by narrow bandwidth links. An evaluation of the system has been completed at the Weather Bureau's facility at the National Severe Storms Laboratory, Norman, Oklahoma, utilizing a dense network of recording raingages operated by the Agri-cultural Research Service near Norman, Oklahoma.
 - (f) Additional work temporarily suspended.
 (g) The evaluation, although incomplete, shows
 that the basic concept has been realized
 that the basic concept has been realized and that the accuracy of the device for measurement of light rainfall has been
 - demonstrated. "Radar Precipitation Measurements Phase III, Evaluation," by Ronald T. H. Collis, Final SRI Report on contract CWB-10282, (h) January 1964.
- (4766) OCEAN-ATMOSPHERE INTERACTION.
 - Laboratory Project.
 - (c) Dr. Kirk Bryan, General Circulation Research Laboratory, U. S. Weather Bureau, Wash. 25, D. C.
 - (d) Experimental, theoretical; basic.(e) As part of the fundamental investigation of atmospheric processes by the General Circulation Research Laboratory, work has been initiated to study the large-scale aspects of the interaction of the ocean with the atmosphere. The problem of the response of a simplified ocean model to wind stress was chosen as a starting point. Numerical solutions for this problem incorporate a much more detailed treatment of the non-linear terms than has been possible in previous studies. Model and boundary refinements will be made to check whether the results could be explained by aspects
 - other than the pattern of wind stress. (g) Development of numerical models for investigating the large scale ocean circulation has continued. Solutions have been obtained for the time-dependent behavior of a six-level model of an enclosed ocean basin, in which density is a function of both temperature and salinity. Calculations have been made for several different cases ditions at the air-sea interface. The solutions indicate that the distribution

of evaporation minus precipitation at the ocean surface, treated only implicitly in previous studies, may have a very important effect on thermocline structure. Future work will incorporate the effect of wind stress at the surface, and the seasonal response of the model ocean to annual fluctuations in the temperature distribution and wind stress distribution at the airsea interface.

 - local velocity by means of the Doppler frequency shift of an ultrasonic signal reflected by minute particles of suspended sediment.
 - (g) Model undergoing laboratory and field tests.
- (5076) DISTRIBUTION AND CONCENTRATION OF RADIO-ACTIVE WASTE IN STREAMS BY FLUVIAL SEDIMENT.
 - (b) U. S. Geological Survey for Atomic Energy Commision.
 - (c) Mr. William W. Sayre, Project Chief, U. S.

Geological Survey, c/o Engineering Research Center, Foothills Campus, Colorado State University, Fort Collins, Colorado 80521.
(d) Experimental and theoretical; basic and

- applied research.
- (e) A significant fraction of the low level liquid radioactive wastes which are discharged into surface streams is often sorbed by bed material and fine material sediment particles. Consequently the manner in which these sediments are transported is a significant factor in determining the distribution of radioactive wastes in the distribution of radioactive wastes in the stream environment. The project is devoted to investigating the dispersion and transport of both fine and bed material sediment particles. Experiments are being conducted in natural streams and in laboratory flumes. Radioactive tracer techniques, fluorometry and nephelometry are among the experimental techniques being employed. Analytically and experimentally the phenomenon of sediment transport is being treated from a Lagrangian point of view point of view.
- (g) The transport of bed material particles can be described as an alternating sequence of steps and rest periods in which the step supps and rest periods in which the step lengths and rest period durations are exponentially distributed. In stochastic processes this would be known as a compound Poisson process. This yields a concentration distribution function which agrees with distributions of concentrations of radio-entive tracer particles chapters in the active tracer particles observed in the North Loup River, Nebraska, and in a laboratory flume. Radioactive tracer techniques provide a feasible method for determining bed material

discharge averaged over a period of time. The longitudinal dispersion of dye and fine suspended sediment particles in a wide rectangular open channel with a rough boundary follows closely the prediction of the Taylor-Elder theory in which a virtual coefficient of longitudinal dispersion is computed using the velocity distribution and the Reynolds analogy concerning the and the Reynolds analogy concerning the equivalence of mass and momentum transfer. Also in such a channel, experiments to date indicate that at large distances from the source the rate of lateral dispersion from a continuous point source is essentially constant over most of the flow depth.

(5077) ARTIFICIAL CONTROLS FOR ALLUVIAL CHANNEL STREAMS.

- (b) Laboratory project.
 (c) Mr. F. A. Kilpatrick, Project Chief, U. S. Geological Survey, c/o Engineering Research Center, Foothills Campus, Colorado State University, Fort Collins, Colorado 80521.
 (d) Field investigation; applied research.
 (e) The basic stream flow data collection program of the U. S. Geological Survey for sand bed channels is in need of improvement. Such chapters unstable stage_discharge
- Such channels have unstable stage-discharge relationships. Thus effort is being made to develop control designs and construction methods suitable for alluvial channels. Methods for improving the stability will be designed and then tested in the laboratory and field. Careful consideration will be given to construction techniques in order to minimize costs to the data collection program.
- (5078) ALLUVIAL CHANNEL HYDRAULICS.

 - Theoretical study; basic and applied research. A statistical model of two-dimensional sedi-(d) (e) (e) A statistical model of the dimensional based on a ment transport in open channels, based on a random-walk process, is used to develop a sediment transport function.
 (g) A distribution profile of sediment trans-tical for a sediment trans-
 - A distribution pointe of setament trans-port based upon bed roughness, fluid re-sistance, particle fall-drag, and the mean sediment discharge is defined in terms of hyperbolic functions. The model is designed to include both bed load and suspended load.
- (5603) ORIGIN OF BASE FLOW.
 - (b)
 - Laboratory project. Dr. G. R. Kunkle, U. S. Geological Survey, WRD, 508 Hydraulics Laboratory, Iowa City, Iowa 52241.
 - (d) Field investigation; basic and applied research.
 - (e) The objective of this study is to determine the origin and characteristics of low flows as related to the hydrology and geology of a small drainage basin. Specific infor-mation is sought upon those hydrologic and geologic factors having the most influence upon low flows. (g) The geology and soils of Four-Mile Creek
 - basin in Tama County, Iowa have been mapped. Accurate stream inflow and outflow records are being gathered together with precipita-tion, soil moisture, and shallow well information.
- (5604) MECHANICS OF FLUID RESISTANCE.
 - (b) (c)
 - Laboratory project. Dr. H. J. Tracy, U. S. Geological Survey, WRD, Room 164 Peachtree Seventh Building, Atlanta, Georgia 30323.
 - (d) Theoretical and laboratory investigation; basic research.
 - basic research.
 (e) The objective of this study is to attempt to describe the effects of the boundary of fluid resistance in terms of dimensionless ratios characterizing the physical size and shape of the roughness. Ultimately, it is expected that a general theory of the nature of the energy-momentum transport mechanism will result.
 - (g) The experimental aspect of the work is being conducted in an artifically roughened, closed circular, air tunnel using hot-wire anemometer equipment to determine velocity profiles, turbulence, and energy spectra. The work consists of tests in

which roughness element size, density of spacing, and shape are systematically varied. The resulting turbulence spectra are being analyzed in order to correlate the physical dimensions of the roughness with the energy and momentum transfer mechanisms in turbulent flow.

- (5605) FLUID RESISTANCE AT EXPANSIONS AND CONTRAC-TIONS.
 - (b) (c) Laboratory.

 - Dr. Nobuhiro Yotsukura, U. S. Geological Survey, WRD, Washington, D. C. 20242. Theoretical and experimental investigation; (d)
 - basic research.
 - The objective of this study is to gain a more basic understanding of the actual mechanism of flow separation and associated losses. (e)
 - Although exploratory experimental work will (g) be carried out, considerable effort is given to development of a rational analytical approach based upon drag and momentum concepts.
- MULTIPLE CHANNEL DIGITAL RECORDING SYSTEM. (5606)

 - Laboratory project. Mr. G. F. Smoot, U. S. Geological Survey, WRD, Washington, D. C. 20242. Instrument development. (b) (c)
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - The objective of this project is to develop a reliable, battery powered, sensing instrument for field operation which is capable strument for field operation which is capable of positioning a punched paper-tape digital recorder. The instrument would be used to provide a variety of hydrologic parameters in rapid sequence for recording on tape. A transistorized system incorporating an A-C Wheatstone bridge balanced by a D-C servo system of minimum power requirements has been developed and is undergoing field testing
 - (g) testing.
- (5607)EVALUATION OF DEPENDENT AND INDEPENDENT VARIABLES IN OPEN CHANNEL FLOW.
 - (b) (c)
 - U. S. Geological Survey. Messrs. H. P. Guy and C. F. Nordin, Jr., U. S. Geol. Survey, c/o Engineering Research Center, Foothills Campus, Colo. State Univ., Fort Collins, Colo. 80521. Experimental; basic research.
 - (d) (e) The objective is to identify and evaluate the dependency characteristics of flow and sediment measures of alluvial channel flow. The experiments are designed to (1) determine mean flow parameters and channel adjustments when bed material is an independent vari-able; (2) determine the importance of depth as a scale parameter and as a driving force; (3) determine the time for change when an independent variable is changed; (4) deter-mine the variance of slope, depth, velocity, sediment transport, and bed conditions in time and space.
- (5608)DISTRIBUTION AND CONCENTRATION OF RADIO-ACTIVE WASTE IN STREAMS BY FLUVIAL SEDIMENT.

 - U. S. Geological Survey. Messrs. W. W. Sayre and F. M. Chang. Experimental and theoretical; basic and $\begin{pmatrix} c \\ d \end{pmatrix}$ applied research.
 - (e) A significant fraction of the low level liquid radioactive wastes which are discharged into surface streams is often sorbed by bed material and fine material sorded by bed material and fine material sediment particles. Consequently the manner in which these sediments are transported is a significant factor in determining the distribution of radioactive wastes in the stream environment. The project is devoted to investigating the dispersion and transport of both fine and bed material sediment particles. Eveniments are conducted in particles. Experiments are conducted in natural streams and in laboratory flumes. Radioactive tracer techniques, fluorometry and nephelometry are among the experimental techniques being employed. Analytically and

experimentally the phenomenon of sediment transport is being treated from a Lagrangian point of view. Discontinued.

- (g) The longitudinal dispersion of fine suspended sediment particles in a turbulent openchannel flow tends to be more rapid than that of dye. The degree of difference depends on the fall velocity of the particles and the flow characteristics in the channel. "Sand Transport Studies with Radioactive
- (h) "Sand Transport Studies with Hadioactive Tracers," by D. W. Hubbell and W. W. Sayre, Am. Soc. Civil Engineers Proc., v. 90, no. HY3, May 1964, p. 39-68.  - (b) Laboratory project -- information for general public use. Mr. J. P. McGee, Research Director, Morgan-
 - (c) town Research Center, Morgantown, West Virginia.
 - Experimental; applied research. The object of the project is to establish friction factor-Reynolds number relationships (d) (e)for coal-water slurries of various concentrations with coals of different ranks and size analyses. Work is being done with 1/2 inch, 3/4 inch, and 1 inch pipes. Data are processed on an IBM-1620 computer.
 - Preliminary results show a change in rheo-(g) logical classification at or above 45 percent coal concentrations.
- (4790) DIELECTRIC SEPARATION OF PARTICLES FROM SUSPENSIONS OF FINE COAL IN OIL.

 - (b) Laboratory project.
 (c) Mr. J. P. McGee, Research Director, Morgantown, Research Center, Morgantown, W. Va.
 (d) Experimental; applied research for a M.S. thesis at West Virginia University.
 (e) The purpose of the project is to explore the feasibility of separating solid particles in proper liquids by the application on a nonpolar liquids by the application on a nonuniform electric field to a flowing stream of the suspension and in particular the separation in an oil vehicle of fine coal from its ash constituents.
 - Capacitance cells have been constructed for (g) determining the dielectric constants of the solids fractions and the oils in the suspensions.

U. S. DEPARTMENT OF THE INTERIOR, BUREAU OF REC-LAMATION.

Inquiries concerning the following projects, except where otherwise indicated, should be addressed to Office of Chief Engineer, Bureau of Reclamation, Denver Federal Center, Denver, Colo. 80225.

- (2719) GLEN CANYON DAM SPILLWAY.
 - Laboratory project.
 - Experimental; design. The model, built to a scale of 1:63.5, (d) (e) included the tunnel spillways on both sides of the river, the curved arch dam, the outlet works, the powerhouse and a section of the Colorado River upstream and downstream from the dam. The tunnel spillways were modeled in transparent plastic so that flow conditions could be thoroughly investigated. Other features studied were the approach channels to the spillway, the discharge capacity of the spillways, the pressures throughout the spillways, the flip buckets and scour at the downstream portal of the tunnels, and the effect in the river when all structures are discharging.

 - (f) Completed. (g) Alinements for the excavated spillway approach channels, tunnel transitions between the spillway crest and the inclined tunnel, new type flip buckets in new locations, and other recommended features and procedures have re-sulted from the studies. "Hydraulic Model Studies of the Spillways
 - (h) and Outlet Works-Glen Canyon Dam," by T. J. Rhone, Hydraulics Branch Report No. Hyd-469, Feb. 1964.
- (2959) STILLING BASINS FOR SLIDE GATE CONTROLLED

OUTLET WORKS.

- (b) Laboratory project.
- (d) Experimental; for design. (e) A model was constructed to generalize stilling basin dimensions, using either one or two slide gates.
-)ata were taken for two types of stilling (g) oasins for high-head slide gates. Prelim-inary design curves were developed for the usual hydraulic jump basin and for a simple plunge-type basin.
- (h) Progress report in preparation.
- (2960) FLAMING GORGE DAM SPILLWAY.

 - (b) Laboratory project.
 (d) Experimental; for design.
 (e) A 1:36 scale model was used to develop a satisfactory spillway and outlet works. (f) Completed.
 - (g) A satisfactory approach channel was developed. and good flow conditions through the crest section, transition, and throughout the spillway tunnel were obtained by the use of an unusual center pier. A new type of flip bucket was developed which permitted the height of one sidewall to be reduced without causing adverse flow conditions. The extent of riprap protection in the powerplant afterbay necessary during diversion through
 - the outlet works was also determined.
 (h) "Hydraulic Model Studies of Flaming Gorge Dam Spillway and Outlet Works," by T. J. Manone, Hydraulics Branch Report No. Hyd-531, May 1964.
- (3267) CANAL INLET AND OUTLET TRANSITION STUDIES.
 - Laboratory Project. (b)
 - (d)
 - Experimental; for design. An existing model will be modified and used (e) to check inlet transition data previously obtained and reported. The model will be of
 - obtained and reported. The model will be of larger scale than the one previously used, and will show if scale effects are present, and will increase reliability of the results. "Hydraulic Design of Transitions for Small Canals," by W. P. Simons, Engineering Monograph No. 33, United States Department of the Interior, April 1964. Available through Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. (h) 20402.
- (3274) CONSTANT HEAD ORIFICE TURNOUT.

 - Laboratory project. Experimental; applied research for design. A 24-inch slide gate turnout is being cali-brated by means of a 1:2 scale model. Desi d (e)Design changes resulting from use of the turnout have necessitated an analysis and calibration of the variables affecting the discharge capacity.
 - $\begin{pmatrix} f \\ g \end{pmatrix}$ Completed.
 - Results show that submergence of the orifice or of the upstream gate of the two-gate turnout has a major effect on the discharge coefficient. A calibration curve for a 9 cfs standard turnout and several comparative calibrations of modified turnouts have been obtained.
 - (h) Report in preparation.
- (3278) CAVITATION OF CONCRETE SURFACE IRREGULARITIES.
 - Laboratory project.
 - Experimental; applied research and design. Into-the-flow offsets with abrupt edges, (d) (e) chamfered edges, and rounded edges were tested to determine the velocity-head relationships for incipient cavitation.
 - (g) Data analysis not completed.(h) Progress report to be prepared.
- (3611) ADJUSTABLE WEIR.
 - Laboratory project.
 - (d) Combined laboratory and field research.

- (e) Weirs having adjustable crest height are used for checking water surface levels for upstream water delivery and for water measure-the surface of the strength of the surface of the second sec ment beyond the weir. An investigation of the head discharge capacity of a single 2-foot crest-length weir was completed.
- Single weir investigation completed. (f) Capacities of weir for crest heights greater than 0.1 foot above fixed blade compare very favorably with standard 2-foot cipolletti weir. (h) Report in preparation.
- (3612) DISCHARGE COEFFICIENTS FOR RADIAL GATES.

 - (b) Laboratory project.
 (d) Experimental, laboratory and field investigations; applied research.
 - (e) Radial gates are used extensively in irrigation systems for discharge and water surface level control. Intelligent operation of the systems requires that the rate of flow passing the gated structure be known. Literature research resulted in an analytical approach and adjusted equation for the gate capacity with unsubmerged flow.
 - (g) Extensive model and prototype radial gate data were obtained from the TVA Hydraulic Laboratory. The data are being analyzed to verify the proposed discharge formula and to extend the scope of presently available information.
- (3614) EXPERIMENTAL STUDY OF SUBCRITICAL FLOW IN CURVED CHANNELS.
 - (b)
 - Laboratory project. Experimental; applied research and design. A fixed-bed, hydraulic model has been constructed to determine the possibility $\left\langle \begin{array}{c} d \\ e \end{array} \right\rangle$ of reduction in scour and deposition in unlined channels due to secondary currents. A Preston Tube has been constructed and is being used to measure boundary shear along the curved portion of the trapezoidal model channel.
 - Tests in progress. For a given model discharge of 2.85 cfs at a depth of 0.75 feet high boundary shear stresses existed on the outside bank downstream from the curve and to a lesser extent on the inside bank in the leading portion of
 - The curve. "Progress Report No. I-Boundary Shear Dis-tribution Around a Curve in a Model Canal," by E. R. Zeigler, Hydraulics Branch Report No. Hyd-526, June 1964. (h)
- (3985) DISCHARGE CAPACITY OF LARGE CONCRETE-LINED CANALS.

 - (b) Laboratory project.
 (d) Experimental, laboratory and field investigations; applied research and design.
 (e) This study is for the purpose of exploring the effects on the hydraulic gradient of the relationship of boundary surface resistance to the cumulative resistance of crossings, inlets, turnouts, checks, and other local items in concrete-lined canals of different sizes, shapes, and grades. This study is part of a program to explain why design procedures used successfully for small and medium sizes of canals may not be adequate for large concrete-lined canals on flat slopes.
 - (g) Between 1957 and 1962, tests were made on 170 miles of nine large (700 to 13,200 cfs) canals having ages ranging from 7 to 25 years. Resistance coefficients varied with the amount growth, canal alinement, and canal size and ranged from 0.013 to 0.016 for the smaller canals, and from 0.015 to 0.019 for the larger canals.
- (3989) YELLOWTAIL DAM SPILLWAY.

 - Laboratory project. Experimental; for design. A 1:50 scale model was used to study the

spillway intake, the tunnel, and the nydraulic jump stilling basin. The basin was designed to still flows up to 12,000 second-feet and to flip larger flows up to 92,000 secondfeet into the river channel.

- (f) Completed.
 (g) The following were developed during the study; width and alinement of the approach channel, length and shape of the pier at the gate section, discharge calibrations, curvature of the turnel trajectory approaching the comthe tunnel trajectory approaching the com-bination flip bucket stilling basin, length, depth and shape of the flip bucket basin, and riprap requirements downstream from the basin.
- "Hydraulic Model Studies of Yellowtail Dam Spillway," by G. L. Beichley, Hydraulics Branch Report No. Hyd-483, August 1964. (h)
- (3994) HYDRAULIC JUMP CHUTE BLOCK AND BAFFLE BLOCK PRESSURES.
 - (b)
 - Laboratory project. Experimental; applied research. A spillway stilling basin model has been constructed to study chute block and baffle block pressures and to relate these pressures (d) (e) to the Froude number of the entrance flow
- (3996) HIGH HEAD ORIFICE STUDIES.

and to tailwater depth.

- (b) (d) Laboratory project.
- Experimental; applied research and design. Tests were made at heads up to 500 feet with (e) circular concentric orifices and a gate valve in a 3-inch-diameter pipeline to determine cavitation characteristics and effects of cavitation on head loss, discharge coefficients, pressure distribution, velocity distribution, and pressure fluctuations.
- (f) Inactive.
 (g) The results showed that head losses across
 orifice stations were not significantly
 discharge coefficient changed by cavitation, discharge coefficients were affected if the coefficients were based on pressures measured downstream from the orifice, and almost normal pressure and velocity distribution reoccurred within five pipe diameters downstream from the orifice or valve station. Easily used cavitation index valves were established for a range of orifice sizes to determine when cavitation would
- sizes to determine when cavitation would begin, and the pressure and velocity con-ditions needed to prevent it. "Progress Report on Hydraulic Characteristics of Pipeline Orifices and Sudden Enlargements Used for Energy Dissipation," by J. W. Ball and W. P. Simmons, Hydraulics Branch Report No. Hyd-519, December 1963. (h)
- (4416) BLUE MESA DAM SPILLWAY.
 - (b) Laboratory project.
 - Experimental; for design. (d) A 1:32.78 scale model was used to study the radial gate controlled intake, inclined tunnel, and the flip bucket for flows up to 33,650 cfs discharging at a velocity of 113 feet per second at the outlet portal. (e)
 - (f) Tests completed.
 (g) The approach channel shape, tunnel transition section at the intake, inclined tunnel, versection at the tunnel, and flip bucket were tical bend in tunnel, and flip bucket were developed.
 - developed. "Hydraulic Model Studies of Blue Mesa Dam Spillway," by G. L. Beichley, Hydraulics Branch Report No. Hyd-515, July 1964. (h)
- (4425) WATER-COLUMN SEPARATION.
 - (b) Division of Design Project.(d) Theoretical and field investigation; applied research.
 - (e) Field tests are being used to check theo-retical developments designed to predict completely the hydraulic transient con-ditions occurring during separation and rejoining of water columns occurring during separation and rejoining of water columns in pump discharge lines.

- (f) Continuing.
 (g) Results of field measurements of transients in two pump discharge lines show that these pressures were greater than had been predicted during design. A theory and method of analysis were developed which explain the the best of the two contents were developed.
- analysis were developed which explain the time-history of the translents measured. "Water-Column Separation at Two Pumping Plants," by R. V. Brown, Applied Mathe-matics and Mechanics Section, Technical Engineering Analysis Branch, May 1964. (h)
- (4791) HIGH-VELOCITY JET ON PROTECTIVE COATINGS.

 - Laboratory project. Experimental; for operation and maintenance. A 100-fps, 1-inch-diameter jet was impinged (b) (d) (e) at 45 degrees on protective coverings proposed for application on concrete surfaces to be subjected to high-velocity flow.
 - Completed. All protective coatings tested, in which the surface was unbroken, withstood the jet for 4 hours. All coatings tested in which a broken or cut surface extended to the cen- $\begin{pmatrix} f \\ g \end{pmatrix}$ crete were ripped from the concrete test blocks in less than 5 minutes.
 - (h) Report in preparation.
- (4792) CANADIAN RIVER AQUEDUCT CHECK TOWERS.

 - (b) Laboratory project.
 (d) Experimental; for design.
 (e) Laboratory tests are being made to determine the hydraulic losses and air-entrainment potential of check towers to be installed in the 125-mile-long Canadian River Aqueduct. The aqueduct consists of 54-, 60-, and 66-inch-diameter concrete conduit. The check towers are so designed that the top of each is slightly below the hydraulic grade line when the aqueduct is flowing full. Each check tower consists of a 90 degree vertical bend to direct the conduit upward, a 180-degree return bend at the top of the tower, and a 90-degree bend at the bottom of the downstream leg to return the conduit to the
 - (f) Completed.
 (f) Completed.
 (g) Head loss was determined for each size check tower. During filling or evacuating the tower, air was entrained in the downstream leg and carried into the horizontal conduit. A 36-inch-diameter vent was installed 120 feet downstream from each tower to release the entrained air.
 - (h) Report in preparation.
- (4794) VERTICAL STILLING WELL.
 - (b) (d) (e) Laboratory project.
 - Applied research.
 - The purpose is to obtain the optimum size, depth, and internal configuration of vertical depth, and internal configuration of vertics stilling wells for high-head discharges. The test installation has a 4-foot by 4-foot-square well 6 feet deep, followed by a canal with a 4-foot bottom width and 1-1/2:1 side slopes. An adjustable down-spout is symmetrically located in the well and discharges against the flat floor. Piezometers are located in the floor and lower sidewalls of the well. lower sidewalls of the well. Adjustable corner fillets provide a means for determin-ing optimum fillet angle, size, and height.
 - Continuing. The addition of corner fillets to the well results in much smoother water surfaces. The fillets direct the flow from the corners back to the center of the well inducing roller action. Optimum fillet configuration has been determined for one ratio of down-spout area to well area. Additional studies will determine optimum fillet configura-tions for larger downspouts.
- (4798) SAN LUIS DAM SPILLWAY.
 - (b) Laboratory project.

- (d) Experimental; for design.
 (e) A 1:14.83 scale model was used to study the morning-glory spillway intake, vertical shaft, and vertical bend for flows up to 3,000 cfs, dropping approximately 100 feet through the inlet and wortical beft through the inlet and vertical shaft. Tests completed. (f)
- (g)
- A deflector, with air vent and guide vanes, was developed for the vertical bend. (h)
- "Hydraulic Model Studies of San Luis Dam Spillway," by G. L. Beichley, Hydraulics Branch Report No. Hyd-516, Sept. 1964.
- (4800) SAN LUIS DAM FOREBAY SPILLWAY.
 - Laboratory project. (b) (d)
 - Experimental; for design. A 1:22 scale model was used to study the (e) morning-glory inlet, vertical bend, and stilling basin for flows up to 3,600 flowing at approximately 50 feet per second at the tunnel exit portal.

 - (f) Completed.
 (g) Morning-glory-inlet, tunnel, and stilling
 basin size requirements were determined. A
 basin size requirements were order when and wide vanes were deflector, air vent, and guide vanes were developed for the vertical bend. Pressures in the inlet, vertical bend, and stilling basin were recorded.
 - "Hydraulic Model Studies of San Luis Forebay Dam Spillway," by G. L. Beichley, Hydraulics Branch Report No. Hyd-517, November 1964. (h)
- (4802) STUDIES ON ORIFICES FOR AUTOMATIC RADIAL GATE CONTROLS.
 - (b) (d) Laboratory project. Experimental; for design.
 - The studies are for the purpose of determin-(e) ing flow characteristics and discharge coef-ficients for various size orifices in float-well intakes of automatic radial gate controls. Studies to date have been made of 1-inch and 3-inch orifices in horizontal and vertical planes, in nonstandard settings with different approach and exit conditions for heads from 1 to 100 feet. Presently a 1:1 scale model of a floatwell intake structure is being constructed to determine discharge coefficients of the irregular orifice configuration in the regulating structure.
 - (g) Although the test arrangements differed substantially from arrangements for which data are presently available, measured coefficients compared closely with existing data.
- (4807) MORROW POINT DAM SPILLWAY AND OUTLET WORKS.
 - Laboratory project. (d)
 - Laboratory project. Experimental; for design. A 1:24 scale model was constructed to aid in the development of the unusual design of the spillway and outlet works for the thin-arch concrete dam. The original design, consisting of a free overfall spillway and an outlet works located near the bottom of the dam, was abandoned because of unthe dam, was abandoned because of un-desirable flow conditions in the artifi-cially formed stilling pool at the base of the dam. The present design includes four fixed-wheel gate controlled conduits near the top of the dam which discharge 34,400 cfs, allowing it to fall approximately 400 feet to the stilling pool. The small slide-gate-controlled outlet works in the lower portion of the dam and the underground powerplant tailrace channels are also included. Completed.
 - $\begin{pmatrix} f \\ g \end{pmatrix}$ Model studies have proven the acceptability of the present design. Design of the control weir which forms the stilling pool was modified and the two inside spill-way conduits were tipped downward to provide more even distribution of impact of the free-falling jets. Revisions were made to the topography of the downstream river channels to improve flow conditions

- in those areas. (h) Report in preparation.
- (4808) JOES VALLEY DAM SPILLWAY.
 - Laboratory project. Experimental; for design.
 - (d)
 - (e) A 1:20 scale model was used to study hydraulic features of the morning-glory spillway. The model included the spillway entrance, a portion of the reservoir topography surrounding the entrance, the vertical bends, and a portion of the horizontal tunnel. Completed.
 - $\begin{pmatrix} f \\ g \end{pmatrix}$ Minor modifications were made to the preliminary design to correct undesirable flow conditions which prevailed for the maximum discharge of 5,000 second-feet. Appurtenant devices were developed to control the vortex which formed during submerged operation and improve flow conditions during

 (c) California Department of Water Resources, Sacramento 2, Calif.
 (d) Experimental; for design.
 (e) Models built to 1:48 and 1:78 scale are

 - Models built to 1:48 and 1:78 scale are being used to study the hydraulic features of a revised design of the flood control outlet. The general flow conditions, dis-charge coefficients, water surface profiles, flow velocities and energy dissipation as the flow reaches the Feather River are being tested on the 1:78 scale model of the entire outlet structure. model of four of the eight outlet bays is being used to obtain discharge capacities for controlled and uncontrolled releases. Pressures along the pier walls and bellmouth roof of the bays were recorded from this model. A 1,740-foot-long uncontrolled overfall spillway which will operate only during extreme flood conditions was not modeled.
 - (g) Flow through the outlet approach area, bays and channel was good except for slight vortex action at the outlet entrances. Modifications at the left abutment virtually eliminated the vortices. Pressures on the pier sides and belmouth roof were all at or slightly below atmospheric. The discharge

capacity was slightly higher than design capacity. The study is being continued to obtain more efficient energy dissipation where the channel flow enters the Feather River.

- HYDRAULIC DOWNFULL COMPUTATIONS FOR GLENDO DAM (4949)FIXED WHEEL GATE.
 - (b) (d)
 - Laboratory project. Theoretical computations.
 - Computations were made to determine the effect of rapid closure of the fixed wheel gate under emergency conditions, with water standing in the gate well due to initial back (e) pressure. Completed.
 - $\begin{pmatrix} f \\ g \end{pmatrix}$ Water temporarily trapped in the gate well Water temporarily trapped in the gate well creates an additional head, and hence addi-tional hydraulic downpull, for most of the gate travel when the gate is closed rapidly. However, the peak hydraulic downpull occurs at small gate openings and is not affected by reasonably rapid gate closure. "Hydraulic Downpull Computations for Glendo Dam Fixed Wheel Gate," by D. Colgate, Hydraulics Branch Report No. Hyd-524, April 1964
 - (h) 1964.
- (4950) NAVAJO MAIN CANAL HEADWORKS.

 - (b) (d) (e)
 - Laboratory project. Experimental; for design. A 1:16 scale model containing two 9- by 12-foot top seal radial gates, a divided under-ground stilling basin, and a horeshoe-shaped downstream tunnel was constructed to aid in evaluating and improving the stilling basin performance, and to test the unusual appli-cation of radial gates. Discharges ranged up to 1,800 cfs, and heads ranged from 15 to 126.5 feet.
 - Completed.
 - (f) Completed.
 (g) A basin was developed that provided good energy dissipation and smooth water surface conditions in the downstream tunnel. Backflow, which struck the downstream faces of the radial gates for a wide range of heads and discharges, was prevented by placing curtain walls above the 15° chutes just above the path of the high velocity jets. An underpass wave suppressor in the down-stream portion of the basin prevented large waves from entering the tunnel. (h) Report in preparation.
- (4951)SAN LUIS OUTLET WORKS EMERGENCY GATES -- DOWN-PULL STUDIES.
 - (b) (d) (e) Laboratory project.

 - Experimental; for design. A 1:35 scale model of a single intake struc-ture and gate was constructed to study downpull characteristics. The studies were performed under controlled discharge conditions simulating maximum power generation at the powerplant, and under conditions simulating a rupture at the structure or in the downstream tunnel. Fresently details are being worked out for suspending the gate on water bearings so that downpull data An attempt will then be made to correlate downpull obtained by the pressure area and weighing methods.
 - Phase one completed.
 - (f) Phase one completed.
 (g) Uplift forces great enough to prevent closure of the gate under its own weight were eliminated by proper shaping of off-sets and recesses in the face of the gate shaft. A gate lip extension-to-leaf thickness ratio of 0.55 was selected as the optimum compromise between structural and hydraulic considerations. A maximum downpull of about 710,000 pounds will occur during emergency closure of the San Luis gate under free discharge conditions
 - at the downstream gate frame.
 (h) Progress Report No. 1--"Research Studies on Hydraulic Downpull Forces on Large Gates

with Special Application to the San Luis Outlet Works Emergency Gates," by R. I. Murray and W. P. Simmons, Hydraulics Branch Report No. Hyd-530, March 31, 1964.

- SURGE STUDIES IN LONG, LOW-HEAD PIPELINE (4952)SYSTEMS.

 - (d)
 - Laboratory project. Experimental; applied research and design. Laboratory studies will be made to verify an electronic computer program for analyzing low frequency surge characteristics of long trading surface that facility conlow frequency surge characteristics of fong pipeline systems. The test facility con-sists of 1,400 feet of 4-inch pipe, a constant head water supply, a constant head terminal reservoir, and a slow closing and opening valve for producing controlled changes in rate of flow. The pipeline is inter-rupted at 160-foot intervals with open check stands that divide the line into individual reaches with pressure heads not greater than 2.8 feet. Total drop of the line is 24 feet.
 - Continuing. A series of test runs with varying control valve closure times have been made. The results, listing head versus discharge for various stations and time intervals have $\begin{pmatrix} f \\ g \end{pmatrix}$ been furnished for debugging and modifying an ADP program which will be used to predict prototype results.
- (4953) ARBUCKLE DAM OUTLET WORKS.
 - Laboratory project.
 - Experimental; for design. Laboratory studies were conducted on a 1:18 scale model to determine the hydraulic operating characteristics of the slide gate (d) (e) controlled outlet works and the effects of operation of the hydraulic jump stilling
 - basin on an adjacent spillway stilling basin. Completed.
 - (f) Completed.
 (g) All features of the design were found to be acceptable. Some fine material was deposited during. acceptable. Some fine material was deposi in the spillway stilling basin during operation of the outlet works alone but no severe eddy currents were observed in the downstream channel.
 - "Hydraulic Model Studies of Arbuckcle Dam Outlet Works," by D. L. King, Hydraulics Branch Report No. Hyd-528, August 1964. (h)
- (4954) SAN LUIS FOREBAY PUMPING PLANT INTAKE TRANSITIONS.
 - Laboratory project. (b)
 - (d)
 - Experimental; for design. A 1:15 scale model was used to compare head loss, velocity distribution, and flow patterns in various configurations of canal transitions to pumping plant intakes.
 - Completed. On the basis of velocity distribution and surface flow patterns in the transition and $\begin{pmatrix} f \\ g \end{pmatrix}$ pump intake bays a symmetrical transition was found to be more desirable than an angled transition. Head losses were too small to justify comparison on this basis. The angled transition was chosen for the final design after consideration of economic factors. Numerical methods and a digital computer were used to analyze (h) Report in preparation.
- (4955) SAN LUIS FOREBAY CANAL SURGE STUDIES.

 - d
 - Laboratory project. Experimental; for design. A 1:48 scale model is being constructed to determine the magnitude and velocity of surge in a pumping plant supply canal after power failure and rejection of flow. Effects of bifurcations, curves, and canal structures and methods of relieving the surge were investigated.
 - (f) (g) Completed.
 - Comprehensive data were obtained on the

size, form, and velocity of surge waves following rejection of the canal flow and drainage from the pump discharge lines. A longitudinal side weir was de-veloped to attenuate the surge to an allowable height.
(h) Report in preparation.

- (4956) YELLOWTAIL AFTERBAY DAM SLUICEWAY AND OVER-FALL WEIR.
 - (b)
 - Laboratory project. Experimental; for design. One to twenty-four scale models were used (d) to determine the hydraulic operating characteristics of the afterbay dam sluiceway and overfall weir, and to develop satisfactory stilling basins for both structures. The basins were judged on appearance of flow conditions and downstream bed erosion.
 - (f) Completed.
 (g) The model study resulted in hydraulic jump type stilling basins containing chute blocks, baffle piers, and an end sill (Type III) being recommended for the sluiceway and overfall weir. Both recommended structures provided smooth approach-, chute-, stilling basin-, and downstream channel-flow, and produced no erosion or movement of downstream riverbed or riprap. Discharge capacity and coefficient curves were prepared for both structures.
 - (h) Report in preparation.
- (4957) BAFFLED PIPE OUTLET ENERGY DISSIPATORS.
 - (b) Laboratory project.
 - Applied research. (d) Hydraulic model studies are being made to extend present information concerning this type of impact energy dissipator. Prototype data from existing operating structures will be compared with model data. Investigation of erosion around the structures and in the downstream bed will be studied.
- (4958) AIR DEMAND TESTS ON 84-INCH JET FLOW GATE --TRINITY DAM, CALIFORNIA.
 - (b) Laboratory project. (d)
 - Field investigations. (e) Field measurements were obtained to compare model and prototype air demand for the complete range of gate openings at maximum operating head (369 feet) on the gate. A laboratory model study was made to obtain centerline velocity coefficients for the prototype air duct to provide for quantitative analysis of field measurements. quantitative analysis of field measurements. (f) Completed.
 - Maximum velocity in the air supply conduit was within design limits. (g)
 - (h) Report in preparation.
- (4959) FLAT BOTTOMED TRAPEZOIDAL VENTURI FLUMES.
 - Laboratory project.
 - Experimental; for design. A pilot study of a single flume is being (d) conducted to determine the best approach to a comprehensive program to generalize the design and calibration of this type of water The model study has demonstrated that the
 - (g) particular pilot flume tested is an adequate measuring device.
 - (h) Report in preparation.
- (4960) PROTOTYPE PIEZOMETRIC AND AIR DEMAND MEASURE-MENTS OF 4- BY 4-FOOT TANDEM GATE--NAVAJO DAM, NEW MEXICO.
 - (b) Laboratory project.
 - (d) Field investigation.
 - To compare the model and prototype, piezometric measurements were obtained for the complete range of gate openings with a head of 164.5 feet. Prototype air demand measurements

were made simultaneously with plezometric valves to evaluate adequacy of the air supply system. Further tests are planned at heads of about 230 feet and 300 feet to more fully evaluate the hydraulic characteristics of this gate and to check the model scaling.

- (4961) USE OF RADIOISOTOPES FOR WATER MEASUREMENT.
 - (b) (d)
 - Laboratory project. Field and laboratory investigations of
 - (c) Theoretical and experimental nature.(e) The purpose of the program is to determine the applicability of the use of radioactive isotopes to measurement of open channel flows by the dilution or total count methods. The program is being continued to provide statistical data on the capabilities of the methods.
 - (g) Method produces widely varying results de-pendant on the quality of the radioisotope-channel water mixture, accuracy of measure-ment of radiostope quality, and counting sensitivity. With adequate mixing, discharge measurement accuracy of 97 percent or better appears possible. "Canal Discharge Measurements with Radio-

- LABORATORY INVESTIGATION OF THE REMOVAL OF SALT WATER FROM A TWO-PART ACULFER USING TILE DRAINS INSTALLED IN THE UPPER MEMBER, AND PUMP WELLS INSTALLED IN THE LOWER ACULFER. (4962)
 - Laboratory project.
 - (d) Applied research.
 - Tests were performed on a 16-foot-long 1:40 scale model containing two-part and single-part aquifers to determine the hydraulic (e) action of simulated tile ground-water drains placed 0.2 foot below the model surface. The lower aguifer was composed of coarse The lower aquifer was composed of coarse sand 50 times more permeable than the fine sand in the upper aquifer. For initial con-ditions the model was charged with salt water, concentration 6,000 ppm Na Cl, dyed blue for visual identification. Tests are continuing using vertical pump wells in the lower aquifer as drains.
 - (g) For the given prototype conditions, tile ground-water drains will not intercept and discharge fresh water if the lower aquifer contains salt water. The fresh water tends to drive the salt water ahead of it to the drain.
 - (h) Progress Report No. 2 in preparation.
- (5329) INVESTIGATION OF A SEEPAGE METER DESIGNED BY THE AGRICULTURAL RESEARCH SERVICE.
 - (b)
 - Laboratory project. Laboratory and field investigation; experi-(d) mental.
 - (e) The purpose of the study is to investigate the accuracy and dependability of the meter which uses a variable-head technique for seepage measurement.
 - Laboratory and simulated field measurements (g) produced apparently satisfactory results, but more data is required before meter accuracy and dependability can be stated.
 - (h) "Progress Report-Investigations of a Seepage Meter Designed by the Agricultural Research Service-Lower Cost Canal Program," by C. E. Brockway, Hydraulics Branch Report No. Hyd-529, June 1964.
- (5330) FRICTION LOSSES IN LARGE TUNNELS AND PIPES.
 - Field project.
 - (d (e Field investigation; design. The purpose is to provide design information on surface resistance coefficients for various sizes of pressure conduits. Piezometers for head loss measurements are
 - installed during construction of the conduit

- or at the time of the measurements. (g) Resistance coefficients were measured on 36-, 42-, and 48-inch-diameter cast-in-place concrete pipe and on an 18-foot-diameter concrete tunnel with satisfactory results.
- "Flow Resistance Coefficients of Three Sizes of Cast-In-Place Concrete Pipe," by C. E. Brockway, Hydraulics Branch Report (h) No. Hyd-533, August 1964.
- INVESTIGATION OF THE EFFECT OF TURNOUT GEOMETRY ON THE ACCURACY OF A PROPELLER-TYPE OPEN FLOW METER. (5331)
 - Laboratory project. (b) (d)
 - Experimental; for design. The purpose of the investigation was to determine whether a change in the design of outlet structures for open flow meters from a relatively unconfined outlet to a confined outlet changed the registration accuracy of the meter. Completed.
 - Results indicate that a confinement just (g)large enough to pass the design discharge of the turnout did not significantly change the meter registration accuracy.
 - (h) Report in preparation.
- (5332) OROVILLE DAM POWERPLANT INTAKE GATE DOWNPULL.
 - California Department of Water Resources. California Department of Water Resources, (b) (c)
 - Sacramento 2, Calif. Experimental; for design. A 1:24 scale hydraulic model was used to
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ determine downpull forces that would occur on the 21- by 34-foot powerplant intake coaster gates during emergency closures under full powerplant operation. The pressure area method of determining downpull was used.

 - (f) Completed. (g) A maximum downpull force of about 376,000 pounds will occur. No uplift was en-countered. A method of computing turbine discharge with the wicket gates moving to full open as the head is reduced during closure of the intake gates is presented. Dimensionless downpull and discharge
 - Coefficients are also included. "Hydraulic Model Studies of the Hydraulic Downpull Forces on the Oroville Intake Gates," by K. G. Bucher, Hydraulics Branch Report No. Hyd-540, Sept. 1964. (h)
- (5333) FLOW-INDUCED VIBRATIONS IN USBR STRUCTURE.
 - $\begin{pmatrix} b \\ d \end{pmatrix}$
 - Laboratory project. Experimental and field investigations; for design.
 - (e) A compilation and discussion of a variety of vibration problems induced in Bureau structures by flowing fluids was made. Vibration problems encountered in radial gates, turbine runners, turbine draft tubes, pump discharge lines, pipeline distribution systems, and overfalling nappes are presented.
 - Completed.
 - $\left(g \right)$ Results show that an awareness of the problems and phenomena involved make it possible to avoid most flow induced vibration problems.
 - "Experiences of the Bureau of Reclamation (h) With Flow-Induced Vibrations," by W. P. Simmons, Hydraulics Branch Report No. Hyd-538, Sept. 1964.
- (5334) SUDDEN ENLARGEMENT ENERGY DISSIPATORS.
 - Laboratory project.
 - Experimental; for design. Limited studies under high heads were made to determine the effectiveness of a sudden (d) (e)enlargement type energy dissipator downstream from an 8-inch gate valve. The enlarged section started at the downstream flange of
 - a 250 psi valve and was 16 inches in diam-eter by 80 inches long. Heads up to 600

feet were imposed on the valve, which was operated over a range of openings. Back pressures of 1 to 7 feet were maintained on the enlargement downstream. Tests were made with and without admission of air into the upstream end of the enlargement.

- (f) Fresent phase completed.
 (g) Results showed that excellent energy dissipation was achieved in the sudden enlargement section, and that very small back pressures of 1 to 7 feet were sufficient to hold the enlargement full of water.
 (b) Studies of a Sudden Enlargement
- Gate Valve," by W. P. Simmons, Hydraulics Branch Report No. Hyd-535, August, 1964.
- (5335) HIGH PRESSURE SLIDE GATE STUDIES FOR RUEDI AND MORROW POINT DAM OUTLET WORKS.
 - (b)
 - (d)
 - Laboratory project. Experimental; for design. A 1:9 scale model is being used to determine operating characteristics and pressure conditions on slide gates to be used for regulation at heads up to 355 feet. The flow passages of the gates slope downward 30° in the direction of flow, and the gate leaves and bonnets are vertical. Effects of flaring the sidewalls immediately down-stream from the leaf are being studied.
 - Preliminary studies show that a gate slot design used very successfully on gates with horizontal flow passages and vertical leaves (g) horizontal flow passages and vertical leaves is not satisfactory for gates with 30° sloping passages and vertical leaves. Also, flaring the downstream walls in the normal fashion just downstream from the leaf leads to extremely subatmospheric pressure con-ditions and cavitation. By offsetting the walls abruptly 3 or 4 inches outward a very short distance downstream from the leaves, an excellent design with either parallel or excellent design with either parallel or diverging downstream walls is apparently obtained.
- (5336) BUTTERFLY VALVE STUDIES WITH CAVITATION OCCURRING.

 - Laboratory project. Experimental; for design. A commercial 8-inch, 125 psi butterfly valve is being tested under portotype head to determine the effects on cavitation charactertatics, air demand, and discharge coefficients that result from discharging the valve di-rectly into sudden enlargements, or through short conduits into the enlargements. Tests are made with and without the admission of air, and quantities of air needed to just quiet the cavitation are being obtained. Effects of air admission on the discharge coefficient are also being obtained.
 - (g) Preliminary results show that satisfactory pressure reducing stations for high dif-ferential heads and low back pressures can be obtained with butterfly valves if the valves discharge directly into a 2.0 dia enlargement. Air in sufficient quantities to relieve cavitation when the discharge short sections of pipe, has little effect upon the discharge coefficient.
- (5337) PRESSURE RELIEF PANELS FOR OROVILLE DAM POWER (5341) GRANBY DAM SPILLWAY. PLANT INTAKE TOWERS.

 - (b) California Dept. of Water Resources.
 (c) California Dept. of Water Resources, Sacramento 2, Calif.
 (d) Experimental; for design.
 (e) The 40- by 42-foot temperature control subtrant for the for the former and set of the forme The 40- by 42-100t temperature control shutters for the inclined intake towers are designed to withstand a maximum head dif-ferential of 5 feet of water. Under maximum discharge through the power plant the head differential across the shutters will be 3 feet. Surges caused by power plant demand fluctuations, or removal or replacement of temperature control shutters, could cause

pressures across the shutters in excess of the design maximum allowable.

- (f) Completed. (g) Relief panels have been designed which will open under a head differential of 3 1/2 from recommended panel was calibrated feet. The recommended panel was calibrated to determine the number of panels required to furnish the discharge demand of the power plant for a maximum head differential of 5 feet of water.
- (h) Report in preparation.
- (5338) LABORATORY TESTS OF GATE SEALS UNDER PROTO-TYPE HEADS.
 - (b) Laboratory project.
 - Experimental; for design A facility for testing gate seals under heads of up to 200 feet was used on two similar double stem rubber gate seals. One seal bulb was capped with terion and the other was uncapped. The program consisted of extrusion (d) (e) tests under sustained load, and tests with relative motion to determine the seals action
 - relative motion to determine the seals action as it approached, touched, and moved on the seat. A new facility is being designed to test seals at heads of approximately 600 feet.
 (g) The teflon cap added to the rigidity of the seal and prevented much of the distortion noted with the uncapped seal. Also, when the seal was moved relative to the seat, the teflon cap prevented the seal from being pinched between the clamp bar and seal seat.
 - (5339) MODEL-PROTOTYPE CORRELATION OF AIR DEMAND.

 - Field tests and laboratory project. Theoretical and experimental; applied research. Easic parameters are being developed to cor-relate model results with prototype measure-ments for the flow of air in a closed conduit partially filled with moving water. Proto-(b) (d) (e) type measurements are essentially complete. Laboratory tests are beginning in a variable slope, enclosed, rectangular channel. The mean air velocity and turbulence intensity of the air stream will be measured for various water velocitites, various water depths and various pressure gradients.
 - (5340) RUEDI DAM SPILLWAY AND OUTLET WORKS.
 - Laboratory project.
 - Experimental; for design.
 - A 1:42 scale model was built to verify the hydraulic design of the spillway crest, chute, and stilling basin; the junction of the auxiliary outlet works with the spillway (e) auxiliary outlet works with the spillway chute; the outlet works stilling basin; a bypass flume and stilling basin; and to in-vestigate the required geometry and extent of downstream river channel improvement.
 - (f) Completed.
 (g) Flow conditions_throughout the structure were Flow conditions throughout the structure were satisfactory. Erosion tests indicated that additional riprap was necessary near the by-pass basin but that little or no riprap was necessary in the river channel. In other areas the specified riprap was adequate. "Hydraulic Model Studies of Ruedi Dam Spillway and Outlet Works," by U. J. Dalde Underwide Decet No. Und

 - (b) Bureau of Ships; David Taylor Model Basin. Hydrodynamic research.
 - (d) (e) Investigations of the characteristics of underwater noise associated with various hydrodynamic phenomena such as cavitation, bubble oscillations, surface disturbances, turbulence, and unsteady flow. Attention is now being given to measurement of spectra and space-time correlations of pressure fluotuations on walls adjacent to turbulent flows, such as curved plate boundary layer flows, turbulent boundary layers on buoyancy propelled bodies, and fully turbulent pipe
 - flows. (g) Boundary layer pressure fluctuations on wall of three inch diameter pipe with air flow, have been determined with particular attention given to the low frequencies.
- (1783) MATHEMATICAL SHIP LINES.
 - Bureau of Ships; David Taylor Model Basin. (b) (d) Theoretical research. Development of a suitable method for the
 - (e) mathematical determination of ship lines which can be applied to a wide variety of ship forms especially to those of modern design.
 - Inactive.
 - (g) A method has been developed for the mathematical fairing of graphical lines. This is a first step toward the development of a flexible system of mathematical ship lines. Future work is directed toward the development of a system of mathematical lines which will permit the derivation of a hull form for a given set of parameters.
- (1786) STUDIES OF THE SLAMMING OF SHIPS.
 - Bureau of Ships; David Taylor Model Basin. Experimental and theoretical basic research.
 - (a) (e)Phase 1: Statistical study to clarify the
 - basic nature of slamming phenomenon experienced by a ship in rough seas and to develop a method for predicting the frequency of occurrence of slamming as well as its severity. Phase 2: Computations and measurements of the pressure distribution and impact forces on the bottoms of slamming ship for the pur-pose of developing criteria to effect their reduction.
 - (f) Phase 1: Active. Phase 2: Partially completed.
 - (g) Phase 1: Basic nature of ship slamming phenomenon has been clarified by conducting tests on a MARINER model. Effects of sea severity, ship speed, course angle, and load-ing conditions on slamming were obtained. A theory for predicting the frequency of occurrence and severity of slamming has been developed. Phase 2: A theory which is applicable to almost any practical ship forebody section has been developed for determining impact force and pressures on ship's bottom during slamming. A two-dimensional drop test to evaluate the effect of sectional form on impact pressure was conducted for three different ship forms ranging from extreme U to extreme V form. A comparison between theoretical and experimental results was
 - theoretical and experimental results was made on impact pressure.

Bledsoe. Fourth Symposium on Naval Hydrodynamics, August 1962. "Two-dimensional Experiments on the Effect of Hull Forms on Hydrodynamic Impact", in preparation.

- (2229) NEAR SURFACE EFFECTS.
 - Bureau of Ships; David Taylor Model Basin. (b) Bureau of Ships; David
 (d) Hydrodynamic research.
 (e) A mathematical study o

 - A mathematical study of the forces and moments acting on bodies due to the proximity of a free surface. The studies in-clude both the case in which the surface The studies inis initially undisturbed and the case in which there are disturbances originating at a distance. Experiments are being conducted to verify the theoretical developments.
 - (g) Methods were developed for computing the forces and moments acting on bodies of revolution, both due to waves generated by the body itself and to regular trains of waves. Experiments with a spheroid of waves. Experiments with a spheroid moving under waves largely confirmed the theory except in following seas. The damping forces on a submerged translating ellipsoid which is oscillating in any of its six degrees of freedom have been developed theoretically. The effect of tank walls has been evaluated theoretically as well.

Theoretical methods have been developed for the determination of wave resistance of floating bodies in steady motion from wave measurements along a parallel cut. The first and second order diffraction and radiation forces acting on a submerged twodimensional circular cylinder have been developed and computations have been made. Analytic expressions have been obtained for arbitrary bodies relating the radiation and diffraction forces to each other. For a submerged, translating, two-dimensional cylinder, it has been shown that secondorder forces due to nonlinearity of the free surface boundary conditions are comparable to second order forces resulting from exact satisfaction of the body boundary conditions. Formulas have been derived for the sinkage and trim of ships moving in shallow water. These agree well with experiments except for speeds near to the shallow water

- critical speed. (2230) THEORY OF SEAWORTHINESS.
 - Bureau of Ships; David Taylor Model Basin.
 - (d)
 - Hydrodynamic research. A theoretical study, with experimental confirmation, of the factors affecting the seaworthiness of ships, for the purpose of developing procedures for predicting their (e) motions.
 - Theoretical results for ship motions based on the "thin-ship" idealization have gen-erally proved to be either inaccurate or (g) incomplete. Recent results from application of slender body theory have shown good agreement with experiments at zero speed of advance. The corresponding theory has been developed for non-zero speeds, but calculations have not yet been made, and so it is not known whether the success at zero speed can be extended to the more general situation. Improved methods of testing ship models have been developed, and the entire frequency response of a ship at a single speed can be determined from one test run. The obtained by a very general theoretical approach. These equations are characapproach. These equations are charac-terized by the appearance of convolution integrals involving the entire past history of the motion; they are free of the usual frequency-dependent coefficients. Tests have been conducted to characterize the dynamics of a ship, relating the

kernels of these convolution integrals to the common added mass and damping coefficients. A survey of ship-motion theory has been prepared.

- (4427) A METHOD OF CALCULATING SPINDLE TORQUE OF CONTROLLABLE PITCH PROPELLERS.
 - David Taylor Model Basin.
 - Theoretical; applied research. A method of calculating the spindle torque of a controllable pitch propeller over the com-plete range of operating conditions and a theoretical investigation of the effect of (a) various design parameters upon spindle torque. In order to calculate spindle torque at off design conditions, the off design performance of the controllable pitch propeller must first be determined.
 - (g) A method of calculating the spindle torque at design conditions has been completed. The geometric problem of determing the effective distortion of blade sections at off design The pitch settings has been solved. The solution has been programmed for the 7090 Computer.
- (4428) COMPUTER SOLUTIONS OF FREE SURFACE FORCES.
 - Bureau of Ships; David Taylor Model Basin. Hydrodynamic research. (b) (d) (e)
 - The linearized potential problem of a body oscillating on the free surface will be solved directly on a digital computer by distributing pulsating sources over the surface of the body and calculating the required source density. The individual source potentials are chosen to satisfy the free
 - (g) The integral equations for the case of two dimensional bodies have been approximated by algebraic equations. Solutions have been obtained for heave, sway, and roll motions of several bodies. Forces and moments have been calculated.
- (4429) LATERAL FORCES.
 - Bureau of Ships; David Taylor Model Basin.
 - Bureau of Ships; David Taylor Model Basin. Hydrodynamic research. The lateral force on a translating body which vertically cuts the free surface is being formulated theoretically. Two special cases are included: (a) If the draft is large compared to the length, the body is a strut with angle of attack. (b) If the draft is very small, the body corresponds to a yawed thin ship. $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Suspended.
 - An integral equation has been derived for the density of a surface distribution of dipoles, such that the boundary conditons are satis-(g) fled.
- (4809) TURBULENT BOUNDARY LAYERS IN PRESSURE GRADIENTS ON ROUGH SURFACES.
 - (b) Laboratory project, David Taylor Model Basin.
 (d) Theoretical and experimental; basic and applied research.
 - Research in behavior of turbulent boundary layers in pressure gradients leading to separation. Initial roughnesses will be screens of various gages fastened to wall of wind tunnel. Velocity surveys and (e)

- turbulence measurements will be performed. (g) Data have been obtained, with one wall thickness, at moderate and high pressure gradients and at zero pressure gradient. Boundary layer velocity profiles were obtained with a pitot tube and hot wire. Longitudinal turbulent intensities were measured with a hot wire. Measurements were made at numerous longitudinal positions along the wall. Measurements are now in progress with a high pressure gradient with induced separation.
- (4810) SHIP WAKE SIMULATION STUDIES.
 - (b) Bureau of Ships; David Taylor Model Basin.
 (d) Experimental and theoretical; applied research.
 - (e) To produce ship wake distributions in a ariable pressure water tunnel in order to determine the performance of propellers in non-uniform wake flows.
 - A theoretical method has been obtained for (g) determining the wire grid geometry necessary to produce arbitrary, steady, three-dimen-sional flows. Simple experimental confirmation of the method has been obtained.
- (4811) STEADY-STATE FORCES ON SUPERCAVITATING AND VENTILATED HYDROFOILS.
 - (b) (d) Bureau of Ships; David Taylor Model Basin. Theoretical and experimental; applied
 - research.
 - (e) To study the steady-state lift and drag (e) To study the steady-state int and drag characteristics of supercavitating hydrofoil configurations for application to hydrofoil craft and supercavitating propeller design.
 (g) Experimental determination of the lift and drag of various three-dimensional super-cavitating hydrofoils is in converse.
 - cavitating hydrofoils is in progress. These include foils with 2-term, 5-term and flat-These faced sections. The effects of aspect-ratio and taper are being investigated. Venti-lation by blowing air through holes in the suction surface of the foil is used to extend the range of cavitation number. Future research includes the determination of two-dimensional lift and drag, studies of flap configurations and measurement of the interaction of tandem and cascade foils.

 - Bureau of Ships; David Taylor Model Basin. Theoretical and experimental; applied (d)
 - research. (e) To develop a design method for ducted
 - propellers and to conduct a parametric study of ducted propeller performance. A theory of the ducted propeller with finite
 - (g) A cheery of blades has been developed. From this theory a design method will be devel-oped and then a parametric study of ducted propeller performance will be conducted.
- (4814) POWERING IN WAVES.

- Bureau of Ships; David Taylor Model Basin. (b) (d)
- Experimental. To determine the powering characteristics and speed loss of ships in waves by con-(e) ducting model tests in regular and irregular waves. Limitations of present procedures for predicting power and speed loss in a seaway from tests in regular waves will be determined and new techniques will . be developed where necessary.
- (f) Cancelled.
- (4815) PARAMETRIC STUDIES.
 - Bureau of Ships; David Taylor Model Basin. (b) (d)Experimental.
 - (e) To provide basic information from which the most suitable destroyer form for high sustained sea speeds in a seaway can be established. Model tests will be conducted in regular and irregular seas using a series of models for which the significant geometric parameters are systematically varied. Motions and powering increase in waves will be studied.
 - (f) Cancelled.
- (4816) FUNDAMENTAL PROPERTIES OF SHIP ROLLING.
 - (b)
 - Bureau of Ships; David Taylor Model Basin. Experimental and theoretical. Though extensive studies of rolling have d) (e) been made in recent years, a great deal remains to be learned concerning the fundamental properties of rolling for both surface ships and submarines. Areas which require additional research are (1) applicability of superposition principle for rolling motion especially in short crested waves, (2) unstable rolling motion in o-blique regular and in irregular waves, (3) In order to clarify the fundamental nature of rolling, forced oscillation tests as well as model tests in regular and irregular waves will be conducted. Parameters significant for roll will be investigated.
- (5121) SERIES 60 PROPELLER INDUCED VIBRATION.
 - David Taylor Model Basin. (b)
 - Experimental; basic research. (d) lel Measurement of propeller induced vibratory forces to study the effect of fore and aft clearance in the propeller aperture of the of blades and the tip clearance will also be determined. In addition, the pressure transmitted and shaft transmitted forces will be measured independently to determine the significance of each. The instrumentation and test techniques for measuring the propeller induced vibratory
 - (g) forces on a single screw ship model has been developed sufficiently to obtain repetitive results. Although there is insufficient information available to permit extrapolation to full scale forces, comparison of test results of models of similar type and dimensions appears valid. Measurements of instantaneous pressures have been made on the hull of the SS Esso GETTYSBURG. This data are being analyzed and it is anticipated that correlation will be performed through model tests.
- (5122) FLOW VISUALIZATION STUDIES.
 - Bureau of Ships; David Taylor Model Basin. d
 - Experimental; applied research. To visually determine in water the effect of boundary-layer growth and trailing edge geometry on separation, and the mechanism of vortex shedding, from stationary and oscil-lating hydrofoil shapes.
 - (g) The hydrogen bubble visualization technique has been adopted to the 12-INCH water tunnel and preliminary flow studies have been made on a number of two-dimensional bodies. The

experiments are being extended to study vortex shedding from stationary foils having different trailing edge geometrics.

- (5123) THE EFFECT OF GAS NUCLEI ON CAVITATION.
 - Bureau of Ships; David Taylor Model Basin. (b)
 - (d)
 - Experimental; applied research. To determine the effect of gas nuclei on the (e)inception of cavitation.
 - Acoustic techniques to measure the distri-(g) bution and size of nuclei are being studied, and one will be applied to the water tunnels at DTMB. Cavitation inception studies will be made for a simple body and propellers and the results correlated with gas nuclei content of the water.
- (5124) PROPELLER OSCILLATING PRESSURE FIELD.
 - Bureau of Ships; David Taylor Model Basin. (b)
 - (a)
 - Experimental; applied research. To experimentally determine the oscillating (e) pressure field about marine propellers and correlate these measurements with theoretical predictions.
 - (g) Pressures have been measured on a flat plate parallel to the axis of two propellers, one a propeller of conventional design and the other of double blade thickness, in both uniform and non-uniform flow.
- (5125) HYDRODYNAMICALLY EXCITED PROPELLER SINGING.
 - Bureau of Ships; David Taylor Model Basin.
 - (d)
 - Experimental; applied research. To determine the characteristics of flow (e) induced propeller singing and investigate methods to suppress singing.
 - (g) Tests on a model propeller have demonstrated the feasibility of studying singing at model scale by suitable trailing edge modifications. The investigation will be extended to determine the applicability of two-dimensional flow-excited vibration data to propeller blades and to study the influence of variations in trailing edge geometry and other
 - design parameters on propeller singing. "Vortex Induced Propeller Blade Vibration: Some Aspects of the Problem", R. A. Cumming, TMB Report 1838, June 1964. (h)
- (5126) CAVITATION INCEPTION ON A ROUGH SURFACE.
 - Bureau of Ships; David Taylor Model Basin.
 - Experimental and theoretical; applied research. (d) (e) An investigation of cavitation inception over isolated three-dimensional roughness elements on a flat plate as a function of boundarylayer parameters, pressure gradient, geometry and size of the roughness elements, etc. Theoretical studies will attempt to establish sealing laws for cavitation.
 - (g) Equipment has been built and assembled. Testing will start toward the end of 1964.
- (5127) INTERACTION FORCES BETWEEN LIFTING SURFACES.
 - Bureau of Ships; David Taylor Model Basin.
 - (d) Theoretical; applied research. (e) A two-dimensional theory for determining the forces and moments acting on two lifting
 - surfaces as one passes through the wake of the other will be developed. This theory will be applied to the prediction of propellerappendage interaction forces on a ship. The theoretical analysis has been formulated (g)
 - and a computer program for solving the integral equations is being written in FORTRAN.
- (5128) BOUNDARY-LAYER STUDIES.
 - (b) David Taylor Model Basin; basic and applied research.
 - Theoretical and experimental; basic and applied (d) research.
 - Studies of boundary-layer phenomena important (e) to naval hydrodynamics; methods of reducing frictional resistance, prediction of transition

from laminar to turbulent flow for bodies of revolution.

- (5324) CAVITY FLOW STUDIES.
 - (b)
 - Bureau of Ships; David Taylor Model Basin. Experimental and theoretical, basic research. A study of the vortex shedding phenomenon (d) (e)
 - recently observed in fully cavitating flow. The study comprises (1) The experimental in-vestigation of the dependence on cavitation number and ventilation index of a modified Strouhaul number for simple two-dimensional bodies; (2) the development of a new mathe-matical model for cavity flows; and (3) the investigation of the relationship between vortex shedding and hydrofoil oscillation. The purpose is to gain more understanding of cavity flows.

U. S. DEPARTMENT OF THE NAVY, NAVAL BOILER AND TURBINE LABORATORY.

- (3623) HIGH PRESSURE-TEMPERATURE WATER FLOW METER CALIBRATION.
 - (b) Bureau of Ships; Philadelphia Naval Shipyard (Naval Boiler and Turbine Laboratory).
 - (Navai Boller and Turbine Laboratory).
 (c) Mr. J. W. Murdock, Associate Technical Director for Applied Physics Division, Naval Boiler and Turbine Laboratory, Phila. Naval Shipyard, Phila. 12, Pennsylvania.
 (d) Experimental; applied research.
 - (d) Experimental; applied research.
 (e) A facility is available for calibrating with water at pressures and temperatures up to 2500 psi and 600 F respectively. Capacity is 100 gpm at maximum pressure and temper-ature and greater at lower pressures and temperatures. After flowing through the metering section the water is cooled and weighed. The facility is also used to investigate and verify orifice meter coefficients at pressures and temperatures above those at which the coefficients in use were established. A number of flow meters which measure the flow in nuclear reactor loops have been calibrated.
 - Inactive.
 - (f) Inactive. (g) A limited amount of test data indicate good agreement between orifice flow rates obtained by calibration at high pressures and temperatures and those obtained by extrapolating from cold water calibrations. Other meter tests show the need to include suitable corrections for change in shape, size, densitty, etc.
- (3624) INVESTIGATION OF ELBOW FLOW METERS.
 - (b) Bureau of Ships; Philadelphia Naval Shipyard; (Naval Boiler and Turbine Laboratory).
 - Mr. J. W. Murdock, Head, Applied Physics Division, Naval Boller and Turbine Lab., Phila. Naval Shipyard, Phila. 12, Pa. Experimental, applied research. The 90 degree elbow has been proposed for (c) $\begin{pmatrix} d \\ e \end{pmatrix}$
 - metering flow in shipboard systems. This type meter is attractive since the use of an existing elbow would not require any changes to the piping and would impose no additional pressure drop on the system. In addition, the elbow can meter reverse flow. The chief drawbacks are large variation in elbows and the lack of an exact relationship between flow and differential pressure. degree, type A elbows of Specification MIL-F-1183 to establish criteria for their installation and use. Completed.
 - $\begin{pmatrix} f \\ g \end{pmatrix}$ When certain standards are imposed on the fabrication and measurement of the elbows

and a specified means of computing flow is used, a measurement tolerance of 4 percent can be expected. In control applications the elbow meter was found to have a square root

- transfer function and a repeatability of 0.%. "Performance Characteristics of Elbow Flow Meters", Transactions of the ASME, Journal of Basic Engineering, Vol. 86, No. 3, 498-506 Cont. 1964 (h) No. 3, 498-506, Sept. 1964.
- (4001) HIGH PRESSURE STEAM AND WATER FLOW TESTS.

 (c) Research Committee on Fluid Meters, American Society of Mechanical Engineers, 345 East Forty-Seventh Street, New York 17, New York.
 (d) Experimental; applied research.
 (e) Although the ASME Research Committee on
 - Fluid Meters has sponsored many fundamental research programs dealing with the development of basic constants used with primary elements, hardly any of this work has been done on steam flow at high pressures and temperatures. Neither has research been dore on high temperature water flow. Analysis of many tests indicate that the basic calibrations obtained with low temperature water (air and gas) could be extrapolated with high accuracy to the measurement of high pressure and temperature steam and water flow provided suitable corrections were made for the change in the shape and size of the primary element, the pipe and the fluid. This procedure has been ex-perimentally verified for steam up to 2000 psi and 1050 F and for water to 2500 psi and 600 F.

 - (f) Completed. (g) Nozzles and orifices were calibrated with Nozzles and orlilices were callorated with water at 240 F, 2200 psia, and with steam at 1050 F, 2000 psia. Pipe Reynolds numbers averaged 600,000 for the water and 4,000,000 for the steam. Coefficients were generally in agreement with ASME predicted coefficients. Two and a quarter percent (2 1/4%) chrome-molybdenum steel proved unsatisfactory for the steam proved unsatisfactory for the steam nozzles showing rusting and pitting after less than 10 hours. Type 430 stainless steel was substituted and was satisfactory.
 - Final report to be presented during Nov.-Dec. annual meeting of ASME Fluid Meters Committee, (ASME Paper No. 64-WA/FM-4. (h)
- (5286) MEASUREMENT OF ACOUSTIC VELOCITY OF STEAM.
 - (b) Joint research project, Naval Boiler and Turbine Laboratory and Office of Naval Research.
 - (c) Mr. J. W. Murdock, Head, Applied Physics Division, Naval Boiler and Turbine Lab-oratory, Phila. Naval Shipyard, Phila., oratory, P Pa. 19112.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Experimental; basic research. Objective is to obtain precise knowledge of acoustic velocity values for steam in liquid-vapor and vapor phase. Data will be obtained with steam pressures and temperatures up to 5000 psi and 800F respectively.

- U. S. NAVAL ORDNANCE LABORATORY.
- (4867) THE HYDROBALLISTICS OF WATER ENTRY.
 - (b) Bureau of Naval Weapons, Department of the Navy.
 - (c) Commander, U. S. Naval Ordnance Laboratory White Oak, Silver Spring, Maryland.
 (d) Experimental, theoretical, basic and
 - applied research.
 - (e) The purpose is to study high velocity water entry as related directly or indirectly to the behavior of missiles. The study includes the stability and forces during the entry, cavity development and pressure, and the missile trajectory. A wide range of developmental and research configurations

and of esperimental conditions are investigated. Guns are used to launch models into a tank equipped for operation at various pressures. A large tank facility is being constructed for experimental projects such as water entry, water exit, and trajectory studies. In this tank the pressure of the gas above the water will be reducible for water-entry scaling.

U. S. NAVAL ORDNANCE TEST STATION.

(4002) MISSILE BEHAVIOR DURING WATER EXIT.

(b) Bureau of Naval Weapons, Navy Department. Commander, U. S. Naval Ordnance Test Station, Attn: Dr. John G. Waugh, Code P8074, 3202 E. Foothill Blvd., Pasadena, (c) California.

- (d) Experimental; basic research.
 (e) The objectives of this project are as follows:
 (l) To study missile water-exit behavior and associated phenomena under different conditions to determine if problems exist in missile water-exit technology and to establish scaling techniques for modeling establish scaling techniques for modeling missile water-exit behavior. (2) To evaluate qualitatively the inherent value of slenderbody theory in predicting the underwater and water-exit behavior of an underwater launched missle in the presence of various sea states. (g) Studies have been made on the water-exit
- behavior of a momentum-propelled 2-inch-diameter hemisphere-head missile under different degrees of cavitation, ranging from fully wetted to fully cavitating, and for a range of trajectory water-exit angles. The results indicate that considerable perturbations in missile pitch and pitch velocity take place at water exit, and it is inferred that problems may exist in missile water-exit technology. The experimental fully-wetted flight and water-exit behavior of a blunt based axi-symmetric missile traveling in a standing wave are simulated on an analogue computer using motion equations derived from slenderbody theory. The analytical approach is supplemented by introducing experimental hydrodynamic coefficients and transverse drag terms. The results of the simulation are compared graphically with the experimental behavior to illustrate an upper limit of the accuracy to be expected of slender-body theory.

 (d) Theoretical experied measures
 - Theoretical; applied research. This project is concerned with solutions to the boundary flow equations for various (d) (e) mathematical models which may be used to describe a shrouded or ducted propeller system. The models under investigation assume an inlet velocity profile and involve iterative solutions to the boundary con-dition on central bodies and shrouds with camber and thickness. The iterations also include the effects of a finite bladed propeller on the boundary condition for both the shroud and central body. The

solution represented by the source and vortex density describing the boundary flow equations is then used to solve the equations describing the induced flow

through the model.(g) Computer programs are available on an IBM 7094 describing the effects of shroud camber, thickness and the average propeller velocities on the shroud loading and shroudinduced flow.

Forces on Isolated Ring Wings at Angle of Attack, " J. F. Reynolds, NAVWEPS Report 8667, NOTS TP 3714.

- (4919) RELATIVE FLOW AT LIFTING LINE FOR COUNTER ROTATING PROPELLERS.
 - (b) Bureau of Naval Weapons, Navy Department.
 (c) Commander, U. S. Naval Ordnance Test Station, Attn: Mr. David M. Nelson, Code P8074, 3202 East Foothill Blvd., Pasadena, Calif. Theoretical; applied research.
 - (e) A theoretical means for determining the relative flow at the lifting line for counter rotating propellers is being developed and programmed for an IBM 7090 computer. This wake-adapted propellers. The induced velowake-adapted propellers. The induced velo-cities at the lifting line arising from the effect of the front or rear propeller on itself are determined by a slightly modified version of the induction factor method developed by Lerbs.* The mean axial velo-cities at one propeller induced by the other are determined by replacing the finitely bladed propeller by an infinitely bladed propeller having the same radial thrust distribution and operating in the same wake distribution and operating in the same wake. The mean tangential velocities at the rear determined by Stokes' theorem. The effect of the tapering afterbody on which the propellers are located is approximately accounted for by continuity consideration. continuity consideration. "Moderately Loaded Propellers with a Finite Number of Blades and Arbitrary Distribution of Circulation," by G. W. Lerbs, Trans. SNAME, Vol. 60, 1952, pp. 73-117. Completed.
 - This work is being incorporated into a lifting-surface propeller design method for counter-(g) rotating propellers which is described in another section.
- (4920) UNDERWATER GAS-JET PROPULSION STUDY.
 - Bureau of Naval Weapons, Dept. of the Navy. Commander, U. S. Naval Ordnance Test Station, 3202 E. Foothill Blvd. Pasadena 8, Calif. (b) (c) Attn: H. V. L. Patrick or T. G. Lang, Code P5006.
 - Experimental; applied research. The thrust and efficiency of a submerged supersonic gas-jet propulsion system will be studied on a model propelled by a solid propellant grain generating hot gas at 4,000 psi exhausted through four nozzles along its afterbody. The efficiency of the momentum exchance with the suprounding variar will be $\begin{pmatrix} d \\ e \end{pmatrix}$ exchange with the surrounding water will be studied in an effort to increase the normally low propulsion efficiency of high speed jets.
 - (g) The test model has been constructed and statically fired. Propulsion tests at speeds to 40 knots in a ring channel are scheduled.
- (5381) BASE-VENTED TORPEDO STUDY.
 - $\begin{pmatrix} b \\ c \end{pmatrix}$ Bureau of Naval Weapons, Dept. of the Navy. Eureau of Naval Weapons, Dept. of the Navy. Commander, U. S. Naval Ordnance Test Station, Attn: H. V. L. Patrick or T. G. Lang, Code P5006, 3202 E. Foothill Boulevard, Pasadena 8, California. Experimental; applied research. The drag of several truncated torpedo models with air exhausted through their bases is

 - measured as a function of gas flow rate, water tunnel speed, and angle of attack. Cavity pressure is also measured. Completed.
 - The drag of all models remained the same as that of a streamlined model for truncations up to 90% of the maximum diameter, one of the models was fully base vented.
 - (h) Two reports in process.
- (5382) DROP TESTS OF OBJECTS IN A HIGH-POLYMER SOLUTION.
 - (b) Bureau of Naval Weapons, Dept. of the Navy.

- (c) Commander, U. S. Naval Ordnance Test Station, Atn: H. V. L. Patrick or T. G. Lang, Code P5006, M. A. Ruszczycky, Code P6076, 3202 E. Foothill Boulevard, Pasadena 8, California.
- $\begin{pmatrix} d \\ e \end{pmatrix}$
- Pasadena 8, California. Experimental; applied research. In the first experiments,twenty-five small objects were dropped in a tank of water with zero, 200, and 1000 wppm of Polyox additive. The majority of the objects were spheres and cones. A second series of tests has been completed to determine of tests has been completed to determine whether high-polymer solutions, in relatively high concentrations, (up to 1.5%), affect the velocity of steel spheres falling at laminar-separation flow conditions.
- (g) In the first series of tests the drag of spheres up to a 1-inch diameter remained unspheres up to a 1-inch diameter remained un-affected, as was the drag of the cones. The drag of spheres ranging from 1 to 2-1/2 inches in diameter was reduced up to 40%; however, significant wall interference occurred so the results are difficult to interpret with-out additional information. In the second series, different diameter spheres dropped in high-polymer solutions showed definite velocity increases over that obtained in In high-polymer solutions showed defined in water. Within the sphere sizes tested, the apparent drag reduction noted was 33.5%. The increased viscosity effect accounts for only about 18% reduction in drag. The highest Reynolds number reached in the tests was $5.19 \times 10^{\circ}$, based on water; and from this it was concluded that all the steel spheres in the tests experienced laminar-separation flow only. "Sphere Drop Tests in High Polymer Solutions"

- COLLAPSE OF GAS FILLED BUBBLES AGAINST A (5383) RIGID BOUNDARY.
 - (b) (c)
 - Bureau of Naval Weapons, Dept. of the Navy. Commander, U. S. Naval Ordnance Test Station, Attn: A. O. Musolf, Code P8076, 3202 E. Foothill Boulevard, Pasadena 8, Calif. Experimental research. (d)
 - (e) The investigation of a high velocity water jet formed during the collapse of small cavitation bubbles is extended to larger, 6-inch maximum diameter, explosively formed bubbles. High speed motion pictures and resilient boundaries clearly show that the jet is capable of imparting a large force to the boundary.
 - (f) Work is partially completed.
- (5384) LIFTING-SURFACE DESIGN METHOD FOR COUNTER-ROTATING PROPELLERS.
 - Bureau of Naval Weapons, Dept. of the Navy. Commander, U. S. Naval Ordnance Test Station, Attn: Mr. David M. Nelson, Code F8074, 3202 E. Foothill Blvd., Pasadena 8, (b) (c) Calif.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Theoretical; applied research. The lifting-surface propeller design method for single-rotating propellers developed at the U. S. Naval Ordnance Test Station is being extended to counter-rotating propellers. The lifting line solution for counter-rotating as the starting point for the lifting surface solution. The camber lines and pitch angles are computed as for the single-rotating propeller except the variation across the chord of the axial component of the inter-ference velocities (velocities induced at
 - one propeller by the other) is accounted for. "A Lifting Surface Propeller Design Method for High Speed Computers," by D. M. Nelson. NAVWEPS Report 8442, NOTS TP 3399, U. S. Naval Ordnance Test Station, China Lake, California, January 1964. (h)
- (5385) DETERMINATION OF THE HYDRODYNAMIC COEFFICIENES OF BODIES OF REVOLUTION USING THE DOUGLAS POTENTIAL FLOW PROGRAMS.

- (b) Bureau of Naval Weapons, Dept. of the Navy.
 (c) Commander, U. S. Naval Ordnance Test Station, Attn: Mr. David M. Nelson, Code P8074, 3202 E. Foothill Blvd., Pasadena 8, Calif.
- (d) Theoretical; applied research.
 (e) The Douglas Aircraft Company computer programs for the solution of the potential flow about
- for the solution of the potential flow about bodies of revolution, where the bodies are represented by a surface source density, are being used to theoretically determine hydrodynamic coefficients for bodies of revolution. A comparison between the theoretical values and the experimental values for blunt base bodies will be made first. Depending on the success of the method for these blunt base bodies, the method will then be applied to streamlined bodies having thick boundary layers on the aft end. This will be done by a combination of boundary layer calculations and potential flow calculations to obtain, if possible, a reasonable theoretical model of the flow about such bodies.

TENNESSEE VALLEY AUTHORITY, Engineering Laboratory.

Inquiries concerning the following projects should be addressed to Mr. Rex A. Elder, Director, TVA Engineering Laboratory, P. O. Box 37, Norris, Tenn.

- (3629) LOW POWER VHF RADIO GAGES FOR REPORTING RAINFALL AND STREAM LEVEL DATA.
 - (d) Development. (e) Transistorize
 - (e) Transistorized radio components powered from nicl cadimum batteries, which will be charged by thermoelectric generators and/or solar cells, will be used. Data in gray code will be transmitted by audio tone pulses. Unattended operation of long duration is a primary objective in the design of these stations.
 - (g) The complete data chain has been assembled and tested.
- (4441) MEASUREMENT OF KAPLAN TURBINE DISCHARGES USING OTT COMPONENT CURRENT METERS.
 - (d) Equipment development and field measurement operation.
 - (e) Turbine discharge rating equipment, using the Ott component type current meters, has been developed to measure the discharge of turbine units. Twenty-seven current meters mounted on three frames are used to simultaneously measure velocities in the three intakes of each unit by either the step or integration method. Measurements made at several fixed loads are employed to calibrate the Winter-Kennedy scroll case pressure taps. The Winter-Kennedy taps are used with suitable measuring equipment to determine the discharge for any turbine loading.
 - (g) Equipment and measuring techniques have been developed. Measurements of turbine discharge have been completed at eighteen turbine units. Calculation of the turbine discharge based on the field measurements is accomplished using an LGP-30 computer.
- (4878) PARADISE STEAM PLANT, AIR DUCT STUDIES.
 - (d) Field investigations for operations.
 (e) Field measurements were taken of the velocity distribution at the entrance to one of the prototype air preheaters

184

at the Paradise project. These measure-ments were obtained to help determine whether poor velocity distribution contributed to the air preheater tube plugging problems.

- (f) Completed.
 (g) The velocity distribution was found to be fair to good and not a substantial factor in causing the plugging in the preheaters.
 (h) Internal report issued.
- (4880) VIBRATION STUDIES OF STEAM PLANT AIR AND GAS DUCTS.
 - (d) Experimental; for basic and applied research. (e) Studies are being made to extend our Studies are being made to extend our knowledge relating to flow induced duct vibrations and to apply the findings to present and future installations. Duct vibrations which are believed to stem from the highly turbulent flows created by the forced draft fans and by the various duct configurations have been experienced in the duct work of some plants. These turbulent conditions create pressure fluctuations which could lead to wall vibrations.
 - (f) Suspended.
- (4881) BASIC STREAM AND RESERVOIR HEAT BUDGET STUDIES.
 - (d) Experimental; for basic and applied research
 (e) This is a study to develop the basic temperature prediction equations for a stream or reservoir into which a volume of water Experimental; for basic and applied research. at a different temperature is injected. All known variables such as stream flow characknown variables such as stream from that teristics, meteorological conditions and thermal characteristics will be included. Theoretical studies, field tests, and possible laboratory studies will be com-bined to produce verified equations. Additional field data were collected during the year and the measured water temperatures are being compared to the predictions pro-
 - are being compared to the predictions produced by the basic heat budget equation.
 (g) A basic heat budget equation has been developed which relates mean water temperature to meteorological, hydraulic, and thermal characteristics. The equation can be used to predict mean water temperature as a function of distance below a steam as a function of distance below a steam plant, using 24-hour time averages. To date this equation has been proved for the completely mixed non-recirculating river flow case.
- (5004) NICKAJACK PROJECT.
 - Experimental; for design. (e) Studies are being conducted on a 1:150 hori-Studies are being conducted on a 1:150 hori-zontal by 1:90 vertical scale model, repre-senting an area of approximately 2 miles in length by 1 mile in width of the river site. River diversion, necessary for the selected project scheme, is being investigated in relation to associated navigation problems. Hydraulic features connected with various construction phases are also being studied. Five internal reports have been issued to
 - (h) Five internal reports have been issued to date.
- (5005) WHEELER PROJECT, TURBINE UNITS 9, 10 and 11, VIBRATION STUDIES.
 - Field investigations; applied research.
 Severe vibrations of these fixed-blade turbines has lead to instrumentation of one unit to study the inter-relationships of the hydraulic forces and the unit vibrations. Pressures were measured in the scroll case at 3 locations, on the head cover at one location and at 5 locations in the draft tube. Vibrations were measured at 8 radial points on the shaft and at one vertical point. A measure-ment was also taken at one point under the generator thrust bearing support bracket. (f) Field measurements and laboratory evaluations
 - completed.

- (g) The vibrations, which were evident in the turbine shaft, are due to the periodic whip of an unstable rope vortex in the draft tube below the runners. Draft tube pressure fluctuations correlated well with the turbine shaft vibration characteristics. (h) Report issued.
- (5007) STUDIES OF BEND LOSSES AND VANING IN LARGE CONDUITS.
 - (d) Experimental; basic research and applied research.
 - (e) These studies are to develop basic design criteria for air and gas duct systems for steam plants, with particular reference to methods of vaning for optimum flow conditions and minimum head loss characteristics and to the effects of multiple bends on the loss characteristics of the system. The first phase of these studies will deal with duct sections having height to width ratios of 2:1. Other phases will deal with more complex duct shapes and bends. The data will be developed entirely by laboratory testing. The study is being conducted on a limited basis in 1964 and will be expanded in 1965.
 - (f) Temporarily suspended.
 - (5008) STUDIES OF THE EFFECTS OF TURBULENCE ON JET DISPERSION.
 - (d) Experimental; basic and applied research.(e) To determine the effect of the turbulence in the discharging jet from a chimney on the rise of the plume above the stack, measurements of the turbulence characteristics of several TVA stacks will be made and by means of model comparisons, the mixing character-istics of the jet will be compared with those for an ideal discharge condition. These data will then be combined by the Division of Health and Safety with other field data from the same plants to develop an overall plume rise equation. This study is co-sponsored by TVA and USPHS. Field and model studies will be conducted during 1964 and 1965.
 - (f) Temporarily suspended.
 - (5386) NICKAJACK PROJECT--LOCK MODEL.
 - (d) (e) Experimental; for design. A 1:25 scale model of the 800' x 110' main A 1:25 Scale model of the 800' x 110' main Nickajack lock was used to adapt the multi-port filling and emptying system to this size chamber. The proposed intake and outlet structures for both the main and 600' x 110' auxiliary lock are being tested by incorpo-rating them with the main chamber model and a simplified model of the auxiliary chamber.
 - (5387) NICKAJACK PROJECT--VALVE-CULVERT MODEL.
 - (d) Experimental; for design.
 - (d) Experimental; for design.
 (e) A 1:10 model of an existing lock filling valve, with related culvert appurtenances, is being used to determine the nature and origin of the hydrodynamic forces which act on reversed tainter lock filling valves. The model was specifically designed to reproduce the transient conditions existing while the valve is opening. Two valve
- (5388) NICKAJACK PROJECT--SPILLWAY MODEL.
 - (d) Experimental; for design. (e) Studies were conducted on a 1:35 scale model of three of the ten spillway bays of the Nickajack project. Tests were for the purposes of determining the spillway capacity under the maximum design head, developing the optimum upstream pier shape.

and finding a relatively simple yet effective apron design. Such factors as water surface profiles through a bay and pressures on the piers under adverse gate openings were also investigated.

- Continuing. An upstream pier shape with a relatively an upscheam piel single with a felalively sharp nose was found to decrease vortex action upstream from the gate for gated discharges. A simple horizontal spillway apron with a dentated end sill minimized scour and produced acceptable wave action. Three internal reports have been issued to (h)
- date.
- FORT LOUDOUN, DOUGLAS AND MELTON HILL PROJECTS--SPILLWAY DISCHARGE RATING TABLES. (5389)

 - (d) Applied research; operations.(e) Booklets containing spillway gate operating instructions, the gate arrangements schedule and the tables of possible spillway dis-charges were compiled for use at the dams. The final discharges were calculated using the LGP-30 computer. Completed.
 - Tables issued.
- (5390) WIDOWS CREEK STEAM PLANT--CONDENSER WATER INTAKE PROBLEMS-UNITS 7 AND 8.

 $\begin{pmatrix} d \\ e \end{pmatrix}$ Experimental; applied research.

- Tests were conducted using a 1:40 scale model of the Widows Creek Plant, Unit 7 and 8, condenser water intake problems. Both sur-face currents and sub-surface currents were reproduced in their relation to the condenser water intakes. The model study was performed to develop entrance conditions which would improve the operations of the intake.
- (f) Completed.
 (g) By simulating the flow patterns in the area of the condenser water intake, changes in the prototype entrance conditions were developed which would provide for improved flows into the details.
- (h) Advance report in process.
- (5391) WIDOWS CREEK STEAM PLANT--UNIT NO. 8-FLOW NOZZLE RATING.

 - (d) Applied research; operations.
 (e) The 16-inch flow nozzle for the condensate discharge line in Unit 8 at Widows Creek Plant was rated in the Laboratory's rating equipment. Coefficients of discharge were determined for the Reynold's Numbers range between 4.8 x 10⁵ and 3.4 x 10⁵ which takes in the complete operating range for this generating unit. Completed.
 - $\begin{pmatrix} f \\ h \end{pmatrix}$ Rating table issued.
- (5392) MODEL FLUME TO BE USED TO STUDY THERMAL DENSITY RECIRCULATION PROBLEMS.
 - Experimental; operations and basic research. A model flume was constructed of transparent material and equipped with circulating pumps to simulate a typical steam power plant's con-densate intake and outlet system. The flume is approximately 100 feet in length and 9 inches deep by 12 inches wide. The basic intent is to develop and prove the analytical equations for flows in the vicinity (3306) of a steam plant or in similar areas. (d) (e)

TENNESSEE VALLEY AUTHORITY. Hydraulic Data Branch.

Inquiries concerning projects should be addressed to Mr. James W. Beverage, Chief, Hydraulic Data Branch, Tennessee Valley Authority, Knoxville, Tenn. 37902.

(765) EVAPORATION IN THE TENNESSEE BASIN.

- Field investigation; applied research. To provide data for estimating reservoir
- losses and derive a general rule, applica-

ble to the Basin, permitting computation of evaporation from pans at six locations in Basin, together with standard meteorological readings.

- Results published in monthly and annual bulletins, "Precipitation in Tennessee River Basin" (Project 768). (h)
- (768) PRECIPITATION IN TENNESSEE RIVER BASIN.

 - (d) Field investigation; basic research.
 (e) A comprehensive study of rainfall and other weather phenomena for purposes of water dispatching and improvements in water con-trol; storm studies as related to maximum precipitation, rainfall-runoff, spillway
 - design and operation, etc. Monthly and annual bulletins, "Precipitation (h) in Tennessee River Basin.
- (769) RESERVOIR AND STREAM TEMPERATURES.
 - Field investigation; basic research. Study of water utilization and water move-ment as concerns industrial plant locations (d) (e) and stream pollution. Variations in temper-ature from surface to bottom in reservoirs throughout the year are determined by soundings, and by continuous recording gages in natural streams.
- (771) GALLERY DRATNAGE IN LARGE DAMS.
 - (d)
 - Field investigations; design. Weirs are placed in main galleries and drainage measured as check on tightness and (e) stability.

U. S. ARMY ENGINEER WATERWAYS EXPERIMENT STATION, CORPS OF ENGINEERS.

Inquiries concerning the following projects should be addressed to the Director, U. S. Army Engineer Waterways Experiment Station, Corps of Engineers, P. O. Box 631, Vicksburg, Miss. 39181.

- (236) MISSISSIPPI BASIN MODEL.
 - (b) Office of the Chief of Engineers, Department

 - (d) Experimental; for design.
 (e) The project provides for construction and operation of a model of the Mississippi River watershed including the Missouri, Ohio, White, Arkansas, and Red Rivers and their principal tributaries. The model area comprises 200 acres and reproduces 1,250,000 comprises 200 acres and reproduces 1,250,000 square miles of the Mississippi Basin. The topography of the streams and flood plains is reproduced to a horizontal scale of 1:2,000 and vertical scale of 1:100. All existing and proposed flood-control reservoirs, levees, dikes, floodwalls, and other particular leves, dikes, floodwalls, and other pertinent works are reproduced. The completed con-struction consists of the Upper Mississippi from Hannibal, Missouri, to Baton Rouge, Louisiana; the Missouri River from Sioux City, Iowa, to the mouth; the Ohio River from Louisville, Kentucky, to the mouth including the Wabash River below Riverton, Indiana; the Tennessee River from Pickwick Dam, Tennessee, to the mouth; the Cumberland River from Old Hickory Dam, Tennessee, to the mouth; the White River from Georgetown, Arkansas, to the mouth; the Arkansas River from Blackburn Damsite, Oklahoma, to the mouth, and the Red River flow Alexandria mouth; and the Red River from Alexandria, Louisiana, to the mouth. Water-surface elevations are measured by electrically op-erated stage devices with the recorders located in central control buildings. Streamflow is introduced and controlled by automatic instru-ments called inflow controllers. The model ments called inflow controllers. The model was designed to study coordination of releases from reservoirs, investigate the effect of reservoir operation on flood stages, check the routing of project and other floods, establish and check levee grades, predict stages, and determine the effect of floodways on stage reduction.

- (g) The extent of model operation each year is determined by the testing programs directed by the Mississippi Basin Model Board and Chief of Engineers and requested by Divisions and Districts that have operable sections on and Districts that have operable sections on the model. The model was operated as an integrated unit to Memphis, Tennessee, for comprehensive (basinwide) tests. Tests were conducted of the four historical floods--1937, 1943, 1945, and 1950--using those reser-voirs (EN) scheduled for completion in the near future (approximately 1970), and with ultimate reservoir (END) modification assuming sufficient capacity in both groups of resersufficient capacity in both groups of reser-voirs to store all inflows that would contribute to flooding on the Lower Mississippi River, and with EN and END reservoirs operated to full capacity to store inflows that affect crest stages of Lower Mississippi River. Tests were completed of the 1927 flood from St. Louis, Missouri, and Golconda, Illi-nois, to Memphis, Tennessee, using the actual flood with present-day conditions and modi-fication by the EN and END reservoirs. Tests Tests were completed of the 1927 flood Mere conducted to verify the model between Memphis, Tennessee, and Baton Rouge, Louisi-ana, to the 1945, 1950 and 1961 floods. Tests were conducted for the U.S. Army Engineer Division, Missouri River, to assist in the design of the Missouri River Agricul-tural Levens from Konses fits to the Mouth Tests of the 1937 and 1950 floods on the Tennessee and Cumberland Rivers with the canal connecting Barkley and Kentucky Reservoirs open, and tests of the 1927, 1946, and hypothetical flood and steady-flow tests of the Cumberland River were conducted for the Nashville District.
- (425) COMPREHENSIVE MODEL STUDY, DELAWARE RIVER, PENNSYLVANIA.
 - (b) District Engineer, U. S. Army Engineer District, Philadelphia, Corps of Engineers,

 - (d) Experimental; for design.
 (e) To develop and test plans for reduction of shoaling in several ranges of the navigation channel, and to determine the probable effect on the hydraulic and salinity regimen in the estuary that would result from modifi-cations of channel depth and alinement and flow regulation, the entire Delaware River estuary from the Atlantic Ocean to Trenton is reproduced in a fixed-bed, silt-injection type model with scale ratios of 1:1,000 horizontally and 1:100 vertically. Tides and norizontally and 1:100 vertically. Tides and tidal currents are reproduced by automatic tide generators. Observed prototype salinities are reproduced in the Delaware Bay portion of the model, and provisions made for the injection of silt, and for measuring silt deposits. Studies are also made of salinity intrusion and the disconsion and dilution of intrusion and the dispersion and dilution of wastes discharged into the estuary.
 - Tests to determine the effects of various (g) degrees of rehabilitation and destruction of Reedy Island and Pea Patch Island training dikes on hydraulic conditions throughout the reach affected revealed that rehabilitation would not benefit navigation or decrease maintenance dredging. Pennsville dike, com-pleted in 1943 to an elevation of +8.0 feet, has also deteriorated and is presently being restored to +3.0 feet. Tests to determine the benefits of raising this dike an additional
 - the benefits of raising this dike an additional 5 feet revealed that the crest elevation of +3.0 feet would be satisfactory. "Delaware River Model Study"; Report 4, "Dike Rehabilitation; Hydraulic Model Investigation." U. S. Army Engineer Waterways Experiment Station Technical Report No. 2-337, May 1964. (Available on loan.) (h)
- (993) CAVITATION RESEARCH.
 - (b) Office of the Chief of Engineers, Department of the Army, Washington, D.C. Experimental; applied research. The cavitation characteristics of such elements
 - (d)
 - (e)

as baffle piers, steps in stilling basins, spillway and conduit gate slots, and offset joints are studied in either a vacuum tank or a variable-pressure, closed-jet water tunnel. The investigation includes a review of literature to evaluate the many variables that affect cavitation results. A highvelocity water facility is being used to study resistance of concrete and protective coatings to cavitation.

- (994) EFFECTS OF MODEL DISTORTION.
 - (b) Office of the Chief of Engineers, Department of the Army, Washington, D.C. (d) Experimental; applied research.
 - (e) This is a general study to determine the hydraulic effects of various types and degrees of model scale distortion on velocity distribution and other hydraulic conditions, with the ultimate aim of establishing limits of permissible distortion for the various types of models. A rectangular flume having a 90-degree bend with provisions for changing the vertical scale to provide distortions of 0 to 10 is used in the study. (f) Suspended.
- (998) WAVE FORCE ON BREAKWATERS.
 - (b) Office of the Chief of Engineers, Dept. of the Army, Washington, D. C. (d) Experimental; applied research.
 - (e) This is a general investigation to obtain data from which the magnitude and elevation of wave forces on a vertical wall can be of Wave forces on a vertical wall can be predicted. The specific purposes of the study are to (1) study existing literature and testing equipment; (2) verify experi-mentally the clapotis pressure theory; and (3) determine maximum shock-type pressures, delineate the critical conditions necessary to create the extremely high shock pressures, and determine the magnitude of pressures due to partially breaking waves. Preliminary measurement of wave-pressure distribution on a vertical wall resulting from breaking waves, conducted in a 1.0- by 1.5- by 94-foot wave flume was completed, and preparation of a report on this phase of the investigation was begun. A theory for the formation of short pressures on vertical walls due to breaking waves was developed, and plans were in preparation for special tests to investigate the applicability of the new theory.
- (999) STABILITY OF RUBBLE-MOUND BREAKWATERS.
 - (b) Office of the Chief of Engineers, Department of the Army, Washington, D.C. Experimental; applied research. Rubble-mound structures are studied in a 5-(d)
 - (e) by 4- by 119-foot and 12.5- by 4- by 119foot wave flumes to develop design procedures and formulas, supported by experimental data, from which the design of safe and economical breakwaters can be determined. In addition to quarrystone, tetrapods, tetrahedrons, tribars, quadripods, modified cubes, and other specially molded armor units are being studied. A 50- by 5.5- by 250-foot, L-shaped wave flume designed to allow the testing of breakwater sections using various angles of wave incidence will also be used in this study.
- (1002) EFFECTS OF SCALE AND OPERATING TECHNIQUES ON HARBOR WAVE ACTION AND BREAKWATER MODELS.
 - (b) Office of the Chief of Engineers, Department of the Army, Washington, D.C. Experimental; applied research.
 - (d)
 - Tests are conducted in flumes and harbor model basins to obtain information that will allow more accurate determination of optimum scales for wave models, and the effects of different scales and operating techniques on the accuracy of model results. (f) Inactive.

188

(1004) INSTRUMENTATION.

- of the Army, Washington, D.C.
 (d) Experimental; development.
 (e) Various types of the second sec (b) Office of the Chief of Engineers, Department
- Various types of measurement and control equipment for use in hydraulic studies are being developed. A feasibility study for a a pilot study for a turbulence meter were a pilot study for a turbulence meter were completed. Development of improvements for remote-control system for a model towboat was suspended. Development of improvements for hawser-stress transducer for measuring hawser forces acting on tows in model locks and the development of a revolution-sensing and remote-indicating device for velocity meters were continued. The development of a spherical-head turbulence meter, a water-level indicator for tests of prototype locks, and improvements of a current-direction indicator were undertaken.
- (1467) DEVELOPMENT OF HYDRAULIC DESIGN CRITERIA.
 - (b) Office of the Chief of Engineers, Dept. of the Army, Washington, D. C. Analytical (model and prototype); for design.
 - (e) A general study to develop, analyze, and disseminate to Army Corps of Engineers establishments hydraulic design criteria to ensure adequate capacity, economy of design and construction, and safe and satisfactory operation of large hydraulic structures. Criteria are developed from model and proto-type tests relating to the design of spillways, outlet works, gates and valves, channels, and navigation structures.
 - (g) Theoretical development of procedures for determining flow patterns in spillway buckets by electronic computer programs was con-tinued. University of Iowa laboratory data on boundary layer development on steep slopes were analyzed using the new concept of energy thickness. The results of this analysis was combined with limited prototype data to produce design criteria charts and a procedure for evaluating spillway energy losses occurring during development of the turbulent boundary layer. The procedure relates the boundary layer thickness, the dis-placement thickness, and the energy thickness with the boundary length and surface roughness.
 - "An Investigation of Spillway Bucket and Toe Curve Pressures" and "A Study of Spillway Energy Losses During Development of the (h) Turbulent Boundary Layer." U. S. Army Engineer Waterways Experiment Station Miscellaneous Papers Nos. 2-625 and 2-642, February and April 1964, respectively. (Available on loan.)
- (1474) OPERATING FORCES OF MITER-TYPE LOCK GATES.
 - (b) Office of the Chief of Engineers, Department of the Army, Washington, D.C. Experimental; applied research.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - A general study to collect basic data on operating forces of miter-type lock gates and to determine the effect of various elements upon these forces was conducted in a 1:20 model. A lock chamber 10 feet wide was reproduced with provisions for varying the length up to 600 feet on each side of the gate. Forces required for operation of The gates were measured for variations of the following elements: gate leaves, speeds and accelerations of operation, submerged depths, recess shapes, bottom clearances, chamber lengths, and nonsynchronous operation of gate leaves of gate leaves.
 - Completed. Three types of linkages were used in determining the operating forces of miter-type Ining the operating for each process of microscopeStaticallock gates: The Panama Canal, the OhioRiver, and the modified Ohio River linkages.(1987)RIPRAP PROTECTION AT HYDRAULIC STRUCTURES.In all tests, the maximum recorded torqueoccurred as the gates entered the mittered(b) Office of the Chief of Engineers, Departmentposition in the closing cycle. The Ohioof the Army, Washington, D.C.

River linkage developed torques greater than did the other two linkages. The maximum torques of the modified Ohio and Panama linkages were practically equal which seems logical since both linkages have no angularity between strut and sector arms in the mitered position. In all tests, the recorded torques decreased as the submergence was lowered by 1/2-foot increments from 4.0 feet to 1.0 foot in the models. The re-corded torques decreased as the time of operation was increased in increments of 6.7 seconds from 10.1 and 13.4 seconds to 40.2 seconds from 10.1 and 13.4 seconds to 40.2 seconds. The effect of chamber length for the modified Ohio River linkage was determined by varying the model length from 15 to 30 feet in 5-foot increments. In general the torque decreases as the chamber is lengthened. In model tests the effect of wave action upon torque was negligible except for the 30-foot chamber where waves of small amplitude but great length caused torques equal to or greater than those recorded as the gates entered the mitered position. Barges simulating a 9-foot draft were installed at 25, 50, 75, and 100 feet below the gates in the 600-foot chamber of the modified Ohio River linkage. The barges aided in reducing wave action and torques as the gates entered the mitered position.

- (h) "Operating Forces on Miter-Type Lock Gates."

- (1475) SIPHON ACTION AT PUMPING PLANTS.
 - (b) Office of the Chief of Engineers, Department
 - (b) Office of the Chief of Engineers, Department of the Army, Washington, D.C.
 (d) Experimental; applied research.
 (e) This study was conducted to aid in developing design criteria for pumping plants that depend on development of siphonic action in the discharge side of the pumps in order to yield the required discharge. Full-size models of a 6-inch and 12-inch plastic dis-charge line were tested. Variables investi-gated during the tests were: initial rates gated during the tests were: initial rates of flow, tailwater levels, slope and length of the riverward leg, and venting conditions at the crown. (f) Final report in preparation.
- (1986) SALT WATER INTRUSION AND RELATED PHENOMENA.
 - (b) Committee on Tidal Hydraulics, Corps of Engineers (correspondence should be addressed to Mr. J.B. Tiffany, Chairman, Committee on Tidal Hydraulics, U. S. Army Engineer Water-ways Experiment Station, Vicksburg, Miss.).
 - (d) Experimental; applied research.
 (e) Analyses of prototype data, flume tests, and analytical studies to establish fundamental laws describing the phenomena involved are being performed to determine the effects of the physical and hydraulic features of estuaries such as tidal prism, tidal range, freshwater discharge, channel depth, channel width, etc., on the extent of salinity intrusion, the nature of salinity intrusion, the magnitudes and durations of current velocities, and other factors considered essential to proper solution of estuarine problems encountered by the Corps of Engineers. The flume studies are made in a lucite flume 327 feet long, 1.5 feet deep, and 0.75 foot wide. One end of the flume is connected to a 25-foot-square tidal basin in which any desired tide can be produced and in which the salinity can be controlled. The opposite end is connected to a freshwater source. Combinations of flume roughness, tidal range, tidal period, source salinity, mean depth, and freshwater inflow are studied.
- (b) Office of the Chief of Engineers, Department

- (d) Experimental; applied research.
 (e) The study of erosion characteristics of various sizes of riprap and gravel material is being performed with a view to securing adequate protection at minimum cost. Measurements of velocity and depth at which move-ment of material begins will be made. Data collected on models of specific structures are being analyzed in an effort to generalize the test results.
- (1988) WATER TEMPERATURE EFFECTS ON BED FORMS AND ROUGHNESS.
 - (b) Office of the Chief of Engineers, Department

 - (b) Office of the Chief of Engineers, Department of the Army, Washington, D.C.
 (d) Experimental; applied research.
 (e) A laboratory flume, in which water temperatures can be varied to simulate normally experienced summer and winter temperatures, is being used to investigate the effects of water temperature on streambed forms and roughness of various types of bed materials. Prelimiof various types of bed materials. Prelimiof various types of bed materials. Itolian nary tests with fine sand have been com-pleted and tests with crushed coal undertaken. (2678) MODEL STUDY OF NAVIGATION CONDITIONS, MCALPINE LOCKS AND DAM, OHIO RIVER. (f) Suspended.
- (2428) MODEL STUDY OF SAVANNAH HARBOR, GEORGIA.
 - (b) District Engineer, U. S. Army Engineer District, Savannah, Corps of Engineers, Savannah, Georgia.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Savannan, Georgia. Experimental; for design. The investigation was conducted in a model which reproduced the following: 1) that portion of the Atlantic Ocean, adjacent to the harbor entrance, from Calibogue Sound on the north to Wassaw Sound on the south; 2) the Source Player and the folded player to 2) the Savannah River and its flood plain to the head of tide at Ebenezer Landing; and 3) that portion of the Intracoastal Waterway which crosses the area included in the model. The model was of fixed-bed construction with scale ratios, model to prototype, of 1:800 horizontally and 1:80 vertically. Automatic tide generators were used to reproduce tides and tidal currents throughout the harbor, and salt water was used in the model ocean to reproduce the effects of density difference on current velocities and distributions. Shoaling studies were made by injecting finely ground gilsonite into the model to reproduce the patterns of shoaling as observed in the prototype, following which and ordered of proposed improvement plans on shoaling patterns were observed and evaluated. Studies (2680) MODEL STUDY OF HURRICANE TIDES IN NARRAGANSETT BAY, RHODE ISLAND. in the prototype, following which the effects were also made of the effects of proposed improvement plans on dispersion and dilution contaminants discharged into the harbor. Refinements of plans for reducing and localizing shoaling were tested for conditions of recently recommended changes in project channel width and depth.

 - (f) Tests completed; preparation of Section 5 of final report in progress.
 (g) Model tests indicated that pollution of Wilmington River by City of Savannah municipal and industrial wastes could be reduced by closure of south channel and/or St. Augustine Creek. Tests also indicated that bank erosion in north channel will probably be reduced by construction of the recommended deeper and wider channel.
 - "Savannah Harbor Investigation and Model Study," Volume III, "Results of Model Investigations"; Section 4, "Results of Tests of Increased Channel Dimensions." (h) U. S. Army Engineer Waterways Experiment Station Technical Report No. 2-580, in publication. (Available on loan.)
- (2673) MODEL STUDIES OF BARKLEY LOCK AND DAM, CUMBERLAND RIVER, TENNESSEE.
 - (b) District Engineer, U.S. Army Engineer District, Nashville, Corps of Engineers, Nashville, Tennessee.
 - (d) (e) Experimental; for design. A 1:120 model, reproducing the Cumberland River from mile 29.4 to 32.2, the lock, dam,

and powerhouse, was used to investigate flow characteristics in the approaches to the lock. A 1:36 model, reproducing the river-ward downstream lock wall including the culvert manifold which discharges into the culver stilling head. spillway stilling basin, five spillway bays, 324 feet of approach channel, and 596 feet of exit channel, was used to investigate flow characteristics in the stilling basin flow characteristics in the stilling basin and exit channel. The emergency lock gate was studied in a 1:25 model which reproduced the gate,gate sill, and portions of the upstream lock approach and the lock chamber downstream from the gate. This model was used to determine: 1) hydraulic forces on and stability of the emergency gate under various flows including free flow over the lock miter sill; 2) hydrostatic forces on the gate in various positions; 3) gate wheel reactions and sill roller reactions at given positions; and 4) head loss through given positions; and 4) head loss through the bridge decking.

- (h) Final report in preparation.
- (b) District Engineer, U. S. Army Engineer District, Louisville, Corps of Engineers, Louisville, Kentucky.
 (d) Experimental; for design.
 (e) A fixed-bed, 1:120 model reproduced a six-mile reach of the Ohio River including adjacent overbank areas the loaks and dom
- mile reach of the Ohio River including adjacent overbank areas, the locks and dam structures, and all bridges and other structures that might affect flow conditions. Purposes of the model study were to: determine the effects of location, size, and alinement of the dam on stages and currents in the upper pool; determine the effects of location, size, and alinement of a new approach channel on navigation and surge conditions; determine the best location or a new navidetermine the best location for a new navi-gable span on the Pennsylvania Railroad bridge; determine a method of operating the dam for optimum navigation conditions; study navigation conditions in the lower approach as affected by flow through dam, powerhouse, and lock-emptying system; and provide a means for navigation interests to satisfy themselves as to the acceptability of the proposed plan by observing the model in operation.
- (h) Final report in preparation.
- (b) Division Engineer, U. S. Army Engineer Division, New England, Corps of Engineers, Boston, Massachusetts.
- $\begin{pmatrix} d \\ e \end{pmatrix}$ Experimental; for design.
- A fixed-bed model, 1:1,000 horizontally and 1:100 vertically, reproduces all of Narragan-sett Bay and an adjacent portion of the Atlantic Ocean. An automatic tide generator reproduces normal tides throughout the model, and a separate, manually operated generator reproduces hurricane tides of the desired characteristics at the bay entrance. Numerous barrier plans for prevention of hurricanetide damage have been proposed. The relative and absolute effectiveness of these plans in reducing hurricane-tide elevations throughout the bay system were determined and the effects of the best plan on such important factors as tidal circulation, pollution, salinity, and shoaling for normal conditions were investigated. Fresh water only is used in the model during tests of the proposed barrier plans, but both salt and fresh water are used in tests to determine the effects of barrier plans on all significant factors for normal conditions. Model appurtenances consist of automatic tide gages to record both hurricane-tide and normal-tide eleboth nurricane-tide and normal-tide ele-vations at critical points, recording salinity meters, recording dye meters for observing pollution and/or flushing characteristics, current velocity meters,

and equipment for simulating shoaling of the channels and other navigation facilities. Completed.

- Model tests indicated that barriers should not be located in the central portions of the bay because of excessive buildup of surge heights downstream from such barriers; that a lower bay harrier along could the a lower bay barrier alone could not satisfy the requirements of the Navy and at the same time afford the desired reductions in surge heights at upstream locations, but Fox Point for the protection of Providence with a system of lower bay barriers with ungated openings could satisfy the require-ments of the Navy for maximum current velocities and at the same time provide hurricane-surge protection throughout the bay system. However, the current velocities (2932) MODEL STUDY OF SHOALING, HUDSON RIVER, N. Y. and patterns in the ungated navigation openings would not be safe for navigation by all craft which use Narragansett Bay. The recommended barrier scheme includes a battery of gated openings as well as the ungated navigation openings in both the East and West Passage barriers. The addition of these gated openings should provide a satis-factory solution to the velocity problem. The recommended plan, if authorized for construction, will be tested to determine the exact effects on the salinity regimen of the bay on the rates and patterns of diffusion and flushing of wastes, and on shoaling of the navigation channels. battery of gated openings as well as the navigation channels. "Protection of Narragansett Bay from Hurri-
- (h) cane Surges, Summary Report; Hydraulic Model Investigation." U. S. Army Engineer Water-ways Experiment Station Technical Report No. 2-662, October 1964. (Available on loan.)
- (2681) SCALE-EFFECT TESTS OF RUBBLE-MOUND BREAK-WATERS.
 - (b) Cffice of the Chief of Engineers, Department of the Army, Washington, D.C.

 - (d) Experimental; applied research.
 (e) Tests are being conducted by the Coastal Engineering Research Center, under the super-vision of the Waterways Experiment Station, to investigate the effects of model scale on the results of experimentally determined criteria for the design of rubble-mound criteria for the design of rubble-mound breakwaters. Stability tests have been made of a breakwater slope of 1 on 1-1/2 using wave periods of 2.61, 3.75, 7.87, and 11.33 seconds. Tests in the Coastal Engineering Research Center wave flume (15 feet by 20 feet by 635 feet) using a linear scale of 7.5 to 1 based on the tests conducted in the Waterways Experiment Station 5- by 4- by 119foot wave flume were temporarily suspended. Stability tests have also been conducted in the Waterways Experiment Station small wave the waterways Experiment Station small wave flume (1 foot by 1.5 feet by 94 feet) using a scale of 0.5 to 1 based on tests conducted in the 5- by 4- by 118-foot wave flume. Therefore, data on the stability of rubble-mound breakwaters will be available for three different linear scales, 0.5 to 1, 1 to 1, and 7.5 to 1. Test data from the Coastal Engineering Research Center wave flume will be correlated with data from the be correlated with data from the flume will Waterways Experiment Station flumes. Testing of 75-pound quadripods in the Coastal Engineer-ing Research Center's large wave flume was completed. Analysis of data was in progress.
- (2:31) MCDEL STUDY OF SCUTHWEST PASS, MISSISSIPFI RIVER.
 - (b) District Engineer, U. S. Army Engineer District, New Orleans, Corps of Engineers,
 - District, New Orleans, Corps of Engineers, New Crleans, Louisana. Experimental; for design. To determine the effectiveness of proposed improvement works (jetty extensions, channel realinements, and contraction works) in elimi-nating or reducing the periodic maintenance now required in order for deep-draft vessels $\begin{pmatrix} d \\ e \end{pmatrix}$

to navigate the jetty and bar channels of Southwest Pass, the lower 12 miles of the Pass and the adjacent area of the Gulf of Mexico were reproduced in a fixed-bed model to scale ratios of 1:500 horizontally and 1:100 vertically. Tides, tidal currents, 1ittoral currents, and wave action in the Gulf of Mexico, and saltwater and freshwater flows in Southwest Pass and the bar channel were reproduced in the model. Shoaling studies were made by introducing various mixtures of plastic materials into the model to simulate prototype shoaling materials and thus reproduce in the model the patterns and distribution of shoaling that occur in the prototype. (h) Final report in preparation.

- (b) District Engineer, U. S. Army Engineer District, New York, Corps of Engineers, New York, N. Y.
 (d) Experimental; for design.
 (e) A comprehensive, fixed-bed model, constructed to linear scales of 1:100 vertically and 1:1,000 horizontally, is being used to determine the source of material shoaling the Hudson River in the vicinity of Edgewater on Wookween pieze and the most effective and Weehawken piers and the most effective and Weehawken piers and the most effective means of reducing or eliminating this shoaling. The model reproduces Upper and Lower New York Bays, Raritan Bay, Hudson River to Hyde Park, East River to Throgs Neck, and tributaries flowing into the modeled bodies of water. Provisions are included for reproducing tides, freshwater discharge, salinity intrusion, and shoaling. Another model, reproducing the Hudson River between pier 21 (Duane Street) and West 158th Street, Manhattan, to scales of 1:100 vertically and 1:300 horizontally, and including provisions for simulating tides, tidal currents, and shoaling of navigation slips is being used to determine the causes of shoaling in the pier slips in New York Harbor, and to develop plans for alleviating
- this shoaling. (h) Tests completed; final report in preparation.
- (3236) MODEL STUDY OF MAXWELL LOCKS AND DAM, MONONGAHELA RIVER, PENNSYLVANIA.
 - (b) District Engineer, U. S. Army Engineer Dist., Pittsburgh, Corps of Engineers, Pittsburgh, Pennsylvania.
 - (d) Experimental; for desigh.
 (e) A 1:120 fixed-bed type, comprehensive model, reproducing about 2.5 miles of the Monongahela River and the locks and dam structures, was used to study approach condi-tions under various river flows and methods of operation of control gates; to determine effects of design modifications; to develop modifications required to overcome any undesirable conditions; and to demonstrate to navigation interests the acceptability of the proposed design from a navigation standpoint.
 - (f) Completed. (g) Tests indicated that modification of the left abutment of the dam and the left bank improved current alinement along the left side of the channel and reduced velocities in the lower lock approach. Modification of the right bank downstream of the lower guide wall provided additional maneuver area with-out appreciably affecting navigation con-ditions. Tests indicated the maximum discharges which could be passed without overtopping the cofferdams during various phases of construction, velocities with the cofferdams in place, and the effects of the cofferdams on navigation during construction.

 - Dam, Monongahela River; Hydraulic Model Investigation." U. S. Army Engineer Water-ways Experiment Station Technical Report No. 2-672, in publication. (Available on loan.)

- (3243) MODEL STUDY OF LOCKS AND DAM NO. 4, MONONGAHELA RIVER.
 - (b) District Engineer, U.S. Army Engineer District, Pittsburgh, Corps of Engineers, Pittsburgh, Pennsylvania.
 - (d) Experimental; for design.
 (e) A 1:120 fixed-bed, comprehensive model, reproducing about 2.5 miles of the Mononga-hela River and the locks and dam structures was used to determine the effects of modi-fications to the existing locks and dam on navigation conditions, and to develop modifications required to overcome any undesirable conditions.
 - (h) Final report in preparation.
- (3584) MODEL STUDIES OF RED ROCK DAM, DES MOINES RIVER, IOWA.
 - (b) District Engineer, U. S. Army Engineer Disrict, Rock Island, Corps of Engineers, Rock Island, Illinois.
 (d) Experimental; for design.
 (e) A 1:50 model that reproduced 900 feet of the District Approximation and the additional sectors.
 - approach channel above the spillway, an 825-foot-wide section along the dam, the cco-ioot-wide section along the dam, the spillway, conduits, stilling basin, and 575 feet of the outlet channel, and a 1:16 model that reproduced one conduit and a 16-foot-wide portion of the spillway and stilling basin were used to study flow conditions in the approach, particularly at the abutments, to verify stilling basin and training wall design, to evaluate reduction in conduit design, to evaluate reduction in conduit flow during combined operation, to determine the need for armor plate at the outlet portal, and to study the effects of deflectors above the conduit outlet portals. (h) Final report in preparation.
- (3586) MODEL STUDY OF HOPPER DRAGHEAD.
 - (b) District Engineer, U.S. Army Engineer District, Philadelphia, Corps of Engineers, Philadelphia, Pennsylvania.

 - (d) Experimental; for design.
 (e) To develop improved dragheads designed to attain a greater rate of intake of solids when dredging mud and silt mixtures (soft training) and dredging densely packed, fil materials) and dredging densely packed, fine sand (hard material), an investigation was conducted in a 60- by 10-foot flume containing various types of bed material. The draghead and suction line, constructed to a scale of 1:6, were connected to a suction pump mounted on a double carriage that provides travel, both longitudinally and transversely, along the top of the flume.(h) Final report in preparation.
- (3590) MODEL STUDY OF EFFECTS OF HURRICANE BARRIER ON NAVIGATION CONDITIONS IN EAST PASSAGE, NARRAGANSETT BAY, RHODE ISLAND.
 - (b) Division Engineer, U.S. Army Engineer Division, New England, Corps of Engineers, Waltham, Massachusetts.

 - (d) Experimental; for design.
 (e) A barrier across East Passage has been proposed to limit the quantity of water entering Narragansett Bay from hurricane surges. A 1:150 model of East Passage was used to examine ship navigation conditions with respect to barrier location and its navigation opening under current, wave, and wind conditions created by astronomical tides and hurricane surges. A self-propelled, radio-controlled, model aircraft carrier, dynamically similar to its prototype, was used in the tests. Two section models, reproducing the barrier to scales of 1:50 and 1:150, were used to determine the effects of approach depth, roughness of the barrier, model scale, and weir design on the discharge characteristics of the navigation opening. In addition, the 1:150-scale, 3-dimensional model was used to determine the discharge characteristics of two weir plans.
 - (h) Final report in preparation.

- (3597) CORRUGATED PIPE ROUGHNESS STUDY.
 - (b) Office of the Chief of Engineers, Department of the Army, and Bureau of Public Roads, Department of Commerce, Washington, D.C.

 - (d) Experimental; applied research. (e) This was a general investigation to determine This was a general investigation to determine a resistance coefficient and the law of velocity distribution for flow in structural-plate corrugated pipe. A fiber-glass test section reproducing a 5-foot-diameter standard corrugated pipe at a scale of 1:4 was tested in order to obtain additional data on the resistance coefficient and velocity distribution and to correlate model work with full-scale tests. Fiber-glass test sections reproducing a 5-foot, 10-foot, and 20-foot diameter structural-plate pipe at scales of 1:2.2, 1:8, and 1:16, respectively, were tested to determine the effect of relative roughness upon the resistance coefficient and velocity distribution. The hydraulic gradient and the energy loss through 20- to 80-diameter lengths of test section were established by piezometers located at 5-foot intervals. These piezometers were 1/8 inch in diameter, on center of the crests of the corrugations, and four in number around the periphery of the pipe. Velocity traverses were made by means of calibrated pitot tubes at several locations along the test section for determination of the velocity distribution.
 - (h) Final report in preparation.
- (3902) RADIOACTIVE TRACER TESTS OF SEDIMENT, GALVESTON BAY, TEXAS.
 - (b) District Engineer, U.S. Army Engineer District, Galveston, Corps of Engineers, Galveston, Texas.
 - Experimental; field investigation. $\begin{pmatrix} d \\ e \end{pmatrix}$ The movement of sediment in the vicinity of the Galveston Bay jetty was investigated by use of radioactive gold-impregnated glass. The glass was ground to the particle size of the natural sediment. In the first series of tests, the activated, gold-impregnated glass was deposited at three locations on the north side of the jetty, and the paths of the particles were traced by instruments from a small boat. Readings were procured over a period of about one week. It was expected that the tidal action, littoral current, and wind waves would move the material around the Wind waves would move the material around the end of the jetty and/or through the jetty. In a second series of tests, the tracer material was deposited at five additional locations north of the north jetty. These locations extended the area under study beyod the end of the jetty. A third series of tests was conducted in which material was placed at three locations outside the south jetty.
 - (h) Final reports in preparation.
- (3903) MODEL STUDY OF TSUNAMIS AT HILO HARBOR, HAWATT.
 - (b) District Engineer, U.S. Army Engineer District, Honolulu, Corps of Engineers, Honolulu, Hawaii.
 - Experimental; for design. A comprehensive, fixed-bed model is being used by the U. S. Army Engineer District, (d) (e) Honolulu, to determine the optimum breakwater plan to decrease wave and surge action in the harbor so that troublesome and damaging ship motion at piers 1, 2, and 3 will be allevi-ated, and to investigate effects of different plans of construction on reduction of damage plans of construction on reduction of damage to the city of Hilo from tsunamis. The model is about 62 feet wide and 92 feet long, with a vertical scale of 1:200 and horizontal scale of 1:600. The model is contoured from 200 feet above to 300 feet below mean lower low water. This model area of 2,286 square feet is comprised of 12- by 12-foot sections with facked supports to compensate south south south south south and a south south

1,809-square-foot concrete slab in the wave generator pit. The wave generator is com-prised of 8 pneumatic chambers, each being 6 by 8 by 10 feet. A programmer operates the generator to simulate tsunami waves. (1) Fairly good model similitude was obtained.

- (g) The prototype tsunami that of water heights at key locations, limits of runup, and marigrams were duplicated with reasonable success in the model. (2) Theoretical analyses concerning the behavior of the reflected wave off the high cliffs along the Hamakia Coast were verified in the model the Hamakua Coast were verified in the model. the Hamakua Coast were verified in the model. The tests indicated that a large percentage of the destruction caused by the 1946 and 1960 tsunamis was the direct result of this reflected wave. (3) It was decided to adopt the 1946 and 1960 tsunamis as the design waves for barrier tests. Testing to achieve duplication of these waves met with fairly good results. The 1946 tsunami was satis-factorily recorded and preliminary tests for factorily recorded and preliminary tests for the 1960 tsunami indicated favorable results. (4) Preliminary barrier plans were tested, using the design waves obtained. These tests indicated two or three barrier plans that might solve the tsunami problem in Hilo Harbor. These tests indicated that it was highly possible that the breakwater alinement and crest elevations could be determined in the existing model, thereby eliminating the necessity of going into Phase II of the project.
- (3906) POWER PLANT TRANSIENTS TESTS, GARRISON AND OAHE DAMS, MISSOURI RIVER, NORTH DAKOTA.
 - (b) Division Engineer, U.S. Army Engineer Division, Missouri River, and District Engineer, U.S. Army Engineer District, Omaha, Corps of Engineers, Omaha, Nebraska.
 (d) Field investigations; applied research and division of the second se
 - design.
 - (e) Hydraulic prototype measurements of power plant transients at Oahe and Garrison Dam have been made to evaluate results of a comprehensive digital computer study made by the sponsoring offices, and to determine extent sponsoring offices, and to determine extend to which operation corresponds to design in order to develop a solution of the entire problem of power plant transients, with primary emphasis on governing stability. For different plant loadings, instantaneous pressure values at a number of locations in the power tunnel, the surge tank system, turbine scroll case, and draft tube were obtained simultaneously with instantaneous values of tunnel velocity, reservoir and tailwater elevations, turbine speed and gate opening, power output, and other elements (including governor system). Fressure and water level were measured with electrical pressure transducers, velocities were easured with pressure transducers mounted in probes projecting into the flow and connected to pitot-static tubes on cross struts in the penstock, and mechanical and electrical values were obtained with appropriate transducers. Measurements were and magnetic tape recorders. Data are being digitized by the Omaha District for computer analyses.
- (3907) SHOALING PROCESSES.
 - (b) Office of the Chief of Engineers, Department of the Army, Washington, D.C.
 (d) Experimental; for design.

 - (e) The annual cost to the Federal Government of maintaining navigable channels in tidal maintaining navigable channels in tidal waterways is estimated to be of the order of \$60,000,000. The Corps of Engineers Com-mittee on Tidal Hydraulics has concluded that a thorough study of shoaling processes in tidal waterways would lead to improvements in channel design, dredging, and spoiling practices, and other maintenance techniques The Committee concludes that the following program of research is essential in arriving at the objective of reducing maintenance

cost: (1) Flume studies to determine the basic laws involved in the movement and deposition of muddy sediments; (2) flume studies to determine effects of repetitive scour and deposition on sedimentation; (3) the development of techniques for using radioactive tracers for observing the move-(4) the development of sediments in nature; (4) the development of a simple and accurate instrument for in-place measurement of tur-bidity; (5) a study of the physical, chemical, and hydraulic factors involved in the stabilization of deposits in navigable channels; (6) determination of the effects of floccu-lation on shoaling; (7) prototype studies aimed at correlation of sedimentation phenomena in tidal waterways with physical, chemical, hydraulic, salinity, and other signifi-cant factors; and (8) classification of the sediments which constitute all major repeti-tive shoals in tidal waterways. Item (1) tive shoals in tidal waterways. Item (1) has been completed, and all pertinent reports have been published; item (2) is presently inactive; item (3) is in active status by the U. S. Army Engineer Waterways Experiment Station and U. S. Army Engineer Districts, Galveston and Wilmington; item (4) is presently inactive. item (5) was (4) is presently inactive; item (5) was completed by the University of California, under terms of a contract with U. S. Army Engineer Waterways Experiment Station, and a preliminary report on the results of this study was prepared and submitted to the committee on midel Wuderuliae, item (6) is Committee on Tidal Hydraulics; item (6) is under study by the Committee on Tidal Hydraulics and Waterways Experiment Station, and a program of field research on this item has been formulated; and items (7) and (8) are in progress by the Waterways Experi-ment Station. No definite conclusions have yet been reached as a result of these studies.

- (3908) MODEL STUDY OF NAVIGATION ENTRANCE TO ARKANSAS RIVER.
 - (b) District Engineer, U.S. Army Engineer District, Vicksburg, Corps of Engineers,

 - District, Vicksourg, Corps of Engineers, Vicksburg, Mississippi.
 (d) Experimental; for design.
 (e) A fixed-bed model reproducing to scales of 1:600 horizontally and 1:100 vertically about 33 miles of the Mississippi River near the mouths of the White and Arkansas Rivers, 57 miles of the lower Arkansas River, 12 mile of the lower White Biver and the major 12 mile of the lower White River, and the major portion of the White-Arkansas River backwater area was used for the investigation. The model was used to demonstrate alternate routes for the entrance to the Arkansas River navigation project, flow patterns, nature of overbank flow, effect of Arkansas-White Cutoff, and problems related to the location and alinement of the navigation entrance to the Arkansas River from the Mississippi River.
 - (h) Final report in preparation.
 - - (b) District Engineer, U. S. Army Engineer District, Pittsburgh, Corps of Engineers, Pittsburgh, Penna. Experimental; for design.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ A 1:120, fixed-bed, comprehensive model reproducing about 4 miles of the Ohio River and the lock and dam structures is being used to study navigation conditions in the approaches to the locks, determine suitability of the selected site, and develop modifications required to overcome any undesiráble conditions found.
 - (f) Suspended.
 - (3911) MODEL STUDY OF MATAGORDA SHIP CHANNEL, TEXAS.
 - (b) District Engineer, U.S. Army Engineer District, Galveston, Corps of Engineers, Galveston, Texas.
 (d) Experimental; for design.

- (e) The fixed-bed model, constructed to scale ratios of 1:1,000 horizontally and 1:100 vertically, reproduced about 800 square miles of prototype area, including all of Matagorda Bay, part of the connecting bay system, and a portion of the Gulf of Mexico adjacent to Pass Cavallo. Tides and tidal currents were reproduced by one primary and one secondary tide generator, and fresh-water discharges of tributaries, together with the rainfall over the area, are introduced by means of weirs and flowmeters. Salt water was used in the model gulf to reproduce the prototype salinity regimen, and provisions were made for the injection of silt in the model for measurements of deposits on the bed of the model. Studies were made to determine: (1) The best location for the entrance channel; (2) the best route for the channel from the entrance to Point Comfort; (3) such protective works as may be required in the interests of navigation and mainte-nance of the channel; and (4) the effects of the deep-draft navigation channel on the salinity regimen of the bay system. (h) Final report in preparation.
- (3912) MODEL STUDY OF GALVESTON BAY (HARBOR), TEXAS.
 - (b) District Engineer, U.S. Army Engineer District, Galveston, Corps of Engineers,
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - Galveston, Texas. Experimental; for design. A movable-bed model, with scale ratios of 1:500 horizontally and 1:100 vertically, reproduces about 174.5 square miles of prototype area, including a small portion of Galveston Bay and a portion of the Gulf of Mexico extending 8 miles north of the north jetty, 6-1/2 miles south of the south jetty, and offshore to about the 50-foot contour of and offshore to about the 50-foot contour of depth. Tides, tidal currents, littoral currents, and wave action in the Gulf of Mexico are reproduced. Studies have been made to determine: (1) Plans for relocation and stabilization of the jetty channel on an alinement and depth suitable for navigation of supertankers; (2) means of protecting the north jetty from undermining action of tidal currents; (3) shoaling characteristics of the relocated and deepened jetty (inner bar) channel and plans for minimizing shoaling; and (4) shoaling characteristics of the and (4) shoaling characteristics of the deepened outer bar channel; (5) construction procedures to be used in the prototype while constructing plan 2 channel realignment; and (6) shoaling characteristics of three proposed jetty modifications in conjunction with the plan 2 channel realinement. Tracer tests to investigate possible return of dredge spoil from the sea disposal area were also conducted.
 - (1) The jetty modification tests indicated that the outer 3,000 feet of the north jetty can be allowed to deteriorate to about elevation -12 feet MLT without detrimental effects on (g) the shoaling characteristics of the entrance. (2) The tracer tests of possible return of dredge spoil from the sea disposal area indicated that wave directions south of about $S45^{\circ}E$ cause movement of bottom sediments toward and into the outer shoal area, while wave directions east of about $845^{\circ}E$ do not move bottom sediment into the channel. These tests also indicated that most of the material which moves toward or into the channel originates in the northeasterly one-third of the disposal area, while material movement from the remaining two-thirds is generally to the east beach area south of the south jetty.
- (3914) MODEL STUDY FOR MODERNIZATION OF EXISTING LOCK, MCALFINE LOCKS, OHIO RIVER.
 - (b) District Engineer, U.S. Army Engineer District, Louisville, Corps of Engineers, Louisville, Kentucky. (d) Experimental; for design. (e) A 1:25 model which reproduced the filling and

emptying system was used to develop feasible modifications which will improve prototype performance.

- (h) Final report in preparation.
- (3915) MODEL STUDY OF DROP STRUCTURE, GERING VALLEY PROJECT, GERING VALLEY, NEBRASKA.
 - (b) District Engineer, U.S. Army Engineer District, Omaha, Corps of Engineers, Omaha, Nebraska.

 - (d) Experimental; for design.
 (e) The Gering Valley project in western Nebraska will consist of low rectangular drop structures designed for alluvial channels, a series of which will be located in the main Gering drain as well as in the tributaries. Structure widths will vary from 6 to 33 feet and lengths from 16 to 47 feet, with drop heights of 5 and 10 feet. A 1:12-scale model and a 1:33-scale model were used to examine the hydraulic performance of the drop structures with particular interest in basin structures with particular interest in bash performance, discharge capacity, and the extent and size of riprap required upstream and downstream of structure. Each model reproduced a typical drop structure, adjacent overbank areas, and about 300 feet of the approach and exit areas. The smaller scale model preditions of model permitted more rapid modifications of the structure. Tests were conducted of 15 drop structure designs. These tests in-volved: (1) observation of flow conditions and investigation of scour tendencies above and below the structures; (2) effect of such factors as basin length, basin elements, and sill height and basin wall position; and (3) determination of riprap size and placement. (h) Final report in preparation.
- (3916) MODEL STUDY OF SPILLWAY, OAHE DAM, MISSOURI RIVER, SOUTH DAKOTA.
 - (b) District Engineer, U.S. Army Engineer District, Omaha, Corps of Engineers, Omaha Nebraska.

 - (d) Experimental; for design.
 (e) A 1:50 model reproduced the remote, gated control structure which will serve as the control structure which will serve as the spillway, the stilling basin, and approxi-mately 1,700 feet of approach and 1,200 feet of exit channel. The model study was concerned with: (1) flow characteristics in the approach and exit channels; (2) dis-charge data for the spillway gates without downstream submergence; (3) the shape, arrangement, and locations of baffles for dispersal of energy downstream from the gate structure: (4) feasibility of a simple twpe structure; (4) feasibility of a simple type of transition between the structure and the discharge channel; and (5) velocities on the apron below the structure and in a portion of the unlined exit channel.
 - (g) Test results indicated that, while the spillway as originally designed functioned satisfactorily, a conventional-type stilling basin was not appropriate because of the lack of residual tail-water to force a hydraulic jump. A shallow, rectangular basin was developed which dispersed the smaller flows and eliminated surface waves noted at the larger flows with the original design basin. A schedule for use in operation of the spillway gates was develop-ed. This schedule when used in conjunction with the shallow basin was the optimum method of dissipating flows on the apron until downstream submergence occurred. Tests of the exit channel indicated that sector walls could replace the concrete transitions below the rectangular section of the basin. The paved apron could be reduced in length some 45 feet, and the riprap section could
 - some 45 feet, and the ripray section could also be reduced in length. "Spillway for Oahe Dam, Missouri River, South Dakota; Hydraulic Model Investigation." U. S.Army Engineer Waterways Experiment Station Technical Report No. 2-657, Sept. 1964. (Available on loan.) (h)

- (3917) GENERAL SPILLWAY MODEL TESTS.
 - (b) Office of the Chief of Engineers, Department of the Army, Washington, D.C. Experimental; for design. (d)
 - Tests are made on various elements of spillways to develop improved designs and to better define values of coefficients used in design formulas. A flume 70 feet long by 6 feet wide and 6 feet high comprises the test facility. Section models designed for study of particular elements of spillways are installed in the test flume. A series of tests was conducted on weirs of various heights to determine optimum shape from a consideration of discharge coefficients and pressures.
- (4382) HYDRAULIC PROTOTYPE TESTS.
 - (b) Office of the Chief of Engineers, Department (d) Field investigations for applied research
 - and design.
 - (e) The hydraulic prototype testing program of the Corps of Engineers is coordinated for complete coverage of needed testing, pre-vention of unnecessary duplication of testing facilities and tests, recommendations of instrument installations at projects where physical and hydraulic conditions will be suitable for obtaining data, and investigation of prototype hydraulic performance. Personnel and equipment are made available to Corps of Engineers Districts conducting hydraulic Engineers Districts conducting nydraulic field tests. Assistance also is given in planning test facilities, analyzing data, and preparing reports. Hydraulic prototype tests related to and conducted partly under this study are described in item 4397 on McAlpine Lock emergency gate tests; item 3906 on power plant transients tests; item 5240 on puetotime bawser-stress measurements. 5249 on prototype hawser-stress measurements, Jackson Lock, Tombigbee River, Ala.; item 5242 on culvert pressure tests, Greenup Locks and Dam, Ohio River, Ky. and Ohio; Locks and Dam, Chio River, Ky. and Chio; item 5243 on prototype pressure tests, Nolin Dam, Nolin River, Ky.; and Acoustic Flow-meter Installation and Protytype Tests of Outlet Works, Summersville Dam, Gauley River, West Virginia.
 - (g) Tests of the emergency gate performance of McAlpine Lock indicated stable gate operation under relatively severe flow conditions. Gate vibration was very low with no tendency to increase, indicating no elastic resonance with any fluctuating hydraulic load. Good agreement was found between prototype obser-vations and results of a model study of the gate. Gate hoist loads were somewhat higher in the prototype than in the model, the variation being attributed to differences in gate construction or higher seal and reaction-
 - gate construction or higher seal and reaction-roller friction in the prototype. "Emergency Gate Performance, McAlpine Lock, Ohio River, Kentucky; Hydraulic Prototype Tests." U. S. Army Engineer Waterways Experiment Station Miscellaneous Paper No. 2-622, February 1964. (Available on loan.) (h)
- (4383) MODEL STUDY OF TURTLE CREEK CHANNEL IMPROVEMENT, PENNSYLVANIA.
 - (b) District Engineer, U.S. Army Engineer District, Pittsburgh, Corps of Engineers, Pittsburgh, Corp
 Pittsburgh, Pennsylvania.
 Experimental; for design.
 To evaluate merced
 - To evaluate proposed channel improvements and determine the necessity for raising bridges and modifying piers and abutments, a 1:50 model reproducing the lower 7,700 feet of Turtle Creek channel was used. The model included provisions for testing plans with the existing and improved channels in the lower, 1,500-foot reach of the channel.(h) Final report in preparation.
- (4384) MCDEL STUDY OF SPILLWAY, PROCTOR RESERVOIR, LEON RIVER, TEXAS.

- (b) District Engineer, U.S. Army Engineer District, Fort Worth, Corps of Engineers, Fort Worth, Texas.
 (d) Experimental; for design.
 (e) A 1:40 model reproducing a center bay and adjacent half bays of the spillway and
- acjacent half bays of the spillway and stilling basin, and 300 feet of approach and exit areas, was used to verify the adequacy of the proposed shape for under-designed crests of low weirs with upstream faces sloping 3 on 2 and 3 on 3; to verify the accuracy of assumed discharge coeffi-cients; and to determine the magnitude of cients; and to determine the magnitude of pressures on the weir. Results will be used for this and other projects in the Fort Worth District.
- (f) Completed.
 (g) Decreasing depth of approach increased weir coefficients slightly; however, pier con-traction coefficients were also increased. A crest shape tangent to upstream face of a creat shape tangent to upstream face of and discharge coefficients. Cover plates were used over the bulkhead slots to reduce
- megative pressures in this area. "Spillway for Proctor Dam, Leon River, Texas; Hydraulic Model Investigation." U. S. Army Engineer Waterways Experiment Station Technical Report No. 2-645, March 1964. (Available on loan.) (h)
- - (b) District Engineer, U.S. Army Engineer District, Huntington, Corps of Engineers, Huntington, West Virginia.
- (d) Experimental; for design. (e) The project involves construction of a nonnavigable-type dam with parallel locks; the main lock will be 1,200 feet by 110 feet and the auxiliary lock 600 feet by 110 feet. A 1:120 fixed-bed model reproducing about 3 miles of the river was used to study navigation conditions in the lock approaches and the effects of the structures on flood stages.
- (f) Suspended.
- (4386) MODEL STUDY OF HOLT LOCK AND DAM, WARRIOR RIVER, ALABAMA.
 - (b) District Engineer, U.S. Army Engineer District, Mobile, Corps of Engineers, Mobile, Alabama.
 - (d) Experimental; for design.
 (e) A 1:80 model, reproducing the structures, 4,800 feet of the approach channel and 4,800 feet of the exit channel, was used to study flow conditions in the lock approaches and in the approach and exit channels for all arrangements of the structures. A 1:36 section model reproducing one full bay and two adjacent half bays of the spillway and two adjacent half bays of the spillway and stilling basin was utilized for studies of the adequacy of the weir and stilling basin design. A 1:25 model reproducing 800 feet of the lock approach channel, intake manifolds, the 670-foot lock chamber, culverts, bottom laterals, outlet stilling basin, and 730 feet of the downstream exit channel was used to study various types of filling and emptying systems to determine filling and emptying systems to determine the most advantageous system from the standpoints of rate of operations, degree of turbulence, and economy. A 1:15 model of a culvert valve was used to study proposed valve designs.
 - (h) Final report in preparation.
- (4387) MODEL STUDY OF WILLOW SPRINGS AND SAG JUNCTION DIVERSIONS, CHICAGO SANITARY AND SHIP CANAL, ILLINOIS.
 - (b) Metropolitan Sanitary District of Greater Chicago, Chicago, Illinois.
 (d) Experimental; for design.
 (e) Tests were conducted on two 1:60 models, reproducing the diversion channels and a

portion of the Sanitary and Ship Canal at each location, to determine the effect of crosscurrents on navigation and to verify or further develop the hydraulic design of the diversion channels and appurtenant hydraulic structures. A 1:16 section model was used for study of control structures.

- (h) Final report in preparation.
- (4388) SECTION MODEL STUDY OF SPILLWAY, TYPICAL LOW HEAD NAVIGATION DAM, ARKANSAS RIVER, ARKANSAS.
 - (b) District Engineer, U.S. Army Engineer District, Little Rock, Corps of Engineers, (d) Experimental; for design.
 (e) A 1:25 section model, reproducing a 5-foot

 - depth of approach channel, one $6\overline{0}$ -foot gate bay and two adjacent half bays, the spillway, used to determine optimum gate sill and pier nose shapes, spillway capacity with full and partial gate openings for both free and submerged flows, stilling basin performance, and riprap requirements for a typical lowhead navigation dam. Additional tests (which will be reported in an appendix to the final report) were initiated to (a) investigate the possibility of eliminating stilling basins at certain structures founded on rock and with considerable tailwater cushion, (b) determine flow conditions and velocities downstream of a trapezoidal gate sill, and (c) determine stilling basin performance and riprap requirements for the conditions of locks and dams 5 and 7.

 - (f) Completed.
 (g) Test results of the main study indicated that: (a) The parabola, X² = 40Y, is the optimum gate sill shape; (b) an ogival pier nose is slightly more efficient than a semi-circular nose; (c) apron elevations in the range of elevations tested do not affect dis-there operatoristics: (d) one row of 4-foot charge characteristics; (d) one row of 4-foot-high baffle piers and a 3-on-4 sloping, 4-foot-high end sill comprise the optimum stilling basin; (e) riprap downstream of the stilling basin is most stable when placed on a 1-on-6 slope; and (f) extension of the gate piers from the toe of the gate sill to the end of the stilling basin produces a more uniform scour pattern in the exit channel. The additional tests (described in (e)) indicated that the elimination of stilling basins was not practical for the conditions investigated. However, a 40-foot-long, horizontal apron terminated by a 4-foot-high sloping end sill provided satisfactory performance and was found to be more effective in dissipating energy than were various roller buckets. "Spillway for Typical Low-Head Navigation (h)
 - "Spillway for Typical Low-Head Navigation Dam, Arkansas River, Arkansas; Hydraulic Model Investigation". U. S. Army Engineer Waterways Experiment Station Technical Report No. 2-655, September 1964.
- (4390) MODEL STUDY OF CANNELTON LOCKS AND DAM, OHIO RIVER, INDIANA AND KENTUCKY.
 - District Engineer, U.S. Army Engineer District, Louisville, Corps of Engineers, Louisville, Kentucky. Experimental; for design. The project involves the construction of a (b)
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ nonnavigable dam with parallel locks, the main lock to have clear dimensions of 1200 by 110 feet and an auxiliary lock, 600 by 9 miles of the river is used for investigation of navigation conditions in the lock approaches, effects of the structures on flood stages, to obtain data for develop-ment of rating curves, and to determine the effect of powerhouse installation on flow and navigation conditions. A 1:25 model, reproducing 500 feet of the lock approach channel, intake manifolds, the 1270-foot lock chamber, culvert, sidewall port manifolds, outlets, and 200 feet of the

downstream exit channel is being used to determine the suitability of a sidewall port filling system under heads and submergences which will obtain at other locks on the Ohio River. (g) Tests on the 1:120 model indicated that the

- powerhouse should be placed on an angle of 7 degrees 45 minutes with the axis of the dam, and that satisfactory navigation con-ditions could be obtained during floods by degrading a portion of the left overbank upstream of the powerhouse entrance channel. Lock model tests indicated that satisfactory performance should be obtained with a sidewall port arrangement for a 110- by 1200foot lock based on the following recommendations: (1) Port-area to culvert-area ratios should be about 0.95. (2) Ports should be spaced 28 feet on centers. (3) The port group should extend over about 50 percent of the lock chamber, and be centered in the chamber. (4) Triangular deflectors or recesses are desirable at the upstream one-third of the ports.
- (4391) MODEL STUDY OF LOCK AND DAM NO. 3, ARKANSAS RIVER, ARKANSAS.
 - (b) District Engineer, U.S. Army Engineer District, Little Rock, Corps of Engineers, Little Rock, Arkansas.
 - Experimental; for design. A movable-bed model reproducing about 13 miles of the Arkansas River and adjacent $\begin{pmatrix} d \\ e \end{pmatrix}$ overbank area, constructed to a scale of 1 to 120 horizontally and 1 to 80 vertically, is being used to determine the suitability of the proposed site for the lock and dam structure, the effects of proposed regulating works in the vicinity including a cutoff, and modifications which might be required to provide adequate channel depths in the lock
 - (g) Indications of the relative scour and scour patterns which could be expected with different cofferdam plans and degree of protection required were determined. dike will be required along the left bank extending upstream above the upper guard wall to eliminate navigation difficulties with overbank flow.
- (4392) EXTENSION OF LA GUARDIA FIELD RUNWAY, NEW YORK.
 - (b) Port of New York Authority. (d)
 - Experimental; for design. The existing New York Harbor model was (e) used for tests to determine the effects of certain proposed fills or pile-supported structures in East River, for the purpose of extending the North-South and East-West runways at La Guardia Airport, on the hydrould and fluching characteristic on the hydraulic and flushing characteristics of the surrounding areas. The fills or the pile-supported structures would close Rikers Island Channel to navigation; therefore, the plan tested included an alternate route for deep-draft vessels now using the channel.
 - Completed.
 - (f) (g) Tests of solid fills showed that such plans would have detrimental effects on the flushing of pollutants discharged in the vicinity. Tests of the pile-supported structures showed that these plans would have no major effects on the hydraulic nave no major effects on the hydrautic regimens of the problem area. Current strengths in adjacent reaches of East River would be increased slightly, but would still be well below existing maximum currents in other areas. Crosscurrents at the entrance to the alternate ship channel might create navigation problems for ships entering or leaving this channel during strengths of flood or ebb, but no problem should exist at or near times of current slack. "Effects of Proposed Runway Extensions at LaGuardia Airport on Tides, Currents, (h)

Shoaling, and Dye Dispersion; Hydraulic Model Investigation". U. S. Army Engineer Waterways Experiment Station Miscellaneous Paper No. 2-641, April 1964. (Available on loan.)

- (4395) DISPERSION STUDIES IN NEW YORK HARBOR MODEL.

 - (d)
 - Interstate Sanitation Committee. Experimental; for design. The existing New York Harbor model was used for a comprehensive study of the diffusion patterns from most of the major sewer outfalls in New York Harbor. Model tests were conducted using conservative fluorescent dyes as tracers, and the results will be used for planning the construction of additional sewage treatment facilities. Results were furnished by the Interstate Sanitation Commission for analysis. (f) Completed.
- (4396) MODEL STUDY OF COLUMBIA RIVER ESTUARY, ENTRANCE TO OAK POINT, OREGON AND WASHTNGTON
 - (b) District Engineer, U.S. Army Engineer District, Portland, Corps of Engineers, Portland, Oregon.
 - Experimental; for design. The model reproduces the lower 52 miles of the Columbia River and pertinent offshore areas to linear scales of 1:500 horizontally and 1:100 vertically. Tides and tidal and Filos Vertically. Files and tidal currents, density currents, waves, and other phenomena significant to the movement and deposition of sediments are reproduced and studied. All portions of the model are presently of the fixed-bed type, while some portions **are t**o be converted to the movablebed type at a later date. The purposes of the study are to determine the need for and to develop optimum plans for rehabilitation of existing jetties and proposed additional improvements; to investigate future shoaling developments in the entrance channel and in the reach between the entrance and Oak Point, and means of alleviating such shoaling; and to investigate existing and proposed spoil-disposal areas to establish locations that will not permit movement of material back to the channel.
 - (g) Fixed-bed shoaling tests indicated that a substantial reduction in entrance channel substantial reduction in entrance channel shoaling (perhaps as great as 20 percent) might be realized by allowing the outer 2,000 feet of the south jetty, which is immediately shoreward of the existing terminal block, to be degraded to elevation -15 mean lower low water. Similar tests on the north jetty indicated a slight reduction of entrance channel shoaling if that jetty is restored to original conditions. Movable-bed studies are scheduled for both the north and south Jetties to determine their optimum lengths. Velocity measurements indicated that if the Sand Island dikes are allowed to deteriorate, the shores of the islands will erode rather rapidly. Fixed-bed shoaling tests indicated that material placed in Disposal Areas C and D will not migrate into the navigation channel.
- (4397) PROTOTYPE TESTS OF EMERGENCY GATE, MCALPINE LOCKS, OHIO RIVER, KENTUCKY.
 - District Engineer, U.S. Army Engineer Dist., Louisville, Corps of Engrs., Louisville, Ky. Experimental; for design. (b) (d)

 - Prototype measurements of the forces acting on the downstream leaf of a two-leaf, verti-cal-lift emergency gate (531 kips dry weight) were made to determine acceptability of the gate under flowing water conditions. Measure-ments included tension in the doad and ac ments included tension in the dead end of the hoist fall lines, gate-end elevations, and gate vibration. The prototype downpull and gate vibration were compared with the results of a model study.

- (f) Completed.
 (g) Results of the tests indicated stable gate operation under relatively severe flow conditions. Gate vibration was very low with no tendency to increase, indicating no elastic resonance with any fluctuating hydraulic load. Good agreement was found between prototype observations and results of a model study of the gate. Gate hoist loads were somewhat higher in the prototype than in the model, the variation being attributed to differences in gate construction or higher seal and reaction-roller
- Friction in the prototype. "Emergency Gate Performance, McAlpine Lock, Ohio River, Kentucky; Hydraulic Prototype Tests". U. S. Army Englneer Waterways Experiment Station Miscellaneous Paper No. (h) 2-622, February 1964.
- (4398) MODEL STUDY OF SPILLWAY, AMISTAD DAM, RIO GRANDE.
 - (b) District Engineer, U.S. Army Engineer District, Fort Worth, Corps of Engineers, Fort Worth, Texas.
 (d) Experimental; for design.
 (e) A 1:70 model reproducing one-half of the river for a distance of 1,500 feet upstream and 2.500 feet downstream. one powerhouse.

 - and 2,500 feet downstream, one powerhouse, and one-half of the 950-foot-wide, 16-bay structure including the spillway and stilling basin was used to verify the capacity of the ogee weir, and to determine (1) the hydro-static pressures on the spillway crest and gate piers, (2) the performance of both a borizontal apron and a double-stage stilling basin, and (3) optimum length and height of spillway and stilling basin training walls. (f) Completed.
 (g) The theoretical spillway rating curve and
 - the expected hydrostatic pressures on the weir crest were in close agreement with those determined with the model. Stilling basin performance of the original design was found to be unsatisfactory. However, satis-factory stilling basin designs were de-veloped for three apron elevations. The height of the original spray wall was found to be inadequate due to the effect of the abutment on the water-surface profile. The original height and length of the stilling basin training walls were found to be the The
 - basin training wars with a part of the potimum. "Spillway for Amistad Dam, Rio Grande, Mexico and United States; Hydraulic Model Investigation." U. S. Army Engineer Water-ways Experiment Station Technical Report No. 2-653, August 1964. (Available on loan.) (h)
- (4593) MODEL STUDIES OF MILLERS FERRY LOCK AND DAM. ALABAMA RIVER, ALABAMA.
 - (b) District Engineer, U. S. Army Engineer Dist., Mobile, Corps of Engineers, Mobile, Ala.
 - (d) Experimental; for design.
 (e) The project will include a nonnavigable dam with a gated and an overflow section, a lock on the left bank having clear dimensions of 600 by 84 feet, and a powerhouse. A 1:100 model, reproducing about 3.1 miles of river, will be used to investigate navigation conditions through an existing bridge and in the lock approaches, the efbridge and in the lock approaches, the ef-fects of the structures on flood stages, and the effects of powerhouse operations on navigation conditions. A 1:50 model of a section of the gated portion of the dam, reproducing 600 feet of the approach channel, a 50-foot-wide gate bay with piers and 28.5 feet of each adjacent gate bay, a 125-foot-wide section of the stilling basin, and 700 feet of the exit area, was used to determine flow characteristics over the spillway and verify the adequacy of the stilling basin design. A 1:25 model stilling basin design. A l:25 model reproducing 700 feet of the lock approach channel, the 600- by 84-foot lock chamber, the entire culvert system, and 800 feet of

the downstream exit channel is being used to study the suitability of the longitudinal floor culvert system for filling and emptying the lock under heads and submergences which will obtain at the site.

- (f) Tests completed; final reports on 1:100 and
- (r) Tests completed; final reports on 1:100 and 1:25 models in preparation.
 (g) Results in the spillway section model indicated that flow separated from the downstream face of the original gate sill, and a parabolic shape was added to guide flow into the stilling basin. The spillway rating curves were determined with full and partial gate openings for both gate sill shapes. The stilling basin are originally downed. The stilling basin as originally designed functioned satisfactorily below the curved sill shape, but alterations were tested in an effort to reduce construction costs. Alterations consisted of (1) shortening the apron by 10 feet, and (2) sloping the apron down on a 1-on-20 slope from the toe of the gate sill to the end sill. The altered basins were not as efficient as the original design; therefore, the original design was recommended. Results in general model indicated the need for modification of the excavation along the left bank to facilitate the movement of downbound tows leaving the lock. In the lock studies, two satisfactory floor culvert arrangements were developed. One arrangement was adapted to the particular foundation conditions existing at the Millers Ferry Lock site which confined the culvert system to the middle third of the lock chamber. The second arrangement was de-veloped for locations with less restrictive foundation conditions.

- (4594) MODEL STUDY OF SPILLWAY, SHELBYVILLE DAM, KASKASKIA RIVER, ILLINOIS.
 - (b) District Engineer, U. S. Army Engineer Dist., St. Louis, Corps of Engineers, St. Louis, Missouri.

 - (d) Experimental; for design.
 (e) A 1:40 model reproducing 1,550 feet of the approach channel, the gated spillway with sloping chute leading to a conventional hydraulic-jump type stilling basin, a portion of the earth embankment on each side of the spillway, outlet works conside of the spillway, outlet works con-sisting of two sluices beneath the 9-footwide creat piers, and 1,150 feet of the exit channel was used to study the overall hydraulic performance of the spillway and outlets of the sluices, and to verify chute and stilling basin designs.
 - (f) Tests completed. (g) Adequate spillway capacity and flow con-Tests completed. ditions at the abutments were obtained by placing rock dikes at the abutment to guide flow into the weir. The diversion blockout located in the center gate bay was found to be adequate and satisfactory for the release of the expected diversion flows.
 - (h) Final report in preparation.
- (4595) MODEL STUDY OF COLUMBIA LOCK AND DAM, OUACHITA RIVER, LOUISIANA.
 - (b) District Engineer, U. S. Army Engineer Dist., Vicksburg, Corps of Engineers, Vicksburg, Mississippi.
 - Experimental; for design.
 - Experimental; for design. The project involves construction of a cutoff channel about 5,600 feet long with a bottom width of 522 feet, a gated structure (consisting of four tainter gates each 50 feet wide and 26 feet high) located about midway of the cutoff, a 200-foot-wide navigable pass on the right of the dam, and a 600- by 84-foot lock on the left. A 1:100 model. reproducing about 2.6 miles of 1:100 model, reproducing about 2.6 miles of

the river, was used to investigate navigation conditions in the approaches to the lock and navigable pass, and the effects of the structures on flood stages.

- (f) Final report in preparation.
- (4596) MODEL STUDY OF OVERFLOW EMBANKMENTS FOR LOW HEAD DAM ON ARKANSAS RIVER, ARKANSAS.
 - (b) District Engineer, U. S. Army Engineer Dist., Little Rock, Corps of Engineers, Little Rock, Arkansas.
 - (d) (e) Experimental; for design. A 1:4 model reproducing a 40-foot-wide section of overflow embankment including 90 feet of approach channel, the embank-90 feet of approach channel, the embank-ment with upstream and downstream slopes of 1 on 3 and 1 on 4, respectively, and crown widths of 20 and 35 feet, and 140 feet of exit channel was used to investigate the stability of various gradations of protective stones and types of embankments, and furnish data on which an economical and workable design of the overflow embankments can be based. The crown was tested with and can be based. The crown was tested with and without a paved roadway. In addition, a l:12-scale section model was tested in a l-foot-wide, glass-sided flume to determine pressures on the crest and downstream slope of the embankment.

 - (f) Completed.
 (g) Test results indicated that the combined effect of embankment height and crown width on riprap stability is small, that embandments supporting roadways can be considered slightly more stable than those without roadways, that all stone failure occurred in the zone of free (rather than submerged) flow, and that the effective or critical size stone of a particular gradation is that which represents 60 to 65 percent by weight of the total. Variation in stone roughness had no discernible effect on the discharge characteristics of the overflow embandments within the range of heights (3 to 10 feet) and crown widths tested. Discharge coeffi-cients applicable to the two types of embankments were determined for both free and submerged flows, and empirical equations were developed. Also, tests indicated that much smaller stone can be used on the lower, submerged portions of the downstream slope of the embankments if warranted economically. (h) "Stability of Riprap and Discharge Character-
 - istics, Overflow Embankments, Arkansas River, Arkansas; Hydraulic Model Investigation". U. S. Army Engineer Waterways Experiment Station Technical Report No. 2-650, June 1964. (Available on loan.)
- (4598) MODEL STUDY OF DROP STRUCTURE, CAYUGA INLET, ITHACA, NEW YORK.
 - (b) District Engineer, U. S. Army Engineer Dist., Buffalo, Corps of Engineers, Buffalo, N. Y.
 (d) Experimental; for design.
 (e) A 1:20 model, reproducing 300 feet of the
 - A rise model, replaced channel, the rectangular, 80-foct-wide drop structure, the 60-foct-long basin with baffle piers and end sill, and about 400 feet of trapezoidal exit channel, was used to confirm the suitability of the drop structure, and if indicated, to develop advantageous modifications thereto. Of particular concern was the magnitude of channel velocities below the structure. (h) Final report in preparation.
- (4599) MODEL STUDY OF CONTROL STRUCTURES, LITTLE SIOUX RIVER, LITTLE SIOUX, IOWA.
 - (b) District Engineer, U. S. Army Engineer Dist., (d)
 - Omaha, Corps of Engineers, Omaha, Nebraska. Experimental; for design. The structure will consist of a low, 50-foot-wide, rectangular drop located in the control channel with rock protection downstream and on adjacent berms. A 1:30 model, reproducing (e)

about 700 feet of the approach channel and berms upstream of the structure with por-tions of the adjacent levees, the drop structure, and about 1,300 feet of the channel and berms below the structure was used to study the placement of riprap materials in the vicinity of the structure, and the discharge capacity of the structure. (h) Final report in preparation.

- (4600) RADIOACTIVE TRACER TESTS OF SEDIMENT, CAPE FEAR RIVER, NORTH CAROLINA.

 - (b) District Engineer, U. S. Army Engineer Dist., Wilmington, Corps of Engineers, Wilmington, North Carolina.
 (d) Experimental; field investigation.
 (e) The movement of material from dredge spoil areas was investigated using labeled sediment to determine if spoil material moves into the wharf areas at Sunny Point Army Terminal. The sediment was labeled using auric chloride (Gold-198) solution adsorbed on existing (Gold-198) solution adsorbed on existing sediment. Material was placed at four locations under two extreme tide conditions. Movement of sediments was observed for two weeks using instruments on a small boat. Completed.
 - (f) (g) Completed. Test results showed that significant amounts of the spoil material are trans-ported into the north and center wharf basins, regardless of whether the material is blaced during rising or falling tide. "Radioactive Sediment Tracer Tests, Cape Fear River, North Carolina". U. S. Army Engineer Waterways Experiment Station Miscellaneous Paper No. 2-649. May 1964.
 - (h) Paper No. 2-649, May 1964.
- (4601) MODEL STUDY OF POLLUTION, CONEY ISLAND CREEK, NEW YORK.
 - (b) New York City Department of Health, New

 - New York City Department of nearth, New York, New York. Experimental; for design. An existing model of New York Harbor was used to investigate diffusion patterns from sewage treatment plant outfalls and combination sewer and storm outfalls with special attention to contamination of bething breakes and other preventional bathing beaches and other recreational facilities. Plans for diverting pollution away from certain critical areas were also investigated. (f) Completed.
- (4602) LOCK FILLING AND EMPTYING SYSTEM.
 - (b) Office of the Chief of Engineers, Dept. of the Army, Washington, D. C.
 (d) Experimental; applied research.
 (e) A 1:15 valve model used to develop the
 - vertically framed Holt Lock valve was utilized to compare the performance of this utilized to compare the performance of this valve with that of the McNary type valve. The Holt valve was 12.5 by 12.5 feet and the McNary valve was 11 feet wide by 12 feet high. Therefore, for tests of the McNary valve the valve was expanded to 12.5 by 12.5 feet by additions of 1.5 feet in width and 0.5 foot in height to the center portions of the valve.
 - (h) Preparation of final report in progress.
- (4603) MODEL STUDY OF FILLING AND EMPTYING SYSTEM FCR LOW-LIFT LOCKS, ARKANSAS RIVER, ARKANSAS.
 - (b) District Engineer, U. S. Army Engineer Dist., Little Rock, Corps of Engineers, Little Rock, Arkansas, and other interested Corps of Ergineers offices.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Experimental; for design.
 - A 1:25 model, reproducing 700 feet of lock A 1:25 model, reproducing 700 feet of lock approach channel, intake manifolds, a 670-foot-long lock chamber, culvert, sidewall port manifolds, outlet manifold, and 700 feet of downstream channel is being used to de-termine an optimum port arrangement for the filling and emptying system for low-lift locks. An intake is to be developed for use in all tests. Then optimum shape, size,

number, spacing, and location of the ports in the lock chamber as related to culvert size will be determined for a full range of heads and submergences. The Little Rock District is sponsoring the first phase of the tests in which a 12- by 12-foot culvert will be used. Tests of other size culverts will be sponsored by interested Corps of Engineers offices for the purpose of standardizing lock design for 600- by 110-foot locks.

- (f) Tests completed. (g) Results of the generalized test indicated that a satisfactory sidewall port arrange-ment for a 110- by 600-foot lock should result from the following recommendations: result from the following recommendations: (1) Fort-area to culvert-area ratio should be about 0.95. (2) Forts should be spaced 28 feet on centers. (3) The port group should extend over about 50-60 percent of the lock chamber and be centered about the midpoint of the lock chamber or a point slightly downstream. (4) Triangular deflectors or recesses are desirable at the upstream one-third of the ports. Filling and emptying characteristics were obtained for a range of lifts and submergences for the optimum arrangements of 14 type A ports (type 35) and 13 type D ports (type 56). (h) Final report in preparation.
- (4604) MODEL STUDY OF INTAKE AND FLOOD-CONTROL OUTLET, DEGRAY DAM, CADDO RIVER, ARKANSAS.
 - (b) District Engineer, U. S. Army Engineer Dist., Vicksburg, Corps of Engineers, Vicksburg, Mississippi.
 - Experimental; for design. A 1:23 model reproducing the intake tower and a portion of the reservoir, the diversion tunnel, stilling basin, and 240 feet of the exit channel is being used to develop a conventional hydraulic jump-type stilling (d) basin, and to study flow through the intake tower, elbow, tunnels, and at the flow-control device at the end of the floodcontrol tunnel.

 - (f) Tests completed.
 (g) A cylinder-gate intake tower functioned with less head loss and less surging than did the slide-gate intake tower. Pressures in the tunnel and elbow were positive and no zones of separation were evident. Pressures in the flood-control transitions approximated the area curve. The stilling basin developed for the large diversion releases was found to be adequate for dissipation of the high-energy flood-control releases.
 - (h) Final report in preparation.
- (4605) MODEL STUDY OF BREAKWATER, KAHULUI HARBOR, HAWAII.
 - (b) District Engineer, U. S. Army Engineer Dist., Honolulu, Corps of Engineers, Honolulu, Hawaii.
 - (d) Experimental; for design.
 (e) Stability tests were conducted in a concrete wave flume 119 feet long, 12.5 feet wide, and 4 feet deep, on section models of both the east and west breakwater heads, and sections of the trunk of the east breakwater constructed to a linear scale of 1:68.5 to develop designs for repair of the damaged breakwater heads and trunks. Tests con-ducted were concerned with the stability of 35- and 50-ton tribars.
 - $\begin{pmatrix} f \\ g \end{pmatrix}$
 - Completed. Stability tests indicated that a repair section consisting of a cover layer of 30-ton tribars placed pell-mell over the existing slopes of the trunk of the east breakwater would be adequate to withstand the attack of waves 34 feet in height. It was found that a repair section consisting of a cover layer of 50-ton tribars from +20 feet mllw down to -20 feet mllw, and 35-ton tribars from -20 feet mllw down to the toe of the slope, would be adequate to withstand the attack of the 34-foot-high waves on the of waves 34 feet in height. It was found heads of both the east and west breakwaters.

For these conditions the slope of the repaired head sections was about 1:3.

- (h) Designs for Rubble-Mound Breakwater Repair, Kahului Harbor, Maui, Hawaii; Hydraulic Model Investigation". U. S. Army Engineer Water-ways Experiment Station Technical Report No. 2-644, February 1964. (Available on loan.)
- (5228) CRITERIA FOR THE DESIGN OF SMALL-BOAT HARBORS.
 - (b) Office of the Chief of Engineers, Dept. of the Army, Washington, D. C.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Experimental; applied research.
 - Theoretical and experimental studies are being conducted to develop equations and experimental coefficients for use in predicting the motion of small boats moored to floating docks under the action of progressive-and standing-wave systems; determine the optimum shape of harbor and types of perimeter with respect to the response characteristics of small-craft harbors and the surging of moored craft in the harbors; and provide design criteria for protective structures at the entrance to small-craft harbors.
- (5229) GENERAL COASTAL INLET STUDIES.
 - (b) Office of the Chief of Engineers, Dept. of the Army, Washington, D. C. Experimental; applied research.
 - (d) (e) This is a general study to develop means for computing discharge and velocity distribution through tidal inlets, leading to determination of tidal prisms and water-surface elevations in inner bay systems; and to determine the factors involved in both inner and outer bar formation, the shealing of inlet channels, and the stability of inlet shape and location. The project will consist of the following three phases: (1) Tests in four generalized test facilities, three of which will be located at the Waterways Experiment Station located at the Waterways Experiment Station and the fourth at the Coastal Engineering Research Center; (2) analysis of results of these tests by the Waterways Experiment Station, the Coastal Engineering Research Center, and the Committee on Tidal Hydraulics; and (3) field observations under sponsorship of the Committee on Tidal Hydraulics to construction confirm the principles developed. Construction of Facility A at U. S. Army Engineer Waterwyas Experiment Station was completed except for the pumping plant and control system, which is being fabricated under contract. Design of Facilities B and C at U. S. Army Engineer Waterways Experiment Station was in progress.
- (5230)MODEL STUDY OF NAVIGATION CONDITIONS, LOCK AND DAM NO. 4, ARKANSAS RIVER.
 - District Engineer, U. S. Army Engineer District, Little Rock, Corps of Engineers, (b)
 - (d) Experimental; for design.
 (e) A l:120 fixed-bed model, reproducing about 5 miles of the Arkansas River and adjacent overbank areas, the lock and dam structures, and all bridges and other structures that might affect flow conditions is being used might affect flow conditions, is being used to determine the suitability of the proposed effects of regulating works in the lower approach, and to develop modification which might be required to overcome any undesirable navigation conditions.
 - (g) A site suitable for a mooring area was selected. The change in the design of the guard wall had little effect on navigation. Removal of the point along the right bank at the Rob Roy Bridge reduced velocities at the bridge with little change in navigation conditions in the upper lock approach.
- (5231) MODEL STUDY OF NAVIGATION CONDITIONS, OZARK LOCK AND DAM, ARKANSAS RIVER.
 - District Engineer, U. S. Army Engineer District, Little Rock, Corps of Engineers, (b)

Little Rock, Arkansas.

- Experimental; for design. A 1:120, fixed-bed model, reproducing about 3 miles of the Arkansas River, adjacent overbank areas, the lock and dam structures, and all bridges and other structures that (d) (e) might affect flow conditions, is being used to determine the suitability of the proposed site for the lock and dam structures, and to develop modifications which might be required to overcome any undesirable navigation conditions.
- Profiles showing effect of structures on water-surface elevations, and velocities along overflow embankments were obtained. (g)
- (5232)MODEL STUDY OF STILLING BASIN, HUNTINGTON RESERVOIR, WABASH RIVER.
 - District Engineer, U. S Army Engineer District, Louisville, Kentucky. (b)
 - (d)
 - Experimental; for design. A gated spillway with six conduits through (e) A gated spillway with six conducts through the spillway section is proposed for Huntington Dam. A 1:60 model of a 60-foot-wide section of the spillway and stilling basin and 500 feet of the exit channel was used in the study. The spillway gate piers and conduits through the spillway were not reproduced; however, the model was adjusted to simulate the increased head that would to simulate the increased head that would have obtained with crest piers and abutments present. The purposes of the study were: (1) To insure good energy dissipation in the stilling basin at low and intermediate flows, and safe conditions at high flows; (2) to study the effect of the flatter than usual downstream spillway slope (10 horizontal to 12 vertical) on basin action; and (3) if the originally proposed basin design was found to be unsatisfactory, to make revisions necessary to secure the desired results.
 - (h) Final report in preparation.
- MODEL STUDY OF SUBMERGED SILLS, ST. CLAIR (5233) RIVER.
 - District Engineer, U. S. Army Engineer District, Detroit, Corps of Engineers, Detroit, Michigan. (b)
 - Experimental; for design. Construction of submerged sills at the head (d) (e) of the St. Clair River is proposed as a means of raising the level of Lake Huron. A 1:60, fixed-bed model reproduces 3 miles of the river from Lake Huron downstream, and has provisions for simulating sediment movement and shoaling. This model is being used to study effects of one or more submerged sills at different locations on backwater effect, to study sedimentation characeristics, and to study velocities and current directions. A 1:20-scale section model installed in an existing, 2.5-ft-wide flume is being used to investigate the stability of the submerged sills and the ability of 15-ton precast units and various sizes of stone to withstand propeller wash with an initial velocity of 25 feet per second.
 - (g) Tests in the comprehensive model indicated that with various combinations of sills, the level of the lake could be raised from 0.25 to 0.75 foot.
- (5234) MODEL STUDY OF SEAWALL, TEXAS CITY, TEXAS.
 - (b) District Engineer, U. S. Army Engineer District, Galveston, Corps of Engineers, Galveston, Texas.
 - Galveston, Texas. Experimental; for design. A levee and seawall system has been proposed to protect Texas City and adjacent areas of the shore of Galveston Bay from flooding caused by hurricanes. To develop designs for (1) vertical-faced seawalls, (2) rubble-mound structures to protect the natural ground at the base of a vertical wall on its bayside, and (3) whole mound average lowers to protect $\begin{pmatrix} d \\ e \end{pmatrix}$ and (3) rubble-mound armor layers to protect

the bayside slope and crown of an earth levee, 1:35 section models of the structures are being tested in a concrete flume 119 feet long, 5 feet wide, and 4 feet deep. Model waves are generated by a plunger-type wave machine, and measured and recorded electrically.

- Tests completed.
- (f) Tests completed.
 (g) To stabilize the type 1 design, when attacked by 6-second, 15-foot waves, 6-ton stones instead of 3.3-ton stones were required at the bayside toe. The landside slope was made stable by using 3.3-ton stones instead of riprap. The type 2 and type 3 designs were made stable under the attack of 6second, 15-foot waves by using a mound of 1- to 1-1/2-ton stones to scotch the toe of the 6-ton cover layers. Pressure distribution tests on the composite seawall design and on the simple vertical-faced seawall showed that the forces acting on the vertical. from Sainflou's theory for nonbreaking waves. and less than those obtained from Minikin's formula for breaking waves. (h) Final report in preparation.
- (5235) MODEL STUDY OF BESSIE CUTOFF, MISSISSIPPI RIVER.
 - (b) District Engineer, U. S. Army Engineer District, Memphis, Corps of Engineers, Memphis, Tennessee.
 - (d)
 - The proposed Bessie Cutoff would eliminate the river bend at New Madrid, Mo., and shorten the river about 20 miles. A model, reproducing 85 miles of the river to a horizontal scale of 1:500 and a vertical scale of 1:100, is being used to obtain indications of the probable effects of various degrees of cutoff development on velocities, current directions, water-surface profiles, navigation depths, channel meandering tendencies, and general navigability of the affected reach. The model is of the fixed-bed type with provision for converting to a movable bed the reaches expected to be affected appreciably by the cutoff.
 - Tests completed; final report in preparation. Tests to determine effects of cutoff at intermediate and final development stages and
 - Intermediate and final development stages and to determine sediment movement as affected by the cutoff were accomplished. "Preliminary Report of Model Study of Bessie Cutoff, Mississippi River; Hydraulic Model Investigation". U. S Army Engineer Waterways Experiment Station Miscellaneous Paper No. (h) 2-680, October 1964. (Available on loan.)
- (5237) MODEL STUDY OF WAVE ACTION, HALF MOON BAY HARBOR, CALIFORNIA.
 - (b) Dist. Engr., U. S. Army Engr. Dist., San Francisco, Corps of Engrs., San Francisco, Calif.
 (d) Experimental; for design.
 - Half Moon Bay Harbor is partially protected from severe storms by a 2,620-foot-long west breakwater and a 4,420-foot-long east breakwater which enclose a 245-acre area with 6-foot or greater water depths, and form a 600-foot-wide entrance channel 24 feet deep. buring storms, a severe concentration of wave energy at the entrance travels into the inner harbor, creating intolerable anchorage conditions. A model study is being conducted to determine: (1) The relative influence of the waves that approach the harbor from the several storm directions; (2) the effects of wave action inside the harbor believed to wave action inside the harbor believed to result from wave energy passing through the voids in the breakwaters in addition to that through the entrance; and (3) the most feasible of several plans proposed for reducing the effects of wave and surge action now prevailing. The 1:100 model, which covered an area of about 15,000 square feet, re-moduced all the income barbor bergers produced all the inner harbor, breakwater

system, and sufficient bay area to permit simulation of waves from all critical storm directions. Waves were generated by a 60-foot-long, plunger wave machine, and measured and recorded electrically.

- (f) Completed.
 (g) Test results indicated that during storms from the southwesterly to south directions, severe wave action obtains inside the harbor severe wave action obtains inside the harbor at the docks and piers as alleged. The shoals southerly of the harbor entrance cause a concentration of wave energy at and in the present harbor entrance. Several breakwater plans studied adequately reduced the wave energy entering the harbor during severe storms. It was concluded that an added section of rubble-mound breakwater about 1,050 feet long, which would extend the existing west breakwater in a south-easterly direction from the present entrance easterly direction from the present entrance and provide a revised navigation entrance about 350 feet wide, would ensure the de-
- sired protection. "Wave Action and Breakwater Location, Half Moon Bay Harbor, Half Moon Bay, California; Hydraulic Model Investigation". U. S. Army (h) nyuraulic Model investigation". U. S Engineer Waterways Experiment Station Technical Report No. 2-668, in publication. (Available on loan.)
- (5238) MODEL STUDY OF SPILLWAY, STOCKTON DAM, SAC RIVER, MISSOURI.
 - (b) District Engineer, U. S. Army Engineer District, Kansas City, Corps of Engineers, Kansas City, Kansas.
 (a) Engineers is dead and
 - (d) Experimental; for design. (e) A 4-gated, ogee spillway A 4-gated, ogee spillway and one 45,000-kilowatt powerhouse unit located in a concrete nonoverflow section adjacent to the spillway are proposed for Stockton Dam. A 1:60 model reproducing 1,700 feet of the approach area, the entire spillway and powerhouse, the stilling basin, and 1,100 feet of the exit channel was used to investigate the hydraulic adequacy of the spillway, stilling basin, and appurtenances, and determine any desirable modifications for various operating conditions.

 - (f) Tests completed.
 (g) The capacity of the spillway as determined in the model was about 6 percent greater than the computed capacity. Efforts to reduce the length of the spillway to take advantage of this increased efficiency were abandoned when rerouting the spillway design flood gave a reduction in surcharge of only 0.3 foot (maximum pool elevation of 905.9 in lieu of elevation 906.2). While the stilling basin of original design performed adequately it was found that economies could be effected by reducing the excavation in the basin (raising basin from elevation 733 to 738) and decreasing the size of the stilling basin elements. The adopted design stilling basin decreasing the size of the setting basin (type 3) provided a depth of about 0.85 D_2 and a length of about 3.0 D_2 at the spillway design flood. (D_2 , the theoretical depth for formation of a hydraulic jump at the design discharge, is 74.2 feet, neglecting losses.)
 - (h) Final report in preparation.
- (5239) MODEL STUDY OF WAVE ACTION, MARINA DEL REY, VENICE, CALIFORNIA.
 - (b) District Engineer, U. S. Army Engineer District, Los Angeles, Corps of Engineers, Los Angeles, California.
 (d) Experimental; for design.
 - (d) (e) Marina Del Rey is a small-craft harbor consisting of eight lateral basins off a main channel which opens into Santa Monica Bay. A 1:175 model of the entire harbor area was used to study wave action within the project area and to investigate and develop remedial plans for alleviating adverse wave and surge action presently restricting full usage of the harbor. Waves were generated

with a 40-foot-long, vertical-plunger wave machine, and were measured and recorded electrically. Completed.

- (f) (g) Final analysis of model test data resulted in recommendation of a wing-type offshore breakwater, 2,325 feet in length, to be constructed 640 feet seaward of the ends of the channel This construction would reduce ietties. wave action within the harbor to an acceptable level.
- "Selection of Optimum Plan for Reduction of (h) Wave Action in Marina Del Rey, Venice, California; Hydraulic Model Investigation". U. S. Army Engineer Waterways Experiment Station Technical Report No. 2-671, in publication. (Available on loan.)
- (5240) MODEL TESTS FOR HURRICANE BARRIERS, WAREHAM-MARION, MASSACHUSETTS.
 - (b) Division Engineer, U. S. Army Engineer Division, New England, Corps of Engineers, Waltham, Massachusetts.
 - (d) Experimental; for design.
 (e) The hurricane protection
 - The hurricane protection plan for the area including Wareham and Marion, Mass., consists principally of 50- and 100-foot-wide, ungated barriers across the mouths of the Weweantic and Wareham Rivers, and a 100-foot-wide, gated barrier across the mouth of Onset Bay which will permit navigation during normal tides. The barriers will reduce the normal tides. The barriers will reduce entry of flood surges into the waterway areas behind them during hurricanes and other severe storms. A 1:25 model, reproducing a 400-foot-wide section including 750 feet of approach channel, each navi-gation opening and allied barrier, and 750 feet of exit channel, was used to determine the discharge characteristics of the barriers and the maximum aurorat velocities though the discharge characteristics of the barrier, and the maximum current velocities through the navigation openings. The cover stone of the barrier and the rock sill of each navi-gation opening were simulated with properly scaled model stone to provide the effect of roughness. Completed.
 - (f) Completed. (g) Test results indicated that both free- and submerged-flow conditions can exist for tail-water elevations of C.O foot mean sea level, depending on the discharge. Therefore, the limits of each flow regime were defined, and discharge equations applicable to each were developed. A method of determining head differential based on discharge and tailwater depth for submerged flow was also developed. The measured maximum velocities were 1 to 1.5 feet per second greater than the theoretical average velocities based upon the observed head differentials.
 - (h) "Discharge Characteristics of Hurricane Barriers, Warenam-Marion, Massachusetts; Hydraulic Model Investigation." U. S. Army Engineer Waterways Experiment Station Technical Report No. 2-663, October 1964. (Available on loan.)
- (5241) MODEL STUDY OF WAVE ACTION AND SHIP MOORING, POINT LOMA, CALIFORNIA.

 - Department of the Navy. Experimental; for design. The Navy Electronics Laboratory desires to use an aircraft carrier, moored behind a protective breakwater about 4,000 feet (b) (d) (e) offshore, in the design and development of electronic equipment. A 1:100 model reproducing about $4.5\,$ square miles of the locality, and a 1:100 model of an Essex class aircraft carrier were used to: class aircraft carrier were used to: (1) Determine wave-action conditions that will obtain within the mooring area; (2) study variations in design and location of the breakwater; (3) secure data on actual movement of the model ship due to wave action; (4) investigate the feasibility of a proposed floating causeway shoreward from the ship; and (5) study adequacy of design of a proposed small-craft landing area

in the immediate vicinity. Waves were generated by a 60-foot-long wave machine and are measured and recorded electrically. The model of the aircraft carrier was dynamically balanced to reproduce the physical characteristics of the prototype ship.

- (f) Tests completed.
 (g) (l) Breakwater length was reduced from 3,600 to 2,100 feet, a 40 percent reduction from original design. (2) It was determined that wave heights behind the breakwater, and the resulting ship motion, would not be excessive insofar as waves from average severe storms are concerned. (3) The optimum crown are concerned. (3) The optimum crown elevation for a rubble-mound causeway and small boat landing area was established. (4) It was determined that a nearby sever outfall pier would be unsafe for fishermen during periods when wave heights approached 13 to 16 feet because of overtopping of the structure.
- (h) Final report in preparation.
- (5242) PROTOTYPE CULVERT PRESSURE TESTS, GREENUP LOCKS AND DAM, OHIO RIVER, KENTUCKY AND OHIO.
 - (b) District Engineer, U. S. Army Engineer (d)
 - District Engineer, U. S. Army Engineer District, Huntington, Corps of Engineers, Huntington, West Virginia. Experimental; for design. The filling and emptying system of the main, 110- by 1,200-foot lock consists of two culverts and a split-lateral system. Prototype pressures in this filling and contribute custor and vettor durations (e) emptying system and water-surface elevations in the lock chamber were measured for comparison with model results and for further development of lock design criteria. Pressures in all parts of both lock culverts, and water-surface elevations in both pools and the lock chamber were measured with electrical transducers connected to piezometers by air-purged lines. Positions of the filling and emptying valves during filling and emptying with one and both valves were determined using circular potentiometers. All data, accompanied by a common time indication, were recorded on light-beam oscillographs. Pressure data points were digitized for reduction and plotting with an electronic computer.
 - (g) Tests and data reduction completed; final report will be prepared by U. S. Army Engineer District, St. Paul, Minnesota.
- (5243) PROTOTYPE TESTS, GATED INTAKE AND TUNNEL, NOLIN DAM, NOLIN RIVER, KENTUCKY.
 - (b) District Engineer, U. S. Army Engineer District, Louisville, Corps of Engineers, Louisville, Kentucky.
 (d) Experimental; for design.
 (e) The Nolin Dam outlet works consist of a three-gated intake structure and horseshee-
 - shaped tunnel having a capacity of 16,000 cubic feet per second. Tests were conducted to measure the tunnel hydraulic grade line and gate-hoist cylinder pressures; from these measurements tunnel friction and intake losses are being evaluated and gate Intake losses are being evaluated and gate forces computed. Test facilities included five pairs of sidewall pierometers connected to a manifold. Pressures at full tunnel flow were measured by means of the air-purge technique, using a mercury manometer and a pressure gage. Pressure taps were provided in one of the operating gate-holst cylinders and measurements of sate budgaulia guilader and measurements of gate hydraulic cylinder pressures were made with pressure gages.
 - (g) Tests indicated lower friction than had been assumed in design of the outlet works tunnel.
- (5245) MODEL STUDY OF HOUSTON SHIP CHANNEL, TEXAS.
 - (b) District Engineer, U. S. Army Engineer District, Galveston, Corps of Engineers, Galveston, Texas.

- (d) Experimental; for design.
 (e) Houston Ship Channel is a 52-mile reach extending from the Gulf of Mexico across Houston. A model study is being conducted to determine if the present cost of maintedetermine if the present cost of mainte-nance dredging in the channel can be re-duced by proposed plans of channel realine-ment, partial or complete diking of connecting bays, sediment traps, dikes in Galveston Bay, local contractions, enlarge-ments, and other remedial measures. The model reproduces a portion of the Gulf of Mexico outside the entrance to Galveston Bay; all of Galveston and Trinity Bays; Bay; all of Galvesion and Trinity Bays; Dickinson Bay and Clear Creek to the head of project; the tidal portion of Trinity River; the Houston Ship Channel in its entirety; and Buffalo Bayou from the Turning Basin to the confluence of White Oak Eayou. The model is of fixed-bed construction with scale ratios, model to prototype, of 1:600 horizontally and 1:60 vertically. Tides and norizontally and isob vertically. These and tidal currents are reproduced by a tide generator located in the Gulf of Mexico portion of the model, and the salinity of the model Gulf is reproduced to scale so that the effects of salinity differences on the vertical distribution of current velocities, as well as salinity concentrations throughout the model, accurately reproduce those of the prototype. The model will be used to establish the effects of all proposed improvement works on tidal current velocities, current patterns, and salinities in all critical areas. All hydraulic and salinity data obtained from the model will be quantitative and can be applied directly to the prototype. Shoaling studies will be made by injecting finely ground gilsonite into the model to reproduce the patterns of shoaling as observed in the prototype, following which the effects of proposed improvement plans on shoaling patterns may be observed and evaluated from a qualitative viewpoint.
- (5246) MODEL STUDY OF NAVIGATION CONDITIONS, UNIONTOWN LOCK AND DAM, OHIO RIVER.
 - (b) District Engineer, U. S. Army Engineer Dist., Louisville, Corps of Engineers, Louisville, Kentucky.
 - Experimental; for design. The project includes a nonnavigable, gated $\begin{pmatrix} d \\ e \end{pmatrix}$ structure and two parallel locks. A 1:120 model, reproducing about 8.6 miles of the Ohio River and adjacent overbank areas, the of the Wabash River, is being used to investigate navigation conditions with the proposed structures, to determine the effects of modifications in the composition and arrangement of the structures, and to
 - develop any modifications considered desirable. Tests indicated the need for modification in (g) composition and arrangement of the locks and dam structures, and developed information needed for design.
- (5247) MODEL STUDY OF FILLING AND EMPTYING SYSTEM, JCNESVILLE LOCK AND DAM, OUACHITA-BLACK RIVER, LOUISIANA.
 - (b) District Engineer, U. S. Army Engineer District, Vicksburg, Corps of Engineers, Vicksburg, Mississippi. Experimental; for design.
 - Experimental; for design. A 1:25 model, reproducing 750 feet of the lock approach channel, intake manifold, the 84-by 600-foot lock chamber, culvert, sidewall port manifolds, outlets, and 650 feet of the exit channel, is being used to develop the optimum side port filling and emptying system for the lock system for the lock.
 - Tests completed. None of the port arrangements using 22-foot spacing resulted in operating characteristics as favorable as those obtained in earlier tests with the types 3 and 19 port arrangements

which used a 20-foot spacing. (h) Final report in preparation.

- (5248) MODEL STUDY OF FLOATING BREAKWATER, SMALL BOAT BASIN NO. 2, JUNEAU, ALASKA.
 - (b) District Engineer, U. S. Army Engineer District, Alaska, Corps of Engineers, Anchorage, Alaska. (d) Experimental; for design. (e) A floating-log breakwater is proposed to

 - protect Small Boat Basin No. 2 from stormwave action. To determine wave attenuation characteristics of a floating-log breakwater, tests were conducted in a concrete wave flume 119 feet long, 5 feet wide, and 4 feet deep. Models of a 30-foot-long section of the breakwater were reproduced at a linear scale of 1:6. The breakwaters simulated 3- and 4-foot-diameter logs spaced on 4.0-, 5.7-, and 8.2-foot centers. Vertical barrier plates were attached to the faces of the logs to increase the effective depth of flotation of the logs. Model waves were generated by a plungertype wave machine, and measured and recorded electrically.
 - (f) Completed.
 (g) It was found that 3-foot-diameter logs spaced from 5.5 to 6.0 feet on centers would from 5.5 to 6.0 feet on centers would provide sufficient protection to the boat basin, based on the criterion of a trans-mitted wave height $(H_{T}) \leq 0.5$ foot, if it is considered feasible to add vertical plates to the seaside face of the logs extending to a depth of 4 feet below the stillwater level stillwater level.
 - "Twin-Log Floating Breakwater, Small-Boat Basin No. 2, Juneau, Alaska; Hydraulic Model Investigation." U. S. Army Engineer Water-ways Experiment Station Miscellaneous Paper (h) No. 2-648, May 1964. (Available on loan.)
- (5249) PROTOTYPE HAWSER-STRESS MEASUREMENTS, JACKSON LOCK, TOMBIGEE RIVER, ALABAMA.
 - (b) District Engineer, U. S. Army Engineer District, Mobile, Corps of Engineers, Mobile, Alabama, and Office, Chief of Engineers, Washington, D. C.
 (d) Experimental; for design.
 (e) The Jackson Lock chamber is 110 feet wide by
 - 670 feet long and has a 34-foot maximum lift. Reverse tainter valves control flow in two 12.5-foot-square culvers, each of which has 6 intake ports in the upper approach walls, 14 side ports to the lock chamber, and an outlet discharging outside the lower lock approach. Measurements of prototype hawser loads resulting from hydraulic forces acting on a tow of loaded barges were made to obtain data for comparison with model test results. Both rigid and flexible connections between the tow and floating mooring bitts were used in the tests. The rigid connections, containing calibrated dynamometers, were installed fore and aft on the portside of the tow and connected to floating mooring bitts in the lock land wall. One connection measured longitudinal hawser forces, and the other measured transverse forces. Potentiometers were mounted on the culvert-valve operating arm to measure valve opening. Differential-type pressure transducers were used for measuring the slope of the water surface in the lock chamber, and absolute pressure transducers were used for drawdown measurements of the water surface in the approach channel. Potentiometers also were installed on the land-wall floating bitts to measure tow movement during the rigid connection tests. For the flexible-connection tests, the rigid connections were replaced by flexible hawsers of l-inch-diameter wire rope, and calibrated dynamometers were installed in the hawsers at each corner of the tow and connected to floating bitts in both lock walls. Other instrumentation was identical with that of the rigid connection

- tests. (h) Final report in preparation.
- (5250) PROTOTYPE SPILLWAY TESTS, FORT RANDALL DAM, MISSOURI RIVER, SOUTH DAKOTA.
 - (b) District Engineer, U. S. Army Engineer District, Omaha, Corps of Engineers, Omaha, Nebraska.
 - Experimental; for design. The Fort Randall Dam spillway is a 1,000-foot-wide concrete chute, with a design capacity of 620,000 cubic feet per second. Discharge $\begin{pmatrix} d \\ e \end{pmatrix}$ is controlled by twenty-one 29- by 40-foot tainter gates. Two test series, one in 1960 and one in 1962, have been conducted to obtain vertical velocity distribution and water-surface depths on the spillway chute for use in checking design resistance coover the spillway. These data will assist in eliminating a deficiency in the infor-mation on full-scale chute spillway flows used in design of such structures. To obtain the measurements, two pitot piers were fabricated and installed on the spillway chute. The pitot piers instrumentation consisted of eight total-head tubes to measure vertical velocity distributions. Waterlength were made with wire-weight gages. Visual observations and photographic records of flow conditions were also made. Data were obtained at seven average flow depths up to 3.5 feet with velocities up to 45 feet per second.
 - (h) Final report in preparation.
- (5251) MODEL STUDY OF NAVIGATION CONDITIONS, ROBERT S. KERR LOCK AND DAM, ARKANSAS RIVER.
 - (b) District Engineer, U. S. Army Engineer District, Tulsa, Corps of Engineers, Tulsa, Oklahoma.

 - (d) Experimental; for design.
 (e) The project will consist of a nonnavigable
 (e) The project will consist of a nonnavigable dam, a 110- by 600-foot lock, and a power-house. A 1:120 model, reproducing about 3.2 miles of the Arkansas River and the lock and dam structures, is being used to study navigation conditions in the approaches to the lock, determine suitability of the selected site, and develop modifications re-quired to overcome any undesirable conditions. The model will be of the fixed-bed bype with provision for a movable-bed section below the dam for use in developing channel
 - (g) Tests resulted in the reach.
 (g) Tests resulted in the development of anticipated channel configurations downstream of the dam and modifications which would provide satisfactory navigation conditions in the approaches to the lock.
- (5634) MODEL STUDY OF BREAKWATERS, DANA POINT HARBOR, CALIFORNIA.
 - (b) District Engineer, U. S. Army Engineer Dis-trict, Los Angeles, Corps of Engineers,
 - Los Angeles, California. Experimental; for design. Dana Point Harbor is a proposed small-craft $\begin{pmatrix} d \\ e \end{pmatrix}$ harbor to be constructed at a site which is exposed to ocean waves. The harbor will be protected by rubble-mound breakwaters which will allow some of the wave energy to pass through the structure. Tests to determine (1) the effectiveness of the proposed breakwater sections in reducing transmitted wave energy and (2) the stability of the break-waters were conducted to provide a basis for the design of the proposed harbor, and to add to the available basic data on the transmission of wave action into artifical harbors. Section models of the proposed structures, constructed to linear scales of 1:50 and 1:100, were tested in a concrete flume 119 feet long, 5 feet wide, and 4 feet deep. Model waves were generated by a plunger-type wave machine and measured and

- recorded electrically.
 (g) Stability tests showed that the proposed breakwater section would be adequate to withstand the attack of the 12-second, 16foot design waves. The maximum transmitted wave height measured on the harborside was found to be about 45 percent of the incident the more wave energy was transmitted through a rubble-mound breakwater. Appreciable scale effect in wave transmission coefficient (Hr/H_1) was about 15 percent. The longer the wave period, the more wave energy was transmitted through a rubble-mound breakwater. Appreciable scale effect in wave transmission was found between the results of tests obtained from the 1:50- and 1:100-scale model.
- (5635) INVESTIGATION OF WAVE REFLECTING AND TRANS-MITTING CHARACTERISTICS OF RUBBLE-MOUND BREK-WATERS, RUBBLE-WAVE ABSORBERS, SAND BEACHES, WAVE TRAPS, AND RESONATORS.
 - (b) Office of the Chief of Engineers, Dept. of (b) for the Army, Washington, D. C.
 (d) Experimental; applied research.
 (e) A theoretical study is being conducted to

 - evaluate the advantages and disadvantages of different types of wave absorbers and to establish a sound basis for laboratory tests of the wave reflecting and transmitting characteristics of rubble breakwaters and wave reflecting-absorbing characteristics of the different types of wave absorbers. The scale effects relating to wave absorbers will be investigated. Laboratory investigations of the different types of absorbers and the wave reflecting transmission characteristics of rubble breakwaters will be conducted in three wave flumes, a 1- by 1.5- by 85-foot tank, a 5-by 4- by 119-foot tank, and a 2- by 5.5- by 149-foot tank.
- (5636) MODEL STUDY OF FLUSHING SYSTEM, VICTORIA CHANNEL, TEXAS.
 - (b) District Engineer, U. S. Army Engineer District, Galveston, Corps of Engineers, Galveston, Texas.

 - Galveston, reads.
 (d) Experimental; for design.
 (e) Victoria Channel will extend about 35 miles from the Gulf Intracoastal Waterway to a turning basin near Victoria, Tex. A flushing system for the channel is proposed to eliminate surface debris, oil, and foul water. Tests to determine the flow require-ments of the flushing system to replace the stagnant water in the navigation channel were made in the Waterways Experiment Station salinity flume which is 327 feet long, 0.75 foot wide, and 1.5 feet deep. Duplicate tests were made for two depth scales (1:15 and 1:30) to determine if the data contained any significant scale effects. In both series of tests, the horizontal scale for length along the channel was 1:323, and that for width across the channel was 1:173. Use of different horizontal scales for length and width was necessary to make the existing flume dimensions conform to those of the landlocked portion of the channel. The salinity scale used for the tests was 1:1.

 - (f) Tests completed.
 (g) With the design discharge of 1,000 cubic feet With the design discharge of 1,000 cubic feet per second, the 20-mile-long landlocked reach of the channel was 50 percent flushed in about 17 hours, 75 percent flushed in about 29 hours, and 105 percent flushed in about 60 hours. With a lesser discharge (500 cubic feet per second), the channel was 50 percent flushed in about 38 hours, and 75 percent flushed in about 60 hours. The test data also showed that the surface test data also showed that the surface stratum of the channel would be completely flushed in 22 hours with a discharge of 1,000 cubic feet per second, or in 35 hours with a discharge of 500 cubic feet per second.(h) Final report in preparation.

(5637) SECTION MODEL OF BELLEVILLE DAM SPILLWAY,
OHIO RIVER, WEST VIRGINIA.

- (b) District Engineer, U. S. Army Engineer District, Huntington, Corps of Engineers, Huntington, West Virginia.
- (d) Experimental; for design.
 (e) Belleville Dam spillway will consist of a concrete sill surmounted by eight tainter gates, and a conventional horizontal stilling basin with baffle piers and end sill. A 1:36 basin with baffle piers and end sill. A 1:50 model, reproducing approximately 700 feet of the approach area, one central gate bay and approximately one-half of the adjacent bays as well as the piers that separate them, a 216-foot-wide section of the stilling basin, and approximately 800 feet of the exit area, and approximately 600 feet of the exit area, was used to determine the optimum shape for the downstream face of the gate sill, develop a satisfactory stilling basin, and verify the stability of the riprap blanket proposed downstream from the stilling basin.
- (f) Tests completed.
 (g) The original parabolic gate sill shape functioned satisfactorily. The stilling basin as originally designed produced maximum bottom velocities in the exit channel as high as 27.0 feet per second. However, a basin was developed that reduced these velocities to 15 feet per second. A riprap stability curve was determined with
 the stone placed on a 1-on-6 slope downstream of the stilling basin.
 (h) Final report in preparation.
- (5638) MODEL STUDY OF NAVIGATION CONDITIONS, LOCK AND DAM NO. 9, ARKANSAS RIVER.
 - (b) District Engineer, U. S. Army Engineer District, Little Rock, Corps of Engineers, Little Rock, Arkansas. Experimental; for design.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ The structures will consist of a gated dam (60-foot span), and a 110- by 600-foot lock with a maximum lift of 19 feet. A 1:120 model,reproducing about 6 miles of the Arkansas River and adjacent overbank area near Morrilton, Ark., will be used to investigate navigation conditions with the proposed structures, to determine the effects of modifications in the composition and arrangement of the structures, and to develop such modifications as might be considered desirable. The model will be of the fixed-bed type with provisions for changes in the channel based on the effects of the proposed regulating structures.
- (5639) MODEL STUDY OF NAVIGATION CONDITIONS, LOCK AND DAM NO. 7, ARKANSAS RIVER.
 - District Engineer, U. S. Army Engineer District, Little Rock, Corps of Engineers, (b) Little Rock, Arkansas. Experimental; for design.
 - A 1:120, fixed-bed, comprehensive model, reproducing about 7 miles of the Arkansas reproducing about / miles of the Arkansas River, adjacent overbank areas, the lock (110 by 600 feet) and dam structures, and other structures that might affect flow conditions, will be used to study navigation conditions in the lock approaches, the design of the upstream guard wall, and location and design of any training works neaded to design of any training works needed to improve navigation conditions and distri-bution of flow to the spillway.
- (5640) MODEL STUDY OF POLLUTION DISPERSION, CHARLESTON HARBOR, SOUTH CAROLINA.
 - (b) District Engineer, U. S. Army Engineer Experimental; for design.
 - A fixed-bed model, constructed to scales of 1:100 vertically and 1:2000 horizontally, will be used to provide data on dispersion and transport of wastes in Charleston Harbor under various conditions of freshwater inflow along with data on tides, currents, and salinities for all inflow conditions studied.

The model reproduces about 17 miles of shoreline, 230 square miles of the Atlantic Ocean, and the entire tidal portions of the Cooper, Ashley, and Wando Rivers and their tributaries. Provisions are included for reproducing tides and tidal currents, upland freshwater flows, ocean salinities, and salinity intrusion. Conservative-type fluorescent dyes will be introduced to simulate industrial and municipal waste.

- (5641) MODEL STUDY OF DROP STRUCTURE, SANDUSKY RIVER, FREMONT, OHIO.
 - (b) District Engineer, U. S. Army Engineer District, Buffalo, Corps of Engineers, Buffalo, New York.
 - (d) Experimental; for design.
 (e) Improvement of the Sandusky River channel will include a drop structure near the upper end of the improved reach to dissipate energy created by the difference in water-surface elevations above and In water surface elevations above and through the reach. The structure will include a 10-foot-high weir, stilling basin, and riprap protection above and below the weir. A 1:36 model, reproducing the drop structure and 800 feet of the channel upstream and 900 feet downstream, will be used to develop an economical design of the drop structure which will assure the dissipation of the kinetic energy developed when the water-surface profile drops from existing levels upstream to the levels within the improved channel.
 - (g) While the original design drop structure performed satisfactorily, basin tests indicated an increased basin length (19 feet) would improve energy dissipation of the structure. Twelve 3- by 20-foot openings through the structure provided satisfactory fish-passage facilities.
- (5642) MODEL STUDY OF SMALL BOAT HARBOR, DANA POINT, CALIFORNIA.
 - (b) District Engineer, U. S. Army Engineer District, Los Angeles, Corps of Engineers, Los Angeles, California.
 (d) Experimental; for design.
 (e) The inner-harbor berthing area and navigation
 - channels will comprise about 200 acres. The inner-harbor basin will be enclosed by a mole and will be accessible through 200foot-wide navigation entrances, one at each end of the 3,500-foot-long inner basin. The inner harbor will be protected by two arms of rubble-mound breakwater having a total length of about 7,700 feet. Tests to study the effects of storm-wave action to study the effects of storm-wave action on the proposed harbor design and to determine what, if any, design modifications are necessary to ensure that wave heights during storms do not exceed (1) 1.5 feet in the inner-basin anchorage, (2) 4 feet in the approaches to the entrances of the inner-harbor berthing areas, (3) 5 feet in the fairway channel paralleling the pro-posed west breakwater, and (4) 2.5 feet in the ramp basin area in the eastern sector of the inner harbor, are being con-ducted on a 1:100, fixed-bed model. The model reproduces sufficient area of the shoreline and oceanward to ensure that propagation of waves toward the problem area is adequately simulated. Waves are generated by a 60-foot-long, plunger-type wave machine, and are measured and recorded electrically.
- District Engineer, 0. S. Alwy Engineer District, Charleston, Corps of Engineers, (5643) ACOUSTIC FLOWMETER INSTALLATION AND PROTOTYHE Charleston, South Carolina. (5643) ACOUSTIC FLOWMETER INSTALLATION AND PROTOTYHE TESTS OF OUTLET WORKS, SUMMERSVILLE DAM, GAULEY RIVER, WEST VIRGINIA.
 - (b) District Engineer, U. S. Army Engineer District, Galveston, Corps of Engineers, Huntington, West Virginia.
 (d) Experimental; field investigation.
 (e) The outlet works consist of an intake structure
 - - ture, 29-foot-diameter operating tunnel,

three ll-foot-diameter outlet conduits, and three 11-foot-diameter outlet conduits, and one 3-foot-diameter low-filow outlet pipe. Tests will be made with an acoustic flow-meter to gage operational discharges, and to measure pressure gradients through the three-branch manifold connecting the 29-foot tunnel to the three ll-foot conduits; from these measurements, evaluations of tunnel resistance and intake and manifold losses will be made. The acoustic flowmeter includes a pair of The acoustic flowmeter includes a pair of transducers in the tunnel and each conduit and the accompanying circuitry to indicate the discharge from the effects of the flow rates on the acoustic signals. The pressure test facilities consist of six pairs of piezometers along the tunnel and three pairs along each conduit.

- (g) A Westinghouse LE (leading-edge) acoustic flow-Meter was installed in a power penstock at Oahe Dam for evaluation tests. Comparative discharge measurements included acoustic, pressure-momentum (Gibson), Winter-Kennedy flowmeter, dye dilution, volumetric changes in the surge tanks, and the turbine model tests. Preliminary analyses of the test data indicate that the acoustic flowmeter measurements should be as accurate as any of the measurements with which they were compared.
- (5644) MODEL STUDY OF NAVIGATION CONDITIONS IN THE LITTLE ROCK REACH, ARKANSAS RIVER.
 - (b) District Engineer, U. S. Army Engineer Dis-trict, Little Rock, Corps of Engineers,
 - (d) (e)
 - Little Rock, Arkansas. Experimental; for design. A fixed-bed model reproducing about 3 miles of the Arkansas River and adjacent overflow areas to a scale of 1:100, is being used to study navigation conditions through six modifications required in the existing bridges, and to develop a plan of regulating structures required to provide satisfactory navigation conditions.
 - Results indicate that navigation conditions (g) with existing conditions would be hazardous due to alinement of the navigation spans, limited width of span, and limited distance between bridges.
- (5645) MODEL STUDY OF OUTLET WORKS, COCHITI DAM, NEW MEXICO.
 - (b) District Engineer, U. S. Army Engineer Dis-trict, Albuquerque, Corps of Engineers,

 - trict, Albuquerque, Corps of Engineers, Albuquerque, New Mexico. (d) Experimental; for design. (e) The dam will contain a concrete, gravity, un-controlled spillway with a 460-foot-long oge crest. A 160-foot-long section of the spill-way crest will be lowered 10.5 feet to provide a service spillway. The outlet works will consist of a triple box conduit. The neces-sity for providing a reliable water supply for irrigation throughout the range of conduit releases. and the need for a two-level stillreleases, and the need for a two-level still-ing basin 60 feet wide to provide for flows as large as 15,200 cfs made it desirable to as large as 15,200 cfs made it desirable to test the energy dissipator, and the irrigation and silt sluices in a model. Tests were con-ducted in a 1:20 model that reproduced the downstream 150 feet of the triple box conduit, the chute, the primary and secondary stilling basins, the irrigation and the silt sluices, and 670 feet of exit channel. Tests completed.
 - (f) Tests completed.
 (g) Primary and secondary stilling basins, requir-interval and secondary stilling basins. ing elements of minimum size at the optimum locations, were developed. The secondary stilling basin, which used tailwater to aid in hydraulic-jump formation, was raised 5 ft. The irrigation sluices were calibrated over the anticipated range of flows. Qualitative silt removal tests of the primary basin were conducted. Final report in preparation. (h)
- (5646) SECTION MODEL OF SPILLWAY, HANNIBAL DAM, OHIO RIVER.

- (b) District Engineer, U. S. Army Engineer District, Pittsburgh, Corps of Engineers, Pittsburgh, Pennsylvania.
- (d)
- Experimental; for design. The spillway will consist of a concrete sill surmounted by 8 tainter gates and a conven-tional, horizontal stilling basin with baffle piers and end sill. A 1:36 section model, (e)piers and end sill. A 1:36 section model, reproducing approximately 700 feet of the approach area, one central gate bay and the adjacent half-bays of the spillway, a 216-foot-wide section of the stilling basin, and approximately 800 feet of the exit area, will be used to investigate the adequacy of the proposed stilling basin for a full range of tailwater elevations at which the structure will be required to operate.
- (5647) GATE VIBRATION TESTS.
 - (b) Office of the Chief of Engineers, Department
 - (d)
 - of the Army, Washington, D. C. Experimental; applied research. A systematic-leboratory investigation will be made to provide design criteria to eliminate (e) or mitigate vibration phenomena at gates and operating criteria for various gate geometrics and conduit configurations with particular attention to the prediction of critical gate opening and operating head combinations. The study will be performed in a 0.5- by 2-foot water tunnel and an 0.5by 2-foot conduit connected to a head tank. The flow velocity in the water tunnel is continuously controlled by a fluid drive up to a maximum of 35 feet per second and the to a maximum of 35 feet per second and the ambient pressure in the low-velocity section can be varied from -9 to 20 pounds per square inch gage. The maximum velocity in the conduit is 7 feet per second. Tunnel and face-type gates of various thicknesses and shapes will be installed and studied.
- (5648) MODEL STUDY OF SHOALING, BRUNSWICK HARBOR, GEORGIA.
 - (b) District Engineer, U. S. Army Engineer District, Savannah, Corps of Engineers, Savannah, Georgia.
 - (d)
 - Experimental; for design. A fixed-bed model, constructed to scales of A fixed-bed model, constructed to scales of 1:100 vertically and 1:500 horizontally and reproducing the harbor, tributary rivers and creeks, and East River in its entirety, will be used to determine if the present high rate of shoaling in East River can be reduced by either changing the distributions of flows, creating turbulence, increasing bottom veloc-ities, or by reducing the tidal prism of East River to a minimum. Automatic tide genera-tors will reproduce tides and tidal currents therourbout the harbor. Shoaling studies will tors will reproduce tides and tidal currents throughout the harbor. Shoaling studies will be made by injecting finely ground gilsonite into the model to reproduce the patterns of shoaling observed in the prototype, and to determine the effects of proposed improvement plans on shoaling patterns. Changes in shoaling patterns as effected by each pro-posed improvement plan will be determined and evoluated and evaluated.
- SECTION MODEL OF SPILLWAY, CANNELTON DAM, (5649)OHIO RIVER, INDIANA.
 - (b) District Engineer, U. S. Army Engineer Dis-trict. Louisville, Corps of Engineers,
 - $\begin{pmatrix} d \\ e \end{pmatrix}$
 - trict. Louisville, Corps of Engineers, Louisville, Kentucky. Experimental; for design. The spillway will consist of a concrete sill surmounted by 12 tainter gates and a conven-tional horizontal stilling basin with baffle piers and end sill. A riprap blanket will be provided downstream from the stilling basin to prevent undermining of the structure. A 1.36 section model, reproducing approximately 1:36 section model, reproducing approximately 70 feet of the approach area, one central gate bay and adjacent half bays of the spill-way, a 216-foot-wide section of the stilling basin, and approximately 800 feet of the exit area, is being used to determine the

flow characteristics of the spillway, the optimum elevation and configurations of the apron, baffle piers, and end sill, and to develop an adequate protective stone blanket downstream from the stilling basin.

- A parabolic weir crest upstream of the gate seals was found to provide satisfactory flow (g) characteristics with the submergible-type tainter gates, and a parabolic gate still downstream of the gate seals was found to be desirable with the nonsubmergible-type tainter gates. A satisfactory stilling basin and protective stone blanket were developed for each design.
- (5650) MODEL STUDY OF FILLING AND EMPTYING SYSTEM, CORDELL HULL LOCK, CUMBERLAND RIVER, TENN.
 - (b) District Engineer, U. S. Army Engineer District, Nashville, Corps of Engineers, Nashville, Tennessee.
 - Experimental; for design. The lock will be 84 by 400 feet. A 1:25 model, reproducing only the portion of the lock (5652) between filling and emptying valves, is being used to evaluate the overall performance of the prototype. MODEL STUDY OF NAVIGATION CONDITIONS, WEBEERS FALLS LOCK AND DAM, ARKANSAS RIVER. (b) District Engineer, U. S. Army Engineer $\begin{pmatrix} d \\ e \end{pmatrix}$ the multiport system, with particular emphasis on determining the optimum number and position of chamber ports, and to investigate methods of controlling pressures below the filling valves.
 - (g) Tests confirmed that acceptable performance could be expected from the original design multiport arrangement. Additional tests resulted in the development of satisfactory resulted in the development of satisfactory multiport arrangements using 8-, 10-, and 12-inch-diameter ports. For a lift of 62 feet, these arrangements resulted in a fill-ing time of about 8.9 minutes with a maximum hawser stress of about 3.5 tons. Tests indicated that pressure conditions in the critical area just downstream from the filling valve were improved by flaring the valve well. The effect of air venting on culvert pressures was also investigated.
- (5651) MODEL STUDY OF JAMES RIVER, VIRGINIA.
 - (b) District Engineer, U. S. Army Engineer District, Norfolk, Corps of Engineers, Norfolk, Virginia, and the State of Virginia. (d) Experimental; for design. (e) The James River, which discharges into
 - Chesapeake Bay, presently has a controlling channel depth from Newport News to Richmond of 25 feet mean low water. An improvement plan has been proposed to increase the channel depth to 35 feet mean low water, and

widen the channel at several locations. Because the James River estuary and tributaries provide ideal locations for oyster beds, an important industry in the area, a model study will be made to deter-mine the effects of the channel improvements on hydraulic and salinity conditions in and adjacent to the oyster beds. The fixed-bed model will reproduce 300 square miles of the Atlantic Ocean, the James River estuary, and all its principal tributaries from Norfolk to Richmond, Va., to scales of 1:1,000 horizontally and 1:100 vertically. Tides and tidal currents will be reproduced by a tide generator located in the ocean portion of the model. The ocean salinity will be reproduced so that the effects of salinity differences on the vertical distribution of current velocities, as well as salinity concentrations through-out the model, will accurately simulate those

- (b) District Engineer, U. S. Army Engineer District, Tulsa, Corps of Engineers, Tulsa, Oklahoma.
- (d) Experimental; for design.
 (e) A fixed-bed, 1:120 model will be used to study navigation conditions in the approaches to the lock, determine the adequacy of the design, and develop modifications required to overcome any undesirable conditions. The model will reproduce about 3.1 miles of the Arkansas River and the lock and dam structures.
- (5653) MODEL STUDY OF LAKE ERIE-LAKE ONTARIO WATER-WAY.
 - (b) District Engineer, U. S. Army Engr. District, Buffalo, Corps of Engineers, Buffalo, N. Y.
 (d) Experimental; for design.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ The project will provide a second overland navigation canal from Lake Erie to Lake Ontario to supplement the existing Welland Canal. An existing fixed-bed model, constructed to scale ratios of 1:360 horizontally and 1;60 vertically, and reproducing the Niagara River from Buffalo to Rainbow Bridge below the Falls, will be used to investigate control structure and lock arrangements, and navigation channel features including compensating excavations or structures required to maintain existing stage-discharge relations. Navigation conditions at the entrance to the overland canal will be studied in a second model.

H. G. ACRES & COMPANY LIMITED, Hydraulic Laboratory.

Inquiries concerning the following projects should be addressed to Mr. O. M. Erickson, Head, Hydraulic Department, H. G. Acres & Company Limited, Consulting Engineers, Niagara Falls, Canada.

- (5088) MODEL TESTS OF CHUTE SPILLWAY FOR THE CALIMA II HYDRO-ELECTRIC PROJECT.
 - (b) Corporacion Autonoma Regional Del Cauca, Cali, Colombia.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Experimental; design.
 - Tests were performed on a 1:32.8 scale movable bed model to determine the approach conditions which provided the optimum discharge characteristics for the oper shaped spillway which is constructed on an arc, the freeboard re-quirements and the magnitude and frequency of pressure fluctuations on the 240-metre long chute which drops 46 metres, and the optimum shape of the downstream flip bucket. Tests completed.
 - $\binom{f}{h}$ Report submitted to client.
- (5616) MODEL TESTS OF THE PERMANENT RIVER DIVERSION STRUCTURE FOR THE CALIMA II HYDRO-ELECTRIC PROJECT.
 - (b) Corporacion Autonoma Regional Del Cauca, Cali, Colombia.
 - $\begin{pmatrix} d \\ e \end{pmatrix}$ Experimental; design.
 - The powerhouse for the Calima II Hydro-Electric Project will be constructed across the yoke of an ox-bow of the Calima River. The tailrace will discharge at right angles to The tallrace will discharge at right angles to the river flowing through the permanent diversion channel. Model tests were carried out on a 1:32.8 scale movable bed model of the tailrace and diversion channel to deter-mine the optimum geometry of the intake to the channel, and the configuration of the tailrace weir and channel slope to eliminate flooding of the powerhouse under design flood conditions. Tests completed.
 - (f) Report submitted to client.
- (5617) MANICOUAGAN II SPILLWAY CHANNEL.
 - Hydro-Quebec.

 - (b) (d) (e) Experimental; design. The discharge of 200,000 cfs, leaving the flip bucket of the spillway, has to be conducted over a rock slope and back into the river downstream of the powerhouse. A model of the spillway, including the five gates and the topography of the slope and riverbed, is being built to a scale of 1.72. Tests will determine the most economical excavated channel and wall combination. The movement of loose rock in the riverbed and its effect on the power-house discharge will also be studied.
- (5618) MODEL TESTS OF THE ROCKFILL CAUSEWAY CROSS SECTION FOR THE NORTHUMBERLAND STRAIT CROSSING.
 - (b) Northumberland Consultants Limited, Charlottetown, Prince Edward Island.
 - Charlottetown, Frince Edward Island. Experimental; design. The rockfill causeway section of the Northumberland Strait Crossing will be approximately three miles in length. The rockfill core must be protected against the combined effects of a 20-foot design wave, currents resulting from partial losure of the Strait which of procest (d) (e) closure of the Strait which at present experiences 8-foot tides, and the movement of extremely large ice floes. Wave studies are being carried out on a 1:20 scale model to determine the most economic combination of dyke freeboard, dyke slope, primary pre-cast concrete armour units and secondary riprap requirements, which will meet the design conditions.
- (5619) TIDAL MODEL TESTS FOR THE PROPOSED NORTHUMBERLAND STRAIT CROSSING.

- (b) Northumberland Consultants Limited, Charlottetown, Prince Edward Island. Experimental; design.
- $\begin{pmatrix} d \\ e \end{pmatrix}$
- Experimental; design. To study the effect of partial closure of the Northumberland Strait by the building of a causeway. Model studies are being made of the Strait to scale of 1:6400 horizontal and 1:64 vertical. Tidal move-ments within the Strait are caused by the tidas imposed or the entropeoper in the tides imposed on the entrances; two tide generators are therefore used. The principal objectives of the study are to confirm conclusions derived from analytical calculations, to determine the velocity distribution through the causeway opening, the overall velocity pattern, and the maximum tidal difference across the causeway. On completion of the studies for design data, the model will be available for studies required by other interested agencies such as the Department of Fisheries.
- (5620) MODEL STUDY OF BRIDGE PIERS SUBJECTED TO PRESSURES FROM LARGE ICE FLOES.

 - (b) Northumberland Consultants Limited, Charlottetown, Prince Edward Island.
 (d) Experimental; design.
 (e) Piers for the bridged section of the proposed crossing of Northumberland Strait will be subjected to ice pressure. Various shapes are being tested on a 1:60 scale model to find the prefitude and direction of the find the magnitude and direction of the forces, and to observe the mechanics of the splitting and breaking of ice floes against these piers. A special substance has been devised having the appropriate mechanical properties to simulate the ice mechanical properties to simulate the first are supported by a specially designed dyna-mometer and placed in the centre of a raceway. The artificial ice floes, floating in the water, are either carried by the current of water, or forcibly propelled and made to collide with the propelled and made to collide with the pier.
- (5621) PANELS FOR MEASUREMENT OF ICE PRESSURES AT PORT BORDEN, PRINCE EDWARD ISLAND.

 - (b) Northumberland Consultants Limited, Charlottetown, Prince Edward Island.
 (d) Field investigation; design.
 (e) A study to determine the forces exerted by a large ice floe when driven by strong winds against the end of a pier at Port Borden. The measurements are to be made by means of a pair of hollow steel panels with relatively flexible walls which are supported on the vertical faces of the supported on the vertical faces of the pier. On being subjected to ice pressures, the walls of the panels transmit the forces to a number of hydraulic flat jacks placed inside them. By sensing the pressure of the hydraulic fluid in the jacks, oscillo-graphs will be obtained of the forces exerted by the ice at various elevations and for both lors and chort periods. and for both long and short periods of time.

UNIVERSITY OF BRITISH COLUMBIA, Hydraulics Lab.

(4451) HEAD LOSS IN SPHERICAL AND CONVENTIONAL WYES.

- (b) Laboratory project.
- (b) Laboratory project.
 (c) Dr. E. Ruus, Dept. of Civil Engineering, University of British Columbia.
 (d) Applied research. Much of the experimental work is being done by an M.A.Sc. student.
 (e) The spherical wye due to its small di-mensions is particularly suitable as a wye-branch in large penstocks under high head. A Lucite model of a spherical wye was con-structed and the head losses measured. Models for conventional type of wes are Models for conventional type of wyes are under construction. For all wyes the inside diameter of the main pipe and the branch pipes are 5 1/4 and 3 3/4 inches respectively.

Several modifications such as tapered out-lets, rounded corners and different sphere diameters are being investigated. (f) Continued.

- (4902) FLOOD SYNTHESIS AND FORECASTING FOR THE FRASER RIVER.
 - (b) British Columbia Disaster Relief Fund
 - Committee. Dr. M. C. Quick, Dept. of Civil Engineering. Mainly theoretical, using existing meteoro-logical and hydrological data, but some extra field and laboratory work is being $\begin{pmatrix} c \\ d \end{pmatrix}$ undertaken.
 - (e) Starting with meteorological data, an attempt has been made to synthesise the 1948 Fraser Flood. Data for other peak flow years has also been examined. From this study a method is being developed to assess the probability of certain peak flows. The present experi-mental project is concerned with soil temperature gradients and freezing levels under the snow.(h) Preliminary report. Paper ready for publi-
 - cation.
- (4903)FORCES ENCOUNTERED BY A CYLINDER IMMERSED IN FLOWING WATER.

 - (b) Laboratory project.
 (c) Dr. M. C. Quick, Dept. of Civil Engineering, Univ. of British Columbia.
 (d) Experimental and theoretical; basic research. Much of the experimental work is being done by or M 4.5 a student by an M.A.Sc. student.
 - (e) The main purpose is to study the variation of lateral and drag forces with the permitted amplitudes of vibration of the cylinder. Various methods of stabilizing the cylinder to reduce or remove the oscillating forces, are being investigated.
 - $\begin{pmatrix} f \\ h \end{pmatrix}$ Investigation continuing.
 - M.A.Sc. Thesis by Yu Min Chow, April 1964.
- (4904)FISH PASSAGE THROUGH HYDRAULIC TURBINES -INFLUENCE OF INJECTION OF COMPRESSED AIR ON FISH MORTALITY.
 - Laboratory project.
 - (c) Dr. E. Ruus, Dept. of Civil Engineering, Univ. of British Columbia.
 - Experimental; applied research. Much of the experimental work is being done by an M.A.Sc. (d) student.
 - (e) Cavitation is considered as a major factor contributing to the mortality of fish passing through a hydraulic turbine. Injection of compressed air in the regions of maximum cavitation results in a significant reduction in cavitation. This project is being under-taken to determine the extent of reduction in fish mortality resulting from the injection of compressed air into the penstock or draft tube. In a series of tests young salmon will be injected into the penstock and will pass through a 10 in. dia. four-bladed model propeller wheel. The turbine will operate under different conditions of speed, gate opening and sigma. Continued.
 - $\begin{pmatrix} f \\ h \end{pmatrix}$ M.A.Sc. Thesis by Thamrong Prempridi, Sept. 1964.

ECOLE POLYTECHNIQUE, Department of Civil Engineering, Hydrodynamics Laboratory.

- (4043)STUDY OF THE RELIABILITY AND OPERATION OF BACK-WATER VALVES ON PLUMBING SYSTEMS AGAINST FLOODING BY PUBLIC SEWERS.
 - (b) City of Montreal, City Planning Department, Inspection Division.
 - (c) Professor Raymond Boucher, Director, Hydro-dynamics Laboratory, Ecole Polytechnique, 2500 Marie-Guyard Avenue, Montreal 26, Quebec, Canada.
 - (d) Experimental; applied research.

- (e) A full scale three-story plumbing system has been erected in the Hydrodynamics Laboratory of Ecole Polytechnique. The diameter of the pluvial column, the soll stack and the drain is 4 inches. The drain has many sections of pyrex glass to permit observations at critical points. A system of valves and of cross-connections on the vents lends to various combinations of tests. The back-water valves have a transparent lucite cover to enable visual observations. As air entrainment has a great importance on the venting capacity, the rate of air entrained in the vertical columns is measured at the inlet by means of a hot-wire air-meter. Various flooding conditions of the public sewers are simulated by a tank in which the water level can be controlled by gate valves. This research is aimed at determining whether back-water valves can offer home dwellers a reliable protection against flooding due to any overload of combined sewers. If this method is not satisfactory, an improved design of plumbing system may be suggested.
- (f) Temporarily suspended.
 (g) The mechanism of air entrainment has been studied and tests have revealed the best
- position for some of the vents. (h) Interim report entitled "Etude experimentale des soupapes de surete contre les surcharges d'egout", by Andre Leclerc, Roger Labonte and Raymond Boucher, December 1963, submitted to sponsor.
- (5089) MODEL TESTS OF THE PILLUR DAM SCOUR VENT FOR THE KUNDAH HYDRO-ELECTRIC PROJECT, INDIA.
 - Canadian Vickers Limited. (c) Professor Raymond Boucher, Director, Hydrodynamics Laboratory, Ecole Poly
 - technique, 2500 Marie-Guyard Ave., Montreal 26, Quebec, Canada.
 - (d) Experimental; applied research.
 (e) The purpose of the investigation was to study the hydraulic performance of a scour vent for different headwater and tailwater conditions. The model built to a scale of 1:20 comprises a hydraulic inlet flared in three directions, a vertical lift emergency gate, a radial type control gate and an energy dissipator. The experimental investigation was primarily concerned with (1) the development of cavitation free entrance shapes, (2) the determination of the hydraulic thrust on the emergency gate for different openings and discharge conditions, (3) the observation of mechanical vibrations on the gates, and (4) the performance of the gates, and (4) the performance of the energy dissipator. $\begin{pmatrix} f \\ h \end{pmatrix}$

 - Laboratory project. Dr. K. M. King, Department of Engineering Science, Univ. of Guelph, Guelph, Ontario, (c)Canada.
 - Field investigations; basic research. The purpose of this investigation is to evalu-ate the factors influencing evapotranspiration (d) (e) by the use of a specially designed floating lysimeter. Study is being conducted on the effect of soil moisture on the heat budget and evapotranspiration for crops.
 - (g) Errors due to temperature variations in zinc chloride filled floating lysimeters were found to be much more serious than those in water filled floating lysimeters.
- (4052) COVER MATERIALS FOR TILE DRAINS.
 - (b) (c)
 - Laboratory project. Prof. F. R. Hore, Univ. of Guelph, Guelph, Ontario, Canada.
 - (d) Experimental and field investigation; applied research.
 - (e) This study is being made to determine the effect of several cover materials on soil movement and water discharged into a tile drain. Laboratory studies of some relatively new glass fiber materials have been completed and a field experiment based on those results was installed in the fall of 1960.
 (g) Biennial sampling of sediment from drains at the field experimental site is being con-
 - tinued.

 - (b) Laboratory project in cooperation with Water Resources Division, Department of Northern Affairs and National Resources.
 - (c) Prof. F. R. Hore, Univ. of Guelph, Guelph,
 - Ontario, Canada. Field investigation; applied research. Four 2 to 10 square mile flat watersheds of fine-textured soils are to be studied to (d) (e) determine the relationship between predetermine the relationship between pre-cipitation, snowmelt, watershed character-istics and runoff. These watersheds are distributed geographically over Southern Ontario. Hydrologic data on this type of watershed are being sought for the establishment of criteria for the design of drainage structures.
- (4925) MECHANICAL DRAINAGE OF AGRICULTURAL LANDS.
 - (b)
 - Laboratory project. Prof. R. W. Irwin, Univ. of Guelph, Guelph, Ontario, Canada. (c)

- (d) Field investigation; applied research.
- Discharge measurements and stage measurements (e) from three pump drainage sites are being recorded together with precipitation values. Data collection is continuing.
- (g) (5508) TRANSIENT PRESSURE AND WATER CONTENT DISTRI-BUTIONS IN SOIL - WATER FLOW SYSTEMS.

 - (b) Laboratory project.(c) Prof. W. N. Stammer
 - Science, Univ. of Guelph, Guelph, Ontario, Canada.
 - Experimental, theoretical; applied research. Experimental and analytical investigation of transient soil water flow systems with saturated and unsaturated flow regions is (d) (e) being investigated.
- (5509) MOISTURE BALANCE AND IRRIGATION REQUIREMENTS.

 - (b) Laboratory project.
 (c) Prof. H. D. Ayers, Dept. of Engineering Science, Univ. of Guelph, Guelph, Ontario, Canada.
 - (d)
 - (e) puted for a ten year period at ten sites in Southern Ontario. The budgeting procedure is based on actual precipitation data and evapotranspiration determined from meteorological conditions and an empirical moisture de-pletion model. A snythetic irrigation schedule is superimposed upon the moisture budget in a supplementary computer program.
 (g) The average annual irrigation requirement for paramial warsterion worked for exposed
 - perennial vegetation varied from approxi-mately 9 inches for coarse textured soils of low moisture storage capacity to about four inches for soils of high storage capacity.
- (5510) GEOLOGICAL INFLUENCES ON STREAM FLOW.

 - Laboratory project. Prof. H. D. Ayers, Dept. of Engineering Science, Univ. of Guelph, Guelph, Ontario, Canada.
 - (d) Experimental, applied research for Master of Science Degree.
 - (e) Various stream flow parameters such as flow various stream flow parameters such as flow duration curve, groundwater recession con-stant, uniformity of monthly discharge and other indices are being compared on drainage basins of differing surficial geology in Southern Ontario. The geological conditions range from fine-textured soils formed on till to coarse textured soils formed on to coarse textured soils formed on sands and gravel.
- (5511) UNIT HYDROGRAPHS FOR ONTARIO WATERSHEDS.
 - (b) (c)
 - Laboratory project. Prof. H. D. Ayers, Dept. of Engineering Science, Univ. of Guelph, Guelph, Ontario, Canada.
 - (d) Experimental, applied research for Master of Science Thesis.
 - (e) Unit hydrographs were developed for five watersheds in the region. Methods of base flow separation were compared. Effects of areal and time distribution and magnitude of rain-fiber of the distribution and magnitude of rainfall on unit hydrograph were assessed. Completed.

 - There was no significant effect on the unit hydrograph peak which could be attributed to the areal or time distribution of rainfall or
 - the areal of time distribution of fainfail of the actual amount of rainfail involved in the storm runoff hydrograph. "Unit Hydrograph Characteristics of Selected Ontario Watersheds," W. T. Dickinson, M.S.A. Thesis, Ontario Agricultural College, Univ. of Toronto, 1963.
- (5512) BASIN PHYSICGRAPHY AND HYDROGRAPH CHARACTER-ISTICS.
 - (b) (c) Laboratory project. Prof. H. D. Ayers, Dept. of Engineering

Science, Univ. of Guelph, Guelph, Ontario, Canada.

- (d) Experimental, applied research for Master of Science Thesis.
- (e) Hydrographs and physiographic parameters of determined. The time of concentration was determined for each hydrograph.
- (f) Completed.
 (g) A multiple regression equation for time of concentration as a function of physiographic
 concentration as a function of physiographic characteristics was developed. This relation-ship was compared with other empirical formula for time of concentration. (h) "The Time of Concentration For Selected
- Rivers From Watershed Characteristics," N. Gryniewski, M.S.A. Thesis, Ontario Agricultural College, Univ. of Toronto, Ρ.

THE HYDRO-ELECTRIC POWER COMMISSION OF ONTARIO, Hydraulic Model Laboratory.

Experimental, applied research. A daily moisture budget based on four different be addressed to Mr. J. B. Bryce, Hydraulic Engineer, soil moisture storage models is being com-Hydraulic Generation Department, 620 University Avenue, Toronto 2, Ontario, Canada.

- (4026) NIAGARA RIVER MODEL.
 - Ontario Hydro.
 - Experimental; for design and operation. An existing 1:250 x 1:50 scale model reproducing five miles of the Niagara River $\begin{pmatrix} d \\ e \end{pmatrix}$ from Buckhorn Island to below the Cataracts is being used to determine the operational characteristics of the Niagara River Control Structure under developed conditions. This model was previously used to investigate the remedial works necessary for the Preservation and Enhancement of Niagara Falls and for the location of the intakes and necessary river improvements of both Ontario Hydro and the Power Authority of the State of New York. To fully realize the terms of the 1950 Niagara Treaty, additional remedial works have been designed. These include a five-gate extension to the existing 13-gate control structure as well as a system containing an upstream accelerating wall, a downstream training wall and overflow weir for the safe passage of ice past the various intakes along the Canadian shore of the river above the Falls. The sequence of con-struction of these works and the conditions during their construction were determined in the model. Rating of the structure under cofferdammed conditions was obtained. An echo-sounding survey with electronic fixing was made in the field in 1962 and portions of the model re-contoured. Certain river improvements were designed and executed to assist in the passage of ice floes.
- (4455) ARROW LAKES DAM COLUMBIA RIVER.
 - British Columbia Hydro and Power Authority.
 - (d) Experimental; for design and operation. An 1:80 scale model of the Arrow Lakes and (e) dam and environs was built to determine the detailed location and adequacy of the water passages in a concrete structure and the energy-dissipating works necessary to ensure the protection of an associated earth dam. Numerous tests have been made with a movable bed of fine sand to determine erosion characteristics and navigation velocities upstream and downstream of a lock situated between the concrete structure and the earth dam.

determine the hydraulic design of the tunnel ports in the concrete structure and to develop the associated energy-dissipating work. Rating of these ports was obtained as well as the hydraulic loadings on the port gates. A 1:60 scale model of one of the four sluiceways is being tested in the flume to determine

the rating of the sluice and the hydraulic loadings on the sluice gate. Piezometers are being used to determine under varying conditions of flow, the rollway pressures as well as the pressures at selected locations in the energy-dissipating bucket and associated tooth-like projections of the dissipator.

- (4963) KIPLING GENERATING STATION MODEL.

 - $\left\{ \begin{array}{c} d \\ e \end{array} \right\}$
 - Ontario Hydro. Experimental; for design. A 1:80 scale comprehensive model has been constructed of the main dam containing two submerged tunnel ports and two sluiceways to determine the dewatering arrangement for construction, cofferdam location and ele-vations, velocities during closure of cofferdam and the rating of the diversion ports during construction of main dam and sluiceways. The elevations and lengths of training walls, and the length of a concrete apron downstream of the sluices were determined by experiment.
 - (f) Work is complete and model inactive.
- (4964) LAKEVIEW THERMAL GENERATING STATION -RECIRCULATION STUDY OF CONDENSER COOLING WATER.
 - Ontario Hydro.
 - (b) (d) (e) Experimental; for design and operation. A 1:24 natural scale model was constructed of the intake channel from Lake Ontario and pump wells for the condenser cooling water of the eight 300-megawatt thermal units. By design of the alignment of the excavated rock canal walls and the introduction of warm condenser water through a "Y" branch pipe into the canal, efficient distribution of the warm water across the pump wells was achieved under a variety of pumping conditions in order to prevent ice difficulties at the travelling screens.
 - (f) Work is completed and model removed.
- (5514) KIPLING GENERATING STATION TAILRACE MODEL.
 - (b) Ontario Hydro.
 - (d) Experimental; for design.
 - Experimental; for design. A 1:50 scale model of the draft tubes of the four turbines and tailrace was constructed to study whether a 3 to 1 slope up from the units was possible rather than a 4 to 1 slope due to the confining nature of the downstream (e) topography.
 - (f) Work completed and model removed.
- (5515) LAKEVIEW GENERATING STATION UNITS 7 and 8.
 - Ontario Hydro. (b)
 - (d)
 - Experimental; for design and operation. A 1:16 plastic scale model was built of the 7-foot diameter condenser cooling water pipes (e) and the branch 5-foot diameter pipes, expanders and various degree elbows leading to and from the condenser box. By experi-ment the actual division of pipe flow to and from the condenser was found as well as the vanes necessary to provide equal flow in the branch pipes.
 - (f) Work completed and model inactive.
- (5516) SIR ADAM BECK-NIAGARA GENERATING STATIONS.
 - Ontario Hydro. (b)
 - (d)
 - Experimental; for design. A 1:80 scale model was built of the two canals leading to the plants including the crossover, in order to determine the per-formance with the increased flow of Sir Adam Beck No. 1 canal due to its enlargement.
- (5517) LAMBTON GENERATING STATION.
 - Ontario Hydro.
 - d
 - A l to 80 scale model reproduces about one mile of the St. Clair River topography. The (e)

model will determine the location and size of the intake channels for cooling water and any river excavation for the channel and shipping.

(f) Model under construction.

LASALLE HYDRAULIC LABORATORY LTD.

- (4456) VELOCITY AND DIRECTION OF CURRENT RECORDER.
 - $\begin{pmatrix} b \\ d \end{pmatrix}$ Laboratory Project.
 - Experimental development of instrument for hydrographic and oceanographic research for acquisition of datum in computable form
 - (punched tape).
 (e) Recording of velocity by impulse counter for propeller type current-meter. Recording of direction by reading an encoder monitorized by a marine compass. Instrument must be:

 rugged, 2) simple and easy to maintain,
 very low power drain for long periods.
 (recording up to 6 months under ice).
 - Prototype studies and tests completed. Industrial instrument design and industrial
 - (g) prototype completed. Ready for marketing.
- (4517) MONTREAL SOREL SHIP CHANNEL.
 - Department of Transport. (b)
 - (d) Theoretical and experimental: design. Two models representing a section of the St. Lawrence River from Laprairie Basin including Montreal Harbour to Sorel Islands were built at a scale 1/150 vertically and 1/600 horizontally. The purpose of the model was to study the improvement of navigation in this section of the St. Lawrence Biver.
- (4965) ST. TIMOTHEE REACH.
 - Hydro Quebec, and consulting engineers. Experimental; design.
 - (d)
 - Study on an undistorted 1/100 scale model of (e) three different solutions to the water level control problem in the St - Timothee reach, including studies of coffer damming, spillways, dikes along the reservoir, currents. Completed. (f)
 - (g) Report submitted to sponsor.
- (5414) PROMENADE DRIVE ALONG RIVIERE DES PRAIRIES.
 - Dept. of Public Works, City of Montreal. Theoretical; design. Part 1. Influence of the projected road (d)
 - (e) embankment upon back water and ice cover profiles along the encroached reach of the river. Part II. Protection of embankment against current and wave action.
 - Completed. (f)
 - Report submitted to sponsor. (g)
- (5415) DRAINAGE OF VERSANT SUD SEWER COLLECTOR ST. JACQUES YOUVILLE.
 - Dept. of Public Works, City of Montreal.
 - (d)
 - Theoretical; design. Hydrology and circular sewer collector design in combined system including high water flow interception device and storm water flow meter.
 - (f) Completed. (g) Report submitted to sponsor.
- (5416) ROAD TUNNEL LAFONTAINE (MONTREAL BOUCHERVILLE).
 - (b) Atlas Wilson and Janin, contractors (joint venture).
 - (d)
 - Experimental; design. Study of the hydrodynamic forces horizontal and vertical, acting on a concrete element of tunnel and accompanying barges during the (e) warping and sinking operations. Tests are carried out in a flume 30' long x ll' wide reproducing a part of the river,

the excavated trench, a calibrated plexi-glass model of tunnel element and sunken element in final position (scale 1/84).

- (5417) EROSION STUDY OF CLAY SAMPLES.
 - (b) Dept. of Transport of Canada, Marine Works Branch.
 - Branch. Theoretical and experimental; basic research. Two series of tests are conducted with undisturbed clay soil samples, and another series is carried out with the clay in the (d) (e) comparatively remoulded state. Results of hydraulic testing, fundamental differences between behaviour of cohesive and non-cohesive materials, and difficulties of scaling-up such flume results are dealt with in the report. Completed.
 - $\begin{pmatrix} f \\ g \end{pmatrix}$ Report submitted to sponsor.
- (5418) MATANE HARBOUR.
 - (b) Dept. of Public Works of Canada (Harbours and Rivers Engineering Branch), and consulting engineers.
 - Sulting engineers. Experimental; applied research, design. Wave forecast study an undistorted 1/100 scale model is used to measure wave action within the harbour and to determine the (e) optimum harbour layout. Stability studies will follow.
- (5419) RIVIERE DES PRAIRIES MARINA.
 - Dept. of Public Works, City of Montreal.
 - Theoretical; design. Planning of a small-craft harbour, including d (e) layout planning, wave action, berthing facilities and services.
 - Completed.
 - (g)Report submitted to sponsor.
- (5420) 1967 WORLD EXHIBITION MARINA.
 - (b) Canadian Corporation for the 1967 World exhibition, and consulting engineers.
 (d) Experimental and theoretical; design.
 (e) Various points are investigated; reduction
 - of currents in the entrance by means of a deflector; wave action within the marina; wind effects in relation to safe entry and exit.
 - Completed.
 - (g) Report submitted to sponsor.
- (5421) CLOSURE OF DIVERSION TUNNELS MANICOUAGAN V.
 - Hydro Quebec. (b)
 - Theoretical; design. (d)
 - (e) Down-pull calculation with existing gates, or with grids to be obturated in place; . air vent calculations downstream from the gates.
 - Completed.
 - Report submitted to sponsor. (g)
- (5422)SINKING OF CAISSON FOR THE WORLD'S FAIR BRIDGE .
 - Dufresne Engineering Corporation Limited. Experimental; design. (d)
 - (e) Scale model to study sinking of large caissons in 15 ft/sec. current. Deter-mination of hydrodynamic forces for optimum anchor systems. Completed.
 - (g) Report submitted to sponsor.
- (5423) CONSTRUCTION OF A DYKE BY THE METHOD OF TOE-DUMPING.
 - (b) Canadian Corporation for the 1967 World
 - Exhibition, and consulting engineers. Theoretical and experimental; design. A dyke is to be built to cut an arm of the (d
 - St. Lawrence river between St. Helen's Island and Notre Dame Island in Montreal harbour. The theoretical and experimental studies were to determine the evolution of

discharges, water levels and rock fill sizes necessary as the dyke progresses across the arm through the toe-dumping method.

- (f) Completed.
- (g) Report submitted to sponsor.
- (5424) ICE CONTROL STRUCTURE IN LAPRAIRIE BASIN.
 - (b) Dept. of Public Works, Canada; and consulting engineers.
 - (d) Theoretical and experimental; design. (e) Scale model of ice cover deformation and evolution under hydrodynamic forces and erosive action as influenced by the con-struction of an ice control structure up-stream from Montreal harbour.
 - (f) Completed.
 - (g)Report submitted to sponsor.
- (5425) LITTLE CURRENT SHIP PASSAGE.
 - (b) Dept. of Public Works, Canada, and consulting engineers.
 - Scale model study of navigation problems in (d) Little Current Narrows. Study of corrective measures for currents induced by wind, tide and seiche action.
- (5426) OUTARDES RIVER DIVERSION WORKS.
 - Hydro Quebec and consulting engineers. (b)
 - Experimental; design. A 1/96 scale model of single 49.5' diameter (d) (e) unlined diversion tunnel. Study of general performance, erosion, flow stability in conduit, etc. Study of the construction of the cofferdam by the toe-dumping method.
- (5427) ARROW LAKES LOCK.
 - C B A Engineering Ltd. (b)
 - d
 - Experimental; design. The purpose of the study carried out on a (e) 1/20 scale model is to ascertain the hydraulic performance of the design of the lock and make the modifications suggested by these preliminary tests.
- (5428) PEACE RIVER TAILRACE.
 - (b) I P E C (International Power and Engineering Consultants Ltd).
 - Experimental and theoretical; design. Study on a 1/96 scale model of the head losses and surge waves in the tailrace mani-(d) (e) fold and tunnel. A special study of the surge waves in the tailrace tunnel is also carried out on a computer.
- (5429) SNOW MELTING DEVICE.
 - City of Montreal.
 - Theoretical and experimental; design. d Study of the hydraulic problems pertaining to snow melters in order to improve their (e)
 - operation.
- (5430) BACK FILLING IN THE ST. LAWRENCE RIVER.
 - City of Montreal.
 - (d) Experimental study. Model study to determine the effect on water levels and ice conditions of a multi-acre back filled area at Point - St - Charles in the St. Lawrence River. (e)
 - Completed. (f
 - (g) Report submitted to sponsor.
- (5431) LOG PASSAGE IN A DIVERSION TUNNEL.
 - Hydro Ouebec and consulting engineers.
 - Theoretical study. Theoretical study. Theoretical study of the different phases of log passage in a diversion tunnel: (1) Float-ing of logs; (2) formation of a sliding cover; (3) characteristics of an immobile cover; (4) evolution of the thickness of the cover under erosion or deposition; (5) (e) characteristics of stabilized cover; and

- (6) transportation capacity of tunnel with stable log cover.
- Completed. $\begin{pmatrix} f \\ g \end{pmatrix}$
- Report submitted to sponsor.
- (5432) GREEN ST. EMILIE SEWER.
 - City of Montreal.
 - (d) Theoretical; design. Study and design of a special automatic flushing device for a long low sloped sewer. The study also includes the design of a 70' high sewer drop. (f Completed.
 - Report submitted to sponsor. (g)
- DRAINAGE OF THE RIVIERE DES PRAIRIES (5433)DISTRICT.
 - (b)
 - City of Montreal. Theoretical; design. Hydraulic design of a 6 mile long combined sewer, draining an 8000 acre basin along the Riviere des Prairies. The sever includes along its course three storm overflows, but as the sever has been designed to store a large volume of storm water, the overflows will discharge in the river not more than three times a year, each discharge being of short duration and the quantity of B.O.D. released during this time will be comparable to that of a water sewage treatment plant effluent.
 - Completed.
 - (g) Report submitted to sponsor.
- (5434) MAISONNEUVE SEWER.
 - City of Montreal.
 - (d) Theoretical; design.
 - Study and design of a special automatic flushing device to prevent sedimentation in a locally submerged sewer. The pro-posed device stores the dry water flow in the sewer itself, and quickly releases the water by means of a siphon. The design includes any movable mechanical part.

MCGILL UNIVERSITY, Department of Civil Engineering and Applied Mechanics.

- (4545) BREAKUP OF SOLITARY WAVE.
 - Laboratory project. (b) Dr. A. J. Reynolds, Dept. of Civil Engineering and Applied Mechanics, McGill University, (c)
 - Montreal 2, P.Q., Canada. Experimental; basic research. Examination of disintegration of a solitary (d) wave in shallow water on encountering deep water.
 - (f) Completed.
- (4546) CAVITATION AT HIGH-HEAD SLUICE GATES.
 - (b) National Research Council, Canada.
 (c) Dr. A. J. Reynolds, Dept. of Civil Engrg. and Applied Mechanics, McGill Univ., Montreal 2,
 - P. C., Canada. (d) Experimental; applied research, for Doctoral degree.

 - (e) Study of pressure fluctuations on wall behind an obstruction which produces cavitation.
 (f) Work transferred to ll" by ll" water tunnel.
 (g) The flow was established in a syphon tunnel of section 3" by 3". Mean pressure distributions were measured for a wide range of blockage ratios, with and without air addition. Overall pressure recovery was found to be accurately predicted by momentum balance assuming one-dimensional flow. Length of eddy behind gate (without air addition) agreed with previous measurements of Rouse and Forthmann. The length of the eddy was found to be as much as twice that of the eddy formed in the very similar flow

at a sluice gate beyond which there is a nearly level free surface.

- (4923) DIVISION OF OPEN-CHANNEL FLOW.
 - (b) (c)
 - National Research Council, Canada. Dr. A. J. Reynolds, Dept. of Civil Engineering and Applied Mechanics, McGill Univ., Montreal 2, P.O., Canada. Experimental; basic research, for Master's
 - (d) degree.
 - (e) Detailed examination of flow at junction between straight channel and a branch at 900.
 - Detailed study of flow at junction under way. All three sections of the experimental channel are 8" wide, the walls and bottom being plexiglas and painted steel. The $\begin{pmatrix} f \\ g \end{pmatrix}$ features noted in several earlier studies of such flows have been fitted into a consistent pattern. Simple mathematical models have been fjound to describe almost every feature of the flow well away from the junction.
- (4924) WAVES IN AND NEAR PACK ICE.
 - Defence Research Board, Canada.

 - Dr. A. J. Reynolds, Dept. of Civil Engrg. and Applied Mechanics, McGill Univ., Montreal 2, P.O., Canada. Experimental; basic research for Doctoral (c)
 - (d) thesis.
 - (e) Study of uniformly distorted turbulence to investigate the approach to equilibrium structure and the nature of that structure. (g) Special wind tunnel under construction.

NATIONAL RESEARCH COUNCIL, Division of Mechanical Engineering.

Inquiries concerning the following projects should be addressed to Dr. D. C. MacPhail, Director, Division of Mechanical Engineering, National Research Council, Montreal Road, Ottawa, Ontario, Canada.

- (4047) BAIE COMEAU, PROVINCE OF QUEBEC.
 - (b) Department of Public Works, Canada.

 - Experimental; for design. The new development of the harbour is com-pleted. It involves a perforated vertical-wall breakwater, 1000 ft. long, 60 ft. wide, 56 ft. high, bullt as the extension to an existing wharf. (e)
 - (g) Observations have shown the breakwater to perform in a satisfactory manner during storms. The wave run-up appears to be suppressed and no erosion can be observed at the toe. The breakwater can thus provide berthing facilities as well as harbour protection.
- (4464) RUSTICO HARBOUR, PRINCE EDWARD ISLAND.
 - Department of Public Works, Canada.
 - Experimental for design. (d)
 - (e) A 1:150 by 1:30 wave and tidal model with movable bed of crushed bakelite was made to study harbour inlet instability and to determine suitable remedial measures.
 - (f) Model study completed and recommendations issued to sponsor. (g) Shallow water interaction between waves and
 - currents found to be responsible for

- instability rather than littoral drift. "Basic Experiments on the Development of Coastal Inlets With and Without Wave Action," K. L. Philpott, Proc. Xth I.A.H.R. Congress, pp. 303-310, London, September 1963. (h)
- (4466) AIR BUBBLERS.
 - Laboratory project. Experimental; field investigations. (b)
 - (d)
 - Field measurements and laboratory tests were performed to determine the mechanism whereby an air bubbler prevents ice formation in an (e) oceanic environment.
 - Field measurements afforded a clear picture (g) of the mechanism and heat balance of the air bubbler operation. In most oceanic environ-ments the air bubbler will be effective with varying degrees of efficiency.
- (4525) FORMATION OF ICE IN RIVERS.

 - Laboratory project. Experimental; field investigations. d
 - Water temperatures are being recorded in the St. Lawrence River between Kingston, Ontario, (e) and Three Rivers, Quebec, to obtain information on heat losses.
 - (g) Preliminary calculations show satisfactory agreement between measured and computed heat losses. For closer correlation more precise measurement of meteorological con-ditions- particularly radiation- will be necessary.
- (4527) TIDE PROPAGATION IN AN ESTUARY.
 - Laboratory project.
 - Theoretical and experimental. During the last 25 years, several structures have been built in the estuary of the Fraser River, B.C., to increase locally the depth of the navigation channel. A 1:1440 by 1:144 fixed-bed model of the entire tidal section (d) (e)
 - has been constructed to determine the actual effect of such structures on the tidal propagation.
 - The model has been calibrated for different discharge conditions and the first series of tests was started during September 1963. (g)
- (4528) EFFECT OF EARTH'S ROTATION ON RIVER FLOW.
- - Laboratory project. Theoretical and experimental.
 - Considerations of gravity and Coriolis forces acting in fast-flowing, straight rivers of small slope indicate that considerable spiral flow is possible. A small rotating table has been constructed to study flow in channels in a rotating system.
- (5090) CODROY HARBOUR, NEWFOUNDLAND.
 - Department of Public Works, Canada.
 - Experimental, for design. A 1:180 by 1:120 fixed-bed wave and current model of the harbour has been constructed to investigate silting conditions in the harbour entrance and to devise remedial works. (d)
- (5091) ST. BRIDES HARBOUR BREAKWATER, NEWFOUNDLAND.
 - Department of Public Works, Canada.
 - d
 - Experimental for design. A 1/36 scale model of a proposed partially submerged breakwater was tested in a wave flume to determine its effectiveness in providing protection seaward of an existing structure.
 - (f) Completed, results reported to sponsor.
- (5092) BRANCH HARBOUR, NEWFOUNDLAND.

 - d
 - Department of Public Works, Canada. Theoretical for design. A study of methods of reducing or eliminating the need for regular maintenance dredging, by making use of a river for flushing combined with reduction of littoral drift (e)

passing the harbour entrance.

- (5093) GENERAL HARBOUR STUDIES.
 - (b) Laboratory project, sponsored in part by Dept. of Public Works, Canada.
 (d) Field and theoretical, applied research.
 (e) A general study of the hydraulic aspects of
 - harbour design with the eventual objective of standardizing procedures and. if possible, designs, for relatively simple situations not requiring model studies. The rirst stage concerns evaluation of design conditions and in this connection a method of processing wind data for estimation of wave probabilities is under study.
- (5094) PERFORATED VERTICAL-WALL BREAKWATER.
 - (b) Laboratory project.
 - Experimental and theoretical. Two-dimensional flume experiments are being (d) (e) made to determine the behaviour of an erodible bed in front of the breakwater.
 - Results obtained hitherto indicate that, (g) for a non-cohesive bed, no erosion develops at the toe of the breakwater regardless of the wave height or period.
 - (h) A report will be prepared.
- (5095) DINGWALL HARBOUR, NOVA SCOTIA.
 - Department of Public Works, Canada. (b)
 - d Experimental.
 - Model study of a harbour subject to heavy sedimentation (sand)induced by waves. (e)
 - (f) The model study has been completed, but the study is still active.
 - (g) The harbour entrance has been rebuilt. It involves four rubble-mound breakwaters forming a wave energy trap. Results indicate that no shoaling of the entrance occurs.
 - (h) Report is in preparation.
- (5096) SAULNIERVILLE HARBOUR, NOVA SCOTIA.

Hydraulic Research in the United States

Guides to projects conducted by various hydraulic and hydrologic laboratories in the United States and Canada during 1962 to 1964. Project reports cover work done at 86 private or State laboratories in the United States, 32 Federal laboratories, and 12 Canadian laboratories. These publications outline individual projects on nearly 200 subjects in the field.

Order:

- NBS Miscellaneous Publication 245, Hydraulic Research in the United States, 1962, 196 pages. Price: \$1.00.
- NBS Miscellaneous Publication 240, Hydraulic Research in the United States, 1963, 210 pages. Price: \$1.00.
- NBS Miscellaneous Publication 261, Hydraulic Research in the United States, 1964, 215 pages. Price: \$1.25.
